QR Code Samples

By Thom Parker, WindJack Solutions, Inc.

Example #1, Fixed Text: The barcode fields below are set to a static text value by hardcoding the value in the calculation script. The text value is shown below each QR Code. These fields could easily be flattened into the PDF so the QR Codes cannot be changed or removed at a later time.

www.pdfscripting.com	(555) 444-1212	Hello World

Example #2, Printable V-Card: Fill in the data to populate the card size area below, including the QR Code. When this card is printed, customers/vendors can scan the information into their phone, or a contact management system. All the code is in the "Update Button", so all the fields can be easily copied into a real business card template, that has graphics and layout. Since the script for setting the barcode value is in the button, the calculation script on the barcode field is set to perform a null operation, so as not to interfere with setting the value. It is interesting to note that even if some of the entered information is removed from being displayed on the card, the info is still encoded into the QR Code.
