the other variables in the model are interacting. Its strength deflates the associative contribution of other factors in student performance that might better illuminate the dynamics of degree completion. Hence, in *The Toolbox Revisited*, we set aside NOSTOP until the last possible moment, the final Step 7.

All five attendance pattern variables introduced in table 24 break the barriers of significance at this stage of model-building:

- Ever part-time: Whether the student was ever part-time, a decidedly negative influence on degree completion. The Delta-p statistic tells us that part-time status reduces the probability of completion by over 35 percent. While previous research has documented the extent to which part-time enrollment pulls students off the "persistence track" (Carroll 1989), the 35 percent reduction in probability seems high given the fact that nearly half of the NELS:88/2000 postsecondary students were part-time at some time. Students are inconsistent in their understanding of what part-time means, and under a more generous definition of the concept, the reduction in probability dropped to 30 percent—still a puzzlingly high number (see definition of PARTTIME in the Glossary).

- Summer-term credits: The more, the better. That is, each step up the short ladder of summer-term credits increases the probability of completion by 14.4 percent.

- Classic community college transfer: The significance of transfer is solid at $p < .05$, and the Delta-p says that the probability of completion for a transfer student increases by 21 percent. At one point in the construction of this variable for the NELS:88/2000 cohort, a flag was added to indicate whether the student's first enrollment at the four-year college occurred within four years of entry to the community college. This attempted refinement of a time-sensitive variable did not change its position in the Step 5 logistic model. Given the fact that many students who ultimately transfer move back and forth between community colleges and four-year institutions, it is very difficult to determine the precise moment of transfer, i.e., the season on the academic clock at which both institutions recognize a permanent change in status for the student. A flag for first date of attendance at the four-year school does not help.

- Four-year to four-year transfer: This variable is not as strong as community college transfer. Its statistical significance is marginal at $p < .10$. The Delta-p says that those who started in a four-year college and transferred to another four-year college increased the probability of earning a bachelor's degree by 15 percent. Some 18.5 percent (s.e. = 0.86) of those who started in four-year colleges transferred to another four-year college. In comparing those who transferred to those who didn't, one could say only that the more selective the first institution attended, the less likely the student would transfer.[44]

[44]Only 5.4 percent (s.e. = 1.54) of NELS students who started in highly selective four-year colleges transferred to another four-year college, versus 15.7 percent (s.e. = 1.71) for those who began in selective institutions and 20.0 percent (s.e. = 0.99) for those who started in nonselective four-year schools.

- Multi-institutional attendance: In the steps of the logistic model of the original *Tool Box*[45] in which it appeared, the parameter estimates for this variable were -0.009, 0.015, and -0.077, and with odds ratios ranging from 0.93 to 1.02. All these data are basically flat and inconsequential. The situation in *The Toolbox Revisited* is different. In light of the two transfer variables and the ostensive intersection of multi-institutional attendance with transfer, what does this variable say by coming out of a logistic model with a Delta-p indicating that attendance at more than one school reduces the probability of earning a bachelor's degree by about 16.5 percent? While further probing of the issue is advised, it appears that the message of the three variables (community college transfer, four-year to four-year transfer, and multi-institutional attendance) is that formal transfer is more effective than broader patterns of multi-institutional attendance, including simultaneous enrollment and "swirling." This common sense encourages institutions to track and guide apparent nomads toward formal transfer.

Of the other statistically significant variables in this step, even though Academic Resources and socioeconomic status quintile are receding in time, they are not so receding in strength, and are very much with the explanation of degree completion. In this new configuration, no delay of entry to postsecondary education and first-year grades are actually stronger than they were in Step 4 in their positive parameter estimates and Delta-p statistics. The negative consequences of earning fewer than 20 credits in the first calendar year following initial enrollment is also among the continuing statistically significant variables, though with a lower parameter estimate and Delta-p statistic than observed in tables 15 (first-year performance logistic) and 16 (financing logistic). What counts continues to count.

And what counts less but remains statistically acceptable for presentation includes: (a) the set of basic demographic variables that has been in the logistic narrative from the beginning, (b) education expectations (which are proving far weaker for the High School Class of 1992 than they were for the High School Class of 1982), and (c) two curricular features of the first year of postsecondary attendance (remedial course work and credits in college-level mathematics) that are about to be reconstructed in Step 6, when we extend the temporal scope of curricular experience to a student's entire undergraduate career.

Step 6: Extended Postsecondary Performance

Both the attendance pattern variables and those covered in this step (and the next) are distinguished from first-year performance considerations (Step 3) by the temporal reach of the observed behaviors. All the variables from Step 5 are carried forward. We then ask what additional key academic measures span the full range of a student's undergraduate history—from entrance through the first calendar year of attendance, and beyond.

As previously noted, consideration of continuous enrollment has been set aside for the last step in the logistic model sequence. Of other extended performance variables, what was called the "DWI Index" in the original *Tool Box* and is described more prosaically here as the ratio of courses from which the student withdrew or repeated to all courses for which the student

[45] Adelman (1999), table 39, pp. 80-81.

enrolled, also is set aside for the last step, as it is another case of a very strong variable that would overwhelm other extended performance measures that the reader should see play out.

The block of variables entered for the first time in Step 6 includes two reconstructions of curriculum-related factors originally presented within the confines of the first calendar year of attendance: type and extent of remedial problems (replacing first-year remediation), and cumulative credits in college-level mathematics (replacing first-year credits). "Remedial Problem" (see page 34 and table 8 above and description in the Glossary, p. 190) was not admitted to the model, while cumulative mathematics credits was easily admitted.

The variable marking the *trend* in cumulative student grade point averages at three points in time is an improvement over its predecessor in the original *Tool Box* (which offered only two points of reference). Event-history analysts would no doubt want to see more points than three, but more points than three would result in the loss of more students than the 22 percent already lost by insisting on three (due principally to cases in which the true date of first attendance could not be determined).

Table 25 offers a descriptive account of the three trend populations (rising, flat, and declining) in terms of average cumulative GPAs at each measurement point, the average elapsed undergraduate time period (in years) that is covered by those three markers, and the proportion of each group that earned a bachelor's degree. The purpose of presenting table 25 is to demonstrate that the permutations of relationships between GPAs at the three moments of measurement work, and the results evidence *prima facie* sense. Students with rising GPAs are more likely to earn bachelor's degrees than those in the other two groups, and students with falling GPAs seem more likely to spend more time as undergraduates (though the differences here are not great). The reader will also note that for the plurality of students, grades were flat over an average undergraduate stay of roughly four and three-quarter calendar years.

Table 25. Three trends in postsecondary grade point average (GPA) of 1992 12th-graders who attended a four-year college at any time through December 2000 and offered complete postsecondary records, by GPA at three points in time, average undergraduate time, and percentage earning bachelor's degree

	Average GPA					
GPA trend	First calendar year	First two calendar years	At end of undergraduate career	Average elapsed undergrad time	Percentage earning bachelor's degree	**Percentage of all in group**
Rising	2.43 (0.30)	2.64 (0.28)	2.93 (0.18)	4.76 (0.57)	73.5 (1.80)	**37.0 (1.09)**
Flat	2.72 (0.25)	2.63 (0.27)	2.73 (0.26)	4.79 (0.59)	65.5 (1.63)	**43.9 (1.10)**
Falling	3.09 (0.29)	2.90 (0.29)	2.70 (0.30)	4.92 (0.81)	63.8 (2.38)	**19.1 (0.89)**

NOTES: Standard errors are in parentheses. Column for percent of all in group may not add to 100.0 percent due to rounding. Weighted Ns: rising GPA = 415k; flat GPA = 486k; falling GPA = 215k.

Changing majors: Not a rare phenomenon

St. John et al. (2004) complained that research on persistence pays inadequate attention to college major. Agreed. There are a number of problems with the extant research when major is an issue, not the least of which is the definition of "persistence" as within-year, i.e., fall to spring, and no attention to *change*-of-major. Stoecker, Pascarella and Wolfle (1988) paid considerable heed to major field, found some race-by-field interactions in a structural equation model, and did so within the context of a nine-year longitudinal study with degree completion as the dependent variable (a better framework than that used by others). But they faced problems of tracking change of major, moment of decision on major, the problem of students who drop out without a major, and the exclusion of community college transfers.

In response to these difficulties, the Step 6 extended postsecondary performance model tried out a variable that marks change of major. This variable was not accepted into the model, principally as a by-product of overlapping characteristics with the community college transfer variable, as virtually all community college transfers "change major" from general studies to a specific field on entrance to a four-year college (see Glossary, p. 191). But it is worth noting that 50 percent (s.e. = 1.26) of NELS:88/2000 bachelor's degree recipients changed majors at least once, and that this estimate comes very close to Simpson's (1987) estimate of 48 percent for a 1976–84 cohort. The 50 percent mark thus appears to be a strong reference point.

All the elements are now in place for the stage of analysis that examines student histories through the end of their undergraduate careers (with the exception of continuous enrollment and the ratio of withdrawals and repeats to all courses). The logistic for Step 6 is presented in table 26. There are three major observations:

> 1) Race/ethnicity, never statistically significant in steps 1 through 5, does not even qualify for entry under extended postsecondary performance. Performance variables overwhelm demography. At this key inflection point in the analysis of degree completion, it appears race/ethnicity doesn't matter (Light and Strayer 2002), though it may be operating as an indirect effect through other variables. But to test what happens in a different way, the Step 6 logistic model was run defining "minority" separately for each of the four major race/ethnicity groups. This test was run at this point in the logistic narrative because Step 7 introduces two very powerful variables that would bury race/ethnicity indicators. The model itself emerged significant for white students, but not for African-American, Latino, or Asian students. For white students, all the significant variables in table 26 were the same except for four-year to four-year transfer, which dropped below the threshold of significance. For Latino students, the only statistically significant variable within a nonsignificant model (t = 1.37 with 10 degrees of freedom) was whether the student had ever been part-time. For African-American students, the only statistically significant variables within a nonsignificant model (t =1.70 with 13 degrees of freedom) were summer-term credits and whether the student had ever enrolled part-time. For Asian students, nothing was significant within a nonsignificant model (t = 0.34 with 13 degrees of freedom).

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

2) The new cumulative college-level math credits variable proves its worth, with a Delta-p statistic that says for every move up the credit-range the probability of earning a bachelor's degree increases by 11.8 percent, putting it in the same range of influence as summer-term credits and trend in grades.

3) When trend in grades is added to the variable block, the influence of first-year grades increases, in part because, by definition, a rising GPA trend requires a lower starting point. In fact, the first-year GPA quintile factor is twice as strong, measured in Delta-p, than the trend.

We also note variables carried forward and remaining statistically significant in the model:

- As predicted, Academic Resources continues to lose some of its power as students move further away in time from high school performance. There are too many intervening experiences. In Step 1, the Delta-p said that for each rung up the quintile Academic Resources scale, the probability of earning a bachelor's degree increased by nearly 15 percent (see table 12 above). At this point, that increase in probability is 6.6 percent. Tested separately (see Appendix J), the tolerance collinearity statistic for Academic Resources dipped close to a 0.50 mark that was set for a caution light. While still acceptable, the tolerance statistic indicates that, at this point in a stepwise logistic with 17 other variables, a Venn diagram would show the circle for Academic Resources overlapping (but not eclipsing) many of the other variables in the model.

- Socioeconomic status quintile continues to evidence some explanatory power, and with a Delta-p that basically doesn't change from model to model. In this model, moving up each step of the SES quintile ladder increases the probability of earning a bachelor's degree by 6.5 percent. SES would assume a more significant dynamic, as Cabrera, Burkum, and LaNasa (2005) have demonstrated with the HS&B/So cohort, if one entered the entire logistic narrative by SES quintile, and the elaboration of that dynamic will be left to future research.

- The echoes of first-year credit generation are still noteworthy. The Delta-p says that dropping below 20 credits will decrease the probability of bachelor's degree attainment by 22.4 percent.

- Whether the student was ever part-time remains a very strong negative, with a Delta-p unchanged from its first appearance in the attendance pattern model.

- Earning credits during summer terms is still good advice, though each step of that variable now adds 11.2 percent to the probability of earning a bachelor's degree, as opposed to 14.4 percent when it was first introduced under attendance patterns.

- Both the classic community college transfer variable and the four-year-to-four-year transfer variable stay in the model with positive contributions to the

probability of degree completion of 18 percent and 15 percent respectively, even as the multi-institutional variable strengthens with a negative parameter estimate and a restraining influence of 22 percent on the probability of degree completion. This tension continues to challenge analysis.

The only other variable carried forward, but losing statistical significance is that indicating no delay of entry. No delay, which has bounced above and below the line of statistical significance, now drops below.

Lastly, what has not counted in previous steps of the model still does not count: education anticipations, selectivity of first institution, first year remediation, gender, and parenthood.

Three major themes emerge in this penultimate step of logistic analysis:

- The combination of the strength of Academic Resources (composite high school performance, dominated by academic curriculum intensity) and cumulative college-level math credits underscores the power of curricular momentum on both sides of the matriculation line.

- A group of attendance and performance factors, including part-time status at some point, low credit momentum coming out of the first calendar year of enrollment, and multi-institutional attendance apparently colored by "swirling" and not formal transfer, are strong restraints on academic momentum.

- Validating the event history critique of the original *Tool Box* offered by DesJardins, McCall, Ahlburg, and Moye (2002), two measures of GPA—first-year and trend—reflecting the quality of student effort, are very positive contributors to degree completion. The stronger position of the class rank/GPA quintile variable within Academic Resources reinforces this message. Grades count; and yes, there is a competitive message here, since our GPA scales and quintile breaks are relative, not absolute.

Step 7: Final Factors

The very last step in the logistic narrative takes all 17 variables from the extended postsecondary performance model of table 26, and adds the two strongest variables from the original *Tool Box* analysis. One of these, a dichotomous variable for continuous enrollment called NOSTOP, is a staple of analyses of postsecondary careers (e.g., Carroll 1989; Astin 1993; Horn 1998; Berkner, He, and Cataldi 2002).

The second of these notable variables is not such a staple of analysis. It is the ratio of courses from which the student withdrew *without penalty* and those the student repeated to all courses in which the student enrolled. This is a rare topic in the higher education literature, and was last

seen in the major journals in Adams and Becker (1990), though the number of course withdrawals appears on the check list of elements in analyses of time-to-degree (Knight 2002, 2004b). The ratio counts course attempts, not credits. Withdrawals without penalty are not the same as courses "dropped" within set periods most colleges and community colleges mark for "drop-and-add," and dropped courses are not included in the ratio. As for no-credit repeats: Less than 4 percent of respondents to the 2002 survey of grading practices conducted by the American Association of Collegiate Registrars and Admissions Officers indicated their institutions did *not* allow repeats; fully 55 percent indicated that a student could repeat *any* course for a better grade; and 55 percent indicated that students could repeat a course as often as they liked (AACRAO 2002). These proportions suggest a very lenient environment. Nothing here involves penalty grades. These are all cases of noncredit grades. The variable WRPT Ratio is dichotomous: On one side of the dividing line are students who withdrew from or repeated 20 percent or more of all courses for which they enrolled.

Table 27 presents the final step of the logistic model for *The Toolbox Revisited*. The power of the last two variables entered is instantly obvious:

- Withdrawing from or repeating 20 percent or more of courses decreases the probability of earning a bachelor's degree by nearly half!!!

- Remaining continuously enrolled increases the probability of degree completion by 43.4 percent.

As a consequence of the introduction of NOSTOP and the WRPT Ratio, remediation in the first calendar year, a weakening variable from the point of its introduction, is forced out of the model. Its attempted replacement, the more elaborate description of type and intensity of undergraduate remedial problems (REMPROB), was tried out again, and again did not qualify to enter the model. As noted previously, remediation appears to be a neutral factor in this account.

The marker for earning less than 20 credits in the first year of attendance, previously a strong contributor to the model, is turned on its head in the final step, and drops below the threshold of significance. Why? Principally because, as table 28 demonstrates, nearly 60 percent of those who wound up withdrawing from or repeating 20 percent or more of the courses for which they registered were *already withdrawing from and repeating 20 percent or more of their courses in the first year*. When one withdraws without penalty, one earns zero credits. When one repeats a course, one earns credits only once (assuming one passes, of course). What the relationships in table 28 strongly suggest is that low credit production in the first year is a logical consequence of withdrawal and repeat behavior. If we allow negative momentum to start early, the consequences will snowball. The phenomenon argues for more intense academic advising and monitoring, more accurate placement, and (in some cases) more sensible credit loads in the first calendar year of enrollment.

Table 27. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Final factors, with complete academic history

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p

[b] Ratio of withdrawal (W) and no-credit repeat (NCR) grades to all grades received.

NOTES: Statistically significant variables are highlighted in bold. Standard errors adjusted by root design effect = 1.76. G^2 = 2993.12; *df* = 4595; G^2/df = 0.651; X^2 (df) =2260.53 (18); pseudo R^2 = 0.4382; Percent concordant predicted probabilities = 91.8.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Lastly, the variable marking swirling multi-institutional attendance continues to be negative —though marginally significant with $p <. 10$—in table 27 at the same time that both community college transfer and four-year-to-four-year transfer variables fall out of significance altogether. In this final accounting, then, all three type of multi-institutional accounts fade in associative power in the face of behaviors that transcend institutional effects: continuous enrollment and academic performance reflected in grades.

Table 28. To what extent does the final ratio of undergraduate course withdrawal and no-credit repeat grades reflect the ratio and volume of withdrawal and no-credit repeat grades in the first calendar year of enrollment? Answers from the history of 1992 12th-graders who attended a four-year college at any time

Final ratio of withdrawals and no-credit repeats to all courses attempted	Percent for whom first-year withdrawal and repeat ratio was 20 percent or higher	Number of withdrawals and no-credit repeats in the first year		
		None	One	Two or more
Less than 20 percent	5.4 (0.60)	66.7 (1.15)	22.7 (1.06)	10.6 (0.71)
20 percent or higher	57.5 (3.93)	13.7 (2.05)	20.3 (3.17)	66.0 (3.62)

NOTES: Standard errors are in parentheses. Weighted N for those with a ratio of no-penalty withdrawals and no-credit repeats to all courses attempted of 20 percent or higher: 106k; of those with a ratio below 20 percent: 1.08M.

Summing Up the Logistic Narrative

Parts III and IV of *The Toolbox Revisited* have walked the reader, sometimes painstakingly, through the consideration of independent variables for each of the seven roughly chronological steps from high school background to extended postsecondary performance. At the end of each step, a logistic account of what was associated with completion of bachelor's degrees for 1992 12th-graders who attended a four-year college at any time was offered. The logistic account applied to students' histories as of that particular moment only. Step 7, of course, offered the concluding account.

But to judge the full sweep of these seven steps, we ought to see them together in the same table. Table 29 allows summative statements about the changing strength of independent variables, the continuity of what counts, and required goodness-of-fit statistics for the whole model. Let's start with the goodness-of-fit statistics because they validate the model. The reader can find them at the bottom of the second page of the table. Everything that is supposed to happen in a stepwise logistic model (Cabrera 1994; Menard 1995) happens. The G^2 (also called the "maximum likelihood function") falls with each step; G^2/df (degrees of freedom in this calculation is the product of the unweighted number of students in the model minus the number of variables

in the model) also falls with each step, though perhaps too much in Step 7. The chi square statistic is a little more erratic, but rises as it is supposed to. So do the pseudo R^2 and the percent of concordant probabilities predicted at each step. These results are a relief to any analyst .

Table 29 includes all the variables that were entered at any of the seven steps of the logistic account, even if they were not carried forward to subsequent steps because they did not meet the *t* statistic threshold criterion that was set at 0.765. In this manner, we can see where these variables were introduced and where they fell out of the model (the first "X" in the table marks the spot). Race/ethnicity is the most noted example because it was present from the beginning, and even though it was never statistically significant, it qualified to be retained until extended postsecondary performance variables were introduced. In Step 7—and because race/ethnicity is a sensitive factor in public discourse on education—another approach was tried out whereby each of the four major race/ethnicity groups was treated as an independent variable in the model. Only the Asian student variable qualified for entry, but wound up with a *t* statistic less than 0.50.

Another "casualty"—though for a very different reason—is the variable describing credits in college-level mathematics in the first calendar year. This variable was purposefully replaced in Step 6 (extended postsecondary performance) by cumulative credits in college-level mathematics across the student's entire undergraduate career because it was more appropriate to the temporal framework. First-year college-level math was never significant, but its more expansive replacement was, as might be expected from comparative participation rates in college-level mathematics by the end of the *second* calendar year of enrollment (table 21).

Another virtue of the presentation in table 29 is that because all statistically significant variables are highlighted in bold, the reader can swiftly identify what was consistently meaningful among the potential associations with bachelor's degree completion for this group of students. From the moment of their introduction, the following factors met the criteria:

- Academic Resources quintile
- Socioeconomic status quintile
- Low (less than 20) credits in the first calendar year of attendance
- First calendar year GPA
- Summer-term credits
- Ever part-time
- Trend in GPA
- Cumulative "career" credits in college-level mathematics

And no delay of entry to postsecondary education from high school evidenced positive and significant association with degree completion in half the stages of the logistic narrative in which it was in play.

Table 29. Seven steps of a logistic regression model with bachelor's degree attainment by age 26 or 27 as the outcome for 1992 12th-graders who attended a four-year college at any time

When one adds the withdrawal/repeat ratio and continuous enrollment (which appear only in the last step of model-building), some rough themes emerge. Of the ten independent variables, three involve **uses of time** (continuous enrollment, ever part-time, summer-term credits); and four clearly reflect different aspects of **academic performance** (high school Academic Resources, first-year GPA, trend in grades, low-credits in the first year, and the withdrawal/repeat ratio).

Under the temporal theme, no delay of entry floats in and out of statistical significance. Some might say, e.g., of no delay of entry, that the fact a variable is significant in one step of the logistic and not in another "does not always mean that different effects are operating" (Anaya 1999, p. 507). One of the reasons that the logistic narrative provides collinearity statistics (see Appendix J) is to reassure the reader that, for whatever reason a variable ducks in and out of significance, it is not because it is excessively tangled up with other variables. The "tolerance" collinearity statistic for no delay of entry is consistently in the high comfort zone.

Summary of Parts III and IV: Investment Behaviors

When we look across the series of ingredients that rise to the top of strength of association with degree completion, we can interpret them in terms of what Noxel and Katunich (1998) called an "investment model," though this author prefers "investment behaviors," a microscale version of human capital. Once the modest consequences of socioeconomic status are accounted for, each step offers students a set of decisions that require the commitment of time and effort likely to yield a future benefit. These decisions move students, sometimes smoothly and sometimes less so, toward the degree. The choices made, beginning with high school curriculum (from the available curriculum—which is an opportunity-to-learn issue) and quality of effort in high school (reflected in class rank/GPA), allow subsequent leverage. Entering a postsecondary institution directly from high school, earning 20 or more credits in the first calendar year of enrollment, and performing well enough in that first calendar year to fall in the top 40 percent of a GPA distribution build on previous investment, and are all signs of commitment. Subsequent choices that may not be reflected in a bounded period of time, such as excessive course withdrawals, prove to be poor decisions with negative returns, breaking accumulated momentum. Other configurations of choice, including summer-term credit generation, meeting the challenge of college-level mathematics, effort that yields a rising GPA, and most of all, remaining continuously enrolled, all reflect continuing leverage of attainment. This is what academic momentum is all about.

Tinto's (1987) approach is just as direct: Students have responsibilities, and are expected to invest time on behalf of their own learning. Yes, in his words, students have the right "to refuse education" (p. 135), but since the primary commerce of the institution is education, those who refuse should not be surprised if (in his very delicate phrasing) the institution exercises its "right . . . to be selective in its judgments as to who should be further educated" (p. 135). One begins to see why student choice (and the responsibility inherent in student choice) emerges not only as a dominant theme of *The Toolbox Revisited* as well, but as the principal challenge to academic advising and counseling from secondary through postsecondary education.

One grants that a great deal more is going on in the lives of traditional-age students at the same time. They are not bloodless. The literature on persistence has included not only a mass of psychological and social considerations (Harmston 2004; Hu and St. John 2001; Kahn and Nauta 2001; Robbins et al. 2004), but also basic aspects of maturation such as physical fitness (Zhang and Richards 1998), nutrition, roommate conflicts, dating problems, time management (Purcell and Clark 2002), and personality-environment congruences and dissonances (Feldman, Smart, and Ethington 2004). Studies such as Stage's investigation of "motivational orientation" (1989) are also valuable in that they override stock demographic explanations and identify "subsets of college students who might react similarly to college experiences" and, hence, assist advisers and student service personnel. Our data sources do not include these factors.

What the Literature Calls "Institutional Effects"

A major strand of the literature on postsecondary retention derives from Tinto's (1987) constructs of academic and social integration, constructs that contributed to the emergence of the National Survey of Student Engagement (Kuh 2001) and its use by hundreds of institutions in assessing the effects of environments on student behaviors. The reason Tinto's work generated such a continuing elaboration and response is a combination of its elegance and *prima facie* common sense. At whatever age they start out, entering postsecondary students are not empty vessels; they come with demographic characteristics and high school experiences (and, if there is a gap of years between high school graduation and postsecondary entry, work experiences and family formation as well) that condition and shade where and how they enter the postsecondary system. Once at an institution, these background characteristics interact with the academic processes and social environment of that institution to yield varying degrees of determination to persist and complete credentials. Institutional culture, including habits of faculty interactions with students outside of the formal classroom and opportunities for a variety of peer group interactions, plays a significant role in Tinto's models of academic and social integration.

It is not surprising that the mass of studies drawing on Tinto's work are institution-specific or use institutional characteristics as independent variables. To attain enough depth on all these features of student lives so that direct and indirect influences can be mapped through path analysis requires extraordinary probing, which is best carried out in institutional contexts where adequate samples can be assembled. Even if we employed hierarchical linear models to illuminate the relationships between nested characteristics of individuals within institutions and outcomes such as GPA, we would need much larger samples of students within each institution than the NELS:88/2000 provides.[46]

---

[46]In a case of a continuous dependent variable for student engagement, and sets of independent variables describing both student and institutional characteristics (half of them continuous), Porter (2005) demonstrates the statistical superiority of multilevel analysis versus Ordinary Least Squares analysis. There are three significant differences between Porter's illustration and the story line of *The Toolbox Revisited* : (1) the dependent variable (bachelor's degree attainment) and most of the independent variables in this data essay are dichotomous, hence, our method is logistic, not linear, (2) Porter's model assumes that students attend only one institution, whereas more than half the students in this analysis attended two or more, and (3) while multilevel analyses can create models for institutions "even for schools with few student observations" (Porter 2005, p. 110), of the 3,258 institutions in the NELS:88/2000 postsecondary transcript files, 1,003 had only one student in the sample. An institution-level model with a population of one is out-of-scope.

With the student as the unit of analysis, and 25 percent of the students in the universe we are examining attending *more than two* institutions as undergraduates, the calculation of institutional effects becomes problematic. For the students who attended only one four-year college, the weighting of institutional characteristics such as those Titus (2004) admits into his analysis of three-year persistence at the same institution (e.g., control, size, selectivity, degree of residentiality, and percent female, etc.) are fairly easy to plot. But for those who attended more than one institution, a weighting scheme for the influence of each institutional characteristic based on the proportion of undergraduate time each student spent in different institutions would be necessary. For a student who earned 26 credits at a community college, 30 credits at a four-year baccalaureate residential college, and 75 credits at an urban university, the ratios would dilute the very meaning—let alone effect—of any single institutional characteristic. This example is not a fantasy. Consider, for example, the credit accumulation at each school attended by two sets of students from the NELS:88/2000 who attended three institutions as undergraduates (fig. 2).

Figure 2. Examples of credits earned at each institution attended by 1992 12th-graders who earned standard high school diplomas by December 1996, attended a four-year college at some time, earned a bachelor's degree, and attended three institutions as undergraduates, by type of transfer

	Credits earned at each school attended		
Student cases	School #1	School #2	School #3
Community college transfers			
#1	66 (community coll)	34 (four-year)	62 (four-year)
#2	32 (community coll)	28 (community coll)	90 (four-year)
#3	41 (community coll)	18 (four-year)	64 (four-year)
Four-year-to-four-year transfers[a]			
#1	24	36	92
#2	36	21	88
#3	25	30	79

[a] All three schools attended by these three students were four-year colleges.
SOURCE: National Center for Education Statistics. NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

How does one evaluate indirect effects of institutional characteristics and experiences (class size, contact with faculty, peer group interactions, etc.) for these students? Does one weight each potential effect by the percentage of credits earned at each school in relation to all credits earned? Can one somehow arrive at a consolidated index for each effect across schools? How would one compare these indices to those for students who attended only two institutions? To those for students who attended only one? All six of the students in figure 2 above earned bachelor's degrees. For students who did *not* earn bachelor's degrees but who attended three institutions,

what is the minimum threshold of credits one would set at each institution attended before trying to determine the range of institutional characteristics and student experiences that might have some degree of association with the dependent variable? Across all patterns of inter-institutional "traffic" (Astin and Astin 1993), is there a common effects metric that encompasses mere excursions (incidental attendance at second or third institutions), true migration (formal transfer), and the nomadic behavior described as "swirling"? The author tried to develop a descriptive framework of excursion, migration, fragmentation, and discovery for this task, but with less than satisfactory results (Adelman 2004b). Certainly, there are more sophisticated models that can address the rhetorical questions above, but they risk both neglect or devaluation of life-changing experiences at institutions where a student spent comparatively little time and earned few credits, and false identification of effects that can be very fleeting.

Postsecondary student attendance patterns have rendered consolidated institutional-effects analyses moot. For that reason, these analyses are best carried out within the context of individual institutions (no matter where else the student goes to school). This study does not belittle the constructs of institutional effects and assessment efforts such as those of the National Survey of Student Engagement (NSSE) at all. For college and community college administrators, these assessments count a great deal in determining the kinds of environmental adjustments likely to intensify student involvement with institutional services as well as to heighten student satisfaction with instruction, even if the student is present for only 24 credits.

Even so, many of the variables of institutional effects analyses (and that includes high schools as well as colleges and community colleges) are sufficiently beyond the control of administrators so that the practical implications of whatever paths one delineates as productive are limited. Yes, high schools can change the structure of opportunity-to-learn, e.g., by not even offering arithmetic or watered-down pre-algebra and simultaneously conveying a clear message to students that they can meet the challenge of higher level math (Lee, Croninger, and Smith 1997). And the postsecondary level can follow suit, e.g., community colleges can refuse to teach arithmetic or basic algebra. Neither of these strategies is micromanagement, and, however some may wish otherwise, neither is likely to be implemented on a large scale. At the postsecondary level, the very conditions of control shift: An administrator cannot change the fact that the institution was not the student's first choice and that he or she is determined to transfer from the moment of first registration; there is no drug to prescribe for a student with severe homesickness; one cannot—and should not—prevent the student from changing majors for the second time; no college authority has any influence on the romantic life and angst of 20 year-olds that may affect their involvement with academic pursuits (Okun, Taub, and Witter 1986); administrators can't sand down every potentially hard edge of their schools. Furthermore, there is a natural capacity limit to truly meaningful contact with faculty outside the classroom. To use examples from the National Survey of Student Experience, how many faculty can deans deploy for student participation in faculty research projects or for students to work with faculty on committees and

student life programs?[47] The larger and/or less residential the institution, the less the opportunity for student-faculty interaction in other than casual or ritualistic activities (Hu and Kuh 2002).

To repeat: The NELS:88/2000 does not reach the details of student development or institution-specific student experiences accounted for in other research lines. The elaborate connections between student background characteristics, social and psychological predispositions, initial perceptions and responses to a particular postsecondary environment, strength of goal commitments, etc. in relation to not only the fact but also the pace of student progress toward a credential—all of which have been explored and documented by the touchstone giants of postsecondary student outcomes research (Astin, Pascarella and Terenzini, Cabrera, Tinto)—lie beyond the scope of national longitudinal studies. That is not an excuse for the "economic" reading, broadly construed, of academic momentum. We all know that the many investment decisions made by students along their paths through postsecondary education do not occur in social and psychological vacuums. But the archival data on which this study draws isolate moments in which student choice intersects the structures of opportunity offered by institutions whose first order of business—and first order reason for existing in our society and economy—is the generation, preservation, and distribution of knowledge. This is a story about taking advantage of that mission; it is not a story about growing up, although that happens along the way.

[47]Kuh et al. (2001) reported that less than 20 percent of seniors in 2000 indicated experiencing these modes of nonstandard faculty contact. By 2004, that proportion had not changed, while 58 percent of seniors indicated they had talked often or very often with faculty outside of class about their grades (a ritualistic interaction that shouldn't carry much weight in assessments of student/faculty contact). See www.nsse.iub.edu/~nsse/2004_annual_ report/html/responses _senior sfi.html. (Accessed 7/31/05).

Part V
Closing the Gap

One of the principal objectives of the *No Child Left Behind* legislation as it works its way through grades K–8 is to close the gaps in achievement between minority and majority students. When that objective is extended to high schools, as this essay underscores in Part III above, we have no adolescent left behind. And when extended to postsecondary schooling, as the logistic narrative has done, our objective is to leave no young adult behind, either. While race/ethnicity itself was not a significant variable in that narrative, the fact of an unhappy gap remains in degree completion—which means that there are residual echoes of experience by race/ethnicity that affect education outcomes. It is not the intention of this monograph to explore these echoes (there are far more sophisticated techniques and far more knowledgeable researchers than the author to engage in that task). But if we focus on the academic story line, we can at least draw some parameters of possibility for assisting minority students.

Two issues attendant on this observation are now addressed: our confidence in degree completion rates, and what might contribute to closing the gap between majority and minority populations in degree completion.

Bachelor's completion rates: Some remarkable agreements

The most prescient and eloquent statement of the problems attendant on our romance with graduation rates was offered a decade ago by Ronco (1996):

> Performance, even in relatively straightforward terms like graduation and retention, eludes our attempts to measure it. Students no longer march lockstep through four years of college to graduation. The educational model of the new millennium will likely be characterized more by lifelong learning, where students move among various kinds of higher education institutions, stopping in and out as their lifestyles and educational needs dictate. Enrollment patterns like these make indicators like four- or even six-year graduation rates for first-time, full-time freshmen largely irrelevant. Transfer students deprive both the sending and receiving institution of retention and graduation credit. (p. 1).

But accepting the object of policy affections for a moment, the most enduring context for the analyses of *The Toolbox Revisited* involves what its predecessor called the Dow Jones Industrial Average accountability measure of U.S. higher education: the proportion of entering undergraduates who earn a bachelor's degree. There are very few truly reliable national portraits of degree completion because there are very few data sources of convincing scope and magnitude. The task requires a longitudinal study with a tested sampling design and matching weights. The technology for a full census of completion does not yet exist.

Ewell (2004) has reminded us that a *student-based* indicator of completion leads to assessments of the benefits of higher education to the entire society and economy. An *institution-based* indicator does none of that, though there is no question that the institution is responsible for contributing to the student's discovery of intellect and path to attainment. While the student is obviously more important, institutions are partners.

There are three recent national accounts of bachelor's degree completion for students who started out in postsecondary education together that can demonstrate how these two indicators, student and institutional, play out.[48] Each account comes from a different data set:

1. The NELS:88/2000 that is the subject of *The Toolbox Revisited*. To repeat its major characteristics: The temporal term is a maximum of 8.5 years (1992–2000) from the month of entrance, no matter when that happens and at what enrollment intensity (full-time or part-time). This is a grade cohort, with all students roughly the same age.
2. A six-year longitudinal study, based on the Cooperative Institutional Research Project's (CIRP) data, that followed 1994 entering college freshmen to 2000 (Astin and Oseguera 2002). While dominated by traditional-age students, this cohort is not wholly homogenous in terms of age at entrance, but is confined to those who started out, full-time, at 262 four-year colleges, weighted to represent beginning full-time freshmen at all public and not-for-profit private four-year colleges (for-profit four-year colleges are not included).
3. Another 6-year longitudinal study, 1995/6 through 2001, conducted by NCES as a spin-off from the massive Congressionally-mandated National Postsecondary Student Aid Study. We have used this data set, the Beginning Postsecondary Students longitudinal study, previously. Beginning students of all ages and enrollment intensities (full-time, part-time, and mixed) are included.

Let us set these three data sets side-by-side, adjust the two NCES databases to match both each other and the CIRP database, and then assess how much they disagree with each other. We will confine both the NELS:88/2000 and the BPS 95/96–2001 to those who started out in four-year colleges, limit the dates of entry of the NELS:88/2000 cohort to the same year (1992) and, most importantly, put an upper bound on age at date of entry in the Beginning Postsecondary Students of 20. Table 30 offers these comparisons.

---

[48]There are other large longitudinal studies of degree completion, but their samples of institutions and students are not representative. For example, Saupe, Smith and Xin (1999) used the Consortium for Student Retention Data Exchange information from 174 public four-year colleges to track six-year (1989–96) institutional graduation rates. While these 174 institutions enrolled nearly half of entering four-year college students in 1989, they represent a class, not a universe. For another, but more dated example, Stoecker, Pascarella, and Wolfle (1988) used a 1980 CIRP follow-up to an initial 1971 sample of roughly 10,000 students who had attended only one four-year college in the interim. Some 487 college and universities were represented. Stocker, Pascarella, and Wolfle were interested in institutional effects, so their restriction of the universe to students who had attended only one school is justified, and their findings revealing. But that doesn't justify using the conclusions as a generalized model of degree completion—certainly not under contemporary conditions of student mobility. For state-level postsecondary longitudinal studies, only Florida has produced data sets comparable to the national accounts.

Given the conditions under which degree completion is judged, the conclusions of these three data sets do not differ that much from each other. We can say that roughly a third of traditional-age students who start in a four-year college will earn a bachelor's degree from the *same* school in the traditional four-year period, and that between 54 and 58 percent will earn the degree from the same school in which they began within six years of entry. When the option of earning a degree from a *different* four-year college than the one in which these students commenced study is included (in the NELS:88/2000 and BPS 95/96–2001), six-year degree completion rates for traditional-age students are in the 62–67 percent range. Only when the temporal boundaries are extended to 8.5 years in the NELS:88/2000 does degree attainment for those who started in four-year colleges approach 70 percent, and Florida state longitudinal studies show a similar rate (Johnson, Coles, and Thomas 2004).

Table 30. Bachelor's degree completion rates for students who began in four-year colleges according to three different national longitudinal studies of the 1990s

	Percent completing bachelor's degree		
Bachelor's degree completion modes	NELS:88/2000 1992–2000	Cooperative Institutional Research Project (CIRP) 1994–2000[a]	Beginning postsecondary students 1995–2001
Bachelor's from same school in 4 years	30.9 (1.14)	36.4	33.1 (1.3)
Bachelor's from a different school in 4 years	3.0 (0.30)	Not available	2.3 (0.3)
Bachelor's from same school in 6 years	52.9 (1.27)	57.6	53.7 (1.2)
Bachelor's from a different school in 6 years	11.3 (0.79)	Not available	8.1 (0.4)
Bachelor's from same school in 8.5 years	55.3 (1.24)	60.6[b]	Not available
Bachelor's from different school in 8.5 years	14.1 (0.84)	Not available	Not available
Total degree completion:	69.3 (1.16)	60.6[b]	61.8 (1.2)

[a] As reported in Astin and Oseguera (2002). Standard errors are not available.
[b] In Astin and Oseguera, this cumulative figure includes students who were still enrolled at their institution of first attendance at the end of six years.
NOTES: Standard errors for the NELS:88/2000 and BPS95/96–2001are in parentheses.
SOURCES: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement) and Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-173). Astin and Oseguera (2002).

Degree Completion: How High Can It Go?

If roughly seven out of ten traditional-age students who start in a four-year college—and roughly two out of three who ever attend a four-year college—graduate within eight and one-half years, how likely is it that the rate will improve, by how much, and among what groups? When looking back at the factors consistently contributing to bachelor's degree completion in table 29 and asking which are most subject to change by external parties with little to modest, but creative, effort, a few stand out, and encourage speculation. All depend on student response. In the words of Tinto's (1987) astute guidance:

> Though . . . institutions owe each admitted student an equal degree of attention, it does not follow that institutions should be held accountable for the equal education of all admitted students. To absolve . . . [students] of at least partial responsibility for their own education is to make a serious error. (p. 135)

Let's look at each of the more promising levers, and then explore what the configuration of change in behaviors and policy might suggest for upper boundaries of degree completion and the closing of the gap in completion among race/ethnicity groups.

1) **Less than 20 credits in the first calendar year of enrollment**: Approximately nine percent of those who entered four-year colleges at any time earned between 15 and 19 credits in their first calendar year, with African-Americans and Latinos overrepresented.[49] Within this group, only 35 percent (s.e. = 3.05) earned bachelor's degrees compared with 77.7 percent (s.e. = 0.99) of those who earned 20 or more credits. Fifteen to nineteen credits is close enough to 20 to be optimistic: If we know more about who students are and where they come from, colleges and community colleges can target dual enrollment efforts to yield at least six additive credits for these students, thus pushing them across the 20-credit line. But we do know something about these students, and our optimism must be tempered by the facts that 15.3 percent (s.e. = 2.49) of them were assigned to remedial reading in their first postsecondary year, an overlapping 34.5 percent (s.e. = 3.93) never reached Algebra 2 in high school, and only 27.9 percent (s.e. = 2.96) earned any college-level mathematics credits in that first year. For the residual group (about six percent of those who enrolled in a four-year colleges at any time), suburban high school students from the Pacific and Southwest Central census divisions[50] are overrepresented, and provide some geo-direction for dual-enrollment policy targeting.

---

[49]Some 7.4 percent (s.e. = 0.56) of white students earned between 15 and 19 credits in their first calendar year of attendance, compared with 11.1 (s.e.=1.86) of African-Americans and 18.5 percent (s.e. = 3.30) of Latinos.

[50]The Pacific census division includes California, Oregon, Washington, Alaska, and Hawaii; the Southwest Central encompasses Texas, Oklahoma, Arkansas, and Louisiana.

2) **Ratio of non-penalty withdrawals and no-credit repeat courses to all courses attempted**: For about 10 percent of the NELS:88/2000 cohort who attended a four-year college at any time, this ratio was 20 percent or higher. That is, this group of students withdrew from or repeated at least one out of every five courses in which they enrolled, behavior negatively associated with degree completion. Compared with white students, all minority groups are overrepresented.[51] What would happen if institutions limited the number of no-penalty withdrawals and no-credit repeats students were allowed to accumulate, converting these cases above a given threshold to penalty grades? This is a risky proposition and difficult to model because we do not always know why students withdraw from courses after the customary drop/add periods (Adams and Becker 1990). Students repeat courses to earn better or passing grades. In the case of remedial work, the repeat is required, and the list of courses with the highest ratios of withdrawal and repeat grades is dominated by remedial offerings (Adelman 2004a, table 6.6, p. 84). In other cases, repeats are a luxury. Since no-penalty course withdrawals and no-credit repeats increase time-to-degree measurably for those who earn degrees (Adelman 2004a, table 6.2b, p. 79; Knight 2004b; Noxel and Katunich 1998), and since these behaviors have a rippling effect by blocking other students from seats, often in high demand courses, it is in institutions' self-interest to limit the practice. Intensified advisory care to student credit loads (Szafran 2001) and more precise placement criteria should help.

A good example of the way this might work is provided by Eno, McLaughlin, Brozovsky, and Sheldon (1998), who predicted difficulty ratings for specific courses likely to be taken by entering freshmen in their institution on the basis of both overall high school GPA and, more importantly, grades in specific high school courses. The hypotheses for each student within each course were then set against the empirical record of students' actual performance in the college course at issue. The information assists students' advisers with indications of which courses a student might find particularly difficult. The likelihood of no-penalty withdrawals or no-credit repeat grades is attenuated by delaying students' engagement with those courses until they have gathered the requisite momentum elsewhere in the college curriculum.

3) **Use of summer terms**: As table 31 suggests, earning more than four credits during summer terms may have a considerable influence on the degree completion rates of African-American students in particular. That is, 78.2 percent (s.e. = 4.12) of those who started in four-year colleges and exceeded this threshold earned bachelor's degrees, compared with 21.2 percent (s.e. = 4.59) of those who did not earn summer-term credits at all. The difference was also significant for white students, but not to the same degree. Parallel comparisons for Latinos and Asians were not statistically significant.

---

[51]Some 8.3 percent (s.e.= 0.68) of white students were in the high ratio category, versus 12.2 percent (s.e. = 3.04) of Asian students, 12.3 percent (s.e. = 1.96) of African-American students, and 19.6 percent (s.e. = 3.56) of Latinos.

Table 31. Of 1992 12th-graders who started their postsecondary careers in four-year colleges, percentage who earned bachelor's degrees by December 2000, by number of credits earned in summer terms, by race/ethnicity

	Percentage earning bachelor's degrees by December 2000		
	Number of summer-term credits		
Race/ethnicity	None	1–4	More than 4
All	56.2 (1.99)	68.1 (2.78)	79.7 (1.29)
White	59.8 (2.22)	74.2 (2.58)	82.2 (1.19)
African-American	21.2 (4.59)	42.5 (10.3)	78.2 (4.12)
Latino	48.6 (7.14)	28.3 (7.15)	56.4 (6.21)
Asian	66.8 (10.3)	70.0 (13.0)	77.9 (7.08)

NOTES: Standard errors are in parentheses. Weighted N=1.14M.

Summer-term enrollment that results in more than four additive credits works for just about everybody (we saw that in the multivariate analyses). While it surprisingly does not shorten time-to-degree for those who earn degrees (see Appendix K), summer credits are associated with higher graduation rates for everyone except Latino students. It is thus in an institution's self-interest to encourage the use of summer-term work, either at the institution itself or at another school. Ways of approaching this goal shy of tuition discounting include moving some of the offerings of high demand courses from the traditional academic-year terms into the summer term, offering summative course work in the major in the summer term, and recruiting students for credit-bearing internships and cooperative education placements in the summer terms. Academic administrators in cooperation with strategic enrollment managers can be very creative.

4) **The high school curriculum component of Academic Resources:** One of the more dramatic illustrations of the potential influence of high school performance on bachelor's degree attainment in the original *Tool Box* isolated four major race/ethnicity groups, confined each to those who entered a four-year college directly from on-time high school graduation, and compared two estimates: the bachelor's degree attainment rate for everyone versus the bachelor's degree attainment rate for those who were in the top 40 percent on each of the three component measures of Academic Resources (curriculum, class rank/GPA, and senior year test score). Though undercut by the fact that, in multivariate analyses, race/ethnicity does not play much of a role in bachelor's degree completion, the cross-tabulation of these estimates suggested that the criterion-referenced curriculum variable had the potential to boost African-American degree completion by 28

percent and Latino degree completion by 18 percent (though that datum was statistically shaky) and white students' degree completion by 10 percent. For Asian students of the period, test scores made more of a difference than either curriculum or class rank/GPA.

Class rank/GPA and senior year test score are not criterion referenced, and while performing better in high school in terms of grades and tests improved degree completion in the original *Tool Box*, it was by lesser magnitudes. It was observed that "in a happy paradox, *everybody* can be in the 'highest 40 percent' on the [criterion-referenced] curriculum measure," whereas that is not true for test scores or class rank (Adelman 1999, p. 85). Content counts, particularly for minority students, and the influence of special preparation programs supports that conclusion (Ishitani and Snider 2004)

Does this analysis still hold, particularly as we have already observed improvements in academic curriculum participation by the High School Class of 1992 compared with the High School Class of 1982 (see tables 4 and 5 above)? That depends on what else is in the mix of factors associated with degree completion, and unlike the original analysis of this feature in *Answers in the Tool Box*, the other factors are matters of *postsecondary* entry and *postsecondary* academic behavior.

How might the four factors just highlighted, along with direct entry to higher education following high school graduation, cumulatively influence bachelor's degree completion for the core universe of this study, the subjects of table 29? To remind the reader just who these students are:

- they were 12th-graders in 1992;
- they earned a standard high school diploma (not a GED) by December1996 (as the NELS transcript records conclude in December 2000, an honest account of degree completion should allow the student at least four years to reach that mark);
- they attended a four-year college at any time (20 percent started in community colleges, and those who started in community colleges earned an average of 52 credits [s.e. = 1.58] from community colleges and 59.5 credits [s.e. = 1.92] from four-year colleges); and
- their postsecondary records were complete, i.e., no transcripts were missing.

Table 32 takes this group, and first sets down a base bachelor's degree completion rate for the entire cohort by four major race-ethnicity groups.[52] The table then enters five key conditions influencing degree attainment that are subject to the initiatives and control of second parties, and marks the *potential* bachelor's degree completion rate for students meeting the thresholds of those cumulative conditions. As each condition is added to the cumulation, the universe narrows for the NELS:88/2000 cohort, and as it narrows, hypothetical degree completion rates rise. One could choose a different sequence of conditions, but the bottom line would be the same.

[52]There were too few American Indians in the base group to follow through a narrowing population as conditions for academic momentum were added.

Table 32. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete, by race/ethnicity

	Percentage earning bachelor's degree				
Cumulative conditions	**White**	**African-American**	**Latino**	**Asian**	**All**
1)Baseline, no conditions	**67.6 (1.18)**	**52.1 (4.26)**	**45.4 (3.74)**	**67.9 (4.71)**	**64.6 (1.12)**
2) No delay of entry	71.0 (1.22)	54.6 (4.49)	50.5 (3.79)	68.2 (4.89)	67.9 (1.15)
3) No delay, top 40 percent of high school curriculum, and highest high school mathematics above Algebra 2	85.6 (1.50)	65.9 (8.57)	69.2 (6.33)	91.5 (1.96)	84.1 (1.40)
4) No delay, top 40 percent of high school curriculum, and more than four credits in summer terms	90.6 (1.31)	84.6 (5.95)	69.2 (8.12)	92.6 (2.27)	89.1 (1.30)
5) No delay, top 40 percent of high school curriculum, more than four credits in summer terms, and 20 or more credits in first calendar year of attendance	92.6 (1.23)	88.2 (5.28)	71.9 (9.07)	93.9 (2.16)	91.4 (1.24)
6) No delay, top 40 percent of high school curriculum, more than four credits in summer terms, 20 or more credits in first calendar year, and less than 10 percent of grades were withdrawals or no-credit repeats	95.5 (0.98)	94.3 (4.62)	79.4 (11.1)	95.3 (2.20)	94.6 (1.07)

NOTES: Standard errors are in parentheses. Weighted Ns for each cumulative step: (1) 1.45M; (2) 1.33M; (3) 712k; (4) 621k; (5) 310k; (6) 273k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

These are statistical coincidences, not causes. The subjunctive is very strong in this presentation. The standard errors indicate that not all these changes would be statistically significant, particularly for minority students, but that phenomenon, too, is a consequence of a shrinking population at each step. No delay of entry is invoked as the first condition because it results in the least shrinkage**,** leaving a larger population with which to assess the other four factors.

All five conditions of table 32 are criterion-referenced. That is, everyone can meet those conditions; everyone can cross those thresholds. The populations could be much larger. Does that mean that future degree completion rates will look like those in this table if everyone meets the criteria on all five counts? No: We know that not everybody will make it. We have already marked and acknowledged that some students will flunk out or become status dropouts for other reasons. But the table suggests just where the improvements are likely to be dramatic—and for whom. Some examples, by race/ethnicity, would be instructive.

For **Latino** students, high school academic curriculum attainment and entering college directly from high school provide the greatest leaps in degree completion, narrowing the gap with white students from 22.2 percent in the base rate to 16.4 percent. But little else narrows the gap much further. Postsecondary summer-term participation, for an obvious case, yields something of a zero, and getting across the 20-credit line in the first year of attendance appears to do little for Latino graduation rates (though if the sequence of conditions were different, it would do more). If we are looking carefully at this fastest growing population in the United States, we pour our efforts into high school preparation above everything else. A decade from now, we will be able to assess better whether postsecondary behaviors become more impressive contributors.

For **white** and **Asian** students, moving into the top 40 percent of the high school academic curriculum intensity index and completing high school mathematics beyond Algebra 2 also is the strongest engine among these variables for boosting college graduation rates. Earning more than four summer-term credits adds something for white students, but nothing to speak of for Asian students. The other factors may contribute minor momentum, but once one reaches a hypothetical 90 percent completion rate, subsequent improvements are not meaningful.

For **African-American** students, who start out at a higher bachelor's degree completion rate than do Latinos, the high school academic curriculum factor does not close the degree completion gap by a statistically significant amount, but earning more than four credits in summer terms offers a stunning boost, narrowing the completion gap vis-a-vis white students from 15.5 percent to 6 percent. The momentum provided by this high-octane persistence behavior continues through the first calendar year credits criterion and avoidance of no-penalty withdrawals and no-credit repeat grades until, at the bottom line of the hypothetical rates set forth in table 32, African-American degree completion rates would be no different from those of whites and Asians.

What did African-American students in the NELS:88/2000 cohort universe who attended a four-year college at any time study during summer terms? A transcript-based account can be very revealing—and in this case, positively so. Using 110 aggregate course categories, table 33 displays the 15 categories accounting for the highest percentages of summer-term credits earned.

Table 33. Percentage of credits earned during undergraduate summer terms by African-American 1992 12th-graders in aggregate course categories

Category	Percent of total summer-term credits
Business other than accounting and administrative science	5.5
Chemistry	5.1
Physical education activities/health information	4.9
College-level mathematics[a]	4.1
College-level writing[b]	3.7
General biology	3.3
Psychology other than general psych	3.0
Physics	2.8
U.S. history surveys, American Civilization	2.8
Micro/macroeconomics	2.6
Accounting	2.5
Calculus	2.5
Foreign languages	2.4
Liberal studies/general humanities/general social science	2.1
Oral communication/public speaking	2.0
Total for top 15 categories	46.7

[a] Includes college algebra, finite mathematics, precalculus, and statistics.
[b] Includes standard English composition, technical writing, creative writing, and advanced essay.
NOTE: The calculation is a "credit ratio" in which the unit of analysis is the course category. All student-weighted earned credits from all course categories are added, with the total a finite glass of 100 percent that becomes the denominator for subsequent calculations. No standard errors are produced.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

This is a very respectable list for anyone. It advises advisers: Point out to African-American students that their peers have proved (a) summer-term credit production is a benefit, and (b) the student can concentrate in the summer terms on the kind of critically demanding and critical gateway courses that might not otherwise be in as intense focus during an academic year term. The learning goes deeper under single-subject concentration. Examples include organic chemistry, calculus, and experimental psychology. To repeat: There are values in summer-term credit production for everybody, but if summer-term credit production looks like it benefits a particular group more than others, that needs to be said. If we don't know why the benefits seem more significant for African-American students, let us submit the issue to future research.

Is the story for low-SES students the same?

Reviewers of drafts of this document asked whether the same type of analysis could be performed by socioeconomic status, since we know that the gap in degree completion between the highest and lowest SES quintiles is far wider than any pair of race/ethnicity comparisons (Adelman 2004a, table 3.1, p.34). The lowest SES quintile group is small: only 6 percent of the

1.43 million 1992 12th-graders who graduated from high school by December 1996 with a regular diploma and who attended a four-year college at some time. These students completed bachelor's degrees at a rate of 35.9 percent, compared with 55.4 percent for students in the middle (3rd) SES quintile, and 79.7 percent for students in the highest SES quintile. Perhaps the best illustration of what might close the gap for them is to compare their hypothetical rates of completion with students from the middle and highest quintiles, and table 34 does so. We use the same levers as variables because they are subject to second-party action. But we have to stop after the step where summer-term credits are added in because (a) in extending the data beyond the boundaries of table 34, subsequent variables in the cumulative sequence (first-year credit threshold and withdrawal/repeat limits) do not add anything to the degree completion rates of low-SES students, and (b) the standard errors of the estimates have risen to the point at which comparisons between the lowest SES quintile group and the middle group are not statistically significant. The data of table 34, though, send clear messages: Despite obviously great limitations inherent in low socioeconomic status, the most promising engine of momentum for

Table 34. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders from the lowest, middle, and highest socioeconomic status quintiles who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete

Cumulative conditions	**Percentage earning bachelor's degree**		
	Lowest SES quintile	**Middle (3rd) SES quintile**	**Highsest SES quintile**
1) Baseline, no conditions	35.9 (3.74)	55.4 (2.34)	79.7 (1.50)
2) No delay of entry	39.9 (4.18)	59.7 (2.47)	81.3 (1.46)
3) No delay, top 40 percent of high school curriculum, and highest high school mathematics above Algebra 2	58.7 (6.14)	72.5 (3.71)	89.0 (1.21)
4) No delay, top 40 percent of high school curriculum, highest high school math above Algebra 2, and more than 4 credits in summer terms	59.6 (9.73)	82.2 (5.26)	91.2 (1.25)

NOTES: Standard errors are in parentheses. Weighted Ns for each cumulative step: (1) 1.43M; (2) 1.31M; (3) 546k; (4) 260k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

these students is a strengthened high school curricular background, and achieving that objective requires greater attention to the provision of curriculum and the quality of learning environments in schools attended by these students, no matter where those schools are located. Even then, the degree completion gap between the lowest and highest SES quintile would be 32 percent.

The bottom line on degree completion

In reporting the proportion of college students who complete bachelor's degrees, there seem to be as many answers as there are observers. A number of rules are recommended:

1. Use transcript-based data sources. They do not lie; they do not exclude.
2. Follow the student, not the institution. Community college transfer students are followed to determine degree completion. Do it for everybody! And if one insists on institutional graduation rates, give the institution credit for students who transfer in. We don't do that now.
3. Do not restrict the universe to students who entered higher education only in the fall term and only full-time (otherwise one excludes half of an entering cohort).
4. Do not mix your 18 year-old daughter and your 34 year-old brother-in-law in the same analytic of degree completion. They live on different planets of life's responsibilities. In other words, institutions should consider ledgers indicating degree completion rates separately by age bracket at the point of entry, and national accounts should follow suit.
5. The only people for whom bachelor's degree completion rates should be calculated are those who actually enrolled at a bachelor's degree-granting institution at some time.

All these common sense rules, respectful of students and their families, were observed in *The Toolbox Revisited*—and in *Answers in the Tool Box* before it.

The elaborate multivariate analyses of Parts III and IV of this essay provided a framework within which academic momentum toward bachelor's degree completion (not toward something else such as first-year GPA or second-year retention) could be tracked and judged, but without race/ethnicity as a vector. When we extract from this framework the most tractable variables and examine their potential repercussions in terms of closing degree completion gaps by race/ethnicity, there is no question that the academic intensity of secondary school curriculum continues to serve as the engine of subsequent academic momentum, and that the use of summer terms for substantive, highly focused postsecondary coursework is an effective booster to that engine. Both these variables are mixtures of the student's use of time and the mastery of content.

But what does "academic intensity" or "an academically 'rigorous' curriculum" really mean? What content, postsecondary as well as secondary, could be labeled as "challenging," that is, the knowledge toward which students eagerly reach as opposed to unenthusiastically slog through? These questions are part of a large missing component in this study. Part VI of this essay will reflect on that component with the greater care it deserves.

Part VI
The Missing Element of This Story

There is (at least) one major missing element of the story line in both the original *Tool Box* and *The Toolbox Revisited*, and some important questions readers might have asked in the course of the logistic narrative that should be addressed. The missing element, a by-product of the limitations of the NCES grade-cohort longitudinal studies database, is content standards in high school curricula. Postsecondary curricula, which are far more complex in organization, offer a different framework for assessing potential student learning.

Beyond Course Titles to Content Standards

In the years following the release of *A Nation at Risk* (1983), a standing one-liner on the lecture and conference circuit ran something like "we've changed the marquée on the theater, but the show inside is still the same." The marquée carried the course titles, and for better or worse, that is what our grade-cohort longitudinal studies transcript files rely on. As Shireman (2004) has concisely put it, "If schools just change the names of the courses . . .students will not have learned anything more" (p. 4). In building the NELS:88/2000 data files, we discovered that in some high schools, "precalculus" on a transcript could mean any mathematics prior to calculus, including Algebra 1. On the postsecondary transcripts we often ran across cases of professorial marketing with course titles such as "Tooth Brush," "Dots to Dinosaurs," "Time After Time," and (yes) "Good Books" that even online catalogues could not explain. The postsecondary transcripts also carried 3-credit courses in topics such as social event planning, daily living skills, and "appreciation of sports" that, when the syllabi were examined online, could be offered to junior high school students. One has to acknowledge the limitations of the data source, in addition to its virtues. But the limitations, in these cases, were serendipitous because the online search for concrete clues to the content of course work was dispiriting.

Over the past two decades, states have paid increasing attention to content standards for elementary and junior high school curricula, and the *No Child Left Behind* legislation has stimulated a period of intense review and refinement of these standards. But as *Achieve* pointed out in its review of state high school graduation requirements (2004), similar detailed sets of content standards at the secondary school level are rare. We get generalized requirements that reference course titles such as "11th-grade English" or "Applied Biology," and have no idea what precise learning objectives will be pursued. There have been exceptions, of course, with mathematics being an often revisited subject and in ways that demonstrated the difference between what should be expected of all high school graduates and what should be expected of entering postsecondary students (California Education Roundtable 1997).

The past five years in particular have witnessed the birth and expansion of a number of large-scale efforts to get beyond Carnegie unit credit counting to comprehensive criterion-referenced statements of what graduating high school students should know and be able to do in order to

"succeed" in postsecondary environments. By "succeed" is meant completing degrees (see, e.g., American Association of Universities 2003; Achieve 2004). We have also witnessed the growth of high profile alternative approaches to secondary-postsecondary transitions such as "early college high schools." These efforts have been aided and abetted by comparative analyses of emerging state high school exit examinations and the content and knowledge-objectives of lower division college courses (Conley 2003; Venezia, Kirst, and Antonio 2003). The American Diploma Project (Achieve 2004) pushes beyond general knowledge-objectives to include samples of college assignments (e.g., profit-maximizing output analyses in microeconomics, pH calculations for a complex solution in introductory chemistry, an essay assignment on Plato's distinction between thinking and belief in introductory philosophy) and workplace tasks (e.g., a bank loan officer's assessment of an application from a corporation for $1.7 million to purchase two corporate aircraft, a report requiring measurements of DC supply voltage for diffusion furnaces in semiconductor manufacturing and analysis of furnace regulator modification costs, and the determination of dosages in an insulin therapy regimen). These are superb examples of digging below the credit count to the stuff of learning.

Granting that the academic quality and intensity of one's high school curriculum is a key determinant of postsecondary success, there is no assurance that either the standards of secondary school performance, content coverage, or challenge of the material will come close to the threshold demands of either four-year or community colleges. For the vast majority of high school graduates, who will not attend selective institutions, the "disconnect" is considerable. Indeed, Venezia, Kirst and Antonio (2003) urge everyone to pay more attention than that to which the media are accustomed to the "broad access colleges," including community colleges, because the service of these institutions to the bulk of the nation's postsecondary learners has the greatest potential to better "the civic and economic well-being" of every state and region (p. 46).

It is with that in mind that the work of the American Diploma Project (2004) is noteworthy because the sample assignments and examination questions selected signal precisely the kind of learning expected of the bulk of the nation's postsecondary newcomers. Such assignments and questions provide clear expectations for students entering community college occupational programs as well as those moving into the general education portions of postsecondary education. The microeconomics problems come from a community college, the chemistry from a research university.

Previews of the future and their risks

In fact, it could be argued that these previews of lower-division postsecondary learning objectives and tasks should be part and parcel of 11th- and 12th-grade curricula, equally accessible to students intending traditional lines to a bachelor's degree and those following career and technical education paths that *may* include the bachelor's, but certainly involve the occupationally oriented community college associate degrees. We can get to these levels through a modest amount of dual-enrollment for many students, but for those for whom dual enrollment is inaccessible, special postsecondary preview modules could be offered either by high school

faculty with the requisite knowledge or by visiting college and community college faculty.[53] Somehow, students should have a taste of what will be expected, and whether their current knowledge and skills puts them at least on the threshold of those expectations, if not beyond. Some may argue that such previews will scare some students away from continuing their education or that some secondary school teachers will resist the intrusion. One has to be optimistic in both cases, and come to the task with the conviction that it's worth the risk. The risk to academic momentum of not providing these opportunities is greater.

While each state bears principal authority and responsibility for linking the curricular pathways of secondary and postsecondary sectors (Venezia et al. 2005), the examples set forth by the American Diploma Project and the "previews of the future" strategies described above do not treat state borders as Maginot lines. And for good reason: Roughly one out of four undergraduates (and one out of three African-American students) in *The Toolbox Revisited* universe started their postsecondary careers in a state other than that in which they graduated high school. The geographic mobility of our traditional-age postsecondary populations suggests that, at the least, multistate regions (e.g., South Atlantic) should be considered productive information zones for providing those concrete signals of expectations and specific examples of quality postsecondary student work.

Moving the messages to students, families, and school teachers

Let's take the best of what is offered by reports such as that of the American Diploma Project and books such as Conley's recent (2005) *College Knowledge*, and move it out to much larger audiences than policymakers and others who habitually read such reports and books. It might be more helpful for each college and community college to include in its information packages for prospective students a sample of those examination questions and assignments in courses typically taken by lower-division students. One might go even further and provide examples of exemplary student responses—even less-than-exemplary student responses—to those examination questions and assignments.

---

[53]Dual enrollment has made huge strides since the NELS:88/2000 cohort went to high school. Some 38 states now have formal policies (Karp, Bailey, Hughes, and Fermin 2004), though these vary widely in terms of what is offered and by whom, who pays tuition, who gets credit toward what, academic eligibility, grade levels, course enrollment limits, and whether credits earned are placed in escrow (though that varies more by institution than state). The 2002–03 NCES survey of dual enrollment practices at postsecondary institutions distinguished between high school students who took courses within formal agreements and those who took courses outside of those agreements. Our NELS:88/2000 transcript data cannot make that distinction, so they lump together all postsecondary credits earned at colleges or community colleges prior to the date of high school graduation.

Kleiner and Lewis (2005) estimate that 813,000 high school students took courses at postsecondary institutions, either within and/or outside of dual enrollment programs and agreements, in 2002–03, compared with the weighted 213,000 NELS:88/2000 students who earned any postsecondary credits through dual enrollment during their high school years (1989–92). While not exactly comparable populations, those figures are testimony to the growth of student participation in these arrangements.

A quarter century ago, the Educational Testing Service worked on developing an experimental examination to assess lower division college competencies across a matrix of cognitive operations (e.g., analysis, synthesizing) and general curricular areas (e.g., science, humanities). Called "Academic Competences in General Education," the questions were open-ended (not multiple-choice) and required responses that could be composed in roughly 10 minutes. For example, one question went something like this:

> Suppose a new method for producing energy had been developed that, when brought on-stream, would have the effect of slowing the rotation of the Earth from 24 to 26 hours. Before we can flip the switch on this new form of energy, an Environmental Impact Statement (EIS) must be filed. What would be the chapter headings and major sub-headings of that EIS ? You need not fill in the details, but the most important questions about the potential effects of a 26-hour day ought to be included.

In a trial of the examination, faculty sorted student responses to questions such as "Earth's Rotation" into piles of descending quality. They then described what the students whose responses were rated most highly did to earn that rating, turned to the second most highly rated collection of responses and arrived at a consensus of what these students did *not* do that the first group did—and so on down the line of the piles of student papers they had rated until a level euphemistically described as "nonresponsive" was reached. The faculty descriptions were subsequently aggregated and ironed out as performance criteria. One could then turn to incoming freshmen with this question, along with an example of a first-rate response and an example of a fourth-rate response (out of seven levels), show them the performance criteria and say, "This is what you can expect to be able to do by the middle of next year; would you be better than the fourth level now?" A light goes on somewhere—or should—when entering students see that what it takes to respond effectively to the "Earth's Rotation" question draws on a selection of knowledge from economics and business, psychology, international relations, world history, cultural anthropology, physical geography, technologies, visual arts—all in addition to the core sciences. More important, the light goes on when students see a good example of how to put all this together in an outline of a document that is as much a product of daily work life as it is a college exercise.

And a similar light can go on among high school seniors as well, nearly all of whom think they are going on to something called "college," but have little idea what that means beyond the fact that they will no longer be bound by school rules. Prospective students are not the only audience for this information: Their families and high school teachers are equal players. Not all parents will understand the assignments, laboratories, and examination questions, but certainly they will sense, from the examples, that postsecondary education is serious business, that their children will not get through with a carefree study schedule, that colleges and community colleges have standards, and that such examples are typical of what their children will learn. Inevitably (being optimistic about this) they will be proud enough at the prospect to ask their children to be prepared. High school teachers reading these assessment "prods" will have to reflect on the extent to which their graduating seniors possess the academic foundations and momentum to

respond successfully. To the extent to which high school teachers have doubts, they may adjust the form and content of their own assignments, laboratories, and examinations. Students are bound to be the beneficiaries of the resulting "postsecondary practice runs."

Postsecondary dimensions of content

At the postsecondary level, the issue of content is somewhat easier to address, but only in the context of a student's entire undergraduate record. We know that students completing organic chemistry enrolled in the course not only with general chemistry as a background, but also mathematics at at least the precalculus level. We know that students completing a course in American economic history would have a very difficult time without prior learning in both U.S. history writ large and the standard introductory micro/macroeconomics sequence. A course in the psychological and cultural components of health care in a community college allied health program will probably not be offered to anyone without previous course work in general psychology. The chances that a fine arts degree candidate's transcript shows an entry for a course in color and color theory without prior foundations and studio courses are remote. In higher education, we can use the second- and third-level courses in a field as rough confirmations of learning at the introductory level. There is a sufficient lattice-work within disciplines to track traces of content from one point on the scaffolding to another. No, the traces inherent in second- and third-level courses in a field are not in themselves content standards, and nuance is expected from school to school, but there is a generalizeable quality to these content cues. In fact, the generalizeable portions of upper-division curricula are what one is likely to see on the Graduate Record Examination Board's subject matter examinations. This topic witnessed a surge of interest in the 1980s (for a paradigmatic analysis, see Oltman 1982), and is worth renewed exploration.

Part VII
Concluding Messages

Compared to its predecessor, *Answers in the Tool Box*, the preponderance of the *Toolbox Revisited* story has been on the postsecondary side of the matriculation line. Implicitly, it calls on colleges, universities, and community colleges to be a great deal more interventionary in the precollegiate world, to be more self-reflective about the paths they offer from high school through their own territories. It also calls on them both to fortify their institutional research capacities and integrate them more intimately with academic advising and course scheduling. As noted above, we are witnessing measurable ferment on the high school side of the passage, and as the principles of the *No Child Left Behind* legislation move beyond grade 8, we will see more. The higher education sector cannot sleep through these changes.

To students as agents of their own futures

Beyond that fundamental banner of institutional fortification, there are three sets of messages impelled by both studies. The first set is for entering high school students who, when asked, blithely shrug that "of course I'm going to finish college."

1. Just because you say you will continue your education after high school and earn a college credential doesn't make it happen. Wishing doesn't do it; preparation does! So . . .

2. Take the challenging course work in high school, and don't let anyone scare you away from it. Funny thing about it, but you learn what you study, so if you take up these challenges, your test scores will inevitably be better (if you are worried about that). If you cannot find the challenge in the school's offerings, point out where it is available on-line, and see if you can get it that way. There are very respectable Web sites offering full courses in precalculus, introductory physics, humanities, music theory, and computer programming, for example.

3. Read like crazy! Expand your language space! Language is power! You will have a lot less trouble in understanding math problems, biology textbooks, or historical documents you locate on the Web. Chances are you won't be wasting precious credit hours on remedial courses in higher education.

4. If you don't see it now, you will see it in higher education: The world has gone quantitative: business (obviously), geography, criminal justice, history, allied health fields—a full range of disciplines and job tasks tells you why math requirements are not just some abstract school exercise. So come out of high school with more than Algebra 2, making sure to include math in your senior year course work, and when you enter higher education, put at least one college-level math course under your belt in the first year–no matter what your eventual major.

5. When you start to think seriously about postsecondary options, log on to college and community college Web sites and look not so much for what they tell you of how wonderful life is at Old Siwash, but what they *show* you of the kinds of assignments and examination questions given in major gateway courses you will probably take. If you do not see these indications of what to expect, push! Ask the schools for it! These assignments and questions are better than SAT or ACT preparation manuals in terms of what you need to complete degrees.

6. See if your nearest community college has a dual-enrollment agreement with your school system, allowing you to take significant general education or introductory occupational courses for credit while you are still in high school. Use a summer term or part of your senior year to take advantage, and aim to enter higher education with at least six credits earned this way—preferably more.

7. You are ultimately responsible for success in education. You are the principal actor. The power is yours. Seize the day—or lose it!

Given the story lines of *The Toolbox Revisited,* it is obvious that students are partners in their own education fate, and shouldn't wait around for someone else to do something to them or for them.

Public discourse, part 1: Dissonant data and their discontents

The second set of messages is for those who engage in public discourse on education in general, secondary-to-postsecondary transitions, and ultimately, degree completion rates (with all stops in-between). We have some problems here.

Foremost among these problems is the sheer volume of dissonant statistics that are thrown around about student progress, and all the labels of "at risk," "minimal college-qualified," and "failure" that get pasted to populations in the process. The "at risk" labeling default has gone so far as to turn students into "patients," whose "illnesses" must be diagnosed and followed up with early intervention, intensive intervention, and continuous intervention (Seidman 2005, p. 298) that may even continue after graduation—and for "a modest fee" (p. 299). The data dissonance and deficit language cloud perceptions and preclude constructive policy. We all have considerable cleaning up to do.

On any given day, the public will be offered a half-dozen different statistics on high school graduation rates, college-enrollment rates, college completion rates, grades, and time-to-degree. The data will appear in respectable academic journals in articles that were reviewed by peers who often are experts on statistical technique and (at best) novices on the data sources. Or they will appear in publications and on Web sites of respectable organizations, even though they were never reviewed by anyone outside the organization. Anything that appears between respectable

covers is taken as authoritative, and once it moves into the mainstream press and onto the home pages, we read the headlines but not the footnotes. Inference runs rampant.[54]

For any of these statistics, we never ask who is in the denominator: that is, who are we counting, and who are we not counting—and how? As a consequence, what often pours out are scare stories that make for good press and bad policy. The bad data-driven scare story, in fact, has become the preferred narrative. We are scared by stagnant high school graduation rates over a 30 year period during which the size of the grade cohorts declined significantly then expanded dramatically with the baby boom echo, and during which we witnessed increased immigration from countries with mandatory school attendance ages much lower than ours. By an alternative view, it's amazing we have maintained a stable high school graduation rate (the quality of high school curriculum aside). The same alternative view could be advanced with reference to rates of postsecondary credentialing: It's remarkable we are maintaining the same degree-granting rates in the face of significantly higher enrollments (unless, of course, we are awarding an excess of cheap degrees).

Dissonance by age and season: A plea for honest tracking

The source of many unnerving postsecondary stories is one of the most grievous errors in analyses of student progress: including in the denominator students who started their postsecondary careers at age 29, 36, or 47 along with the mass of students who entered the postsecondary universe at age 18 or 19. Common sense says that a 19-year-old and a 31-year-old are on completely different life trajectories, and the national data from the Beginning Postsecondary Students longitudinal studies back up the common sense. When the newspaper story uses the term, "college students," most adults think of their children, not their brother-in-law or their coworker. Community and four-year college administrators know the difference, and provide academic programs, scheduling and services for those different populations.

But what are they to do when the press and the news Web sites complain that nearly half of entering students do not return for their second year or that the graduation rate is *only* 50 percent (thus assuming everyone else is a dropout), and they are called before legislative committees and boards of trustees to explain? There is an enormous difference by age at entry to the postsecondary system in these measures, and an even greater distortion when one restricts the

[54]For example, consider the following statement in a respectable publication: "One of the key reasons that low income students have such low completion rates in postsecondary education is that many work long hours in order to be able to afford college. They struggle to balance work with part-time enrollment in college . . ." (Allen, Goldberger, and Steinberg 2004, p. 222). The data source for this assertion is the National Postsecondary Student Aid Study of 2000, a one-year snapshot that includes no "completion rate" data. Analyses of the NPSAS 2000 data files show that the statement does not reach the threshold of justification unless one divides the population by age bracket. At that point, one finds that, and among traditional-age students (presumably the group referenced by the scare), poor kids are no more likely to be working longer hours at their jobs than anyone else, though they are more likely to use their wages for education expenses. That, at least, is an honest statement—for a snapshot population. And it is not what we really would want to know.

definitions of what it means to "return to" or "graduate from" to those who started in the fall term, full-time, and who came back to or earned a degree from the same school. That denominator knocks out half of traditional-age students from the calculation, and denies the realities of geographic mobility that the Bureau of the Census—let alone NCES longitudinal studies—has documented for the 20-something population (Schachter 2004; Adelman 2005b). Policies designed to "retain" students who have already moved to another state or who are *de facto* ghosts by not being included in the retention denominator in the first place are, at best, wastes of energy.

What is *not* a waste of energy is the task of developing more universal and efficient student tracking systems, and recapturing the headlines from the mongers of scare. There are those who will not accept NCES national longitudinal studies on the grounds that they are samples (no matter how scientific the sampling design), that we can only afford to start one every six or 10 years, and then have to wait for people to age and accumulate academic history by which time, the grievance goes, "the data are old." Impatient to simulate instant longitudinal cohorts, they impute sequences of data from different sources and with denominators that include "projections," and produce shock data that cannot be validated by any sensible reference points, e.g., that only 18 percent of ninth-graders will earn an associate or bachelor's degree within the subsequent ten years (National Center for Public Policy and Higher Education 2004).[55]

But even the best of state tracking systems and the services of the independent National Student Clearinghouse information system that currently (2005) covers about 2900 institutions (and cites a burgeoning interest in including high schools in the universe), will not produce the wealth of information that a NELS:88/2000 or a Beginning Postsecondary Students study yield. This essay cannot recommend policy in these matters, but it can recommend creativity and cooperation, serious reading of the papers and reports from Florida's tracking system (e.g., Whitfield and Howat 1999; Goodman, Latham, Copa, and Wright 2001; Goodman, Copa, and Wright 2004; Johnson, Coles, and Thomas 2004), and reflection followed by activistic innovation, and will wager that the long-term results look better than the scare stories assume.

Public discourse, part 2: The language we use

Language does more than reflect reality—it creates reality as well. There are considerable problems with the language used in describing what happens to students in our education system, and our choice of terms sets boundaries and colors of reality. The boundaries and colors, in turn, condition the terms of policy. Let us illustrate with a few paired terms. These are contrary rhetorics, and this study frankly admits to taking sides in their contention. But it does so in order to urge a positive tone that, not so by-the-way, legislators, superintendents of schools, college presidents and other leaders would prefer to use. The language of leadership is a "can do" language, not a punitive rhetoric.

---

[55]There has never been a national longitudinal study of ninth-graders. But we do have a national longitudinal study of eighth-graders—the NELS:88/2000—with transcripts, not imputations, projections, and dubious math. If we follow these eighth-graders, including high school dropouts, all the way through to age 26, ultimately 34 percent earned either an associate or bachelor's degree (see the full account offered in Appendix L, table L12). That percentage at least puts us in range of doing better. If we accept the putative (and utterly false) 18 percent, we risk abandoning all hope and effort.

"Attrition" versus "Persistence." When "attrition" is the governing term, we worry about students who (it appears) leave school or college, and seek explanations for departure that have included theories of organizational turnover (Bean 1983) and failures of academic and social integration (Tinto 1987). At the first sign of exit—even though the student may return—we turn to negativity. There has to be something wrong here, we say. The student was "at risk," the institution did not respond—we witness a cycle of blame.

When "persistence" is the governing term, we take our directions from students. What did they do that resulted in attainment? What structures of opportunity do we need to offer so that future students can follow the same paths? What do we think works? Can we test it out? This is a far more positive approach. This essay endorses it: Drop "attrition," embrace "persistence"!

"Retention" versus "Persistence." Institutions "retain"; students "persist." If our language is governed by "retention" all we see are institutions determined to hold on to students, keeping them in places that may be unproductive, at all costs, and for the sake of their public ratings. If our language follows student "persistence," on the other hand, we see those individuals making a series of rational choices that take advantage of the opportunities offered by institutions so as both to discover true interests and reach productive ends. Tinto would not object if the rhetoric of leaving an institution was turned into a saga of discovery. Students may go elsewhere; they may take extended time off from higher education; but ultimately they may judge the change as positive and not a result of failure (Tinto 1987, pp. 132–33). In the rhetoric of "retention," students are passive: Something is done to them, and that "something" assumes a deficit model. Under the rhetoric of "persistence" they are actors shaping their fate, with a model of success in mind. Wouldn't anyone rather have success?

"Pipelines" versus "Paths." As Bach et al. (2000) noted—and others have followed—there is no linear path to a degree, particularly for students who start out in community colleges. The default "pipeline" metaphor, used to describe presumably linear learning experiences and environmental sequences, is wholly inadequate to describe student behavior. Pipelines are unidirectional closed spaces, and under the "pipeline" metaphor students are passive creatures (as in "retention") swept along or dropping out of the space completely through leaks at the joints. But student behavior doesn't look like that at all: It moves in starts and stops, sideways, down one path to another and perhaps circling back. Liquids move in pipes; people don't.

At the high school level, for example, a student can acquire momentum in science through a combination of statistics and biology, on the one hand, or physics and calculus, on the other. These are different paths, but who is to say that, once in a four-year or community college, these students could not move in very different directions? The students entering a community college with the statistics and biology background thinking they were heading for further study in allied health fields could easily discover business and computer programming, and transfer to a four-year college to pursue an academic program in management information systems with both quantitative background and empirical habits of mind born of study in the life sciences. The paths to degrees offer many such intersections.

Under the "pipeline" metaphor, we look for easy (sometimes glib) causalities along a single line of explanation. "Paths," on the other hand, allow for multiple analyses and discoveries of tools that suggest (but do not predict) productive routes to education goals. This essay obviously endorses "paths."

Reiterations

Virtually all reviewers of drafts of this study recommended a concluding reiteration of its major themes and conclusions. Three configurations of themes and conclusions stand out in response:

First, there was a story about curriculum, the content of schooling, that was compelling in its secondary school dimensions in the original *Tool Box*, and is even more compelling now on both secondary and postsecondary stages. What you study, how much of it, how deeply, and how intensely has a great deal to do with degree completion. All of this is common sense, but requires equitable execution with emphasis on primary tools, which in this story means that:

- Secondary schools must provide maximum opportunity-to-learn, by which we mean not merely course titles, but course substance. If we seek better preparation for any kind of postsecondary education—occupational, professional or traditional arts and sciences—we have to ratchet up the challenge of content.

- Postsecondary institutions have got to be active players and reinforcers at the secondary school level—particularly in partnership with schools that are not providing or inspiring students—with opportunity to learn at those ratcheted-up levels of content. Pep talks, family visits, recruitment tours, and guidance in filling out application and financial aid forms are not enough.

- Indeed, the first year of postsecondary education has to begin in high school, if not by AP then by the growing dual enrollment movement or other, more structured current efforts (for examples, see Hughes, Karp, Fermin and Bailey 2005). If all traditional-age students entered college or community college with a minimum of 6 credits of "real stuff," not fluff, their adaptation in the critical first year will not be short-circuited by either poor placement or credit overload.

Second, this curriculum story, joined by nuances of attendance patterns that turn out to have significant leverage, continues into higher education. These features of the saga of degree completion are rarely attended to, and all provide tools to enhance completion rates.

- It's not merely getting beyond Algebra 2 in high school any more: The world demands advanced quantitative literacy, and no matter what a student's postsecondary field of study—from occupationally-oriented programs through traditional liberal arts— more than a ceremonial visit to college-level mathematics is called for.

- Academic advisers and counselors have to target every first-time student for at least 20 additive credits by the end of the first calendar year of enrollment. We saw the same consequences in the original *Tool Box*, though now we understand better that the chances of making up for anything less than 20 credits diminish rapidly in the second year. Community colleges have some special challenges here, given increasing rates of transfer among traditional-age students. With 6 credits of dual-enrollment course work, even part-time students can reach 20 credits in the first calendar year, and community colleges enroll the bulk of traditional-age part-time students.

- Excessive no-penalty withdrawals and no-credit repeats appear to do irreparable damage to the chances of completing degrees. This phenomenon was also observed in the original *Tool Box*. Twice advised, institutions might think very seriously about tightening up, with bonuses of increased access and lower time-to-degree.

- More than incidental use of summer terms has proven to be a degree-completion lever with convincing fulcrum. It's part of the calendar-year frame in which students are increasingly participating. Four-year and community colleges can entice students into fuller use of summer terms with creative scheduling.

Third, in contrast to their treatment in the mass of literature on academic progress, students are explicit, rather than implicit, in *The Toolbox Revisited.* They are respected adults playing large roles in their own destinies. What we call "variables" are not bloodless abstractions: they are signs of what students do; and our messages are about where and when the green lights and caution lights will flash along the paths toward degrees. While we trust that school and college actions will not leave them behind, they have equal responsibilities.

Legacy

These are limited beginnings of change in the terms of the enterprise with which any reader of this document is concerned. They are honest terms and do not pretend to predict, rather help us draw a background tapestry against which we can judge just how well we are doing for our children as they cross the cusp of adulthood. The terms derive from the story; the story derives from the wisdom of the U.S. Department of Education in establishing and maintaining its longitudinal studies; and our subsequent discussions and enlightenment derive from the leadership of the National Center for Education Statistics in executing those studies and providing us with archives of information that are the envy of other nations. All of this constitutes an unmatchable legacy.

APPENDIX A

Changes in Demography, Geo-Demography, and Postsecondary Entry From the High School & Beyond/Sophomores to the NELS:88/2000

Table A1. Contrasts in the percentage distributions of selected demographic backgrounds, postsecondary plans, and postsecondary entry behavior of 1982 and 1992 12th-graders

	1982 (HS&B/So)	1992 (NELS:88/2000)
Parents' highest level of education		
Less than high school graduate	12.2 (0.47)	8.1 (0.59)
High school graduate	32.4 (0.66)	19.5 (0.79)
Some postsecondary	29.8 (0.58)	41.2 (0.92)
Bachelor's degree	12.7 (0.45)	17.0 (0.71)
Graduate or first professional	12.9 (0.55)	14.2 (0.74)
Race/ethnicity		
White	77.5 (0.77)	72.2 (1.32)
African-American	12.6 (0.63)	12.0 (0.96)
Latino	7.1 (0.33)	10.1 (0.89)
Asian	1.5 (0.16)	4.3 (0.37)
American Indian	1.3 (0.19)	1.5 (0.43)
Proportion of same race in childhood neighborhood		
10 percent or less	4.5 (0.26)	6.3 (0.43)
11–50 percent	8.4 (0.43)	11.7 (0.63)
51–85 percent	16.8 (0.59)	24.1 (0.82)
More than 85 percent	70.3 (0.83)	57.9 (1.13)
Proportion from second language backgrounds		
All 12th-graders	5.5 (0.30)	9.4 (0.84)

APPENDIX B

Principal Features of the NCES Grade-cohort Longitudinal Studies

There are four grade-cohort longitudinal studies designed and conducted by the National Center for Education Statistics. Three of these have been completed:

- National Longitudinal Study of the High School Class of 1972 (NLS-72), started with a cohort of seniors in the spring of 1972, concluded in 1986;
- High School and Beyond, with a cohort of seniors in 1980, concluded in 1986, and another cohort of sophomores in 1980 (HS&B), concluded in 1993; and
- National Education Longitudinal Study of 1988, initiated with an eighth-grade class in 1988 (NELS:88), concluded in 2000.

The data from these studies are available in both public release and restricted (license required) form on CD-ROM, with electronic code books (ECBs) listing all variables, with descriptions and distributions.

The fourth, the Education Longitudinal Study of 2002 (ELS:2002), starting with a sample of 20,000 10th-grade students in the spring of 2002, is in progress.

Curtin, Ingels, Wu, and Heuer (2002) offer a figure with a temporal presentation of the four longitudinal studies,[56] highlighting their component and comparison points. Each of the studies begins with a national probability sample involving a stratified sample of schools and a random sample of students within the target grade in those schools. Schools in minority communities are over-sampled. In some cases, the samples are refreshed at later points in the longitudinal study (NELS:88 in 1990 and 1992)[57] and, in some cases, augmented at a later point (NLS-72 in 1973).

Each of these longitudinal studies includes a great deal more information than what is used in *The Toolbox Revisited.* Not all of them are comparable in terms of the depth with which various topics are explored. The surveys of the NLS-72 were focused wholly on students, whereas those

Washington, DC: U.S. Department of Education, National Center for Education Statistics (http://nces.ed.gov/pubs2002/2002323.pdf, p.3).

[57]As Lucas and Berends (2002) remind us, the high schools attended by students in the NELS study are not a true representative sample. The reason stems from the decision to begin the longitudinal study in the eighth grade. When students move into high schools from the eighth grade (or, in some districts, from the ninth grade), it is impossible for the sampling framework to be based on high schools. Roughly 1,000 middle schools and junior high schools became 4,000 high schools by grade 10, and there was no way to follow the students into all 4,000 of those schools. So the NELS sample was refreshed in 10th and 12th grades to reflect the total enrolled population in those years (Ingels et al. 1994), and , by necessity, the refreshing was based in the high schools in which the vast majority of the existing NELS cohort students were enrolled.

of the subsequent longitudinal studies included parents, teachers, and secondary school administrators. The cognitive tests administered in the 12th grade to the NLS-72 cohort were administered in the 10th and 12th grades to subsequent cohorts, thus enabling measures of intellectual growth. High school course-taking for the NLS-72 was summarized and reported by the school, whereas for the HS&B/Sophomore cohort and NELS:88/2000 high school course-taking was derived directly from transcripts. And the postsecondary transcripts for the NELS:88/2000 were used to fill in missing information from the high school transcripts in that cohort. Labor market histories were far more detailed in the NLS-72 and HS&B/Sophomore cohort than they were for the NELS:88/2000. Military records exist for the NLS-72 but not for any subsequent study. Student financial aid information included an unobtrusive Pell Grant file for the HS&B/Sophomore cohort, and that for the NELS:88/2000 included data from the National Student Loan Data System (though this file requires more cleaning and reconstruction in order to be truly helpful).[58]

Lastly, the shift from paper-and-pencil survey response forms to computer-assisted telephone interviews (CATI) in the1990s constricted the range of questions asked (e.g., there was no time to ask students about reasons for changing majors, reasons for transferring from one college to another, and degrees of satisfaction with different aspects of postsecondary experience), whereas the NLS-72 paper survey forms covered these topics in some depth.

Nonetheless, the archives of these data sets are the richest we have to explore the nature of secondary and postsecondary education and its consequences in the early adult life histories of Americans over the past 30 years.

---

[58]See the brief discussion of financial aid data in the NELS:88/2000 in Adelman, C. *Principal Indicators of Student Academic Histories in Postsecondary Education, 1972-2000.* Washington, DC: U.S. Department of Education, 2004, p. 98.

APPENDIX C

Differences Between the High School & Beyond/Sophomore Cohort and NELS:88/2000 High School Record Variables, and Limited Imputation Procedures for the NELS:88/2000

The principal portions of the data sets in question are secondary school transcripts and allied information derived from survey questionnaires and computer assisted telephone interviews (CATI). The secondary school transcripts were collected and coded by the same contractor for both data sets, but the returns were very different. The High School & Beyond/Sophomore cohort began with a stratified national sample of secondary schools, all of which agreed to participate in the project and provide transcripts, access to teachers and administrators. The NELS:88/2000 began with a national stratified sample of schools with eighth grades, all of which agreed to participate in the project and provide appropriate information. As noted above in Appendix B, when students moved into high schools, the NELS sample was refreshed in10th and 12th grades to reflect the total enrolled population in those years (Ingels et al. 1998), and, by necessity, the refreshing was based in the high schools in which the vast majority of the existing NELS cohort students were enrolled. The analysis file created for this study includes the12th grade refreshed sample, but some of the high schools that were not part of the original stratified sample did not provide transcripts.

At the postsecondary level, on the other hand, the transcript return rate increased from 89 percent for the HS&B/So to 93 percent for the NELS:88/2000 (Curtin, Ingels, Wu, and Heuer 2002), and the proportion of postsecondary participants with complete records increased from 88 to 97 percent.

Editorial processes

The postsecondary transcript-based versions of both data sets were edited by the same person (the author of this study), and with the same rules, a feature that increases reliability at the price of intra-coder bias. If one thinks of two sets of archival documents: secondary and postsecondary transcripts for two cohorts, i.e., four data files, in only one did the editor actually see the paper documents submitted by institutions, namely, the postsecondary transcript files of the NELS. These artifacts contained information that allowed corrections and fill-ins for missing information on the secondary school transcript files, e.g., state location of high school, high school graduation date, high school diploma type, Advanced Placement course credits (by examination), and SAT and ACT test scores. Hence, the presentation of secondary school transcripts on the restricted file with the postsecondary transcript data (NCES CD#2003-402) is more accurate than it is on earlier NELS restricted files. After a year of use, a supplement to NCES 2003-402 was issued in June 2004, containing further refinement of both high school and college transcript-derived variables, in addition to new derived variables.

Missing data and limited imputation

The analysis files for both this study and *Answers in the Tool Box* used high school transcripts with complete records for at least grades 10–12. But the NELS:88/2000 transcript data, as well as test score data, fell short of the HS&Beyond/So coverage, even after preparation of the 2004 Supplement to the original NELS Postsecondary Files that included the second round of corrections and fill-ins of missing information on the high school transcripts.

Table C1. Unweighted percentage of 1982 and 1992 12th-graders missing precollegiate academic performance data

	HS&B/So	NELS:88/2000	After Supplement
Performance variables			
Curriculum measure	18%	14%	14%
Class rank/GPA	13	20	17
Senior test score	9	14	14
One or more measures	**18**	**24**	**21**

SOURCES: High School & Beyond/Sophomore cohort (NCES #2000-194); NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Class rank/GPA, the combined high school class rank/grade point average quintile, is the major problem in the comparison displayed in table C1. In both data sets this variable (called "CLSSRNKQ" for programming purposes) was constructed in the same way, but the input data initially yielded a far smaller universe for the NELS than was the case for the HS&B/So.

The construction of this variable begins with class rank, expressed as a percentile, for students whose high school graduating classes are greater than 10. Class rank was chosen for the base reference because it overrides variability in local grading practices. Not all high schools compute class rank, so for a significant percentage of students, this datum is missing. For these missing cases (as well as for the students from very small high schools), the variable construction turns to high school grade point average (where available, and only for students with three years or more of course work in all high schools attended). In both data sets, all known cases of high school GPA were weighted and set out in quintiles. The missing cases of class rank, by quintile, were then substituted by the GPA quintile (the correlation between the two quintile scales was .84).

However, there are two significant differences in data input between the HS&B/So and the NELS:88/2000. First, the HS&B/So grade point average was for academic courses only, whereas in the NELS, the GPA applied to all courses. Second, by the time of the NELS histories, some high schools evidently were indicating neither class rank nor cumulative GPA of

any kind on transcripts (either that or the original data entry for the NELS high school transcripts did not compute GPA). While 13 percent of the HS&B/So students were missing the combined CLSRANKQ variable, half again of that proportion (20 percent) of the NELS students lacked a CLSSRNKQ value (see Glossary for further details and citations).

This difference would have serious consequences in the replication of the original *Tool Box* hypotheses. The universe of NELS students with positive CLSSRNKQ values was initially smaller than those for the curriculum variable (HSCURRQ) and senior year test score (SRTSQUIN). Since the multivariate analyses of both *Tool Box* studies depend on positive values for all three variables, the composite variable built from a partition of the three would overestimate the value of CLSSRNKQ at the expense of the other two components. In preparing the analysis file for this study, plausible values for missing cases of CLSSRNKQ were imputed when values for both curriculum quintile (HSCURRQ) and test score quintile (SRTSQUIN) were positive and equal, e.g., both were in the third quintile. In these cases, CLSSRNKQ was assigned the same value as the other two variables. The impact of this imputation strategy lowered the unweighted missing cases of CLSSRNKQ from 20 to 17 percent, and the unweighted cases of NELS:88/2000 students missing one or more of the high school performance variables from 24 to 21 percent (see table C1).

Bias and potential imputation.

Even after this revision, a problem remained, and a multiple imputation procedure was followed (Herzog and Rubin 1983). In the original edited version of the NELS high school transcript data that appears on NCES data CD 2003-402 (March 2003), and modified by its June 2004 supplement, some 17.3 percent of the students were missing CLSSRNKQ, 13.8 percent were missing HSCURRQ, and 13.5 percent were missing SRTSQUIN. Under NCES statistical standards, CLSSRNKQ would have to be evaluated, since the proportion of students with non-missing values was less than 85 percent.[59]

The formula used to determine the nonresponse (i.e., missing) bias in these three variables was:

> A*(b-c) where A is the percent of students missing data, b is the percent of those missing data who did NOT earn a bachelor's degree, and c is the percent of those not missing data who did not earn a bachelor's degree.

To obtain the relative bias with respect to the estimate, the result of this formula is divided by b.

The initial nonresponse bias rates for the three variables were:

	Bias	Relative bias
HSCURRQ	0.015	0.021
CLSSRNKQ	0.034	0.049
SRTSQUIN	0.039	0.048

[59]See NCES 2002b.

In other words, for example, if the estimate for the curriculum variable was based only on those with positive values, it would overestimate the percent who did not earn bachelor's degrees by 2 percent. These are all small biases, and would not threaten tests of statistical significance. But the missing cases were less than random: Students who never entered postsecondary education by age 26 or 27 were overrepresented, and those who never graduated from high school or who were still enrolled in high school after the scheduled graduation of the class in 1992 would not show complete transcript records in1992.

In order to increase the number of students with positive and plausible values for all three components of the Academic Resources variable, another limited imputation was undertaken, focused on class rank/GPA. The first question identified, of all students who were in the 12th grade in 1992 and for whom the file showed positive values for both the curriculum (HSCURRQ) and test score (SRTSQUIN) variables:

1) those who also showed a positive quintile value for class rank/GPA (CLSSRNKQ), and were in the *same quintile* on all three measures.	16.6%
2) those who were in the same quintile on both curriculum and test score measures, also had a positive quintile value for class rank/GPA, but the rank of this quintile differed from the others by $\pm$ 1.	13.4
3) those who were in the same quintile on both curriculum and test score measures, but were missing class rank/GPA.	2.7
4) those who were missing class rank/GPA, and whose quintile positions on curriculum and test score measures differed by 1.	2.5
5) those who were in the same quintile on both curriculum and test score measures, also had a positive quintile value for class rank/GPA, but the rank of this quintile differed from the others by > 1.	5.8
6) those who were not in the same quintile on both curriculum and test score measures, whether or not class rank/GPA was missing.	59.0

The focus of imputation was on those members of groups 3 and 4 whose high school transcripts registered 12 or more academic Carnegie units. This small group was then examined for *prima facie* anomalies in variables such as postsecondary attendance, selectivity of first institution of attendance (if any), and postsecondary remedial work. There were none. An algorithm was then developed that assigned a value to CLSSRNKQ, as follows: (1) where HSCURREV = SRTSQUIN, the class rank/GPA quintile was assigned the same value; (2) where the difference between HSCURREV and SRTSQUIN was $\pm$1, CLSSRNKQ was assigned the lower value in half the cases, and the higher value in the other half.

The result reduced the proportion of missing ("nonresponse") cases of CLSSRNKQ from 17.3 to 15.8 percent. The nonresponse bias rates improved as follows:

	Before imputation	After imputation
Bias rate	0.034	0.019
Relative bias	0.049	0.026

The consequent reconstruction of Academic Resources

The proportion of students with non-missing values for all three components of the Academic Resources index rose from 70 to 72 percent as a result of the imputation described above. However small the increase, it required a recalculation of the comparative weights of the three components of Academic Resources, in the following steps:

a) A logistic regression was run with bachelor's degree attainment as the dependent variable, the three components as independent variables, and a universe limited to1992 12th-graders. The ratios of the standardized beta coefficients for each of the independent variables produce the weights for each variable in the composite. The changes between the earlier version of these weightings and the post-imputation version are small, but required, as table C2 shows.

Table C2. Differences in ratios of standardized betas for the three components of the Academic Resources composite, before and after limited imputation of missing class rank/GPA data for 1992 12th-graders

	Partition weight	
Component of Academic Resources	Before imputation	After imputation
Curriculum	41.9	42.4
Class rank/GPA	32.9	32.5
Senior-year test score	25.2	25.1

SOURCE: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

b) Each of the three components is then multiplied by its weight brought forward from the logistic model. So, for example, a student in the third quintile of HSCURRQ is credited with 1.272 points (3*0.424). The points are added, then weighted by the enhanced NELS high school transcript weight for those in the 12th grade in 1992 (F4F2HWT), then set out in quintiles of Academic Resources. The difference in distributions of the values of Academic Resources, before and after imputation, are indicated in table C3.

Table C3. Differences in distribution of 1992 12th-graders across the values of the Academic Resources composite variable, before and after limited imputation of missing class rank/GPA data

	Percent distribution of students	
Values of Academic Resources	Before imputation	After imputation
Missing	29.9	27.9
Highest quintile	14.3	14.6
2nd quintile	13.3	14.3
3rd quintile	14.2	14.7
4th quintile	13.9	13.6
Lowest quintile	14.3	14.9

APPENDIX D

Technical Issues

Accuracy of estimates and standard errors

There are different kinds of statistics in *The Toolbox Revisited*, and all of them are estimates derived from student samples. Two kinds of error occur when samples are at issue: errors in sampling itself, particularly when relatively small subpopulations (for example, American Indians) are involved; and nonsampling errors. Even in surveys as large as the three grade-cohort longitudinal studies used in this monograph, sampling errors can affect estimates of statistical significance.

Non-sampling errors are more serious. A good example of a non-sampling error would be the fact that transcripts are missing for some students in all three grade-cohort studies. The transcripts are missing either because the student did not tell the interviewer that he or she attended the school (and there were no transfer credits on another transcript to identify the school); the school refused to send the transcript; the school could not find the transcript; the information sent by the school was not really a transcript; or while the student may have enrolled at the school he or she never registered for courses and did not generate a record. In this case, we can mitigate the effect of missing transcripts by differential weighting of the population, and, indeed, for both the High School and Beyond/Sophomore and NELS:88/2000 files, the analyst is given a choice of weights, one of which is confined to students with complete records (see the discussion of weights and flags below). Weighting, though, will not address the panoply of nonsampling errors.

The effects of sampling and non-sampling errors ripple through databases. To judge the accuracy of any analysis, one needs to explicate and judge these effects. When the unit of analysis is the student, this is a straightforward issue because the original samples in the longitudinal studies consisted of students. For example, when questions are asked about the proportion of students who earned credits in an aggregate category of courses (e.g., table 21), the questions are about nonrepetitive behaviors of the students who were sampled. The descriptive comparisons in *The Toolbox Revisited* dealing with non-repetitive student behaviors require invocation of the Students'*t* statistic to determine whether the difference between two independent estimates is significant. The formula for computing Students' *t* values is:

$$t = \bullet \bullet \frac{(P_1 - P_2)}{(se_1^2 + se_2^2)}$$

where P_1 and P_2 are the estimates to be compared and se_1 and se_2 are the corresponding standard errors. In this case, if $t \geq 1.96$, one has a statistically significant difference at $p < .05$, a standard marker. For the judgments of statistical significance in all cross-tabulations in this document, an Excel template developed by MPR Associates for the production of reports to the National Center for Education Statistics, was used.

The formula becomes more complex, however, for multiple comparisons among categories of an independent variable such as race/ethnicity. For multiple comparisons, the critical value for *t* rises depending on the number of comparisons that can be made in the family of the independent

variable. For race/ethnicity presented in five categories, there are10 possible comparisons, so the significance level of each test must be $p \leq .05/10$ or $p \leq .005$. To determine the significance level of t values in any comparison of means or proportions, the result should be matched against standard published tables of significance levels for two-tailed hypothesis testing.

When estimates are not independent, a covariance term must be added to the Students' t formula

$$t = \bullet\bullet \frac{(P_1 - P_2)}{(se_1^2 + se_2^2) - 2(r)se_1se_2}$$

where r is the correlation between the two estimates. The determination of correlations requires a statistical software package, such as SAS or SPSS, and the invocation of proper weights for the comparison.

Because none of the longitudinal studies invoked in *The Toolbox Revisited* was based on a simple random sample of students, the technique for estimating sampling error involves a more complex approach known as the Taylor series method. To produce Taylor series standard errors, the estimates presented used AM, a program developed by Jon Cohen and associates at the American Institutes for Research under contract to the National Center for Education Statistics.

Flags and weights

Each of the grade-cohort studies used in this monograph carries a complex set of flags and weights to mark the populations for which estimates are to be generated. The selection of these flags and weights is very important for both the accuracy and meaningfulness of estimates.

For the postsecondary transcript sample of the High School and Beyond/Sophomore cohort (HS&B/So), the process was somewhat complex. Using the weights for the first follow-up survey (1982, the scheduled 12th-grade year for this cohort), three postsecondary transcript weights were developed. The first was based on a ratio of the sum of weights for all students in the 1982 panel who subsequently (in surveys of 1984, 1986 or 1992) claimed to have attended a postsecondary institution to the sum of weights for those for whom a transcript validating the claim was subsequently received. The ratio was then modified by factors derived from the stratification cells in the 1982 survey design to create multipliers that were applied to the raw weights for the students for whom transcripts were received or for whom postsecondary attendance was imputed from survey storylines. This is a generous formulation for all likely postsecondary participants.

The second High School and Beyond/Sophomore weight involved the same procedure as the first but a more restrictive ratio applied to those students for whom a true postsecondary transcript was received. These students are more than "likely" participants; they are "known participants." The third weight followed the same procedure as the second, but confined the population to only those students with complete postsecondary records (i.e., no missing transcripts). This weight is used in analyses of credit production and grades, since complete records are necessary for the analysis of both these features of student academic history. These weights are labeled PSEWT1, PSEWT2, and PSEWT3, respectively.

To accompany these weights for the comparisons that hold the population to students who were in the 12th grade in 1982, a special flag, SENRFLAG, was constructed from variables in the HS&B/So that described student status in 1982. Using the given flag for participation in the 1982 cohort sample would be insufficient and not wholly accurate because not all students were in the 12th grade in 1982, e.g., students who graduated early from high school in 1981. But there were also students who were labeled "early graduates" on the data set (and thus candidates for exclusion from a 12th-grade flag) whose high school graduation date was listed as 1982. Early graduates were excluded, and erroneously labeled "early graduates" were included in the population with SENRFLAG = 1. If these students were not participants in the 1982 panel (even if postsecondary transcripts were received) their weight = 0. Using the 1982 panel weight alone without this flag will not produce an accurate universe of 1982 12th-graders.

For all calculations of HS&B/So data in this document, SENRFLAG = 1, and the appropriate PSE weight invoked.

The weights and flags for the NELS:88/2000 are more complex, still, because the cohort, established in the eighth grade, was "refreshed" twice: first, to be representative of the census of 10th-graders in 1990, and second, to be representative of the census of 12th-graders in 1992. The weights deriving from the 1992 12th-grade refreshing are at the core of weights subsequently developed for the postsecondary transcript sample. The same three postsecondary weight types developed for the High School and Beyond/Sophomores were employed here, but in combination with the 12th-grade (second follow-up survey, or F2) weight and the student's presence in the final (2000) survey panel, F4. In addition, a set of weights based on the NELS high school transcripts in combination with the three postsecondary weight types also was developed when questions arise concerning the relationship between secondary school variables derived from high school transcripts and postsecondary variables derived from postsecondary transcripts.

The most frequently used NELS:88/2000 weights in *The Toolbox Revisited* are:

F4F2P2WT	For all known postsecondary participants who were 12th-graders in 1992.
F4F2HP3W	For all postsecondary participants with complete records who were 12th-graders in 1992 and for whom high school transcripts are also part of the file.
F4F2P3WT	For all postsecondary participants with complete records who were 12th-graders in 1992.

As in the case of the High School and Beyond/Sophomore cohort, a special flag was developed for 12th-graders in 1992. The existing flag on the NELS:88/2000 files excluded over 250 students who, in fact, were awarded high school diplomas in the spring of 1992 and who carry positive weights for the panel (the descriptive windows of the Electronic Code Book for the fourth follow up survey of 2000 offer no reasons or clues for this anomaly). These students are included in the flag, GRADE12A, used in this monograph.

The weighted Ns for samples used in a table are provided in the notes to the tables. Even if the same weight and flag is used on two tables, the weighted Ns may differ slightly because missing values in a particular variable are excluded from the calculations.

Multivariate analyses

For all multivariate analyses in this monograph, special procedures were employed in accordance with the complex sampling designs of NCES longitudinal studies. These procedures are in the spirit, though not exactly to the letter, of those discussed and recommended by Thomas and Heck (2001). Thomas and Heck recommended alternative ways of producing both regression models and their adjusted standard errors in a single step, as opposed to the two-stage procedure used in this study. The reader should be aware that the software employed in this study, AM, correctly estimates standard errors associated with complex, cluster samples.

For any model, an adjusted weight based on the population with non-missing values on all variables in the model was calculated, in the following steps:

1. A weight appropriate to the question was selected. For example, for determinants of transfer from a community college to a four-year college, the weight for NELS students with received postsecondary transcripts, F4F2P2WT, was chosen.
2. A simple tabulation of the dependent variable was then run for students who evidenced positive (non-missing) values for all variables in the model. Call this universe A. The selected weight was invoked.
3. The log of the program for step 2 produces both unweighted and weighted Ns for universe A.
4. The selected weight is then adjusted by what Thomas and Heck (2001) refer to as NORMWT, i.e., the weighted N / unweighted N of universe A.
5. The selected weight is then multiplied by the NORMWT, thus adjusting the effective sample size.
6. The example would look as follows:

   F4F2P2WT / (f4f2p2wtA / unweighted N for A configuration of variables)

7. The result becomes a variable in its own right, a weight with a name, e.g., COREWT1.

A root design effect (DEFT) reflects the effect of departures from simple random sampling, and in the methodology reports for the NELS:88/2000, is calculated for sub-populations on each of a selection of variables (Haggerty et al. 1996; Curtin, Ingels, Wu, and Heuer 2002). For any logistic model in *The Toolbox Revisited*, a DEFT based on the population with non-missing values on all variables in the model was calculated in order to adjust the standard errors produced by statistical packages such as SAS (used in the production of this study). The DEFT is calculated in three steps:

1. The requisite data for a simple standard error are produced by the same equation used for NORMWT, and set out as follows:

$$\sqrt{\frac{p(1-p)}{N}} = \text{s.e.}$$

2. A matching Taylor series standard error is produced by AM software with the same dependent variable and equation, with the population filtered by positive (non-missing) values for the same variables used in the equation in step 1. The Taylor series s.e. takes into account both stratum and primary sampling unit in combination with the weight selected, hence accounting for the complex sampling design.

3. The DEFT = Taylor Series s.e. / simple s.e.

Every discrete multivariate analysis has a unique DEFT. The DEFTs for the NELS:88/2000 are rather substantial, e.g., 1.83, reflecting not only the original sampling design in 1988 but also the successive "refreshings" of the sample in 1990 and (for the analyses in this monograph) in 1992.[60] They are used to adjust the standard errors in the multivariate analyses, and hence reduce the likelihood of overestimating the effects of independent variables. The effect of the DEFT also is reflected in the production of the *F* and *t* statistics, for which the formulas used are:

$$\left(\frac{\beta}{\text{s.e.} \times \text{DEFT}}\right)^2 = F$$

and

$$\sqrt{\frac{F}{\text{DEFT}^2}} = t$$

In the logistic models employed in *The Toolbox Revisited*, the level of significance of the *t* statistic—*p*—for a two-tailed test is determined by reference to a standard table of critical values of *t* that can be found in any statistics textbook.

Collinearity data

This study includes Appendix J with tolerance statistics for collinearity for all the logistic model tables in order to assure the reader that the independent variables included in the models do not exhibit a nearly perfect linear relationship, in other words, that they do not overlap to such an extent that analysis of each variable, taken singly, is impossible. There are sometimes situations in which one variable is part of the definition of another, e.g., family income in relationship to

[60]Curtin, Ingels, Wu, and Heuer (2002) report the mean DEFT for all students in the fourth follow-up (2000) survey of the NELS as 1.954 (p. 209). The range of DEFTs in *The Toolbox Revisited* is 1.76 to 2.19.

socioeconomic status or multi-institutional attendance in relation to transfer. In cases such as these, collinearity statistics are produced as by-products of Ordinary Least Squares regressions for the variables in the logistic models.

Of these by-products, tolerance is the statistic of choice: It measures how well one independent variable can be predicted by other independent variables in the model, and is equal to $1-R^2$ for that variable. Ideally one would want this predictive relationship to be close to 1. The literature (e.g., Belsley, Kun, and Welsch 1980) suggests that there are no hard and fast rules for determining collinearity using either tolerance or its inverse, variance inflation, but that, in general, a tolerance reading of .20 or less evidences collinearity problems. This study adopted a tolerance threshold of 0.50, i.e., any reading above that threshold indicates no serious collinearity problem. Any indication below that point required further investigation of the independent variable(s) in question through correlation matrices. If the variables in question were part of the constructs of other variables, a choice was made as to which variable would be dropped. Dropping independent variables is one of the recommended options when potential multicollinearity arises (Knight 2004).

APPENDIX E

Populations Included and Excluded From the Study Universe

The population subject to analysis in *The Toolbox Revisited* consisted of 1992 12th-graders who subsequently attended a four-year college at any time through December 2000, who earned their high school diploma by December 1996, who presented complete high school transcript records and a senior year test score, whose postsecondary records were complete, and whose socioeconomic status was known. But there are other students who participated in the 1992 NELS:88/2000 survey and who subsequently attended a four-year college at some time who are not part of this population principally because (a) one or more of these data elements were missing or (b) because they were not in the 12th grade in 1992.

It is natural to ask about the demographic characteristics of the students who are excluded from the analysis because they are missing data or because they were not in the 12th grade in 1992, compared with the demographic characteristics of the students who *are* included. In order to compare distributions of this comparative demography, we include all 1992 survey participants.

Considering those who attended a four-year college at some time but were nonparticipants because one or more of the key data elements were missing, key contrasts include:

- A higher proportion of minority students than white students;
- A higher proportion of students who were 20 years old or older in 1992 than those who were less than 20 years old;
- A higher proportion of students from the lowest third of family income distribution than those from higher income levels;
- A higher proportion of first-generation students than those whose parents had either some college or who had earned at least a bachelor's degree;
- A higher proportion of nonnative speakers of English than those from English monolingual backgrounds;
- A higher proportion of those with three or more siblings than those who were either only children or had one or two siblings;
- A higher proportion of those who became parents by age 20 than those who did not;
- A higher proportion of those who had been retained in grade at least once than those who were never held back; and
- A higher proportion of those who came from high schools in urban areas than those from suburban or rural areas.

Some 60 percent of this group was missing only one of the key data elements, but it was a very important one: a high school transcript.

Of nonparticipants because they were not in the 12th grade in 1992, we notice distinctively higher proportions by age (20 years or older), origin in a second language household (though not among nonnative speakers of English), and parental status, and among those who had been retained in grade and those who earned General Education Diplomas.

Table E1. Percentage distribution of participants in the 1992 survey of the NELS:88/2000 by participation status in *The Toolbox Revisited* universe, by demographic and schooling background characteristics

Characteristics	Participants in the universe of this study	Nonparticipants[a] who were 12th-graders in 1992	Nonparticipants[a] who were *not* 12th-graders in 1992
All students	77.8 (1.11)	20.6 (1.05)	1.6 (0.33)
By gender			
Male	76.5 (1.57)	21.3 (1.46)	2.2 (0.57)
Female	79.2 (1.35)	19.8 (1.34)	1.0 (0.22)
By race/ethnicity			
White	81.1 (1.08)	18.0 (1.07)	0.9 (0.20)
African-American	64.3 (4.44)	30.0 (4.04)	5.7 (2.72)
Latino	66.2 (4.11)	29.6 (3.99)	4.2 (1.19)
Asian	73.2 (5.09)	26.6 (5.09)	0.1 (0.09)
American Indian	53.6 (12.8)	43.1 (13.0)	2.4 (2.30)
By age in 1992			
Missing	48.5 (9.15)	51.5 (9.15)	#
20 or older	41.6 (8.56)	47.9 (9.52)	10.4 (4.86)
Under 20	79.2 (1.06)	19.3 (1.01)	1.5 (0.34)
By family income			
Missing	70.8 (3.02)	27.1 (2.55)	2.2 (1.24)
Highest third	81.5 (1.44)	17.3 (1.41)	1.2 (0.37)
Middle third	80.1 (1.79)	19.2 (1.79)	0.7 (0.17)
Lowest third	71.3 (1.74)	25.2 (2.60)	3.5 (1.12)
By postsecondary generational status			
Missing	66.2 (4.08)	33.4 (4.07)	0.4 (0.24)
First generation	73.7 (2.73)	23.8 (2.74)	2.5 (0.68)
Parents had some college	78.3 (1.72)	19.2 (1.60)	2.5 (0.74)
Parents earned bachelor's	81.2 (1.34)	18.1 (1.32)	0.7 (0.27)
By second language background			
Nonnative speakers	68.8 (3.78)	28.9 (3.73)	2.3 (0.81)
From second language households	68.3 (5.48)	22.5 (4.94)	9.2 (4.06)
Monolingual English	79.0 (1.12)	19.7 (1.08)	1.3 (0.35)

See notes at end of table.

Table E1. Percentage distribution of participants in the 1992 survey of the NELS:88/2000 by participation status in *The Toolbox Revisited* universe, by demographic and schooling background characteristics—continued

Characteristics	Participants in the universe of this study	Nonparticipants[a] who were 12th-graders in 1992	Nonparticipants[a] who were *not* 12th-graders in 1992
By number of siblings			
None	76.0 (4.37)	23.3 (4.39)	0.6 (0.31)
One or two	81.8 (1.15)	17.2 (1.13)	1.0 (0.24)
Three or more	71.8 (2.04)	25.5 (1.87)	2.7 (0.84)
By parenthood			
Parent by age 20	64.6 (5.38)	22.5 (4.07)	12.9 (4.62)
Not a parent by age 20	78.3 (1.10)	20.5 (1.07)	1.2 (0.25)
Held back in grade at least once			
Missing	59.2 (6.33)	38.5 (6.21)	2.3 (1.11)
Yes	62.9 (4.85)	30.4 (4.54)	6.7 (2.64)
No	79.9 (1.07)	18.9 (1.04)	1.2 (0.31)
By urbanicity of high school location			
Urban	69.9 (2.36)	27.1 (2.15)	2.9 (0.99)
Suburban	80.1 (1.58)	19.0 (1.57)	0.9 (0.28)
Rural	83.9 (1.71)	14.9 (1.71)	1.2 (0.29)
By type of high school diploma[b]			
Standard	79.0 (1.07)	20.5 (1.06)	0.5 (0.13)
GED	8.7 (2.56)	23.6 (6.49)	67.7 (7.10)

[a] Nonparticipants are defined as students who were either (a) missing data on senior year test score or socioeconomic status or both, (b) missing an in-scope high school transcript, (c) graduated from high school in January 1997 or later, (d) presented an incomplete postsecondary record, and/or (e) were not in the 12th grade in 1992.
[b] A tiny percentage who received a certificate of attendance was included with the GEDs.
Rounds to zero.
NOTES: Standard errors are in parentheses. Universe consists of students who participated in the 1992, 1994, and 2000 follow-ups of the NELS:88/2000 and who attended a four-year college at some time. Weighted N=1.45M.

APPENDIX F

Gradations of Academic Intensity of High School Curriculum

The following figure sets forth the 31 gradations (in descending value) of academic curriculum intensity and quality as used in the development of the Academic Resources index and variable for the NELS:88/2000 cohort. The figures in the boxes represent the minimum rounded number of Carnegie units required for the gradation on a given *row*. Where a cell is empty, there are no minimum requirements. Where a cell indicates "none" (for remedial math and remedial English), it means that no remedial work is allowed for that gradation. Where the cell for AP courses indicates zero, that means the student did not take any AP courses, not a minimum. For the NELS:88/2000 cohort, computer science was not nearly as widely offered as it is today. Therefore, computer-related credits were brought into play only to disaggregate lumps in the distribution. Total high school academic credits is an empirically-derived factor that comes into play only in the very lowest gradations.

The basic five-subject credit thresholds were constructed in the course of examining the edited, coded transcript data for students who were known high school graduates with graduation dates through Dec.31, 1996. The editorial process paid particular attention to all cases that showed less than 16 total high school credits. Where the evidence strongly suggested dissonance with other variables in the student's record, all transcript records from that student's *school* were examined. Where nonstandard credit metrics were found, they were adjusted with reference to state standards for high school graduation (Medrich, Brown, and Henke 1992), and major components (e.g., mathematics, English, etc.) multiplied or divided by as much as (but no more than) two. For example, when a group of students from the same high school showed 40–45 Carnegie units in a state that required 20 for an academic diploma, the editorial process cut those 40–45 units in half—across all subjects in which they were given. The editorial process also Windsorized cases of total Carnegie unit counts above 32, adjusting the major components down one-by-one, and dropped fragmentary transcripts with less than 6 Carnegie unit counts.

As noted in the parallel appendix in the original *Tool Box*:

> These gradations of academic intensity and quality are based on the history of one national high school class that was scheduled to graduate in 1982. The next graduating class for which we possess similar data is that of 1992. While the specific number of Carnegie units, APs, and remedial indicators might change, the basic form and principles of the gradations will probably not change. This presentation of the possibilities of high school curricular attainment is criterion-referenced: theoretically, *everybody* can reach gradation level #1. (p. 114)

The account of curriculum for the class of 1982 had 40 gradations. This account, for the class of 1992, has 31. One implication of the shrinking number of gradations is that, in fact, more students were moving up the academic intensity ladder, clustering at higher criterion-referenced levels.

Table F1 presents the actual mean number of Carnegie units earned in core academic fields, irrespective of the theoretical thresholds, for students in each of the five quintiles of academic intensity derived from the 31 more detailed gradations.

Figure 3. Curriculum components of the 31 gradations of the high school academic intensity measure of the NELS:88/2000, by Carnegie unit minimums

Grada-tion	English	Math	Science	Foreign Langs	Hist and Soc Stu	Highest Math	Remed Math	Remed English	APs	Computer Science	Total Academ Units
1	3.75	3.75	>2.0*	>2.0	>2.0	>Alg2	None	None	>1	>0	
2	3.75	3.75	>2.0	>2.0	>2.0	>Alg2	None	None	>0

15	3.0	2.5	2.0*	2.0	2.0	Alg2	None	None	0	>0	
16	3.0	2.5	2.0	2.0	2.0	Alg2	None	None	0		
17	3.0	2.5	1.0	1.0	2.0	<Alg2	None	None	0		
18	3.0	3.0	1.5	1.0	1.5	<Alg2		None			
19	2.5	3.0	1.5	1.0	1.5	Alg2	None				
20	2.5	2.5	1.5	0.5	1.0	<Alg2			0		≥12
21	2.5	2.5	2.0		1.0	Alg2	Net 0			>0	≥12
22	2.5	2.5	1.0		1.0		Net 0			>0	≥12
23	2.5	2.0	2.0		1.5	<Alg2	Net 0				≥12
24	2.5	2.0	2.0		1.5	<Alg2	Net 0			1.0	
25	2.5	2.0	1.0		0.5	Alg2	Net 0	None			
26	2.5	2.0	1.0			<Alg2	None	None			≥12
27	2.5	2.0	1.0		1.0		Net 0				

28	2.5	1.5	1.0		0.5		Net 1				
29	2.5	1.5	1.0		0.5						
30	2.0	1.0	0.5		0.5						
31											≥6

NOTES: (1) Net 1 means the sum of total mathematics credits minus remedial mathematics credits was 0.5 or less, i.e., if remedial math appeared at all on a student's transcript, it was a major presence; Net 0 means the sum of total mathematics credits minus remedial mathematics credits was more than 0.5, i.e. of remedial math appeared at all on a student's transcript, it was a minor presence.
(2) The figures in the cells for English, math, science, foreign languages, and history and social studies represent the minimum rounded number of Carnegie units required for the gradation on a given row. Where a box is empty, there are no minimum requirements.
(3) An asterisk in a cell for science credits indicates core laboratory science (biology, chemistry, and physics).
(4) The reference points for highest level of mathematics studied in high school are higher than Algebra 2 (>Alg2), Algebra 2 (Alg2), and less than Algebra 2 (<Alg2). Where there is no entry in the cell, there is no highest mathematics requirement for that row.
(5) Minimum requirements for total high school academic Carnegie units, e.g., =>12 and =>6, come into play only in the very lowest gradations of the curriculum distribution.
(6) When the distribution of students across these 31 levels is weighted and then aggregated to quintiles, the quintile breaks are as follows: 1–8 (highest quintile), 9–15 (2nd quintile), 16–20 (3rd quintile), 21–25 (4th quintile), and 26–31 (lowest quintile).

APPENDIX H

The Timing of Departure

When this narrative took up the topic of the second calendar year of student histories and pointed out that roughly one out of five of our subjects had become status dropouts by that point, the question naturally arose: What happens to all those students who leave after the first year—or even the first semester—when most attrition occurs? How does one account for them? We need to provide some corrective data in this excursion, since we considered status dropout status only in the context of the paradoxes of first-to-second year persistence.

With rare exceptions (e.g., Tinto 1987), most attrition studies are (a) short-term, as in first year to second year, without allowing for the fact that students who skip the second year may return in the third or fourth years, and (b) limited to attrition at the same institution, without allowing that the student who can no longer be found at Old Siwash may, in fact, be enrolled at Greentree Valley Community College. Students who leave one school and attend another one are not dropouts—they are most likely transfers. Tinto (1987) made that point a long time ago, and it should be obvious. If they are not transfers, they may be on temporary "excursions" or more sustained voyages that end in either fragments or "discovery" (Adelman 2004b).

Given the systemwide perspective and the length of a longitudinal study such as the NELS:88/2000, a more sophisticated question about withdrawal can be asked, looking backwards from the last month of the longitudinal study (December 2000):

> What percentage of traditional-age students who entered postsecondary education during this period are no longer enrolled—anywhere—and never completed a credential of any kind, by timing of the gap between their first month and last month of enrollment?

This question follows the student—wherever the student goes. It tells us who became a "status dropout" by age 26 or 27 (which does not preclude even these students from returning at a later moment). And it tells us *when* the student became a status dropout, setting up an inquiry concerning the reasons for departure that follows Tinto's (1988) common sense suggestion that these reasons change by point of departure. Table H1 sets forth these data for *all* 1992 12th-graders who entered postsecondary education, by type of institution first attended.

Yes, the highest attrition rate in postsecondary education occurs in the first year (Schutz and Malo 2003), but table H1 shows that the proportion of traditional-age students who leave in the first year and never return is not radically higher than the proportion of those who leave at later points in time, and differs by type of institution first attended. Consider the face validity of these data: The mean number of credits earned by students who ultimately became status dropouts, by period of departure, matches roughly what one would expect—half or less of the full-time norm for the period. Proportion, however, is not the ideal way to assess the phenomenon.

Event-history accounts of attrition offer a more enlightening approach (e.g., Ronco 1996; DesJardins, Ahlburg, and McCall, 1999). The driving force of event history is risk or hazard, as befits a methodology derived from medical history analyses (Singer and Willett 1991), as in:

given the patient's medical momentum and other configurations of the patient's life-style, demography, and environment, when is the patient at risk of dying (the ultimate censoring event) if the patient did not die last year? The flip side of risk in event history is survival. While the purpose of this study stops short of survival analysis, the first step involved in setting up risk modeling involves determining hazard probabilities, and these are instructive in light of the

Table H1. Percentage of 1992 12th-graders who entered postsecondary education and withdrew without completing any credential by December 2000, by timing of withdrawal and institution of first attendance

Withdrawal behavior and its timing	Institution of First Attendance: Four-year	Community college	Other sub-bacc[a]	Mean credits	Percent of all
Left postsecondary without a credential and did not return					
Left within 11 months of first enrollment	4.6 (0.59)	14.6 (1.13)	15.5 (2.77)	9.85 (0.54)	**8.9 (0.58)**
Left within 12–23 months	3.3 (0.41)	11.0 (1.32)	6.5 (1.50)	21.64 (0.99)	**6.7 (0.59)**
Left within 24–47 months	4.9 (0.41)	12.5 (1.11)	4.6 (1.05)	39.88 (1.62)	**7.9 (0.50)**
Left within 48–102 months and not enrolled in 2000	8.7 (0.73)	14.3 (1.23)	4.0 (1.62)	58.29 (2.68)	**10.6 (0.65)**
No credential but still enrolled in 2000	4.7 (0.52)	9.2 (0.94)	1.8 (0.85)	70.98 (3.56)	**6.4 (0.47)**
Earned credential	73.8 (1.09)	38.4 (1.67)	67.7 (3.55)	124.73 (0.90)	**59.5 (1.05)**

[a] Sub-baccalaureate institutions other than community colleges.
NOTES: Standard errors are in parentheses. Columns may not add to 100 percent due to rounding. "Credentials" can be certificates, associate degrees, or bachelor's degrees.

first-year performance variables used in our analysis. That is, if we start at the first month of the first term of attendance and, for each calendar year following that point, asked what percentage of students left the postsecondary system with no degree and had not returned to school by December 2000, changing the denominator for each year to the number of students who remained in the system, we have a "declining risk set" (Ronco 1996) that serves as a rough guideline for the timing of potential dropout. The annual metric is obviously more even than the time brackets chosen for table H1.

The "declining risk set" for this study is presented in table H2. To summarize: For all postsecondary students, the risks of becoming a status dropout are highest in the first year, decline through the fourth year, flatten out through the sixth year, and decline after that. For students who attended a four-year college at any time, the risks of becoming a status dropout are much lower across the temporal board, are slightly higher in the first year, drop and then flatten from the second year through the sixth, and drop again after that. This is only the first step—and hardly the final analysis—of event history, but is perhaps a more accurate way of describing the parameters for understanding the phenomenon of when students leave postsecondary education.

Table H2. Declining "hazard probabilities" for 1992 12th-graders who entered postsecondary education, by calendar year following first date of enrollment

	"Hazard probabilities" for leaving without a degree	
Departure timing for those who never returned by December 2000	All students	All who attended a four-year institution at any time
First calendar year	.102	.039
Second calendar year	.061	.029
Third calendar year	.048	.030
Fourth calendar year	.039	.027
Fifth calendar year	.037	.027
Sixth calendar year	.041	.029
Seventh calendar year	.031	.025
More than seven calendar years	.026	.020

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The reader of table H1 will note that community college beginners exit sooner than do students who started at four-year colleges, and are more likely to still be enrolled at the end of the longitudinal study period. While there is comparatively little variance in the pace of permanent dropout for students who started in community colleges when the periods between the first and the fourth year are considered, there is no question that beyond that point, attrition slows. The same cannot be said for the pace of status dropout for students who started in four-year colleges: The rate of permanent attrition appears to be stable over time, a finding slightly different from that of the "declining risk set" approach, and a product of the clumping of years in table H1. As for sub-baccalaureate institutions other than community colleges, which specialize in short-term certificate programs, the status dropout rate drops dramatically from the first year to the second and subsequent periods.

Advancing on Tinto's (1988) suggestion, Eaton and Bean (1995) hypothesize that the factors affecting attrition are different for first-year students who withdraw from higher education versus the factors that come into play for students who leave at later points in time. Unfortunately, Eaton and Bean could not investigate that hypothesis because their study was confined to first-year and second-year students at one institution (a public research university), and bracketed

only one year's account of retention/attrition (for a similar inquiry, see Patrick 2001). The NELS: 88/2000 data, on the other hand, offer 8.5 years and a myriad of institutional types in which to explore and detail the boundaries of the issue. As Ronco (1996) notes, the timing and duration of "enrollment events" is a critical framework for identifying factors associated with graduation, transfer, and stop-out—the three modes of "exit" from an institution.

Table H3 provides a framework for future consideration of the differential attrition hypothesis. The literature on the putatively sophisticated economic decisionmaking of adolescents with respect to entering higher education, even in the face of uncertainty of returns (Altonji 1993), can be extended to reasons for leaving a path to postsecondary credentials. As Beattie (2002) points out, human capital theory is not rigid: it recognizes something called individual taste or proclivity that may be only tangentially related to group membership (e.g., ethnicity, gender, family income). At the least, students already in the postsecondary system know that they will eventually be better off for their education efforts (or they wouldn't have been there in the first place). So, what did the students in our universe who did not complete a bachelor's degree program (and who were not still enrolled as degree candidates at the end of the 8.5 year period) tell us of their reasons for leaving, by period during which they became status dropouts?

Table H3. Reasons for leaving postsecondary education without credentials by timing of exit: 1992 12th-graders who entered postsecondary education by December 1996

	Percent offering these reasons for leaving postsecondary education				
Timing of withdrawal	**Finances**	**Job/ Military**	**Academic**	**Personal/ Family**	**Mood/ Lifestyle**
Left postsecondary without a credential and did not return					
Left within 11 months of first enrollment	19.7 (3.10)	14.8 (2.03)	5.9 (1.92)	31.5 (3.51)	25.9 (3.99)
Left within 12-23 months	25.2 (5.19)	11.0 (2.81)	5.6 (1.40)	42.6 (6.19)	12.7 (2.23)
Left within 24-47 months	19.4 (3.60)	17.4 (2.69)	3.6 (0.99)	35.2 (3.78)	20.5 (2.30)
Left within 48-102 months and not enrolled in 2000	17.8 (2.19)	18.9 (2.45)	7.7 (2.46)	29.3 (4.04)	21.2 (3.21)

NOTES: Rows will not add to 100.0 because (a) student responses to questions about reasons for departure are not mutually exclusive, and (b) a category for "other" is not included. Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

When the NELS:88/2000 students were asked (in the spring of 2000) why they left school, they were offered a list of reasons (though only 17 percent of students responding to the question indicated more than one reason). As table H3 indicates, personal and family reasons for departure dominate all other reasons for students who left postsecondary education without a credential between the 12th and 47th month following the first month of enrollment. The same factor ranks at the top versus all other factors except mood/lifestyle for students who left in the first year and students who left after the fourth year. Strictly financial reasons are not as prominent in students' judgment as some contend. "Job/military considerations" might be considered "financial," but there is too much ambiguity in that category of response to leap to that conclusion. Some 6.6 percent (s.e. = 0.47) of the1992 12th-graders subsequently served in the military, but 14.9 percent (s.e. = 4.95) of status dropouts who cited financial reasons for leaving school had served in the military, and an identical 14.9 percent (s.e. = 3.84) who cited "job/military considerations" for leaving had served in the military. If the NELS files had offered a more complete labor market history, we might be able to resolve the ambiguities.

As a partial confirmation of these observations, consider the work of Li and Killian (1999), who surveyed 622 students of all ages and levels who left a large state flagship university in 1997 (present in the winter term but not the following fall) and elicited 45 discrete reasons for departure. First, Li and Killian discovered that 20 percent of these students were not really dropouts at all, rather either transfers to other institutions (principally for reasons of academic program or location) or stop-outs with intentions of returning. Of the remaining students, 43 percent left for academic reasons (e.g., didn't like the program, classes too large, poor performance), 34 percent left for personal reasons (e.g., unstated personal problems, location issues including homesickness, illness, "social" reasons), and 20 percent for financial reasons. Of the financial reasons, Li and Killian advise us that "individual patterns of money management, more than family income" may be responsible for financially-driven attrition (p. 12), and that if we are going to understand attrition at all so that student affairs officers can establish realistic efforts to address what is within the control of the institution to assist, we have to dig below the level of large-scale concepts of academic and social integration. There is a considerable range of reasons that students leave an institution, and, as Li and Killian point out, students usually have more than one reason for departure. We can't control homesickness; we can help students deal with money management.

As for academic reasons for departure, table H4 reveals that compared to those who earned bachelor's degrees, no one in the departure universe was performing very well, no matter when they left, and even though a tiny percentage (see table H3) cited academic reasons for walking away. Braxton, Brier, and Hossler (1988) argue that when students are asked about their reasons for withdrawal in post-hoc surveys, they offer "socially acceptable rationalizations." We should hence be appropriately wary of the percentage distributions in table H3. Given the low percentage of students who cited academic reasons, and GPAs and cumulative credits for the same students that can be described as, at best, marginal, there is some indirect support for this contention.

Table H4. Mean postsecondary GPAs of 1992 12th-graders who withdrew without completing any credential, by timing of withdrawal, and compared with GPAs of those who had not completed a credential but were still enrolled in 2000, and those who earned bachelors degrees by December 2000

	Mean grade point average		
Departure behavior and timing	In first calendar year of attendance	Through second calendar year of attendance	Entire undergraduate record
Left postsecondary without a credential and did not return			
Left within 1st 11 months of first enrollment	2.10 (0.091)	2.10 (0.091)	2.10 (0.091)
Left within 12–23 months	2.30 (0.057)	2.08 (0.058)	1.83 (0.100)
Left within 24–47 months	2.31 (0.049)	2.26 (0.046)	2.03 (0.060)
Left within 48–102 months	2.10 (0.059)	2.02 (0.054)	2.03 (0.050)
No credential, but still enrolled	2.14 (0.069)	2.08 (0.069)	2.19 (0.078)
Earned bachelor's degree	2.89 (0.015)	2.91 (0.014)	3.04 (0.011)

NOTE: Standard errors are in parentheses.

APPENDIX I

Course Categories Included in Aggregates for Participation Rates In the First Two Calendar Academic Years of Attendance

Aggregate	Course categories
College-level writing	English composition; technical writing; creative writing; advanced essay
Oral communications	Oral communications; public speaking/debate; voice
Computer-related	Introduction to computer science; introduction to computing; computer programming: general
Introductory biological sciences	General biology; human biology; cellular biology; zoology: general; botany: general
Introductory physical sciences	General chemistry; general physics; general geology
College-level mathematics	College algebra, liberal arts mathematics, finite mathematics, statistics, precalculus, calculus
Core history	Western civilization, world history, U.S. history surveys, European history 1789–present, Asian history, African history, Latin-American history
General psychology	[single course category]
Micro/macroeconomics	[single course category]
Humanities other than literature and foreign languages	Humanities: general; introduction to philosophy; ethics (philosophy); religious studies surveys; interdisciplinary humanities; arts/humanities
Literature	Literature: general; introductions to poetry, fiction, drama, non-fiction prose; English literature; American literature; Afro-American literature
Core social sciences	Anthropology: general; cultural anthropology; geography: general; introduction to political science; U.S. government; introduction to sociology
Visual/graphic arts	Visual communications; introduction to design; fine arts: introduction; art history; drawing
Foundation business	General business principles; business law/legal environment; introduction to accounting

APPENDIX K

So They Earned a Degree! Now, How Long Did It Take Them?

The second most frequently asked question about U.S. higher education concerns time to degree. Despite accumulating evidence over the past quarter-century, the normative benchmark for completing a bachelor's degree has remained at four elapsed academic years. Our ideal seems not only to get it over with, but to get it over with in normative time. An altruistic argument in favor of the normative is that when students finish in a timely manner, they make room for others, i.e., completion keeps the access channels open. Yet recipients of bachelor's degrees are adults who have made a variety of decisions concerning competing goals and obligations that often do not include finishing a degree in four years. For example, if one looks at all recipients of bachelor's degrees in 1999–2000, and asks when they commenced their studies and how old they were when the degree was awarded, one finds that 62.8 percent (s.e. = 1.5) of the 7.5 percent of bachelor's degree recipients who were over 40 in 2000 started out in postsecondary education before 1980. At a minimum, the elapsed time to degree for these people was 20 years (in fact, the average was over 27 years). Of the 9.2 percent (s.e. = 0.4) of degree completers who were between 30 and 39 in 2000, 73.3 percent (s.e. = 1.7) entered postsecondary education prior to 1990, so, at a minimum, the elapsed time to degree for these people was 10 years (in fact, the average was nearly 15 years).[61]

The key phrase for our purposes is "elapsed time," as that is the customary way of measuring time to degree. It is not surprising that the older the baccalaureate recipient, then more likely that student had taken at least two years off from higher education, and the more likely that their principal reason for doing so was "change in family status," as in becoming a parent and raising children. The reader might consider, in passing, when complaints are raised about excessive time to degree, whether our system of higher education should be "blamed" for providing the opportunity for adults with different life trajectories to return to school and complete degrees, even if the time between initial enrollment and degree award is 15 or more years. That is the practical meaning of elapsed time.

There is an obvious difference between elapsed and enrolled time. When DesJardins, Ahlburg, and McCall (2002) investigated factors leading to "timely graduation," they confined one of their universes to students who had never stopped out—not even for the one term this study allows stop-out without labeling the student a non-continuous enrollee.[62] If we followed this mode of analysis, we could focus in on student *uses* of enrolled time to determine what contributed to and what detracted from year-by-year progress. Knight (2002) includes types and timing of

---

[61] All data in this paragraph were generated from the National Center for Education Statistics: Baccalaureate and Beyond Longitudinal Study, 2000: Data Analysis System.

[62] The research here involved a "competing risks" model in which the histories of students who had never stopped out were compared to the histories of those who had stopped out, hence, embraced both elapsed and enrolled time.

remediation, majors and changes-of-major, course withdrawals and repeats, course failures, credit hours earned and grades in general education courses, hours per week working and studying, and first-year grade point average among variables reflecting different aspects of the uses of time.[63] Volkwein and Lorang (1996) took up the phenomenon of students with extended time-to-degree because they purposefully carried lighter credit loads. Why did they carry less than the 15 credit per semester norm for the institution that served as the site for this study? To enhance GPA (an objective which precipitated dropping difficult courses), and to generate more free time, some of which was for work or family responsibilities, or both. Some respondents also cited difficulty of enrolling in a course "at the time I wanted," a phenomenon familiar to anyone who has worked student registration lines.

We also know that many disciplines require credit hour production that, when translated into standardized semester metrics, exceed the 120 credits that would be produced by students who attended only during the regular academic year and carried a standardized full-time load of 15 credits per semester. In a survey of 91 public universities in all 50 states, Pitter, LeMon, and Lanham (1996) found combinations of university and program requirements ranging from 122–124 credits in social sciences, foreign languages, psychology, mathematics, and protective services, for example, to 130–142 credits in such fields as engineering, architecture, and health professions (e.g., nursing, physical therapy, etc.). They also confirm our observation of five-year bachelor's degree programs in pharmacy, for a noted case, with a median credit requirement of 161. Any requirement above 120 credits will either add time to degree or encourage students to (a) earn credits by examination, including Advanced Placement, (b) attend during summer terms, and/or (c) carry credit loads in excess of 15 per semester in order to graduate "on time".[64] As Garcia (1994) observed, whether the student is a community college transfer or a native student in a four-year college, the "basic recipe" for completing a bachelor's degree within the standard "templates for time-to-degree is to maintain continuous enrollment and to earn more than 30 semester units each academic year" (p. 8). Sounds simple, but the list of diverting phenomena is long, complex, and often best assessed for *indirect* effects, as Garcia has done, using path analysis.

What we learn from these studies of the uses of enrolled time in relation to normative models of time to degree is what to include in both descriptive and multivariate accounts of elapsed time—and elapsed time is the measure used in both the original *Tool Box* and *The Toolbox Revisited.* The descriptive statistics are offered to the reader in Appendix L, table L13, but some basic observations are worth repeating here. First, the mean elapsed time to degree for bachelor's recipients in the NELS:88/2000 was 4.58 calendar years, and the median time (which

---

[63]Knight's list for a "hypothesized model of effects upon total semesters elapsed" (Knight 2002, p. 6) also includes provisions for variables derived from student surveys that are parallel to those used in the National Survey of Student Engagement, e.g., in Kuh et al. 2001.

[64]The small number of NELS:88/2000 bachelor's recipients who completed the degree in three elapsed calendar years or less entered with a mean of 10.6 acceleration credits (s.e. = 2.81) and subsequently accumulated a mean of 12.2 credits during summer terms (s.e. = 1.94).

is probably more meaningful) was 4.24 calendar years.[65] Shorter time to degree is observable among students from the highest quintile of high school Academic Resources, students who first entered highly selective institutions, among those who brought more than four acceleration credits across the matriculation line, and among those who attended only one school. Considerably longer time to degree is observable among those who attended three or more schools, among both community college to four-year college and four-year-to-four-year transfer students, among those who took more than one remedial course, those who were not continuously enrolled, and those who majored in the physical sciences. Most of these relationships confirm common sense.

But it is the multivariate analysis that will tell us what counts, and that is the purpose of table K1. Table K1 presents a linear (Ordinary Least Squares) regression in which the dependent variable, time to degree, is set on a scale with four values: more than 6 calendar years, 5–6 years, 4–5 years, and less than 4 calendar years (which encompasses the normative four-year degree). With one exception, a dichotomous variable indicating whether the student ever engaged in a cooperative education or internship course, the independent variables selected were those previously explored and (in most cases) used in the logistic narrative of Part IV of this study. The statistically significant independent variables are highlighted in bold. How do we read the table? What do we see?

On reading the table: First, the R^2 indicates that this linear model accounts for half the variance in timing of bachelor's degree completion for the NELS:88/2000 cohort. That's a very convincing level. Second, the positive parameter estimates mark variables that add time to degree, while the negative parameter estimates indicate variables that shrink it. Third, the following variables did not meet the significance threshold for entering the model (set at $p < .05$): race/ethnicity, becoming a parent by age 20, multi-institutional attendance, and freshman year remediation.

There is no question of the major contributors to extended time to degree:

1. Excessive no-penalty course withdrawals (W) and no-credit repeats (NCR)—Damaging to degree completion, these are just as damaging to time to degree. Yes, we can keep students continuously enrolled, but if much of that enrollment is nullified by withdrawals and repeats, we have what Tinto calls retention without education. It's worse, though, because every seat at every available hour in every facility of an institution of higher education is at stake, and every seat marked with a W or NCR bars another student from sitting down. When the blocked seats reach a critical mass, general access is impeded as well. This observation is worth repeating.

[65]Broh (1991) presented an intriguing argument for an alternative time to degree calculation that began with the *median*, not the mean, and included students who had not finished the degree but who were still enrolled as degree candidates. In *The Toolbox Revisited*, the median for students who had completed degrees is 4.24 calendar years. Including students who had not earned degrees by December 2000 but who were still enrolled as bachelor's candidates, the median time to degree would be 4.49—very close to the mean of 4.58.

2. Transfer, both classic community college to four-year, and four-year to four-year—As previously noted, transfer often involves a hiatus in enrollment and extra effort to meet prerequisite requirements at the new institution.
3. Change of major—Garcia (1994) observed that the more times the student changed major, the greater the elapsed time to degree. Knight (2002, 2004a, 2004b) also includes multiple changes of major among the set of variables with significant impact on both enrolled and elapsed time.
4. Whether the student was ever part-time—Since our variable for part-time attendance was constructed partly with reference to course withdrawals that, in effect, produced lighter course loads, the result here backs up the conclusions of Volkwein and Lorang (1996).

Table K1. Ordinary Least Squares regression indicating factors influencing time-to-degree for 1992 12th-graders who earned bachelor's degrees by December 2000

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Partial R-square[a]
Intercept	3.5227	0.2703	8.41	0.001

Gender	0.0623	0.0388	1.04	†	0.0010
					$R^2 = 0.5052$
					Adjusted $R^2 = 0.5056$

†Variable did not meet minimum criterion for statistical significance in this model.
[a] Indicates the contribution of each variable to the explanation of variance, the total R^2.
[b] Ratio of no-penalty withdrawals and no-credit repeats to all courses attempted.
[c] See Glossary, p. 191.
NOTES: Root design effect = 1.55. Statistically significant variables are highlighted in bold. Weighted N=922k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

And there is no question concerning which variables will contract time to degree: continuous enrollment and no remediation (the highest value of the "total remediation" variable). Socioeconomic status is a marginally significant contributor to lower time to degree, while the position of freshman year GPA quintile as a contributor to extended time to degree is somewhat puzzling.

Of those variables that were admitted to the linear model but failed to reach the threshold of statistical significance, enrollment in cooperative education or internship courses deserves special attention because it raises contrasting policy options with respect to influences on time to degree. Knight (2004b) observes that:

> Timely degree completion is not all that matters in terms of college student outcomes. Both analytical and student self-report evidence supports the fact that enrollment in cooperative education classes, involvement in internships, etc., while extending time-to-degree, significantly improves student learning and skill development, affective outcomes, career prospects, and the like. Significantly reducing time-to-degree could perhaps demand a trade-off against other long-term (and maybe more important) outcomes. (p. 14).

It turns out that the NELS:88/2000 baccalaureate students who engaged in cooperative education or internships or clinical externships did not take longer than others to complete degrees. But Knight is really asking readers to reflect on the principal objectives of conducting a baccalaureate enterprise. The modes of instructional delivery in professional and applied fields, in particular, often include carefully designed, graded experience in occupational environments, involving considerable time commitments that lie beyond the classroom. If we say to a school of engineering, "You can't offer cooperative education any more and cannot require more than 128 credits for a degree," what do we accomplish in terms of the quality of student learning and the quality of engineering graduates?

In contrasting spirit, if we observe institutions in which students can withdraw from courses, without penalty, as much as 10 weeks into a 14-week semester, a volume of withdrawals equivalent to 15 percent of all credits offered by the institution in a calendar year, and the average time to degree for native students at that institution to be well over five calendar years, we would accomplish a great deal by a tightening of course withdrawal policy. Here is a prime candidate for future research governed by quasi-experimental design: Find two comparable institutions (mission, size, demography, distribution of majors), one with lax withdrawal rules, the other with restrictive rules. The hypothesis, from everything learned in this data essay: An institution that restricts course withdrawal policy will witness higher graduation rates and shorter average time to degree.

Table L2. Percentage distribution of high school graduation status, postsecondary participation and degree completion of students in the 1992 NELS:88/2000 survey, by retention in-grade

	Was student ever retained in grade?		
	No	Yes	Indeterminable
Population			
All students:	73.0 (0.94)	17.8 (0.90)	9.2 (0.71)
Education Attainment			
High school completion			
Academic diploma	90.6 (0.67)	58.6 (2.44)	57.1 (3.50)
GED and other	4.7 (0.43)	20.2 (2.28)	14.8 (2.31)
Did not complete	3.8 (0.52)	18.9 (1.86)	26.7 (3.60)
Indeterminable	0.9 (0.18)	2.2 (0.61)	1.4 (0.37)
Postsecondary entry	81.3 (0.86)	48.7 (2.23)	47.5 (3.53)
Highest degree			
No postsecondary	18.7 (0.86)	51.3 (2.23)	52.5 (3.53)
No degree	35.1 (0.90)	35.0 (2.17)	29.1 (2.93)
Certificate	3.7 (0.32)	3.7 (0.65)	4.1 (1.22)
Associate	6.2 (0.41)	3.2 (0.61)	4.8 (1.33)
Bachelor's or above	36.4 (1.00)	6.8 (0.82)	9.5 (1.91)
Highest degree of those who entered postsecondary			
No degree	40.5 (1.01)	69.0 (2.60)	57.8 (5.19)
Certificate	4.8 (0.43)	9.1 (1.59)	9.8 (3.23)
Associate	8.0 (0.54)	6.2 (0.95)	10.7 (2.86)
Bachelor's	46.7 (1.10)	15.6 (1.83)	21.7 (4.05)

NOTES: (1) Standard errors are in parentheses. (2) Column totals for high school completion and highest degree may not add to 100.0 percent due to rounding. (3) Weighted Ns for all students: Never retained in grade = 2.298M; retained in grade = 560k; indeterminable = 291k.

Table L4. Descriptive relationship of number of credits earned in the first calendar year of attendance by 1992 12th-graders to highest degree earned by December 2000

	Highest degree earned by December 2000				
Number of credits in first year	None	Certificate	Associate	Bachelor's or higher	**Percentage of all students**
0–10	84.6 (1.44)	6.4 (0.98)	5.4 (0.88)	3.6 (0.75	**24.5 (0.94)**
11–19	63.9 (2.27)	4.9 (0.88)	12.0 (1.65)	19.2 (1.70)	**16.5 (0.73)**
20–29	27.5 (1.39)	3.8 (0.75)	8.4 (0.79)	60.3 (1.60)	**31.0 (0.83)**
30 or more	10.6 (0.86)	5.1 (0.66)	7.9 (0.83)	76.5 (1.31)	**27.9 (0.81)**
Among those who attended a four-year college at any time, number of credits earned in first year					
0–10	75.8 (3.15)	4.9 (1.50)	8.8 (2.18)	10.4 (2.11)	**12.4 (0.88)**
11–19	53.9 (2.82)	2.1 (0.55)	12.1 (2.22)	31.9 (2.51)	**14.1 (0.70)**
20–29	24.2 (1.39)	2.0 (0.79)	5.0 (0.62)	68.9 (1.59)	**38.8 (1.01)**
30 or more	8.4 (0.81)	0.6 (0.16)	3.4 (0.48)	87.6 (0.93)	**34.8 (0.94)**

NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding. Weighted N for all 1992 12th-graders = 2.09M; for those who attended a four-year college at any time:1.47M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L5. Percentage distribution of enrollment intensity over six years (1995/96–2001) of students who started out in postsecondary education in 1995/96, by age as of December 1995

Age at entry	Enrollment intensity		
	Full-time only	Part-time only	Both full-time and part-time
All Students	47.0 (1.1)	12.2 (0.8)	40.7 (1.0)
Less than 21	51.8 (1.1)	4.4 (0.5)	43.8 (1.1)
21–23	40.0 (3.8)	18.7 (3.1)	41.3 (1.1)
24–29	30.2 (3.7)	35.5 (4.6)	34.3 (4.2)
30 and older	32.1 (3.1)	42.9 (3.5)	25.0 (2.8)

NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding.
SOURCE: National Center for Education Statistics: Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-171).

As the reader will notice, about 48 percent of traditional-age students in the BPS longitudinal study of 1995/96-2001 told us that they attended part-time at some point in their undergraduate careers. In contrast, only 38 percent of the NELS:88/2000 postsecondary cohort indicated in their 2000 CATI interviews that they had attended part-time at any time. Are the two cohorts, three years apart in their modal starting date, that different? No.

NELS:88/2000:

Part-time by student report	37.7
Part-time by transcript evidence	9.7
Total part-time	47.4

BPS95/96–2001 students who started before they were 21:

Always part-time	4.4
Mixed full-time and part-time	43.8
Total part-time	48.2

So a dichotomous variable indicating whether the student *ever* attended part-time can be included in the logistic model in Step 5 (attendance patterns).

Table L6. Mean Carnegie unit credits earned in grades 10–12 by (a) all 1992 12th-graders and (b) by those of known socioeconomic status who attended a four-year college at any time and for whom high school transcript records and senior year test scores were complete

	Mean Carnegie units earned by:	
Category of earned credits	All 1992 12th-graders	All 1992 12th-graders who are the subjects of *The Toolbox Revisited*[a]
All high school credits	17.93 (0.09)	18.74 (0.09)
All academic credits	16.06 (0.09)	17.13 (0.09)
All vocational credits	1.28 (0.03)	1.01 (0.03)
English	4.11 (0.02)	4.18 (0.02)
Mathematics	3.39 (0.03)	3.61 (0.03)
Foreign language	1.98 (0.04)	2.31 (0.04)
Science	3.14 (0.03)	3.39 (0.03)
Social sciences	3.55 (0.03)	3.64 (0.03)

[a] These students are the same as those described under (b) in the title of this table.

NOTES: Standard errors are in parentheses. Weighted N for all 1992 12th-graders: 2.62M. Weighted N for 1992 12th-graders who graduated from high school by December 1996, attended a four-year college at any time, and were of known socioeconomic status: 1.41M.

Table L11. Institutional attendance patterns of 1982 and 1992 12th-graders who subsequently earned more than 10 postsecondary credits[a]

Attendance characteristics	Class of 1982	Class of 1992
Number of schools attended		
One	46.9 (0.82)	43.5 (1.06)
Two	33.8 (0.75)	35.1 (0.93)
More than two	19.3 (0.63)	21.5 (0.84)
For those who attended more than one school:		
Attended in more than one state	39.5 (1.21)	35.7 (1.36)
Institutional combinations:		
Four-year only	38.9 (1.21)	27.5 (1.17)
Reverse transfer[b]	7.6 (0.60)	8.2 (0.76)
Community college transfer	18.1 (0.90)	22.1 (1.12)
Alternating/simultaneous[c]	10.2 (0.67)	13.8 (1.01)
Four-year student with incidental community college[d]	[e]	12.7 (0.90)
Four-year plus other sub-baccalaureate	4.9 (0.46)	1.8 (0.36)
Community college only	10.2 (0.69)	9.1 (0.71)
Community college and other sub-baccalaureate	5.3 (0.50)	3.0 (0.33)
Sub-baccalaureate trade school only	1.1 (0.22)	0.3 (0.20)
Other combinations	3.6 (0.51)	1.5 (0.31)

[a] The reason for excluding incidental students (those who earned 10 or fewer credits) is that they provide an insufficient history for judging multi-institutional attendance.
[b] Student began in four-year institution, did not earn a degree, and transferred to a community college.
[c] Student moved back and forth between four-year and two-year institutions, or attended two institutions at the same time, or did both.
[d] Student was based in a four-year institution, and earned 10 or fewer credits, principally during summer terms, from community colleges. This measure was not available in the High School & Beyond/Sophomore cohort transcript file.
[e] Category was not available in the High School & Beyond/Sophomore cohort transcript files (NCES 2000-194).
NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding. Weighted N for those who earned more than ten credits: 1.83M.

Table L12. Percentage distribution of final (December 2000) education status of 1988 eighth-graders, by type and timing of high school diploma (if any), and including those who did not earn high school diplomas

Secondary/postsecondary status	Percent
1) Earned standard high school diploma by July 1992 and	
Earned at least a bachelor's degree	29.1 (0.94)
Associate degree was highest earned credential	4.7 (0.28)
Certificate was highest earned credential	2.8 (0.24)
No degree, but still enrolled in 2000	4.6 (0.33)
No degree, not enrolled in 2000	23.6 (0.79)
Never entered postsecondary education	13.1 (1.10)
2) Earned standard high school diploma *after* July 1992 and	
Earned at least a bachelor's degree	0.2 (0.12)
Associate degree was highest earned credential	0.3 (0.14)
Certificate was highest earned credential	0.2 (0.04)
No degree, but still enrolled in 2000	0.4 (0.14)
No degree, not enrolled in 2000	1.9 (0.29)
Never entered postsecondary education	1.6 (0.23)
3) Earned GEDs or certificates of attendance and	
Earned at least a bachelor's degree	0.1 (0.03)
Associate degree was highest earned credential	0.2 (0.05)
Certificate was highest earned credential	0.4 (0.14)
No degree, but still enrolled in 2000	0.8 (0.22)
No degree, not enrolled in 2000	2.8 (0.38)
Never entered postsecondary education	3.9 (0.46)
4) Others	
Did not graduate from high school, but entered postsecondary	1.0 (0.42)
Did not graduate from high school, no postsecondary	6.7 (0.65)
Indeterminable high school graduation status	1.7 (0.37)

NOTES: Standard errors are in parentheses. Percent column may not add to 100.0 due to rounding. Weight used throughout this table is the F4BYWT with a base year (1988) flag. F4BYWT covers NELS:88/2000 students who were in both the base year (1988) sample and the 2000 follow-up survey sample. Weighted N=2.93M.

GLOSSARY

VARIABLES AND THEIR CONSTRUCTION

This glossary serves not only to expand the definition of the variables considered for *The Tool-box Revisited*, but also to provide details on their construction and allied guidance for interpretation that the reader may find helpful. As in Part II of this study, the presentation follows the order of the seven steps of the logistic narrative.

Where the initial definition of the variables in Part II was simple and transparent, e.g., GENDER, no further elaboration is provided here. Nearly all these variables were either taken directly or derived from other variables on NCES 2003-402 and its June 2004 Supplement.

Step 1a: Demographic Background

NNSE (Nonnative speaker of English)—New in this analysis.

The most notable demographic change between postsecondary students from the High School Class of 1982 and those from the High School Class of 1992 was a doubling of those who not only came from households where English was a second language, but who themselves were users of the heritage language. More than half of both Asian and Latino postsecondary students were so classified (Adelman 2004a, table 1.3, p. 9).

IMMIG (Family immigrant status)—New in this analysis.

Allied to second language background is the immigrant status of families. A dichotomous variable, IMMIG, was created to indicate whether the student's parents were immigrants to the United States within the previous 10 years. Among those who attended a four-year college at any time, 27.5 percent (s.e. = 3.33) of Asian students and 8.8 percent (s.e. = 1.61) of Latino students came from recent immigrant families. The dichotomous variable did not meet the minimum *t* criterion for retention in the demographic logistic model. Nonresponse bias undermines this variable: Responses from nearly 15 percent of the NELS:88/2000 families are missing.

BROSIS (Number of siblings)—New in this analysis.

Some research has indicated that students from larger families have more difficulty entering and successfully participating in higher education (Stage and Hossler 1989; Leigh and Gil 2003; Perkhounkova, McLaughlin, and Noble 2004). The dichotomous variable, BROSIS, marks students with three or more siblings versus those with one, two, or none.

FIRSTGEN (First generation postsecondary student)—New in this analysis.

A dichotomous variable under which the criterion for first-generation status is that *neither* parent had attended a postsecondary institution. Parents' education status was reported by parents themselves, not by students. The discrepancy between students' understandings of their parents' education status and parental accounts was demonstrated in the original *Tool Box* (p. 36): For the High School Class of 1982, only 50 percent of the students with at least one parent who had

earned a bachelor's degree (but not a graduate degree) could correctly describe their parents' achievement. Parents' highest level of education is a key component of socioeconomic status, and the original *Tool Box* did not test it separately.

FAMINC (Family income)—New in this analysis.

Family income in 1991 (the year before NELS students were scheduled to be in the 12th grade) was reported by parents, and set in six bands with a fairly even distribution of all respondents across those bands. In 2005 dollars (adjusted for a Gross Domestic Product deflator[66] of 1.288), as shown in figure 4, these bands were:

Figure 4. 1991 family income bands used in the NELS:88/2000 in 2005 dollars

Income band	Income range ($000)
Highest	96.6 and higher
Second	64.4–96.5
Third	45.1–64.3
Fourth	32.2–45.0
Fifth	19.3–32.1
Lowest	Less than 19.3

SOURCES: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement); *Budget of the United States Government: Historical Tables, Fiscal Year 2005*, table 10.1.

For purposes of our analysis, the bands were combined in pairs—highest two, middle two, and lowest two—to produce a trichotomy. This version is used in the Step1a logistic model (demographic characteristics only), along with FIRSTGEN, as one of the proxies for socioeconomic status.

NEWCHILD (Parenthood by age 20)—Carried forward from *Answers in the Tool Box.*

The variable, abbreviated as NEWCHILD, is a dichotomous marking of students (of either sex) who became parents by age 20. It was a powerful, negative, and consistently significant variable through all stages of the logistic story of the HS&B/So. A decade later, the rate of early parenthood had changed. For the entire cohort of the HS&B/So, 11.6 percent (s.e. = 0.43) became parents by age 20, a proportion that rose to 16.4 percent (s.e. = 0.92) for the NELS:88/2000. For those who ever entered a postsecondary institution, these percentages drop in half. Georges (2000) would remind us of the common sense that students who became parents by age 20 were not likely to enter college at all by that time. Indeed, 59.4 percent (s.e. = 2.30) of

[66]For the GDP deflator calculator, go to http://www1.jsc.nasa.gov/bu2/inflateGDP.html

the NELS:88/2000 participants who had children by 1994 did not enter any postsecondary institution by 2000, compared with 20.9 percent (s.e. = 0.89) of those who did not become parents by 1994.[67]

SESQUINT (Socioeconomic status quintile)—Carried forward from the original *Tool Box*.

In NCES longitudinal studies, socioeconomic status (abbreviated SES) is a composite index of family income, parents' highest level of education, prestige of parents' occupations, and the presence of items such as books, regular newspapers, and a computer in the student's household. Parents provide this information, and the 1992 parent interview was the primary source. The NELS:88/2000 files presented this index in centiles, as did the HS& Beyond/So file before it. To match quintile presentations of high school curriculum intensity, high school class rank/Grade Point Average, 12th-grade test score, and the composite variable, Academic Resources (see below), the centile scale was collapsed to quintiles. SES is an anchor of the education attainment literature, with recent studies enlightening our understanding of the complex ways students of different SES backgrounds experience higher education (e.g., Walpole 2003).

Step 1b: High School Background

EDUANTIC (Education anticipations)—Modified from *Answers in the Tool Box*.

In both the original *Tool Box* and *The Toolbox Revisited*, this is a composite variable describing the consistency and level of the student's education expectations, hence, goal commitment (Allen and Nora 1995). It departs considerably from measures of student education "aspirations" that are based on the student's answer to a single question at one moment in time. The variable was built from matched pairs of questions asked in grades 10 and 12. The High School & Beyond/Sophomore cohort surveys included six pairs of questions: highest level of education expected, planned dominant activity in the year following high school graduation, timing of college entry, choice of a two-year or four-year college as entry point, lowest level of education with which the student would be satisfied, and whether the student would be disappointed if he or she did not graduate from college.

The NELS:88/2000 version does not have as strong a base. Only two pairs of questions were asked in grades 10 and 12 that feed into the construction: highest level of education expected and timing of college entry.[68] In grade12 only, the respondent was asked what was the most likely type of postsecondary institution he or she would enter: four-year, two-year, or trade school, and the answer to this question also was used in building the variable. But the lack of parallelism

---

[67]These percentages are based on the entire panel of participants in 1992 who also participated in the 1994 and 2000 follow-up surveys.

[68]Georges (2000) used a similar level-of-expectations by consistency-of-expectations construct for parental visions of their children's future education in the NELS:88/2000 cohort. Parents were interviewed on this issue when students were in the eighth grade and again when students were scheduled to be in the 12th grade.

between the HS&B/So survey and the NELS:88/2000 lead to revisiting the NELS categories and applying stricter algorithmic standards to yield an education anticipations variable closer to the structure of its predecessor, as displayed in figure 5.

Even after this construction, the education anticipations variable required an adjustment. Unlike the quintile variables for curriculum, class rank/GPA, and senior year test score, in which meanings are linear, the five-level anticipations variable is categorical. For purposes of multivariate analysis, the five levels were reduced to three as follows: (1) consistently expected to earn a bachelor's degree; (2) raised expectations to the bachelor's degree between grades 10 and 12; and (3) either lowered expectations from the bachelor's level between grades 10 and 12 or never expected to earn a bachelor's degree. The result is still a categorical variable, but the reference point—expectations for earning a bachelor's degree—is now constant in all three values.

Figure 5. Comparison of the education anticipations composite variable in the High School & Beyond/Sophomore cohort and the NELS:88/2000: Changes in students' expectations between grade 10 and grade 12

HS& B/So	NELS:88/2000
Bachelor's consistent	Bachelor's consistent
Raised to bachelor's	Raised to bachelor's
Lowered from bachelor's to some college; associate consistent	Lowered from bachelor's to some college, inconsistent
Lowered to no degree; associate inconsistent	Raised to some college; consistent "some college"
No degree plans, don't know	Sub-baccalaureate, including high school diploma or less

SOURCES: National Center for Education Statistics: High School & Beyond/Sophomore cohort, NCES 2000-194; NELS:88/2000 Postsecondary Transcript Files, NCES 2003-402.

CLSSRNKQ (Class rank/GPA quintile)—Carried forward from the original *Tool Box*.

This variable is a composite of high school class rank and GPA quintile. In both the HS&B/So and NELS:88/2000 data sets the composite was constructed in roughly the same way. The construction is described in detail in Appendix C, but the key features are worth repeating here.

The construction of this variable began with class rank, expressed as a percentile, for students whose high school graduating classes were larger than 10. Class rank was chosen for the base

reference because it overrides variability in local grading practices,[69] and responds to the divergence between stable scores on standardized tests such as the SAT or ACT and rising GPAs among the college bound (College Board 1998). Not all high schools compute class rank,[70] so for a significant percentage of students, this datum is missing. For these missing cases (as well as for the students from very small high schools), the variable construction turns to high school GPA (where available, and only for students with three or more years of course work). Basing a percentage scale first on class rank, and filling in the missing values with available GPAs from a matched scale using an equipercentile concordance methodology (Houston and Sawyer 1991), weighting the combined scale and cutting it by quintiles solves some of the bias and validity problems that would result from relying on GPA alone.

SRTSQUIN (Senior year test score quintile)—Carried forward from the original *Tool Box*.

SRTSQUIN is the quintile version of a senior year test score. Comparing the HS&B/So to the NELS:88/2000, this variable had the least variation in construction among the precollegiate academic performance variables. In both data sets, composite scores on an "enhanced mini-SAT" given to survey participants in the 12th grade were set out in percentiles. For missing cases, ACT scores were first converted to the SAT scale using ACT's equipercentile concordance methodology (accounting for the 1989 revision of the ACT test battery), and a combined SAT/ACT variable constructed. Scores on this variable were set out in percentiles, and filled in for missing cases of the senior year test score percentile using the equipercentile concordance method. SRTSQUIN reduces the noise in the lumpy distribution with a quintile presentation. Despite these efforts, 14 percent of the students in the NELS:88/2000 database are missing a senior year test measure, compared to 9 percent in the HS&B/So (see Appendix C). It must be acknowledged that the construction of SRTSQUIN combines low-stakes test scores with high-stakes test scores, though it is unclear how that ultimately affects a quintile presentation.

HIGHMATH (Highest level of mathematics reached in high school)—Carried forward from the original *Tool Box*.

In the original construction of this variable in both the HS&B/So and NELS:88/2000 data sets, some editing of the original coding of high school mathematics courses was required in light of postsecondary transcript evidence. For example, if the original coding in 1992 judged the student's highest level of high school mathematics to be "geometry," and the student's postsecondary transcript record of 2000 showed enrollment and completion of "Calculus III" in the first semester of college, then it was obvious that the original coder did not know the

---

[69]Among the divergent policies found by the College Board (1998): (a) 9 percent of high schools do not use A-F or numeric grading systems; (b) 8 percent of high schools do not give credit for grades lower than C-; (c) 19 percent of high schools are in districts where grading systems vary; and (d) 43 percent of high schools exclude some courses when calculating GPA.

[70]In its survey of high school grading practices, the College Board (1998) found that 19 percent of high schools did not calculate class rank.

difference between "geometry" and "analytic geometry," and the student's high school record had to be adjusted accordingly. HIGHMATH is considered a categorical variable (as opposed to a continuous variable) because the distance between its levels cannot be judged as ordinal.

SCIMOM (High school momentum in science and mathematics)—New in this analysis.

This variable has three values: (1) A student who reached a level of math beyond Algebra 2 and who earned three or more Carnegie units in core laboratory science was labeled as having sufficient momentum in STEM (Science, Technology, Engineering, and Mathematics)-oriented fields to enhance that momentum even further in a postsecondary environment (whether or not they chose to do so). (2) Students who reached Algebra 2 but no higher, and accumulated more than 1.5 units of core laboratory science exhibited "modest" science momentum, and (3) those whose high school records fell short of "modest" on either the mathematics or science criteria were labeled "weak-to-minimal" in terms of science momentum. SCIMOM is one of three variables tested together as proxies for the combined measure of the academic intensity of a student's high school curriculum, HSCURRQ.

FLAN (Number of units of foreign language in high school)—New in this analysis.

This variable was developed as part of a configuration of proxies for academic curriculum intensity so that we could test the proxies against the consolidated academic curriculum index, HSCURRQ, described on pages 24–27 and in Appendix F. FLAN indicates the number of Carnegie units earned in high school foreign language study, and has five values: more than 3 units, from 2.01 to 3 units, from 1.01 to 2 units, from 0.1 to 1 unit, and 0 units. FLAN is one of three variables tested as proxies for HSCURRQ.

ADVANCE (Number of Advanced Placement courses)—New in this analysis.

This variable was constructed with three values based simply on the number of AP courses recorded: three or more, one or two, and none. It was tested, along with SCIMOM and FLAN, as a proxy for the consolidated academic curriculum index, HSCURRQ.

The identification of Advanced Placement course work in the NELS:88/2000 was a complex task.The version of the NELS:88/2000 high school transcripts to which researchers have referred in the past understates participation in AP courses, though it was difficult to say precisely by how much. Two proxy measures were employed to create the first version of an AP variable on the data file used in this study:[71] AP test scores recorded on the high school transcripts and AP entries on the postsecondary transcripts (which do not include test scores). These were combined to yield 7 percent of the NELS:88/2000 12th-graders, compared with the College Board's

[71]NCES CD 2003-402.

estimate of approximately 11 percent of 1992 12th-graders having taken AP courses.[72] Not everyone who takes AP courses takes AP examinations, and while that might explain some of the gap in the estimates, it still left an uncomfortable discrepancy between the NELS and College Board accounts of Advanced Placement volume.

In light of this low yield and anomalies in the data, a new approach was taken in the work that produced the 2004 Supplement to the original NCES 2003-402 files. Enough new cases of AP course taking (*not* courses labeled "honors" or just "advanced") were identified to raise the proportion of NELS 12th-graders with AP courses to 9.4 percent.[73]

Step 2: Postsecondary Entry

FIRST4 (First school attended was a four-year college)—Carried forward from *Answers in the Tool Box.*

The dichotomous variable indicating whether the first institution attended by the student was a four-year school was active in the original *Tool Box* account, but did not qualify for entry into the model in this replication. It is not clear why this should be the case. Some 81.9 percent (s.e. = 0.82) of the class of 1982 who attended a four-year college at any time started at a four-year college, versus 78.1 percent (s.e. = 1.04) of the class of 1992. There is no meaningful difference in those numbers.

DOCT (First school attended was a doctoral degree-granting institution)—Carried forward from the original *Tool Box.*

Another dichotomous variable indicating that the first institution attended by the student was not only a four-year college, but a doctoral degree-granting school. In the original *Tool Box*, this variable was admitted to the steps of the logistic model but was never statistically significant. In *The Toolbox Revisited* analysis, this variable did not qualify for entrance in the model, even though roughly similar percentages of students who attended a four-year college at any time started in a doctoral degree-granting institution (33.8 percent; s.e. = 1.06 for the HS&B/So versus 34.1 percent; s.e. = 1.11 for the NELS:88/2000).

---

[72]See indicator #14 in *The Condition of Education, 1999*. Washington, D.C.: National Center for Education Statistics, 1999, p. 56.

[73]This approach began by isolating students who were consistent in their claims to have taken an "advanced placement course," planned to take an AP test, and reported taking at least one AP test between 1990 and 1993. From this group, those for whom AP course work had already been recorded were dropped. The balance were first matched against the HIGHMATH variable. For students who reached calculus or precalculus, responses to another question as to whether they took the course to earn college credit were invoked. If the student responded positively, the record was credited with an AP course. College transcripts were also examined for foreign language study at advanced levels in the first year of attendance (along with more than 2 years of foreign language study in high school), etc. Where matches were found, the student record was credited with an AP course.

The variable indicating the selectivity of the first institution of attendance (SELECT) is, to a large extent, confounded with doctoral degree-granting status (55 percent of the NELS:88/2000 students who started at doctoral degree-granting institutions started at either selective or highly selective schools).

SELECT (Selectivity of first institution attended)—Carried forward from the original *Tool Box.*

A dichotomous variable indicating that the first institution attended by the student was either highly selective or selective.[74] Some 4.1 percent (s.e. 0.49) of the universe for this study started in highly selective institutions (e.g., Princeton, the University of California at Berkeley, and Harvey Mudd). Another 17.8 percent (s.e. = 0.98) began their postsecondary careers in selective institutions (principally flagship state universities such as Michigan-Ann Arbor, North Carolina-Chapel Hill, Wisconsin-Madison, and Texas-Austin). More than half of the universe of students in this study (56.3 percent; s.e. = 1.32) commenced study in nonselective four-year colleges, and 20.7 percent (s.e. = 1.19) in open-door institutions, a category that is just about identical to community colleges. For the previous cohort of students from the High School Class of 1982, selectivity of first institution had a modestly positive and statistically significant association with degree completion until the last step of that analysis, extended postsecondary performance. Readers interested in the distribution of first institutional selectivity by race/ethnicity, gender, and socioeconomic status are referred to Appendix L, table L3.

NODELAY (Direct entry to postsecondary education following high school)—Carried forward from the original *Tool Box.*

This dichotomous variable was built from a simple distinction: Among students for whom we know both the month and year of high school graduation and the month and year of a transcript-documented attendance in a postsecondary institution following high school graduation, is the difference (a) seven months or less, (b) 8–18 months, or (c) more than 18 months? The first of these options is regarded as "direct entry." Dual enrollment courses do not count in this determination. The student who graduates from high school in June has until the following January to enroll and be judged "no delay." To those who might question the seven month allowance and argue for four months, one would point to a small percentage of graduates with April commencement dates who would be judged late entrants in September under a four-month rule.

---

[74] Institutional selectivity in the postsecondary files of all three grade-cohort longitudinal studies conducted by the National Center for Education Statistics has five values: highly selective, selective, nonselective, open-door, and not ratable. The first three of these values were based on the selectivity cells developed by the Cooperative Institutional Research Project (CIRP) at UCLA for its annual survey (since 1966) of entering freshmen. Community colleges and area vocational-technical institutes (AVTIs) were assigned the value of "open-door." Theological seminaries, music conservatories, and sub-baccalaureate vocational schools were considered "not ratable."

ACCELCRD (Credits earned prior to high school graduation and by examination)—New in this analysis.

ACCELCRD sums all college credits earned by course work prior to high school graduation, along with credits earned by examination—including Advanced Placement, College Level Examination Program (CLEP), and institutional challenge exams (the majority of these—in the records of the NELS:88/2000—in foreign languages). Most of these credits were earned either prior to matriculation or during the first term of enrollment, though some were earned at later points in the student's undergraduate career. The ACCELCRD values were set at three levels: more than 4 credits, 1–4, and zero.

Step 3: First-year Performance

LOWCRED (Less than 20 additive credits earned in the first calendar year of attendance)— Carried forward from *Answers in the Tool Box.*

A dichotomous variable built on an analysis of the mean number of additive credits (those that count toward degrees) earned by all postsecondary students in the first calendar year following the date of first enrollment. The threshold at which this broad population began to earn any credentials (including certificates and associate degrees) was 20 credits (in the NELS:88/2000 population, 20.252 credits, to be precise; s.e. = 1.016). LOWCRED is an early momentum indicator with enduring consequences. As table L4 in Appendix L demonstrates, the more additive credits earned in the first year, the more likely a degree will be completed.

FRSHGRAD (Grade point average in the first calendar year of attendance)—Carried forward from the original *Tool Box.*

Grade point averages were determined for the first *full calendar year* of postsecondary attendance, and were then set out in quintiles. FRSHGRAD is a dichotomous variable that divides the highest two quintiles from the other three. For the history of the HS&B/So used in the original *Tool Box* study, the dividing line was 2.70. For that of the NELS:88/2000 used in *The Tool- box Revisited*, the line is drawn at 2.88. The difference reflects the general trend in GPAs of the two cohorts (see Adelman 2004a, table 6.1, p. 78).

FREM (Any remedial course work in the first calendar year of attendance)—New in this analysis.

FREM is a dichotomous variable marking students who took any remedial courses during the first calendar year of attendance. Three variations on first-year remediation were tried out in the process of arriving at this formulation: one that focused only on remedial reading, another on remedial math, and a third on all types of remediation. The dichotomous version of the latter was the only form that could meet the minimal statistical criteria for entrance into the stepwise logistic model and allow us to track any association of early remediation with degree completion.

Step 4: Financial Aid

In general, the NCES grade-cohort longitudinal studies have been weak on financial aid information, where as the event-cohort Beginning Postsecondary Students longitudinal studies have offered a panoply of financing data. For example, if we were to ask about grants or scholarships received in the first year of attendance (1995–96) for the BPS:95/96–2001 by traditional-age students who attended a four-year college at some time, we would find the information indicated in table Glossary-1.

We would know, too, that for those who received grants/scholarships in 1995/96, the amount constituted an average of 69.3 percent (s.e. = 1.0) of all aid received, and covered 33.4 percent (s.e. = 0.7) of the price of attendance for the 1995–96 academic year. We could easily break these averages out by type of institution first attended. And we would know more, as the BPS:95/96–2001 covers PLUS (Parent Loan for Undergraduate Students) loans, Perkins loans, Stafford loans (subsidized and unsubsidized), need-based aid by source, merit-aid by source, Pell grants, SEOG (Supplementary Educational Opportunity Grants) grants, and other types of financial aid. If the grade-cohort longitudinal studies such as the NELS:88/2000 had gathered even a third of this information, a much richer analysis would be possible—though not necessarily an analysis demonstrating a significant association of types, amounts, and ratios of financial aid to degree completion.

Table Glossary-1. Percentage of 1995/96 beginning postsecondary students 20 years old and younger who attended a four-year college at any time, and received grants or scholarships in 1995/96, by source and average amount of award, and bachelor's degree attainment rate by 2001

			Percent earning bachelor's degree by 2001	
Source of grant	Percent receiving grant	Average amount of grant	Received grant or scholarship	Did not receive grant or scholarship
All sources	54.6 (1.3)	$4506.00 (170.7)	59.8 (1.4)	49.1 (1.9)
Federal	23.2 (1.0)	1958.60 (34.0)	47.8 (1.9)	57.1 (1.4)
State	19.1 (1.0)	1757.40 (68.8)	58.6 (2.0)	54.0 (1.4)
Institution	31.9 (1.3)	4312.00 (208.0)	67.5 (1.7)	49.0 (1.5)
Other	16.1 (0.7)	1529.60 (73.5)	71.1 (2.0)	51.9 (1.4)

NOTE: Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-173).

Step 5: Attendance Patterns

FOURTRAN (Transfer from one four-year college to another)—New in this analysis.

The algorithm for classic transfer from a community college to a four-year college was fairly easy to construct. But to distinguish a true four-year-to-four-year college transfer required an indirect route. In the final survey of NELS longitudinal study (2000), respondents who attended any postsecondary institution(s) were asked whether they ever "transferred credits." One cannot equate the yes/no answer to that question with institutional transfer. One group of four-year-to-four-year transfers was easy to identify: those who started in a four-year college and earned a bachelor's degree from a different four-year college. The second group was defined by the following attendance characteristics: They started in a four-year college, attended at least two four-year colleges, earned more than 30 credits from four-year colleges, were *not* reverse transfers, and earned less than 20 credits from community colleges and other sub-baccalaureate institutions. For the most part, these students did not earn bachelor's degrees, but they accumulated an average of 85.6 credits (s.e.=3.57) from four-year colleges. Of those who did not earn a degree, 34.6 percent (s.e. = 4.17) were still enrolled and degree-candidates in 2000.

MULTINS (Student attended more than one postsecondary institution as an undergraduate)—Carried forward from *Answers in the Tool Box.*

MULTINS is a dichotomous variable indicating that the student attended more than one institution. This is a macro-vision of otherwise multidirectional student behavior. One might suspect that when MULTINS, TRANSFER, and FOURTRAN are in the same logistic model, at least one of these variables will evidence an unacceptable degree of collinearity. But within the context of the universe under study in *The Toolbox Revisited*, the correlation between community college transfer (TRANSFER) and MULTINS is 0.3363 and that between four-year-to-four-year transfer (FOURTRAN) and MULTINS is 0.3246. These are modestly positive, but not so high as to indicate collinearity problems. What that may mean is that the three independent variables are making distinctly different statements in the context of the logistic regressions in which they appear.

SUMMER (Number of credits earned during summer terms)—New in this analysis.

Attendance and credit generation during summer terms turned out to be a strong proxy for high-octane persistence among community college students (Adelman 2005a), and was, hence, brought into the model for the population of those who attended a four-year college at any time. The variable was set by three bands of the number of credits earned in this manner: more than 4, 1–4, and 0. Some 54.8 percent (s.e. = 0.92) of all 1992 12th-graders who continued their education earned credits in at least one summer term; 61.1 percent (s.e. = 0.96) of those who earned more than 10 credits did so, as did 63.2 percent (s.e. = 1.10) of the universe on which this essay focuses. Given the magnitude of those percentages, it is not so much the fact of using summer terms, but the volume of credit generation that should count.

PARTTIME (Was the student's enrollment intensity *ever* part-time?)—New in this analysis.

The original *Tool Box* declined to confront part-time status and its effects. If one is using transcripts as evidence, there are a number of problems in determining which students are part-

time and when. This issue deserves extended attention, with support drawn from very different data sources (see, e.g., O'Toole, Stratton, and Wetzel 2003). Even if one standardizes credits on a semester metric across over 3000 institutions in the NELS:88/2000 postsecondary transcript files, it is often difficult to know what is considered "part-time" in term X at institution Y in program Z. With over 60 percent of students earning credits in summer terms, we would be obligated to include such terms in an account of enrollment intensity, and the question, "What is 'full-time' in a summer term?" would have to be answered in each institution. In the last survey of the NELS:88/2000 cohort in 2000, students were asked whether they had ever "attended less than full time." Despite the ambiguity of the phrasing and students' understanding of what "less than full time means," student responses were accepted as the first stage of creating a variable indicating part-time status at some point in their careers. In their 1994 interviews, students were also asked about their enrollment intensity status at the first institution they attended. When they indicated part-time, that fact overrode any denial of part-time status in their 2000 interview. Proximate judgment supercedes retrospection.

The second stage in developing this rough proxy draws on the transcripts and the notion of reducing credit load to part-time status. To identify students who may start with a full-time schedule but reduce it to part-time intensity by withdrawing from courses, we take the average credit load per semester for bachelor's degree recipients—14.2 (average annual load of 30.8 minus the sum of summer-term credits, credits by examination, and dual enrollment credits divided by two)—and ask by what percentage that figure would have to fall to bring the student's credit load below the threshold for full-time status (12 credits). The answer is 16.2 percent. So for the sake of this crude proxy measure, it is assumed that students who withdrew from attempted credits at 16.2 percent rate or higher were—or became—part-time at some time. With that group added to students who indicated part-time status in the course of their 2000 interviews, the proportion of NELS students who were part-time at some time in the undergraduate careers was 47.4 percent—compared with 48.2 percent of traditional-age students in the BPS longitudinal study of 1995/96–2001 (for an account of enrollment intensity in both data sets, see Appendix L, table L5).

Step 6: Extended Postsecondary Performance

REMPROB (Nature and intensity of remedial work)—Carried forward from *Answers in the Tool Box.*

In both the original *Tool Box* and *The Toolbox Revisited*, REMPROB describes the nature and extent of a student's remedial course work without the boundary of the first calendar year of attendance. For that reason, when REMPROB is tried out in the logistic narrative at the stage of extended postsecondary performance, it replaces the freshman year remediation variable (FREM).

REMPROB is created by an if-then-else logic that starts with remedial reading as the most serious of remedial problems,[75] and works its logical steps as follows:

[75]For an elaboration of REMPROB in relation to student demographic backgrounds, high school performance, and degree attainment, see Adelman 2004a, pp. 87–94, and Wirt, et al. (2000), indicator 14, p. 52 and supplemental tables (p. 152).

1. Any remedial reading
2. Two or more remedial courses (not reading, and, if math, more than two)
3. One or two courses of remedial mathematics only
4. One remedial course (not reading, not math, thus leaving writing, language arts, and general basic skills)
5. No remedial course work

For the sake of presentation in the logistic sequence, REMPROB is a dichotomous variable in which remedial reading plus more than one remedial course falls on one side of the border, and all other remediation (including no remediation) on the other side. In the original *Tool Box*, REMPROB was admitted into the model, but did not reach the threshold of statistical significance. In *The Toolbox Revisited*, REMPROB did not meet the minimum statistical standard for entry into the model when it was invoked in Step 6.

TREND (Trend in student's grade point average)—Modified from previous presentation in the original *Tool Box*.

This variable describes the trend in a student's postsecondary grade point average (GPA), and applies only to those students with complete undergraduate transcript records and computable GPAs. In its original *Tool Box* version, two reference points were used: end of the first calendar year GPA, and final undergraduate GPA. From these two markers, one could observe whether GPA was rising, flat, or falling, using a ratio of final GPA to first-year GPA. Ratios in the .95 to 1.05 range were judged to indicate no change, with ratios above 1.05 indicating a rising GPA, and ratios below 0.95 indicating a falling GPA. For a slightly better set of markers, the NELS:88/2000 postsecondary transcript files thus added a variable for GPA two years after entry. With three points of reference, ratios are not invoked, rather relationships (greater, less than, or equal to)—and at three points in time. From the permutations of these relationships one can determine whether the trend was rising, flat/inconsistent, or falling.

CUMMATH (Number of credits earned in college-level mathematics)—New in this analysis.

This variable, setting out cumulative credits earned in college-level mathematics in three bands (more than four, 1–4, and 0) replaces the parallel variable for first-year college-level mathematics credits in the context of an extended postsecondary history account. The motivation for including this curriculum marker is the same: Even if postsecondary students do not concentrate their studies in science, technology, engineering, or mathematics/computer science (STEM), their quantitative background will be called upon (in business and the social sciences, in particular). Student academic momentum, it is hypothesized, will be as much enhanced by quantitative study on the post-matriculation side of education history as it was in secondary school.

CHANMAJ (Change of major)—New in this analysis.

If transcripts are our principal source of evidence, the only moment at which we are sure of a student's major is the moment of degree award. Sometimes, the NELS:88/2000 transcripts with no degree indicated a major, which was verified by hand-and-eye reading by two judges only when the transcript carried a minimum of 15 credits and the major field indicated carried a minimum of 12. But that still leaves a large swath of missing accounts of students' major. It is wholly possible, for example, that a student earning a B.S. in computer science changed majors

twice along the way, and in two different institutions. In the matter of major—and change-of-major—the transcript is not as credible as the student. So the last NELS survey in 2000 asked students whether they had changed majors at any time, but unfortunately did not ask "from what to what."

A dichotomous change-of-major variable was developed and tried out for this study. Basically, it took the universe of students who said they changed majors, and added to that universe community college transfer students who moved from general studies to a discrete major, and cases where the student presented two transcripts with no degrees but different majors. It also took student responses in 1994 to questions about their major at the first institution attended and that at the most recent institution attended. Where the student reported two different disciplinary majors, e.g. electrical engineering at the first institution and biology at the most recent institution, that, too, was marked as a change of major no matter what the student told interviewers in 2000. Unfortunately, all these steps created a collinearity problem with the TRANSFER variable, and CHANMAJ did not qualify for entrance into the logistic narrative. On the other hand, it was admitted and played a notable role in the linear account of time to degree (see Appendix J).

Step 7: Final Model

NOSTOP (Continuous enrollment)—Carried forward from *Answers in the Tool Box.*

Given the extended potential undergraduate periods of 12 years (National Longitudinal Study of the High School Class of 1972), 11 years (High School and Beyond/Sophomores), or 8.5 years (NELS:88/2000), it makes no sense to describe stop-out behavior as one semester or its equivalent. In all three NCES postsecondary transcript-based grade-cohort studies, non-continuous enrollment was defined as *more than* a one semester (or its equivalent, e.g., two quarters) stop-out period. In the dichotomous variable, NOSTOP, the student is considered continuously enrolled even with one semester (or two quarters) off. From the moment of its introduction, NOSTOP was the strongest independent variable in the logistic narrative of the original *Tool Box*.

WRPT Ratio (Ratio of non-penalty withdrawal and no-credit repeat grades to all grades received)—Carried forward from the original *Tool Box.*

In the original *Tool Box*, this variable was called the DWI (drops, withdrawals, and incompletes) index. DWI is not a wholly accurate acronym. What is really described is a ratio in which the number of courses from which the student withdrew without penalty *plus* those the student repeated is the numerator, and the total number of courses in which the student enrolled is the denominator. The ratio counts course attempts, not credits. Withdrawals without penalty are not the same as courses "dropped" within set periods that most colleges and community colleges mark for "drop-and-add." Courses "dropped" are not included in the ratio. Nothing here involves penalty grades. All cases at issue are noncredit grades. The variable WRPT ratio is dichotomous: On one side of the dividing line are students who withdrew from or repeated 20 percent or more of all courses in which they enrolled.

Tables

Table Number **Page**

Part I: Background

1. From macro to micro: Contraction of the universe of 1988 eighth-graders to the universe subject to analysis in *The Toolbox Revisited* 10
2. For each of four definitions of the universe of students in the NELS:88/2000, percentage distribution by gender, race/ethnicity, socioeconomic status quintile, and second language background 12

Part III: What Is and What Happens Before Matriculation

3. Logistic account of the relationships among major demographic variables and bachelor's degree attainment for 1992 12th-graders who attended a four-year college at any time 24
4. Percentage of 1982 and 1992 12th-graders and 1982 and 1992 12th-graders in academic high school programs whose curriculum fell below selected content and intensity thresholds 29
5. Bachelor's degree attainment rate by highest level of mathematics reached in high school by 1982 and 1992 12th-graders 31
6. Percentage of 1992 12th-graders who attended high schools that offered courses in statistics, trigonometry, and calculus, by race/ethnicity and socioeconomic status quintile 32
7. The math ladder for 1982 and 1992 12th-graders: Odds ratios and parameter estimates of earning a bachelor's degree at each rung, controlling for socioeconomic status quintile 33
8. Percentage of 1982 and 1992 12th-graders who attended a four-year college at any time, by type and amount of remedial courses taken in postsecondary education 34
9. Percentage of on-time 1992 high school graduates who continued their education in any postsecondary institution who earned bachelor's degrees by December 2000, by quintile performance in the three component variables of Academic Resources 36
10. Component weights of the high school Academic Resources variable for 1982 12th-graders and 1992 12th-graders who presented positive values for all three components 37
11. Correlations of major precollege Academic Resources variables and high school graduation status, college entry, and bachelor's degree attainment by December 2000 for 1992 12th-graders 38
12. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time—demographic and high school background, version 1: Using the composite variable for high school Academic Resources 41

Tables (continued) **Page**

Part IV. Matriculation and Beyond: The Features of Postsecondary History

13. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary entry phase 45
14. Percentage of 1992 12th-graders who earned credits in five categories of college-level mathematics courses in the first calendar year of attendance; and among non-incidental students, the percentage who ever earned credits in those five categories, by type of institution first attended 48
15. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: First postsecondary year performance 49
16. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary financing 51
17. Percentage of 1992 12th-graders with complete postsecondary records who persisted in postsecondary education from their first calendar year of enrollment to a second calendar year, by type of institution first attended, and, of those who persisted, percentage with lagging first-year performance 54
18. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, credits earned, and GPA at the end of the second year following initial enrollment in postsecondary education, and extended postsecondary attendance and performance markers, by ultimate bachelor's degree status 56
19. Status drop-out rates at the end of the second year following initial enrollment in postsecondary education of 1992 12th-graders who attended a four-year college at any time, and allied academic performance data 57
20. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, course participation rates by the end of the end of the second year following initial enrollment in postsecondary education, by ultimate degree status 58
21. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, participation rates in lower division course category aggregates and average number of credits earned in each aggregate by the end of the second year following initial enrollment in postsecondary education, by ultimate degree status 60
22. Relationships of GPA in first year of attendance to number of institutions attended by 1992 12th-graders, by type of first institution attended by 1992 12th-graders, by type of first institution attended 63

Tables (continued) **Page**

23. Combinations of institutions attended by 1992 12th-graders who attended a four-year college at any time and who also attended more than one school, and percentage earning bachelor's degrees under each combination 64
24. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary attendance patterns 66
25. Three trends in postsecondary GPA of 1992 12th-graders who attended a four-year college at any time through December 2000 and offered complete postsecondary records, by GPA at three points in time, average undergraduate time, and percentage earning bachelor's degree 69
26. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Extended postsecondary performance 71
27. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Final factors, with complete academic history 75
28. To what extent does the final ratio of undergraduate course withdrawal and no-credit repeat grades reflect the ratio and volume of withdrawal and no-credit repeat grades in the first calendar year of enrollment? Answers from the history of 1992 12th-graders who attended a four-year college at any time 76
29. Seven steps of a logistic regression model with bachelor's degree attainment by age 26 or 27 as the outcome for 1992 12th-graders who attended a four-year college at any time 78

Part V: Closing the Gap

30. Bachelor's degree completion rates for students who began in four-year colleges according to three different national longitudinal studies of the 1990s 87
31. Of 1992 12th-graders who started their postsecondary careers in four-year colleges, percent who earned bachelor's degrees by number of credits earned in summer terms, by race/ethnicity 90
32. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete, by race/ethnicity 92
33. Percent of credits earned during undergraduate summer terms by African-American 1992 12th-graders in aggregate course categories 94
34. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders from the lowest, middle, and highest socioeconomic status quintiles who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete 95

Acknowledgments

For review of the drafts of *The Toolbox Revisited*, the author is deeply grateful to Laura Horn of MPR Associates, Alisa Cunningham of the Institute for Higher Education Policy, Rosa Aronson of the National Association of Secondary School Principals, Alberto Cabrera of the University of Wisconsin-Madison, six anonymous external reviewers selected by the Office of Vocational and Adult Education (OVAE) of the U.S. Department of Education, and expresses particular appreciation for the meticulous review by Paula Knepper of the Department's National Center for Education Statistics. In the final stages of review and revision, the author is especially appreciative of the efforts and insights of Jeffrey Owings of the National Center for Education Statistics and David Bergeron of the Office of Postsecondary Education, both of the U.S. Department of Education.

While cited in the text, it is appropriate to repeat gratitude for the paths blazed and inspirations offered by Karl Alexander of Johns Hopkins University and Vincent Tinto of Syracuse University. C. Dennis Carroll and Jeffrey Owings, both of the National Center for Education Statistics, are responsible for the data sets used and the way they are used, and for continued support, encouragement, instruction, and tough oversight. All who invoke these national data treasures owe them.

Colleagues in the Policy, Research, and Evaluation Studies group of OVAE—Braden Goetz, Andrew Abrams, Ricardo Hernandez, and Chief of Staff, Jana Toner—are thanked for their management of the review process for this document, for instructive feedback, and for shepherding the penultimate drafts of this document through the Department, while Joan Athen made sure that the community college role in the story of the students traced in this document was appropriately highlighted. The final shape of *The Toolbox Revisited* owes a considerable amount to its ultimate editor, Katherine Devine, and to the support of Jacquelyn Zimmermann, the Department's Director of Editorial Policy and Publications. For the Web version, the author owes much to the skill and dedication of Carol Bryant.

THIS PAGE INTENTIONALLY LEFT BLANK

Executive Summary

The Toolbox Revisited is a data essay that follows a nationally representative cohort of students from high school into postsecondary education, and asks what aspects of their formal schooling contribute to completing a bachelor's degree by their mid-20s. The universe of students is confined to those who attended a four-year college at any time, thus including students who started out in other types of institutions, particularly community colleges.

The core question, data source, and legacy

The core question is not about basic "access" to higher education. It is not about persistence to the second term or the second year following postsecondary entry. It is about completion of academic credentials—the culmination of opportunity, guidance, choice, effort, and commitment.

To answer the question, *The Toolbox Revisited* uses the most recently completed of the national grade-cohort longitudinal studies conducted by the National Center for Education Statistics. This study, known as the NELS:88/2000, began with a national sample of eighth-graders in 1988. They were scheduled to be in the 12th grade and graduate from high school in 1992. They were followed through December 2000. In addition to regular interviews with these students, the data set on which this essay draws includes the critical components of high school and college transcripts, and the transcript data are the principal sources for the academic history observed.

The Toolbox Revisited was designed as a replication of a noted previous study published by the U.S. Department of Education, *Answers in the Tool Box: Academic Intensity, Attendance Patterns, and Bachelor's Degree Attainment* (1999), hereinafter referred to as "the original *Tool Box,*" which based its analysis on a national cohort of high school students who were scheduled to graduate in 1982, and who were followed through 1993. The question naturally arose as to whether the hypotheses and analyses based on that cohort's history would hold up in the story of the slightly overlapping 1992–2000 period.

We have learned a great deal in a very short time from numerous initiatives of states and private foundations to prepare high school students better for higher education, and from major federal stimuli under the *No Child Left Behind* legislation to jump start the process of academic momentum prior to high school. One of the reasons for examining the academic history of the NELS:88/2000 cohort is that its students attended high school after the wave of reforms in the 1980s that followed the critique of U.S. education offered by the seminal report, *A Nation at Risk* (1983), and, hence, may provide some clues as to the likely outcomes of current reform efforts.

Much has changed in other ways, too, since the High School Class of 1982 (the subjects of the original *Tool Box*) moved through their scheduled 12th grade and through postsecondary education. A dramatically higher proportion of high school seniors of all race/ethnicity groups continue their education, though access gaps remain (Wirt et al. 2005, indicator 22). Postsecondary attendance patterns among traditional-age students have become far more

complex, with nearly 60 percent of undergraduates attending more than one institution, and 35 percent of this group crossing state lines in the process; community college transfer rates rising nearly 10 percentage points; one out of eight undergraduates based in four-year institutions using community colleges to fill in pieces of their curriculum, and another eight percent "swirling" back and forth between the four-year and two-year sectors. Dual-enrollment while in high school, credit-by-examination, and use of summer terms all added to the dynamic mix of time and space that marked student pathways in the1990s.

With all this change, we still measure something called "college graduation rates" with anachronistic formulas that do not track students through increasingly complex paths to degrees. As a result, we do not understand what is really going on. The dominant language accompanying analyses bemoaning putatively low graduation rates is a language of "attrition," with students labeled "at risk" or "minimally college-qualified," and leaking out of "pipelines."

This study looks at student histories derived from transcript records in a different way and with a different tone. It follows the student, not the institution, because it is the *student's* success that matters to families—and to the nation. It allows the maximum length of postsecondary time for the High School Class of 1992, 8.5 years, for students to earn degrees no matter how many institutions they attend. It notes that if the history of the Class of 1982 were truncated at 8.5 years, there has been a decent improvement in bachelor's degree attainment among non-incidental students (those who earned more than 10 credits, i.e. "made a go of it") who attended a four-year college at any time (from 60 to 66 percent). It is natural to ask how this happened, to identify the moments and aspects of schooling that may have made a difference, and to reflect on what might make the most difference in the future for narrowing degree-completion gaps by race/ethnicity. In that task, *The Toolbox Revisited* looks for the features of academic history that are realistically subject to change by institutions whose principal business is the generation, preservation, and dissemination of knowledge. While acknowledging that for degree-completion rates to improve, students themselves must respond, and that their response does not occur in a vacuum, the features of student histories that are the domain of this inquiry do not include social and psychological variables attendant on the passage from adolescence to adulthood.

It is important to note that, as was the case for the original *Tool Box*, the student universe for *The Toolbox Revisited* constitutes roughly half who reach the 12th grade (table 1). It does not include students who failed to graduate from high school, those who earned General Education Diplomas (GEDs), those who had not enrolled in any postsecondary institution by the age of 26, and those who entered the postsecondary system but never attended a bachelor's degree-granting institution. The resulting demographics are slightly more female, slightly less minority, less with a second language background, and a higher socioeconomic status distribution than the cohort as a whole (table 2).

Organization

We learned from critiques of the original *Tool Box* to sort the chronology of events with greater care. There are seven steps in the analysis of *The Toolbox Revisited*, each of which involves a

collection of variables that are investigated in terms of the degree to which they help us explain bachelor's degree completion for the population of students under investigation:

Step 1: Demographic background and high school history
Step 2: Postsecondary entrance (timing and type of institution)
Step 3: First postsecondary year history (curriculum and performance)
Step 4: Factors of financing postsecondary education in the early years
Step 5: Postsecondary attendance patterns
Step 6: Extended postsecondary history (curriculum and performance)
Step 7: Final model, with complete academic history

This essay also takes an important pause outside the steps of the core statistical model to consider the characteristics of student progress through the *second* year following postsecondary entry.

As each step of the statistical model of student history is set forth, it is pointed out where the results are similar to the findings of the original *Tool Box* with its earlier population, and where they diverge. All seven steps are subsequently assembled together in one place (table 29) so that the reader can observe the factors that have *consistently* contributed to degree completion.

Principal Stories and Guidance

This executive summary offers themes, highlights, and implications of the data for those who comment on secondary and higher education and make decisions about institutional or system policy—editorial writers, legislators, researchers, education administrators.

Two national longitudinal studies, a decade apart, have told similar stories. When the second story reinforces the first—and sheds even more light—something has to be right, and it behooves us to pay attention. Both of them provide support for current efforts to improve the quality of high school curricula and the participation in those curricula of ever larger proportions of students. Both of them provide guidance for college and community college processes likely to lead students to degree completion.

Some of what was learned from the original *Tool Box* was taken to heart at the secondary school level, and, in some respects, we are seeing positive results in academic curricular participation in high schools. But counting Carnegie units[1] in English or science is not the same as describing and validating what students have learned, and whether that learning links smoothly to the performance expectations of the postsecondary world. *The Toolbox Revisited* says we have more to do, that the bulk of our task lies both after the college matriculation line, and in communication and outreach between postsecondary institutions and high schools. How do we

[1]A Carnegie unit is the basic credit system for U.S. secondary schools. It is generally recognized as representing a full year (36-40 weeks) in a specific class meeting four or five times per week for 40-50 minutes per class session (Martinez and Bray 2002).

learn what we have to do? By following students in the richness and complexity of their postsecondary histories.

Curriculum, starting in high school, and continuing

However complex students' attendance patterns, the principal story line leading to degrees is that of content. What one learns is what one studies, and what one brings to economic and community life. The story starts in high school, but merely crossing the bridge to college or community college doesn't mean the story is over. Furthermore, the bridge is not always aligned with the road on the other side.

The academic intensity of the student's high school curriculum still counts more than anything else in precollegiate history in providing momentum toward completing a bachelor's degree. At the highest level of a 31-level scale describing this academic intensity (see Appendix F), one finds students who, through grade 12 in1992, had accumulated:

3.75 or more Carnegie units of English
3.75 or more Carnegie units of mathematics
highest mathematics of either calculus, precalculus, or trigonometry
2.5 or more Carnegie units of science *or* more than 2.0 Carnegie units of core laboratory science (biology, chemistry, and physics)
more than 2.0 Carnegie Units of foreign languages
more than 2.0 Carnegie Units of history and social studies
1.0 or more Carnegie Units of computer science
more than one Advanced Placement course
no remedial English; no remedial mathematics

These are minimums. In fact, students who reached this level of academic curriculum intensity accumulated much more than these threshold criteria (see table F1), and 95 percent of these students earned bachelor's degrees (41 also percent earned master's, first professional, or doctoral degrees) by December 2000.

Provided that high schools offer these courses, students are encouraged or required to take them, and, in the case of electives, students *choose* to take them, just about everybody could accumulate this portfolio. Unfortunately, not all high schools present adequate opportunity-to-learn, and some groups of students are excluded more than others. Latino students, for example, are far less likely to attend high schools offering trigonometry (let alone calculus) than white or Asian students. Students from the lowest socioeconomic status (SES) quintile attend high schools that are much less likely to offer any math above Algebra 2 than students in the upper SES quintiles (table 6). If we are going to close gaps in preparation—and ultimate degree attainment—the provision of curriculum issue has to be addressed. In recent years, colleges and community colleges have begun to provide these courses to high school students, and distance learning provides additional options if students have access to the technology. The hypothetical

consequences of participating in curriculum configurations approaching that illustrated above for Latino degree completion rates, in particular, are stunning (table 32).

There is a quantitative theme to the curriculum story that illustrates how students cross the bridge onto and through the postsecondary landscape successfully. The highest level of mathematics reached in high school continues to be a key marker in precollegiate momentum, with the tipping point of momentum toward a bachelor's degree now firmly above Algebra 2. But in order for that momentum to pay off, earning credits in truly college-level mathematics on the postsecondary side is *de rigeur*. The world has gone quantitative: business, geography, criminal justice, history, allied health fields—a full range of disciplines and job tasks tells students why math requirements are not just some abstract school exercise. By the end of the second calendar year of enrollment, the gap in credit generation in college-level mathematics between those who eventually earned bachelor's degrees and those who didn't is 71 to 38 percent (table 21). In a previous study, the author found the same magnitude of disparity among community college students in relation to earning a terminal associate degree (Adelman 2005a). The math gap is something we definitely have to fix.

A dominant feature of academic histories that cannot really be assessed until the end of the second year following college entry is the extent to which students successfully completed credits in a range of "gateway" courses. It is at this point that the postsecondary curricular story line fully emerges, with ratios of participation in the "gateways" between those who ultimately earned degrees and those who did not running 6:1 in American literature, 4:1 in general chemistry, and more than 3:1 in precalculus, micro/macroeconomics, introduction to philosophy, and world civilization (table 20). These gaps in curricular participation argue for academic administrators to identify their key gateway courses and regularly monitor participation.

College and community college expectations for their first-year students in those gateway courses—expressed through examinations, paper and laboratory assignments—need to be more public. Examples such as those offered by the American Diploma Project in its report, *Ready or Not: Creating a High School Diploma That Counts* (2004), should be shared with larger audiences than policymakers and others who habitually read such reports. Parents should see those assignments even if they don't understand them; high school teachers should ponder them to assess whether their exiting students are likely to be prepared; and, most importantly, high school students have got to see them as road signs to their next education destination. *The Toolbox Revisited* advocates making these examples part and parcel of admissions packets, publicity brochures, and Web sites. There is risk in this: Some students may be scared away. But there is no better way to enhance articulation and preparedness than to display what students can expect.

Postsecondary benchmarks

In both colleges and community colleges, the curriculum story line intersects attendance patterns and performance in ways that set benchmarks for academic advisement and intervention:

- Less than 20 credits by the end of the first calendar year of enrollment (no matter in what term one started, whether summer, fall, winter, spring) is a serious drag on degree completion. The original *Tool Box* told the same story. It is all the more reason to begin the transition process in high school with expanded dual enrollment programs offering true postsecondary course work so that students enter higher education with a *minimum* of 6 additive credits to help them cross that 20-credit line. Six is good, 9 is better, and 12 is a guarantee of momentum.
- We falsely believe that beginning students drop out of higher education in appalling numbers by the end of their scheduled first academic year of attendance. In fact, about 90 percent of traditional-age beginning students turn up somewhere (maybe not at the first school attended) and at some time (maybe not in the fall term) during the subsequent calendar academic year (which we measure as July 1 through June 30). However impressive this percentage, the *quality* of persistence counts more, and, for a third of these students, the quality of persistence leaves much to be desired (table 17). *The Toolbox Revisited* urges that institutions monitor and report the quality (as much as the fact) of persistence.
- More than 60 percent of the students in the sample under investigation enrolled during summer terms. Undergraduates are not only more geographically mobile, but have shattered observance of the traditional academic calendar. Summer term credits are more than metaphors for high octane persistence: Earning more than 4 credits during those terms held a consistently positive relationship to degree completion, and gave African-American students, in particular, a significant boost in hypothetical graduation rates (table 32). College and community college administrators can be very creative in expanding the use of summer terms.

Student uses of time

The example of summer-term credits, particularly in combination with the complex multi-institutional attendance patterns, underscores another theme of *The Toolbox Revisited*: Student uses of time in undergraduate careers are now more important than their uses of place. In other words, *when* students do something academic has a more significant relationship to degree completion than *where* they do it. For example:

- For the High School Class of 1982 (the subjects of the original *Tool Box)*, timing of entry to postsecondary education never rose to a level of statistical significance in the analysis, whereas variables for the type of institution first entered played inconsistent but positive roles in explaining degree completion. A decade later, with a higher proportion of high school students continuing to college, the situation was reversed (table 13). What this means is that recruitment efforts have to insure that students enter postsecondary education immediately following high school graduation. The longer students wait, the less likely they will finish a degree.

- The only characteristic of the first institution of attendance to be admitted to statistical analysis was selectivity, but it never rose above the threshold of significance. Quite frankly, one isn't worried about degree completion for the 5 percent of traditional-age undergraduates who enter highly selective colleges. One is more concerned with the rest of the river—particularly the 78 percent who start in either nonselective four-year colleges or open-door community colleges.
- The original *Tool Box* study declined to confront part-time status and its effects. If one is using transcripts as evidence, there are a number of problems in determining which students are part-time and when. *The Toolbox Revisited* found a way around these problems to mark whether a student's enrollment intensity *ever* fell into part-time status, i.e., less than 12 credits per semester or its equivalent. Part-time attendance by whatever means, as Carroll (1989) labeled it, proved "hazardous" to degree completion health (table 24; table 29).
- In longitudinal studies extending for as long a period of postsecondary time as does the NELS:88/2000 (8.5 calendar years), a student is allowed stop-out periods totaling one semester or its equivalent (e.g., two quarters), exclusive of summer terms, and still be considered "continuously enrolled." Continuous enrollment is a factor of attendance patterns, and another marker of the student's use of time. It proves to be overpowering: with 16 other variables in play, continuous enrollment increases the probability of degree completion by 43 percent (table 27). The original *Tool Box* offered the same message, arguing for assiduous monitoring of student stop-out periods. Put another way: Keep the student continuously enrolled, even part-time (less damaging than excessive stop-out periods).

Purposeful migration versus "swirling"

The complexity of student postsecondary enrollment patterns, already a notable phenomenon for the population under study in the original *Tool Box*, accelerated in the subsequent cohort. The construction of the NELS:88/2000 postsecondary transcript files took advantage of what we learned from more sophisticated institutional and state system tracking studies of the 1990s; hence, some new attendance pattern variables were available and others (those describing different kinds of multi-institutional attendance) refined.

What we found for the students of the 1992-2000 period was this:

- Formal transfer from a community college to a four-year college and formal transfer from one four-year college to another were positively associated with degree completion, but wandering from one school to another was not.

In fact, the nomadic multi-institutional attendance behavior increasingly known as 'swirling,' held a significant and negative relationship to degree completion (table 24, table 39). These statements are a very simple untangling of complex realities.

The basic question asked of the transcript data—did a student attend only one school or more than one?—begins a process of inquiry to determine *how* the student attended second and third institutions. Given very taut definitions of what transfer means, we are advised to ensure that multi-institutional attendance is purposeful and productive. For that, we require much better student tracking systems than we currently possess, and regular contact with students in motion.

Student academic performance

More than the original *Tool Box*, *The Toolbox Revisited* recognizes that the path of student academic performance, marked by grades, is a reflection of quality of effort, and pays off. It starts in high school: Academic curriculum participation is still the strongest of the precollegiate momentum indicators, but between the 1980s and 1990s, class rank/GPA moved markedly ahead of senior year test score in its contribution to students' overall "Academic Resources" index, a composite indicator of high school curriculum intensity, class rank/GPA, and senior year scores on a 90-minute exam best described as a mini, enhanced SAT (see p. 16 and Glossary).

This story continues on the postsecondary side of the matriculation line:

- Earning grades that place one in the top 40 percent of first-year GPA for the whole cohort is a strong—and positive—contributor to academic momentum, and remains in the account of degree completion throughout the histories of both the class of 1982 and the class of 1992 (table 15).

- The theme of quality-of-student-effort, reflected in grades, is strengthened when the canvas covers the student's entire undergraduate career. In the original *Tool Box*, the variable describing the *trend* in students' GPA had only two reference points: first calendar year and final GPA. For *The Toolbox Revisited*, there are three such points: first calendar year GPA, cumulative GPA for the first two calendar years, and GPA as of the last date of attendance, whether or not a degree was earned. A rising trend in grades fits with attainment (table 25), contributing positively and significantly (table 26).

A story twice told should be a story to which we listen

Both the original *Tool Box* and *The Toolbox Revisited* revealed that one of the most degree-crippling features of undergraduate histories is an excessive volume of courses from which the student withdrew *without penalty* and those the student repeated. We set this up as a ratio, and marked those who withdrew from or repeated 20 percent or more of their course attempts. Doing so cuts the probability of completing a degree in half (table 27)!

The withdrawals counted here are not "drop" grades that apply during standard drop-and-add periods at the beginning of terms. They are the result of institutional policies that allow withdrawals without penalty after the drop-and-add period. No-credit repeats are standard fare

in remedial courses, but when they reach destructive levels the question arises as to how many times an institution allows a student to repeat a course. Think of it this way: Every non-penalty withdrawal and no-credit repeat means that a seat in a course is not available to someone else. Add those seats up, and admission to an institution may not be available to someone else. Excessively lax withdrawal and repeat policy, then, ultimately blocks general access. And in terms of degree completion, such policies do students no favors.

What Does Not Count in The Account of Completion?

- Students' education "anticipations" (the consistency and level of their vision of how far they will get in school) were not significant at any step of the logistic account for the High School Class of 1992. This is a change from the position of the "anticipations" variable in the original *Tool Box*, where it ducked in and out of significance. The new message is more clear: Among students who attend a four-year college at some time, expectations are distinctly secondary to one's uses of academic time and to one's academic performance.

- Whereas grants and student work-study were modestly significant contributors to degree momentum at *early* stages of students' postsecondary careers in the history of the High School Class of 1982, the data on finance mechanisms for the High School Class of 1992 are poor, and the results inconclusive. Analysts are directed instead to the Beginning Postsecondary Students longitudinal studies, which contain detailed financial aid data (but skeletal information on high school histories and postsecondary course work).

- Of student demographic characteristics, only one—socioeconomic status—was significantly associated with degree completion, though in a modest manner. Gender and race/ethnicity were never significant in the logistic narrative, even though some *indirect* effects of these key demographic characteristics would probably be found in other statistical models. When each race/ethnicity group was treated as an independent variable, the basic story did not change.

- Both a dichotomous variable marking any remedial work in the first calendar year of attendance, and an elaborate variable describing types and extent of remediation over the course of a student's entire undergraduate career were employed in the analysis, but to no avail. The same procedure was used in the original *Tool Box*, where the variables were admitted to the statistical model but did not reach the threshold of significance. Sufficient numbers of students who took remedial classes successfully moved through them so that remediation did not make a strategic difference in degree completion.

- Half of the students in the sample for *The Toolbox Revisited* who earned bachelor's degrees changed their major along the way. It was natural to ask whether change-of-major had any influence on degree attainment. It did not,

principally because, with few exceptions, community college transfer students come in to the four-year institution from a general studies program and automatically are classified as "change-of-major" the minute they enter a specific program at the four-year school.

Students as active, responsible participants

The Toolbox Revisited does not treat students as passive creatures whose fate is wholly molded by schools and colleges. It demonstrates that, within the population of traditional-age students who attend a four-year college at any time (obviously including community college transfers), we *can* improve graduation rates and close some of the gaps in completion by race/ethnicity and socioeconomic status. But it also argues that there is a limit to what we can realistically do unless students respond to highly targeted advice and prodding.

The analysis of *The Toolbox Revisited* identifies features of academic history that are most tractable in terms of second party intervention. But there is also something we might dub "first party intervention." Once the modest echoes of socioeconomic status are accounted for, each step of academic history offers *students* a set of decisions that require the commitment of time and effort likely to yield the return of earning a degree. Provided there is opportunity, the choices made by students, beginning with high school curriculum and quality of effort in high school, allow subsequent leverage. Entering a postsecondary institution directly from high school, earning 20 or more credits in the first calendar year of enrollment, and performing well enough in that first calendar year to fall in the top 40 percent of a GPA distribution build on previous academic investments, and are all signs of commitment.

Subsequent choices that may not be reflected in a bounded period of time, such as excessive course withdrawals, prove to be poor decisions with negative returns, breaking accumulated momentum. Other configurations of choice, including summer-term credit generation, meeting the challenge of college-level mathematics, effort required to yield a rising GPA, and most of all, remaining continuously enrolled, all reflect continuing leverage of attainment. This is what academic momentum is all about. While these choices do not take place in a social and psychological vacuum, this is a story about the intersection of student choice with the structures of opportunity offered by institutions whose first order of business is the distribution of knowledge. It is not a story about growing up, although that happens along the way.

Degree Completion: How High Can We Go? How Much Can the Gaps Be Closed?

In Part V of *The Toolbox Revisited*, three different national longitudinal studies conducted during the 1990s are set side-by-side, so as to demonstrate a remarkable degree of agreement on the rate of bachelor's degree completion for students who started out in four-year colleges (granted, that is only part of the broader universe addressed in this essay). Looking at the concordance of these three sources (table 30), it is fair to say that:

- A third of traditional-age students who started in a four-year college earned a bachelor's degree from the same school in the "traditional" four-year period.

- Between 54 and 58 percent earned the degree from the same school in which they began within six years of entry.
- When the option of earning a degree from a different four-year college than the one in which these students commenced study, the six-year completion rates are in the 62–67 percent range.
- Only the NELS:88/2000 extends the time period for earning a degree beyond six years; at 8.5 years, its degree completion rate for students who started in a four-year college approaches 70 percent.

However, it is unfortunate to note that despite increased participation of minority students to postsecondary education over the past quarter century, the gap in bachelor's degree completion between whites and Asians, on the one hand, and Latinos and African-Americans, on the other, remains wide.

What features of academic history might close the gaps, and by how much?

The data-driven exercise in Part V of *The Toolbox Revisited* can be characterized as "reasoned speculation." From the NELS:88/2000, we start with a degree completion gap between whites and Asians vis-a-vis African-Americans of 15 percent; and with reference to Latinos, 22 percent. We go back through our analysis and ask what factors:

(a) consistently contributed to bachelor's degree completion at all stages of the model in which they were "in play," and

(b) were most subject to change by external parties with little-to-modest—but creative—effort that might improve the portrait of degree completion.

Five factors stand out, four of which affect small populations in which minority students are over-represented. Small populations can add up. These factors are:

1. **First-year credit generation**, i.e., the goal of making sure that postsecondary students end their first calendar year of enrollment with 20 or more additive credits.

2. The problem of **excessive no-penalty withdrawals and no-credit repeats**, which affect 10 percent of the cohort. Institutional policy and advising can cut the incidence of withdrawals and repeats in half.

3. **Use of summer terms**. Strategic enrollment management can move more sections of high demand courses into summer terms, offer credit-bearing internships in summer terms, and engage in other creative initiatives that will also smooth out the utilization of institutional resources over what has become an "academic calendar year."

4. **No delay of entry.** This is a matter of recruitment strategy among high school students whose commitment to postsecondary education is less than fervid. The later they show up, the more their postsecondary fate is in jeopardy.

5. **The high school curriculum component of "Academic Resources."** This is not a case of "little-to-modest" effort or a small population. It is a megawork in progress, much of which depends on students' reading skills on entering high school. If students cannot read close to grade level, the biology textbook, the math problems, the history documents, the novel—all will be beyond them. And if high schools are not offering a full academic curriculum, there is little hope.

But with those five factors in mind, and assuming full student response and success, *potential* degree completion rates were hypothesized based on the records of NELS:88/2000 high school graduates by race/ethnicity (table 32) and socioeconomic status quintile (table 34). Virtually every one of these factors contributed to closing degree completion gaps, but none more than high school academic curriculum participation—which, to repeat, is criterion-referenced, hence, open to everyone to rank at or near the top. For African-American students, the combination of moving into the top 40 percent of the high school academic curriculum intensity index plus earning more than four credits during postsecondary summer terms would lower the degree completion gap vis-a-vis white and Asian students from 15 percent to 6 percent. For students from the lowest socioeconomic status quintile, moving into the top 40 percent of the academic curriculum intensity index and entering postsecondary education directly from high school would improve degree completion from 36 to 59 percent. For Latino students, the same steps would improve degree completion from 45 to 69 percent. Does that mean that future degree completion rates will look like those in tables 32 and 34 if everyone meets the criteria on all five counts? No; not everybody will make it. But the tables suggest just where the improvements could be dramatic—and for whom.

Messages to Students and Commentators

Student responsibility (the intersection of choice with opportunity) is a major theme of *The Toolbox Revisited* in a way that was only implicit in the original *Tool Box*. The essay concludes with some recommendations for students, who are partners in their own education fate, who shouldn't wait around for someone else to do something for them, and who are rarely addressed in studies of attainment.

The concluding messages also reflect on the dissonant data of public discourse on high school graduation rates, college attrition rates, and college graduation rates, examples of consequent "scare stories" that do not help us identify and address real problems, and a plea for creativity and cooperation in developing better student tracking systems. These messages also urge a considerable change in the language we use in describing what happens to students from a negative rhetoric that assumes passivity to one that respects students as active players, seeking and discovering paths to their education goals.

A Guide for Reading Tables and Terms

Interchangeable terms

This essay frequently compares the histories of two grade-cohort longitudinal studies carried out by the National Center for Education Statistics (NCES). Each of these studies can be referenced in a number of ways, and all of these references are used.

The following labels for the longitudinal study that began with a national sample of 10th-graders in 1980, the High School and Beyond/Sophomore cohort, are interchangeable:

HS&B/So
High School Class of 1982
class of 1982 (where inter-cohort comparisons of 12th-graders are at issue)

"High School & Beyond/Sophomore cohort" will also be spelled out when the entire longitudinal study, including all its data set components, is the subject.

The following labels for the longitudinal study that began with a national sample of eighth-graders in 1988, the National Education Longitudinal Study of 1988, are interchangeable:

NELS:88/2000
High School Class of 1992
class of 1992 (where inter-cohort comparisons of 12th-graders are at issue)

On reading tables in this study, part 1: Descriptive cross-tabulations

All tables in this study are constructed to meet the statistical standards for table presentation of the National Center for Education Statistics (NCES 2002a). They are stand-alone tables, so that if they are reproduced outside the context of the essay, they tell a complete, self-contained story. To ensure a complete story, the descriptive cross-tabulations in this document include the standard errors of the estimates. The reason for this election—instead of placing tables of standard errors in an appendix—is to enable the reader to judge, on the spot, whether the difference between any two estimates is statistically significant. While the text draws the reader's attention to statistically significant (and insignificant) estimates important to the narrative, it does not comment on all statistically significant estimates. In general, the formula invoked for statistical significance is the simple student's *t* test:

$$t = (P_1 - P_2) \div \bullet\bullet \overline{(se_1^2 + se_2^2)}$$

where P_1 and P_2 are the percentage estimates to be compared and se_1 and se_2 are the corresponding standard errors. If $t > 1.96$, one has a statistically significant difference at $p < .05$ (which means that the probability that this observation would occur by chance is less than 1 in 20), a standard marker. In the case of multiple comparisons, the critical value for *t* rises.[2]

[2]For technical issues concerning standard errors and multiple comparisons, see Appendix D.

Variances in estimates

The reader will often find that estimates for the same phenomenon will differ somewhat, e.g., in one table a bachelor's degree completion rate is 69.3 percent, in another table, 64.6 percent. These differences are due to the definition of the universe (i.e., who are we counting?) for each table and the weight employed in the calculation.

On reading tables in this study, part 2: Logistic models

The core analytic method employed in *The Toolbox Revisited* is a logistic regression, and there are a baker's dozen tables in both the text and appendices that present the results of logistic models. There are many ways in which researchers have presented these results (Peng, So, St. John, and Stage 2002), and a number of statistics are employed in these representations. *The Toolbox Revisited* employs the following for each row of these tables:

The name of the variable—Variable names were created so that the realities to which they refer are self-evident.

The unadjusted parameter estimate—also known as the log odds, or the natural logarithm of the odds of the outcome of interest happening, e.g., whether a bachelor's degree was earned. The reader should note whether the sign for this estimate indicates a positive or negative relationship to bachelor's degree completion, as well as the magnitude of the estimate (though that alone does not indicate whether the estimate is significant).

The adjusted standard error of measurement for the estimate—Some researchers will say that this statistic is not necessary. The author provides it because, without it, one could not verify the accuracy of the other statistics on the row. We need the adjustment because NCES longitudinal studies are based on complex sampling designs. The adjusted standard error is calculated by multiplying the simple standard error by the Root Design Effect for students who offer non-missing values for all variables in the logistic model at issue (see Appendix D).

The t statistic—This is the measure that opens the gate to the judgment of degree of significance for the variable in question on that row. Again, some researchers will say that this statistic is not necessary because in the next column, the p statistic indicating degree of significance is provided. The author offers the t statistic because a minimum t of 0.765 was selected as a threshold for keeping a variable in the sequence of logistic models, and the reader should see those instances where a variable fails to meet that criterion. Why 0.765? In any statistics textbook, one will find an appendix with a table of relationships between levels of significance (p values) and t-values for two-tailed significance tests according to the number of degrees of freedom (number of variables in a model minus one). If one goes to the column for the lowest level of significance in this standard table ($p < .50$), and scrolls down to the t-value for the smallest number of

variables used in any of the logistic models in *The Toolbox Revisited*, three, one will find it equal to 0.765. This is a very generous threshold.

The *p* statistic—This notation tells us whether the observed relationship would occur by chance, and, if so, at what ratio of chance. A *p* of <.05 says that the odds of the relationship between independent and dependent variables in that model occurring by chance are less than 1 in 20. This is also known as a 95 percent confidence level. In all of the logistic models in *The Toolbox Revisited* there are variables that do not meet the *t* requirements for even a marginal level of significance ($p < .10$). All variables with a *p* of <.10 or better are highlighted in bold.

Delta-p is the critical statistic for telling the story of the association of the parameter estimate with degree completion. It says that every unit change in the independent variable changes the *probability* that X will happen by Y percent—and the Y is indicated by the Delta-p, e.g., 0.1285 would be translated in the text as 12.9 percent. The statement of change in probability is not a linear statement, and is always the result of relationships among the variables in a particular logistic model. It certainly should not be read as a statement of cause or prediction.

Three decision rules

In indicating whether a variable was used in the logistic models of *The Toolbox Revisited*, three criteria were observed:

- Any statistical software package (the Statistical Analysis System, or SAS, was used in this report) allows one to set a threshold of statistical significance for a variable to be admitted to a multivariate model. The default threshold is that 95 percent confidence level, represented as $p < .05$. For both the original *Tool Box* and *The Toolbox Revisited* this threshold was changed to a much more generous .2, i.e., the probability that the variable would be admitted by chance is less than 1 in 5. The purpose of the more generous threshold is to allow more variables to "compete," so to speak, within the boundaries of a statistical model, and then to see which variables survive.
- As noted above, the survival indicator in a model was a *t* value set to 0.765. If a variable failed to exceed that value when utilized in the step of the logistic series in which it was introduced, it was not carried forward to subsequent steps.
- Collinearity—Think of the Venn diagrams you learned in high school mathematics. If each circle in the Venn diagram represents a variable, you don't want a situation where two or more of them overlap to a point approaching an eclipse, for if they do, analysis of either one is impossible. There are special statistics for determining the extent of collinearity, and these were employed to determine when this situation arose. When it arose, one of the variables had to be dropped. This often happens when one variable is a major component of another, e.g., family income in relation to socioeconomic status. The narrative will describe these cases. For further comments on collinearity, see Appendix D.

THIS PAGE INTENTIONALLY LEFT BLANK

Organization of This Data Essay

The following is a brief outline of *The Toolbox Revisited* so the reader knows what to expect.

Part I: Background. The introduction presents the basic question, the data sets invoked, the purposes and statistics of the investigation, and the demography of the subject universe.

Part II: Variables Explored and Used in This Analysis. This short section of the study lists all the independent variables that were considered and provides brief definitions and basic statistical characteristics. A summary figure (pp. 20–21) indicates which of these met the criteria for inclusion in the logistic narrative of Parts III and IV. A more elaborate glossary (pp.179–193) provides details on the construction of these variables, allied data and commentary, and will be of particular interest to researchers.

Part III: What Is and What Happens Before Matriculation. Here we begin the chronological narrative, using both descriptive and multivariate data, of what ultimately made a difference in bachelor's degree attainment by December 2000 for 1992 12th-graders who attended a four-year college at any time. Part III begins with background demographic characteristics, then adds the critical components of high school academic history.

Part IV: Matriculation and Beyond. This section continues the cumulative steps of the logistic narrative, starting with the characteristics of entry to the postsecondary world, and continuing with first calendar year performance, financing considerations, attendance patterns, and extended performance (that is, taking students' entire undergraduate careers into account). It includes a special consideration for the second calendar year of enrollment and concludes its logistic narrative with attention to two very powerful variables: continuous enrollment and the ratio of course withdrawals and repeats to the number of all courses attempted.

Part V: Closing the Gap. Having demonstrated how the universe of independent variables is related to degree completion, *The Toolbox Revisited* then asks two questions: (1) To what extent do the major national data sets agree on "graduation rates"? And (2) Given what we have learned about what makes a difference in degree completion, what variables provide the most promising guidance for closing the gap in graduation rates, by race/ethnicity and socioeconomic status, for students who attend a four-year college at any time?

Part VI: The Missing Element of This Story. A key missing part of the story that is a by-product of the limited features of the NELS:88/2000 is addressed in this section: the content standards of high school and postsecondary course work. Other brief "excursions"—timing and reasons for permanent ("status") drop out from college, and time-to-degree—are placed in Appendices H and K respectively.

Part VII: Messages. Finally, *The Toolbox Revisited* offers some messages—to students and to those who engage in public discourse about the issues we have covered—and highlights the major conclusions of the study.

Appendices: With one exception, appendices are presented in the order in which they are cited in the text. The exception is the last appendix, Appendix L, that contains a variety of reference tables on miscellaneous topics raised in the text.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Part I
Background

This study explores the academic resources and momentum students build through their high school and college careers, and analyzes the relationships between those factors and degree completion rates. It departs from most previous research on attainment by focusing on the details of students' high school and college curricula and academic performance that are available from transcript records. Its principal data are drawn from the National Education Longitudinal Study of 1988 (hereafter referred to as the NELS:88/2000 or just NELS). This longitudinal study followed a national sample of over 12,000 students (representing a weighted 2.9 million students) from the time they were in the eighth grade in 1988 to roughly age 26 or 27 in December 2000.

In round numbers, of the high school graduates in this cohort, 83 percent engaged in some form of postsecondary education by age 26, and 68 percent attended a four-year college at some time. Of those who earned any credits from four-year colleges at any time (which includes a substantial proportion of students who began postsecondary study in community colleges), 66 percent earned a bachelor's degree.

While the 66 percent completion rate sounds impressive for a mass system of higher education, it masks an unhappy differential by race/ethnicity, and more so by socioeconomic status. As we strive to improve high school graduation rates, to invite greater numbers of high school graduates into the postsecondary system, simply to maintain—let alone improve—our completion rates will take a great deal of effort. We need constructive guidance and benchmarks.

This study was designed as a follow-up and replication of a previous attempt to provide that guidance—*Answers in the Tool Box: Academic Intensity, Attendance Patterns, and Bachelor's Degree Attainment* (hereafter referred to as the original *Tool Box*).[3] Since its publication in 1999, the original *Tool Box* has become one of the most frequently cited works in public discussions about—and initiatives to improve—the preparation of students for higher education. Its most visible uses have included the presentations of the Texas "Master Scholars" program (2002), the revisions in entrance requirements for the University of North Carolina system (2000), standards goals set by the Illinois Board of Higher Education (2001), and suggestions of the Education Commission of the States for state high school graduation policies (2001). It was summarized in major litigation addressed to inequities in opportunity-to-learn in high schools (e.g., *Daniel v. California* 1999), and in the research literature, its analyses of both precollegiate preparation and post-matriculation attendance patterns and performance have also been marked (e.g., Horn and Kojaku, 2001; Zucker & Dawson, 2001; Cabrera and La Nasa, 2001) and improved on (DesJardins, McCall, Ahlburg and Moye, 2002; Cabrera, Burkum, and LaNasa 2005).

---

[3]Out of print but available at http://www.ed.gov/students/prep/college/thinkcollege/early/aboutus/edlite-resources.html.

The analyses in the original *Tool Box* were based on the High School & Beyond/Sophomore cohort longitudinal study (hereafter occasionally referred to as the HS&B/So), the second of the U.S. Department of Education's national grade-cohort longitudinal studies,[4] which followed a national sample of 10th-graders from 1980 to1992 in surveys and to September 1993 on postsecondary transcripts. As with all of the grade cohort longitudinal studies carried out by the National Center for Education Statistics,[5] test scores are included in the database, along with surveys of parents, school teachers, and school administrators. The modal high school graduation year for the HS&B/So was 1982, and student age at the conclusion of the study was 29 or 30.

The HS&B/So data, while compelling, are now somewhat dated. There were considerable changes in both the demography and postsecondary entrance behavior of high school seniors in the comparatively short span of the decade between 1982 and 1992. Appendix A highlights contrasts in selected background characteristics of all 12th-graders in the two longitudinal studies cohorts. Some of these changes have been frequently observed (higher proportion of minority students, westward and southward movements of populations, higher proportion of high school seniors entering higher education and planning to earn a bachelor's degree), and some rarely observed (higher proportion who grew up in mixed-ethnicity neighborhoods, and a higher proportion with parents who indicated some postsecondary education). The question naturally arises as to whether the hypotheses and analyses based on the history of the High School & Beyond/Sophomore cohort would hold up in the story of the NELS:88/2000. The NELS history offers a more contemporary account,[6] one that, in terms of secondary school records, may reflect the high school curriculum reforms of the mid- and later-1980s[7] that followed the discussion of the report of the National Commission on Excellence in Education, *A Nation at Risk* (1983). *The Toolbox Revisited* follows the same path of analysis using the NELS:88/2000 as did its predecessor with the HS&B/So. In that sense, it is a replication. It is a modified replication, however, because it introduces new constructs based on critiques of the original *Tool Box* and because it offers a more refined chronology of steps from high school to the end of a student's undergraduate education.

A substantial amount of the analyses and endorsements that followed the original *Tool Box* revived the flagging "seamless" K–16 themes of the 1980s post-*Nation at Risk* reform effort. In an October 2000 policy brief that visited these issues, the Education Commission of the States reminded people of what most of the 1980s reform reports did not address: the fact that K-12 and postsecondary systems are governed in very different ways, even in the public sector of postsecondary, and that there is a consequent "disconnect" of substantial dimensions (Education

---

[4]The first was the National Longitudinal Study of the High School Class of 1972 (1972–86).

[5]For a description of the grade-cohort studies, see Appendix B.

[6]A fourth-grade-cohort longitudinal study is currently in progress. Called the ELS2002, it began with a national sample of 10th-graders in 2002 and is expected to run at least through 2012. We obviously will have to wait some years before we see its full results.

[7]For an account of changes in high school graduation requirements in the years immediately following issuance of *A Nation at Risk*, see Stedman and Jordan (1986).

Commission of the States 2000). The metaphor of bridges (Venezia, Kirst and Antonio 2003) and the rhetoric of disconnect (e.g., Conley 2003) created a more sophisticated focus of analysis than the reform reports of the 1980s embraced. The major work that sought to build new bridges and connect the disconnects underscored the obligation of the system not merely to assure college "access," but degree completion, with curriculum playing the key role. While "degree completion," in public discourse, refers to the bachelor's degree, the same principles apply to associate degrees granted principally by community colleges as well (Adelman 2005a).

What Did the Original *Tool Box* Say?—And Based on What Kind of Evidence?

In a nutshell, here are the major conclusions of the High School & Beyond/Sophomore-based *Answers in theTool Box* analysis:

1) Of three traditional measures of precollegiate educational history—curriculum configuration, academic performance (on a scale that combines class rank and GPA), and assessed general learned abilities (a senior year mini-SAT)—the intensity and quality of one's secondary school curriculum was the strongest influence not merely on college entrance, but more importantly, on bachelor's degree completion for students who attended a four-year college at any time. The highest level of mathematics the student reached in high school played a significant role in the strength of the curriculum configuration. One of the major contributions of *Tool Box* not only to the literature, but to practice as well, was to change what was understood by the "entry characteristics"of students by digging out and demonstrating the power of the academic intensity of secondary school curriculum over combinations of standardized test scores and grades.

2) By moving into the top two quintiles of the curriculum measure and completing a high school mathematics course beyond Algebra 2, African-American students who started out in a four-year college would hypothetically increase their bachelor's degree attainment rate from 45 percent to 73 percent; Latino students who did the same would hypothetically increase their bachelor's degree attainment rate from 61 percent to 79 percent.[8] These increases were significantly greater than those for white and Asian students under this scenario, and, more importantly, were considerably greater than the influence of moving into the top two quintiles of either test scores or class rank/GPA. In other words, curriculum counts, particularly for minority students.

3) The three traditional precollegiate measures can be combined in a composite measure of "Academic Resources." This measure had continuing, statistically significant relationships with bachelor's degree completion in both linear and (more appropriately and convincingly) logistic regression sequences involving four post-matriculation steps (blocks of variables for financial aid, attendance patterns, first-year performance, and extended postsecondary performance).

---

[8]For African-American students in the HS&B/So who reached the 12th grade and entered postsecondary education, 52.3 percent started in four-year colleges, a percentage that rose to 54.2 in the NELS:88/2000. The comparable percentages for Latino students, who are more likely to start in community colleges, were 38.9 percent for the HS&B/So and 38.6 percent for the NELS:88/2000. For white students, the proportions starting in four-year colleges were 54.3 percent for the HS&B/So and 57.4 percent in the NELS:88/2000.

4) Post-matriculation behaviors and attendance patterns that were strongly and positively associated with bachelor's degree attainment were continuous enrollment, transfer from a community college to a four-year institution after more than 10 credits earned at the community college, and the *trend* in students' grades.

5) Post-matriculation behaviors and attendance patterns that had a strong negative influence on bachelor's degree attainment were the ratio of courses from which the student withdrew or repeated to all courses attempted, and earning less than 20 credits in the first calendar year of postsecondary attendance.

6) Socioeconomic status had a modest and diminishing association with bachelor's degree attainment. Minority status had a modest negative association until performance (first-year performance and continuing performance) was taken into account, at which point it had no effect Gender had no effect at any stage of the model. The only demographic variable to have a strong (and in this case, negative) association with degree completion was becoming a parent by age 20.

The overall message was about academic momentum and what adds to that momentum at each stage of a student's history from secondary school onward. The evidence was archival, was treated in the tradition of quantitative history (Elder, Pavalko, and Clipp 1993; Clubb, Austin and Kirk 1989; Haskins and Jeffrey 1990), and like this essay, did not claim causality.

Why use these data sets?

There are three types of national data sets available to construct longitudinal analyses such as the original *Tool Box* and this replication, but only one type of data set—the NCES transcript-based grade-cohort study—is truly suited to the task. The other two are (1) the Cooperative Institutional Research Project (CIRP) occasional longitudinal follow-ups to its annual survey of entering college freshmen, and (2) the NCES Beginning Postsecondary Students studies (BPS). Each of these has its virtues, and will be revisited in Part V of this study when we compare what three different longitudinal studies of the 1990s say about degree-completion rates. The CIRP produces an enormous amount of information on student attitudes, values, and college experiences, and does so with large samples of (principally) entering four-year college students. Its occasional longitudinal follow-ups involve sufficient history (e.g., six or nine years) to track not only long-term undergraduate completion rates, but also postbaccalaureate education (Astin 1993). The BPS longitudinal studies are shorter (five or six years), not dependent on institutional decisions to participate (as is the CIRP), inclusive of students of all ages at entry, and, as befits their principal population sample (a subset of the triennial National Postsecondary Student Aid Study), contain very strong and reliable financial aid data. The BPS study of 1995/96–2001 will be used at a number of points in this study to expand the range of our observations.

However, in both cases, all features of precollegiate history must be rendered as exogenous variables. The high school histories provided by students in CIRP are retrospective, and the precollegiate histories in the Beginning Postsecondary Students studies derive from a combination of retrospective offerings by students and accounts on the student information

questionnaires for those who took either the Scholastic Assessment Test (SAT) or American College Test (ACT) within the two years prior to the BPS start date (nearly half the students in the BPS studies did *not* take either exam). As Kahn and Nauta (2001) demonstrated, there is an inevitable loss of accuracy in the process of these retrospections.

On the other hand, the very nature of a longitudinal study population assembled in the 10th grade (High School & Beyond/Sophomore cohort) or eighth grade (NELS:88/2000) renders precollegiate history endogenous to analytic models. The transcript-base overrides student accounts and provides far more detail than either paper-and-pencil surveys (used by CIRP) or computer-assisted telephone interviews (used by the BPS studies) can provide.

Every data set sacrifices something. No data set is constructed with the questions a particular researcher may have a decade later, so variables are derived and secondary. The High School & Beyond/Sophomore study and the NELS:88/2000 are wanting in many ways where the other studies are strong: financial aid (BPS), and changes in values and opinions (CIRP). But as stories about the core activities we call education, they are unsurpassed by the others.

Purposes and Statistics of This Monograph

The primary purpose of this monograph is to trace the elements of academic momentum as they played out in the secondary school and college history of the High School Class of 1992 (through December 2000) compared with the parallel history of the High School Class of 1982 that was the foundation for the original *Tool Box* study. In the process, the analysis is enriched by including variables we learned to construct or modify on the basis of commentaries and critiques of *Tool Box*, and by a more accurate chronological order in presentation of those variables. The portrait of academic momentum that emerges is a framework within which more sophisticated analyses can be pursued, and within which ameliorative policies (the tools) can be advocated. This study does not pretend to answer complex questions about indirect effects of home, peer, school, and postsecondary institution interactions, but rather trusts future research to deal with those issues.

A secondary task is to demonstrate the construction of a replication when the two data sources, a decade apart, are presumably parallel**,** but turn out to be something less (for a key example, see Appendix C). The principal encouragement for the replication is that the bachelor's degree attainment rate for students who attended a four-year college at any time remained the same despite differences in the length of cohort history: 65.6 percent for the HS&B/So over 11 years, and 66.5 percent for the NELS:88/2000 cohort over 8.5 years (Adelman 2004a, table 2.2, p. 21). If the HS&Beyond/So history were truncated at 8.5 years, the bachelor's degree attainment rate would have been 59.7 percent. From this perspective there was a marked improvement in degree completion for traditional age college students over the two decades in question. It is natural to ask how this happened, and if the answers to that question provide any guidance for the future.

In terms of statistical technique, both the original *Tool Box* and *The Toolbox Revisited* use simple logistic regression, not structural equations or other path models that are common to causal inquiries or searches for indirect effects, e.g., of discrete aspects of school or college environments (Dey and Astin 1993). A logistic regression is focused on an event that either happens or it doesn't. The dependent variable is dichotomous: yes or no. The independent variables are judged within each model by the degree to which they contribute to what happened in relation to or controlling for all other independent variables in the model (Hair, Anderson, Tatham, and Black 1995).

There are a number of ways of expressing this "degree." One is by an "odds ratio," which, expressed in a simple way, is a ratio of the odds that X will happen given a unit of change in the independent variable to the odds of X not happening, and ultimately shows the strength of association between the independent and dependent variables—with the closer the odds ratio to 1, the less the strength of the association.[9] This was the measure used in the original *Tool Box*. Another way of expressing the value of the contribution of an independent variable is by a "Delta-p" statistic that says every unit change in the independent variable changes the *probability* that X will happen by Y percent given the values of the other variables in the model (Peterson 1985; Cabrera 1994). The narrative of *The Toolbox Revisited* relies on Delta-p,[10] and the logistic model tables provide Delta-p statistics only for those parameter estimates that are statistically significant since there is no way to determine the statistical significance of the Delta-p itself (Cabrera 1994).[11]

But in this paper there is a major methodological departure from the original *Tool Box* study: there are seven (and not five) steps in the model employed, all driven by the empirical history of the NELS:88/2000 students. Following St. John, Paulsen, and Starkey (1996), the blocks of variables in each step were entered "in a sequence that parallels the order in which students pass through well-established stages of persistence behavior" (p. 194) on their way toward bachelor's degree completion (or not). Each of the seven steps, too, is cumulative. That is, variables in one step that meet the statistical criteria for remaining in the model are carried forward to the next step. This extended accounting, which we will call a "logistic narrative," allows "a meaningful examination of the direct effects of variables on persistence, as well as their interactions with the variables entered in successive steps" (St. John, Paulsen, and Starkey 1996, p. 194).

The reader can already tell that there is a great deal of technical material in this presentation, but it is presented in the spirit of the U.S. Department of Education's goal of building a culture of evidence. The author trusts that reports such as *The Toolbox Revisited* will contribute to the

---

[9] Odds ratios, as Peng, So, Stage, and St. John (2002) remind us, are not odds. Their interpretation is not as transparent as the original *Tool Box* assumed them to be. And while an R^2 statistic is presented in the logistic tables of this study, it cannot be read the way one would interpret an R^2 in a linear regression, i.e., it does not indicate the percent of variance in the dependent variable that is explained by the independent variables (Long, 1997). For that reason, it is called a "pseudo R^2" (Cabrera 1994) and is one of a number of measures of goodness-of-fit. As blocks of variables are added to the model in the stepwise manner followed here, the pseudo R^2 should increase.

[10] For the computation of Delta-p, I am using a shortcut recommended by Paul Allison of the University of Pennsylvania: bp(1-p), where b is the logistic coefficient and p is the probability for the dependent variable in the model. This heuristic produces slightly higher values than the formula advanced by Petersen (1985).

[11] For all technical issues, please see Appendix D.

attainment of that goal. Some of the technical material is placed in appendices so that researchers have access to documentation, and all readers have access to reference material.

Who Are We Talking About? And Who Are We *NOT* Talking About?

As was the case for the original *Tool Box*, the basic universe of analysis in *The Toolbox Revisited* does *not* consist of everybody who started out in the cohort. We have to be very clear about this. The basic question of both studies is:

> What demographic, high school performance, postsecondary entry, and postsecondary history (attendance patterns, academic performance) factors are convincingly associated with bachelor's degree attainment for 12th-graders who subsequently attended a four-year college at any time in their undergraduate careers?

This is not a question about completing high school, completing high school on time, or completing high school on time with a standard diploma (as opposed to a GED or certificate of attendance).[12]

This is not a question about entering the postsecondary system. We are not talking about "access." Nor is it a question about "persistence" to the second term or the second year following entry to postsecondary education. It certainly is not about "retention" in the same institution to the second term or the second year.

This is a question about *completion* of academic credentials—the culmination of opportunity, advisement, choice, effort, and commitment.

The question is carefully worded. The universe does not include people who never reached the 12th grade. In fact, as a consequence of the sampling design and weighting of the two longitudinal studies, both essays include only those students who were in the 12th grade *in the same year,*[13] along with those who graduated from high school. The definition of the universe also requires that we have demographic information, high school transcripts,[14] test scores, and postsecondary transcripts for everybody whose careers are subject to analysis. Not everybody can present all this information, and, with rare exceptions (involving some aspects of high school records, and as explained in Appendix C) both the original *Tool Box* and *The Toolbox Revisited* decline to impute any of this information.

---

[12]For details on the high school graduation status of those who were eighth-graders in 1988, see Appendix L, table L1.

[13]For details on those in the NELS:88/2000 cohort who, though in the 12th grade in 1992 along with others, had previously been held back at least one year in the course of their schooling, see Appendix L, table L2.

[14]Only 21.3 percent (s.e. = 1.17) of the NELS:88/2000 who were in the 12th grade in 1992 were missing high school transcripts, compared with 73.7 percent (s.e. = 2.58) of those who had either dropped out of high school or were not in-grade. Nearly 100 percent of the former group graduated from high school with a standard diploma.

There are two other notable features of the basic question. First, both essays argue that, regardless of what students *say* on a survey about their education expectations, it is what they actually *do* that counts. So the only students we can talk about honestly with respect to bachelor's degree attainment are those who set foot in a bachelor's degree-granting institution at some time. This criterion obviously includes students who started their postsecondary careers in community colleges and other types of sub-baccalaureate institutions. Second, the term used to describe the relationship between the dozens of independent variables describing demography, high school performance, postsecondary entry, and postsecondary history and the dependent variable of bachelor's degree completion is "convincingly associated." Neither essay claims "cause" or "prediction."

To illustrate how these conditions restrict the universe, let us start with 2.93 million 1988 eighth-graders in the NELS:88/2000 cohort. Table 1 lays out the stages of contraction of the basic population until we reach the subject universe of this study.

Table 1. From macro to micro: Contraction of the universe of 1988 eighth-graders to the universe subject to analysis in *The Toolbox Revisited*

Description of Universe	Percent	Descending weighted N[a]
A. Initial universe of 1988 eighth-graders	100.0	2.93M
B. Of (A), those who were in the 12th grade in 1992	83.6 (0.98)	2.45M
C. Of (B), those who continued to postsecondary education at any time through December 2000	81.7 (1.28)	2.0M
D. Of (C), those who presented complete high school transcripts, test scores,[b] complete postsecondary transcript records, and socioeconomic status information	80.5 (1.01)	1.61M
E. Of (D), those who attended a four-year college at any time.	73.5 (1.00)	1.19M
Net percentage of 1988 eighth-graders in the universe	41	1.19M
Net percentage of 1992 12th-graders in the universe	51	1.19M

[a]Like other NCES longitudinal studies, the NELS:88/2000 cohort is a stratified sample, in which each student is assigned a weight to represent other similar students in the cohort (see Curtin, Ingels, Wu, and Heuer 2002).
[b] See definition of SRTSQUIN in Glossary.
NOTES: Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: NELS:88/2000 postsecondary transcript files (NCES 2003-402 and Supplement).

Looking more closely at our universe in terms of the types of schools attended, we find that 20.2 percent (s.e. = 1.13) started in community colleges, and 41.0 percent (s.e. = 1.29) earned credits from community colleges, whether or not they started at community colleges. While we will describe the attendance patterns of the NELS:88/2000 cohort in more detail later, the point is that the universe under analysis is not limited to those who attended *only* four-year institutions, and that the community college plays a significant role in the careers of the group of students under consideration.

To repeat: Our subject universe consists of half the 1992 12th-grade students in the NELS:88/2000 cohort. We are *not* talking about:

- students who did not graduate from high school or those who graduated with something other than a standard diploma (G.E.D. or Certificate of Attendance);
- students for whom we do not have full high school records (transcripts, grades, test scores);
- students for whom socioeconomic status could not be determined;
- students who did not enter any postsecondary institution by December 2000, when they were 26 or 27 years old; and
- students who entered the postsecondary system, but never set foot in a bachelor's degree-granting institution.

That is the other half. Some 22.2 per cent (s.e. = 1.05) of 1992 12th-graders who attended a four-year college at any time are in this "other half" because they are missing key information that excludes them from the universe under analysis. Readers interested in the demographic differences between included and excluded students due to missing data elements are referred to Appendix E.

Comparative demography of the subject universe

Given the strong boundaries drawn around the subject universe, how does its demography compare to less restrictive definitions? Table 2 sets out the major demographic categories, and compares the target subject universe with (a) all 1988 eighth-graders who participated in the last survey of the NELS:88/2000 in 2000, (b) all participants in the 1992 survey, whether or not they were in school or in the 12th grade,[15] and (c) all 1992 12th-graders who attended *any* postsecondary institution by December 2000.

As readers work from left to right across the columns of table 2, they will notice that gender balances are even until the moment of entry to postsecondary education, at which point women pull ahead of men. The same type of observation applies to the race/ethnicity distribution: At the point of entry to postsecondary education, the proportion of African-Americans, Latinos, and American Indians declines, while that of whites and Asians rises. In the universe for this study,

[15]The reader should note that, unlike the High School & Beyond/Sophomore cohort study, the NELS:88/2000 sample was "refreshed" in 1992 to be representative of 12th-graders in that year. The "refreshed" students are included in our analyses.

Table 2. For each of four definitions of the universe of students in the NELS:88/2000, percentage distribution by gender, race/ethnicity, socioeconomic status quintile, and second language background

Demographic variable	1988 eighth-graders	All 1992 survey participants	All 1992 12th-graders who entered postsecondary education	1992 12th-graders who attended a four-year college at any time and met other criteria to be subjects of this study[a]
Gender				
Men	49.7 (1.01)	49.9 (0.83)	46.5 (0.93)	48.8 (1.27)
Women	50.3 (1.01)	50.1 (0.83)	53.5 (0.93)	51.2 (1.27)
Race/ethnicity				
White	71.7 (1.50)	71.5 (1.30)	74.9 (1.29)	78.2 (1.31)
African-American	12.9 (1.26)	12.7 (0.94)	10.3 (0.90)	9.4 (1.03)
Latino	10.5 (0.87)	10.4 (0.84)	9.1 (0.88)	7.0 (0.72)
Asian	3.5 (0.32)	3.7 (0.31)	4.8 (0.43)	4.7 (0.42)
American Indian	1.4 (0.43)	1.7 (0.55)	0.7 (0.23)	0.6 (0.18)
Second language background				
Nonnative speaker of English	8.6 (0.68)	10.1 (0.83)	10.0 (0.90)	7.4 (0.67)
Native speaker of English from a second language household	3.3 (0.33)	2.7 (0.21)	2.4 (0.23)	2.2 (0.28)
Socioeconomic status quintile				
Highest quintile	21.3 (0.92)	21.1 (0.88)	29.1 (1.08)	38.5 (1.52)
2nd quintile	20.8 (0.79)	21.0 (0.69)	25.3 (0.88)	26.4 (1.24)
3rd quintile	20.7 (1.10)	19.8 (0.68)	20.2 (0.73)	17.7 (0.85)
4th quintile	19.6 (0.83)	19.2 (0.66)	15.4 (0.61)	11.7 (0.59)
Lowest quintile	17.6 (0.93)	18.9 (0.85)	10.0 (0.73)	6.8 (0.50)

[a]1992 12th-graders with known socioeconomic status and high school records (transcripts and test scores), who graduated from high school by December 1996, and attended a four-year college at any time.

NOTES: Standard errors are in parentheses. Columns for gender, race/ethnicity, and socioeconomic status quintile may not add to 100.0 percent due to rounding.

SOURCE: National Center for Education Statistics: NELS:88/2000 postsecondary transcript files (NCES 2003-402 and Supplement).

the proportion of whites rises even further, while that of Asians, American Indians, and African-Americans[16] holds steady, and that of Latinos declines. There are no statistically significant differences in the proportion of students who were nonnative speakers of English[17] until the final boundaries are drawn for the universe for this study.

The most dramatic and expected changes in the distributions of table 2 are by socioeconomic status quintile, with quantum leaps in the proportion of students from the top two quintiles as soon as one crosses the postsecondary line, and parallel declines in the proportion of students from the bottom two quintiles. Only the third quintile (the 41st–60th percentile) remains stable until the final contraction of the cohort for the universe used in this study.

What do these demographic changes within the universes of students who might be the subjects for a study mean? *The Toolbox Revisited*—and *Answers in the Tool Box* before it—is a study about students who graduate from high school and go on to college. Given historical data, it is not surprising that this group will evidence a higher SES profile and a lower percentage of under-represented minorities than others in the same grade cohort. Since the 1980s, women have been in the majority in this group.[18] Within our subject universe, demography is not necessarily destiny, as the original *Tool Box* demonstrated. For the comparison group—the other half that either does not graduate from high school, graduates but doesn't continue its education, or graduates and continues but never at a four-year college—*The Toolbox Revisited* says: If we want more people to wind up with at least a bachelor's degree in life, here are some guidelines based on the experience of people who tried.

Summary of Part I

What do *Answers in the Tool Box* and *The Toolbox Revisited* do, and what do they not do? Both studies use the histories of 12th-graders who subsequently attended a four-year college at any time (entered in any term and not just the fall term, entered as part-time as well as full-time students, entered in community colleges as well as four-year institutions) to indicate what factors in those histories are associated with completing a bachelor's degree—not in four years, not in six years, but whenever the longitudinal tracking ended (8.5 years from high school graduation for the class of 1992; 11 years for the class of 1982). They do not ascribe cause or pretend to predict. They recognize that what is associated with degree completion in one generation may not be associated with it in the next, or that the strength of association may change. Conditions and populations change, after all. Rigid prediction is a risky call, and besides, that's not what the data and statistical standards allow one to do.

---

[16]The difference in the African-American proportion of the two universes is not statistically significant.

[17]Nonnative speakers were defined as those who said their first language was not English and, in grade 10 and/or 12 (the 1992 survey) indicated that they spoke to their mothers most or all of the time in their first language.

[18]Though to the extent to which the group includes students who commenced their postsecondary studies in community colleges—and it does—that majority will be a little less.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Part II
Variables Explored and Used in This Analysis

With two major exceptions—high school academic curriculum intensity and the composite high school performance variable we call "Academic Resources," both of which are covered in Part III—the construction and allied information for most of the variables explored in *The Toolbox Revisited* are detailed in the Glossary (starting on p. 179). Whenever the reader asks for details on "How was that defined?" or "How did they get that?" the Glossary is the place to go.

The purpose of this section is to provide the reader with an advance reference list of the variables considered and used in this analysis. The reader should keep in mind that "variables" are *representations* of realities (e.g., first-year college grades) or constructs (e.g., transfer). We use them as a shorthand.

The variables listed and described are presented in the order of the steps of the logistic narrative for which they were considered. The collection represents neither a "fishing expedition" nor a "mind dump," as a majority of the variables considered were determined by the attempt to replicate the original *Tool Box* study with a more recent parallel cohort. A quick summary of their properties can be found in figure1.

Demographic background variables defined

1) NNSE—Nonnative speaker of English. A dichotomous variable marking those students whose first language was not English *and* who, in grade 12, reported that they conversed in that language with their mothers most or all of the time.

2) IMMIG—Parent immigrant status. A dichotomous variable indicating whether the student's parents were immigrants to the United States within the previous 10 years.

3) BROSIS—Number of siblings. A dichotomous variable marking students with three or more siblings, versus those with one, two, or none.

4) FIRSTGEN—First generation postsecondary student. A dichotomous variable indicating students for whom neither father nor mother ever attended a postsecondary institution.

5) FAMINC—Family income. This variable was first set in six bands, then trichotomized to yield upper-, mid-range, and low-income populations.

6) URBAN—A dichotomous variable indicating whether the student's high school was located in an urban area.

7) NEWCHILD—A dichotomous variable to mark students, male or female, who became parents by the time they were 20 years old.

8) RACE—A dichotomous race/ethnicity variable, with under-represented minority (African-American, Latino, and American Indian) = 1 and White and Asian = 0.

9) GENDER—A dichotomous variable in which male = 1 and female = 0.

10) SESQUINT—Socioeconomic status quintile. See Glossary.

High school background variables defined

1) EDUANTIC—Education anticipations. A three-level variable: (a) consistently (in grades 10 and 12) expected to earn a bachelor's degree; (b) raised expectations to the bachelor's degree between grades 10 and 12; and (c) either lowered expectations from the bachelor's level between grades 10 and 12 or never expected to earn a bachelor's degree.

2) CLSSRNKQ—High school class rank/GPA quintile. See Glossary and Appendix C for accounts of construction and limited imputation, respectively.

3) SRTSQUIN—Senior year test score quintile. A test of general learned abilities was administered to NELS high school seniors and the results set out in percentiles. For those who did not take that test but for whom SAT or ACT scores were available, those scores were substituted using an equipercentile concordance methodology, weighted, and set out in quintiles. See Glossary for a more detailed account.

4) HIGHMATH—Highest level of mathematics reached in high school. A five-level variable with calculus and precalculus at the high end and Algebra 1 and prealgebra at the low end. See Glossary.

5) SCIMOM—High school momentum in science and mathematics. A three-level variable combining highest level of mathematics with numbers of credits earned in core laboratory science. See Glossary.

6) FLAN—Number of units of foreign language in high school on a five-level scale.

7) ADVANCE—Number of Advanced Placement (AP) courses. Three values based simply on the number of AP courses recorded: three or more, one or two, and none. See Glossary for a full account of identifying AP course work.

8) HSCURRQ—Academic intensity of high school curriculum, in quintiles. This variable is the core of the analysis of students' precollegiate histories, and, hence, is described in detail in Part III and Appendix F.

9) ACRES—Academic Resources. A quintile index representing a composite of students' pre-collegiate attainment (curriculum plus class rank/GPA plus senior year test score). ACRES is the dominant precollegiate variable in both the original *Tool Box* and *The Toolbox Revisited.* The construction of this variable is described in detail in Part III.

Postsecondary entry variables defined

1) FIRST4—A dichotomous variable indicating whether the first postsecondary institution attended by the student was a four-year college.

2) DOCT—Another dichotomous variable indicating whether the first postsecondary institution attended was a doctoral degree-granting institution.

3) SELECT—A dichotomous variable indicating that the first institution attended by the student was either highly selective or selective.[19] See Glossary for details on selectivity.

4) NODELAY—A dichotomous variable marking students who entered postsecondary education within seven months of high school graduation.

5) ACCELCRD—Acceleration credits. A sum of all college credits earned by both course work prior to high school graduation and by examination. The values of this variable were set at three levels: more than 4 credits, 1–4, and zero.

First-year performance variables defined

1) LOWCRED—A dichotomous variable marking students who earned less than 20 additive credits earned in the first calendar year of attendance. For descriptive data on the relationship between number of credits earned in the first year and highest degree, see Appendix L, table L4.

2) FRSHGRAD—GPA in the first calendar year of attendance. Grade point averages were determined for the first *full calendar year* of postsecondary attendance and were then set out in quintiles. FRSHGRAD is a dichotomous variable that divides the highest two quintiles from the other three.

---

[19]Institutional selectivity in the postsecondary files of all three grade-cohort longitudinal studies conducted by the National Center for Education Statistics has five values: highly selective, selective, nonselective, open-door, and not ratable. The first three of these values were based on the selectivity cells developed by the Cooperative Institutional Research Project (CIRP) at UCLA for its annual survey (since 1966) or entering freshmen. For the distribution of NELS:88/2000 postsecondary students by selectivity of first institution attended, see Appendix L, table L3.

3) FREM—A dichotomous variable indicating any remedial course work in the first calendar year of attendance.

4) FCOLMATH—Another dichotomous variable indicating whether the student earned any credits in college-level mathematics during the calendar year following first enrollment. "College-level mathematics" was defined to include college algebra, finite math, statistics, precalculus, calculus,[20] and a category of "liberal arts mathematics" courses that require the equivalent of high school Algebra 2 as a prerequisite, and include such topics as game theory, basic combinatorics, and foundations of numerical methods.

Financing postsecondary schooling variables

There are three dichotomous financing variables in both *Answers in the Tool Box* and *The Toolbox Revisited*: GRANTS, LOANS, and STUWORK. Each indicates only whether the student used that form of financing during his/her early postsecondary career. The reader is referred to the text of Part IV for elaboration.

Attendance pattern variables defined

1) TRANSFER—community college to four-year. With students going back and forth between community colleges and four-year colleges, it is important to mark transfer as a permanent change of venue, a migration that is formally recognized by system rules. A transfer student is one who (a) started in a community college, (b) earned more than 10 credits from the community college before (c) enrolling in a four-year college and (d) earning more than 10 credits from the four-year college. The only time limit set for these changes of venue and credit accumulation is the length of the longitudinal study. In the case of the NELS:88/2000, that means 8.5 years from the modal high school graduation data of June 1992. This is a dichotomous variable.

2) FOURTRAN—A dichotomous variable indicating transfer from one four-year college to another. The algorithm for classic transfer from a community college to a four-year college was fairly easy to construct. But to distinguish a true four-year-to-four-year college transfer required an indirect route. See Glossary for details.

3) MULTINS—A dichotomous variable indicating that the student attended more than one institution. This is a macro-vision of otherwise multidirectional student behavior.

4) SUMMER—Number of credits earned during summer terms, set in three bands: more than 4, 1–4, and none.

---

[20]The category of "calculus" includes not only the standard sequence but also special "short calculus" or "brief calculus" courses, and specialized introductions to calculus for business, economics, and life science majors.

5) PARTTIME—A dichotomous variable tagging students whose enrollment intensity was *ever* part-time**.** The construction of this variable involves complex algorithms, and the reader is referred to the Glossary for details. (For an account of enrollment intensity in both the NELS:88/2000 and the Beginning Postsecondary Students longitudinal study of 1995/96–2001, see Appendix L, table L5).

Extended postsecondary performance variables defined

1) TREND—Trend in student's GPA: rising, flat, or falling. Cumulative undergraduate GPA was measured at three points in time—at the end of the first calendar year following initial enrollment, at the end of the first two calendar years following initial enrollment, and at the end of the student's undergraduate career, no matter when that occurred. See Glossary for further elaboration.

2) CUMMATH—Number of credits earned in college-level mathematics**:** more than 4, 1–4, and 0.

3) CHANMAJ—A dichotomous change-of-major variable. See Glossary for a full description.

Final factors variables defined

1) NOSTOP—In all three NCES postsecondary transcript-based grade-cohort studies, noncontinuous enrollment was defined as *more than* a one semester (or its equivalent, e.g., two quarters) stop-out period. In the dichotomous variable, NOSTOP, the student is considered continuously enrolled even with one semester (or two quarters) off.

2) WRPT Ratio—A dichotomous variable. On one side of the dividing line are students who withdrew from or repeated 20 percent or more of all courses in which they enrolled (ratio of non-penalty withdrawal and no-credit repeat grades to all grades received).

Summary: Locus of Responsibility

Figure 1 presents the basic statistical characteristics for 39 of the major variables described above that were either tested, used in trials, and/or employed in the final logistic narrative of *The Toolbox Revisited.* Seven of these variables describe demographic characteristics, and another three label types of financial aid that ultimately are offshoots of demography. Of the remaining 29 variables, 14 are principally matters of student choice (e.g., changed major), five are indicators of student academic effort (e.g., first-year grades), seven reflect interactions of student choice plus student effort plus opportunity to learn (e.g., highest high school math), two mark interactions of student effort and institutional judgment or guidance (e.g., first-year remediation), and one (education anticipations) reflects student experience, attainment, and self-assessment, along with the encouragement of family and peers. The student is at the center of all these representations. The locus of responsibility for the way each of these variables will tilt lies as much with the student as with external forces. *The Toolbox Revisited* is optimistic that most students can make it all come out right. We will return to this optimism in Part VII.

Figure 1. Values, means, standard deviations, use of variables considered, and step no., if used, in the logistic narrative of *The Toolbox Revisited*, with universe confined to 1992 12th-graders with complete high school records and known socioeconomic status who attended a four-year college at any time through December 2000

Variable	Values	Programming name	Mean	S.D.[a]	Used	Step no.	Relationship to variables in the original *Tool Box*
Nonnative speaker of English	2[b]	NNSE	0.1472	0.3544	No		New

Part III
What Is and What Happens Before Matriculation

There are at least three distinct ways of setting up Step 1 in the progression of multivariate analyses that lead us to appreciate what makes a difference (and how much of a difference) in completing a bachelor's degree for students who attended a four-year college at any time. The first step covers both student demographics and high school performance. Let us cover the demographics first because they do not present complex analytic choices.

What If We Knew Nothing Except Demography?

The demographic background of students is marked as of a set moment in time (in our case, in grade 12). It is what students look like, where they are living, their parents' education(s), occupation(s), and income(s), and other features of the student's family. Demographic characteristics may be subject to special attention in education policy from local to national levels, but, with the exception of the student's marital and parental status, are not subject to change.

Demographic variables are normally considered in the context of other aspects of student experience, behaviors, and attitudes when attainment of any kind (e.g., high school graduation, test scores, grades, college degree) is the dependent variable. Indeed, that is the way this analysis treats demographic characteristics. But to demonstrate what happens to the demographic variables in the analysis, this section opens with a stark presentation. If someone asked us to explain bachelor's degree completion for 1992 12th-graders who subsequently attended a four-year college at any time, and all we knew about them were demographics, what would the various associations of demography with degree attainment look like?

Table 3 presents a logistic exploration that started with nine demographic variables described in Part II above. The socioeconomic status quintile variable is not included, but two of its components (family income and parents' highest level of education) are present to serve as proxies for SES. Two of the nine demographic variables—whether the student was a nonnative speaker of English and family immigrant status—were not accepted into the logistic equation.

Whether there were nine variables or seven, however, this logistic model fails to reach significance as a *model,* regardless of whether independent variables within the model turn out to be significant. The t value for the intercept falls below the threshold of 0.765 this study uses for keeping independent variables under consideration, and the proportion of concordant probabilities predicted at 63 percent is the lowest–by far–of any logistic model in this study.

Of the independent variables within the model, four are significant, even though that significance is undercut by the statistical characteristics of the model as a whole. The most significant ($p < 0.01$) is first generation college status, with a Delta-p statistic that says the probability of completing a bachelor's degree is reduced by roughly 21 percent for first generation students.

Race/ethnicity and gender are significant at $p <.05$, with the messages of the Delta-p that minority status reduces the probability of earning a bachelor's degree by 17 percent, and being male reduces that probability by 11 percent. Falling in the highest third of family income is marginally significant.

Table 3. Logistic account of the relationships among major demographic variables and bachelor's degree attainment for 1992 12th-graders who attended a four-year college at any time

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p
Intercept	0.2250	0.1869	0.69		
Race/ethnicity	**-0.7257**	**0.1434**	**2.90**	**0.05**	**-0.1660**
Gender	**-0.4760**	**0.1072**	**2.54**	**0.05**	**-0.1089**
Parenthood	-1.6285	0.5255	1.77	†	†
Siblings	-0.3619	0.1109	1.87	†	†
Family income	**0.3870**	**0.1111**	**2.00**	**0.10**	**0.0885**
First generation	**-0.9137**	**0.1420**	**3.69**	**0.01**	**-0.2089**
Urban high school	0.1839	0.1217	0.87	†	†

†Variable did not reach the minimum level of significance (p<.10) in a two-tailed test.
NOTES: Statistically significant variables are in bold. $G^2 = 6288.09$; $df=5144$; $G^2/df = 1.222$; $X^2(df) = 413.76(7)$; pseudo $R^2 = .077$. Proportion of concordant probabilities predicted = 63.0. Root design effect = 1.75.
SOURCE: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

But the most important message is the failure of the purely demographic analysis itself. If the statistical model does not reach a convincing level of significance, and all the variables inside the model are basically cut from the same cloth, then even if some of those variables are significant within the model, the cloth is frayed. That failure sets up a hypothesis that will unravel in the course of subsequent steps of the logistic narrative: Among students who attended a four-year college at any time, student demographics and family demographics may have, at best, indirect connections with degree completion. In fact, at the moment high school academic history is included in the multivariate account, demography plays a considerably reduced role at the same time that the logistic model becomes more persuasive.

High School Background and History

This is where the academic momentum story begins, where the major contributions of the original *Tool Box* were most prominent, and where the story continues to be of considerable importance.

There were four core high school background and performance variables in the first step of the logistic inquiry in the original *Tool Box*: senior year test score, a combined index of class rank and GPA, academic curriculum intensity, and the student's education "anticipations." The first three of these variables were combined in a composite index of "Academic Resources" that proved to have lasting positive repercussions through students' postsecondary histories.

Before we examine the results of the Step 1 logistic model, we should (a) revisit education "anticipations," and (b) provide a detailed account of how *The Toolbox Revisited* deals with high school curriculum.

"Anticipations" versus "aspirations"

Both the original *Tool Box* and this study employ a variable that some people will interpret as indicating students' education "aspirations." But this construct is carefully labeled "anticipations," and is *not* based on the student's answer to a question asked only once (for example, in a 12th-grade survey or in a freshman registration line). Rather, "anticipations" is built from sets of questions asked in both the 10th grade and the 12th grade, and describes the *consistency* and *level* of the student's abstract expectations and concrete plans.

Perhaps as a by-product of the national visibility of discussions on secondary-to-postsecondary transitions that followed the release of *A Nation at Risk* in1983, along with a burst in recruitment of minority students by both colleges and professionally-oriented organizations such as the National Action Committee for Minorities in Engineering, the proportion of 12th-graders who *consistently* expected to earn at least a bachelor's degree more than doubled from 22.5 percent (s.e. = 0.58) among 1982 12th-graders to 59.4 percent (s.e. = 1.02) among 1992 12th-graders. Continuing one's education after high school, at some point and "in some form of postsecondary education" is now a norm of expectations among high school graduates: 92.6 percent (s.e. = 0.54) of NELS:88/2000 students who graduated from high school with any kind of diploma, whether "on-time" in 1992 or later, expected to continue their education in a postsecondary setting. That which is a norm of behavior is like breathing in and breathing out. When virtually everyone expects to continue, the serious curricular "disconnect" between K-12 and postsecondary systems eloquently dissected by Venezia, Kirst, and Antonio (2003) is even more fraught with hazards and ironies. "Anticipations," one can surmise, will not play as significant a role in a logistic account of bachelor's degree completion as it did in the original *Tool Box*.[21]

To aspire is an active concept. In our ordinary usage, it means to hope, seek, wish, or yearn. When Kao and Tienda (1998) describe "aspirations" as "a realistic evaluation of likely outcomes" (p. 352), they are not describing "aspirations" as we normally understand the term. Qian and Blair (1999), too, indicate that they use the "aspirations" to describe expectations or plans

[21]Even there, the variable floated in and out of significance over the steps of the logistic model (see Adelman 1999, pp. 80–81).

"rather than a wish" (p. 622). And that's just the point: With these rare exceptions, the literature on education "aspirations" consistently confounds an emotively-laden term applied to motivation, desire, or drive with an assessment of possibility based in experience (Mezias 1988). Underneath the consistency-by-level construct of the educational "anticipations" variable used in both the original *Tool Box* and in this study is what Kao and Tienda (1998) document as a growth from abstract attitudes about a very distant possibility when students are in junior high school to a rational judgment based on both school experience and input from parents and peers as the time draws closer to high school graduation. There is no doubt that the consistency-by-level formulation of our anticipations variable is influenced by what happens to students between grades 10 and 12.

A different interpretation of expectations is implicit in Venezia, Kirst, and Antonio (2003): Expectations become assumptions, more passive than "aspirations." Their principal thesis—that students falsely assume that the momentum inherent in a high school diploma is sufficient not merely to enter a postsecondary environment ("the easy part," in their words) but to complete a credential—is all the more powerful when these assumptions end in less than completion. The principal culprit lies in poorly articulated (secondary-to-postsecondary) curricula (Conley 2005), a topic addressed in Part VI of this essay.

Academic Intensity of Secondary School Curriculum

Think of a series of moving walkways in an airport. Passengers expect that one leads to the next, and don't think too much about what's happening along the way. What the most perceptive of contemporary analysts of the curriculum paths from high schools into colleges of any kind have observed (Venezia, Kirst and Antonio; and Conley) might be described as a disconnect in both the location and speed of these successive moving walkways, so that the passengers stepping mindlessly off the first and heading to the second trip, stumble into the moving hand rail, and desperately grasp at their luggage so that it doesn't get stuck in the space between the two segments. This issue was imperfectly highlighted in the original *Tool Box* and is worth extended preliminary attention here.

The "differential course work" hypothesis, originating in the work of Pallas and Alexander (1983) and Alexander and Pallas (1984) in relation to high school test scores, and validated by *Answers in the Tool Box* with a longer time frame and a bachelor's degree attainment dependent variable, remains the core of the presentation in *The Toolbox Revisited* as well. With these forebears as guidance, we are going to look at the components of the curriculum variable, alternative presentations of those components for multivariate analyses, and some critiques of the measure. In the past decade, a number of short-hand representations of the high school curriculum, e.g., the New Basics as advocated in *A Nation at Risk* (1983), "minimum college-qualified" (Berkner and Chavez 1997), and "track location" (Lucas 1999; Lucas and Berends 2002) have become common in both the research literature and the general press. The New Basics are the best known of these heuristics. The highest level of these "new basics"

—which simply counted Carnegie units[22] (four of English, three each of mathematics, science, and social studies, and two of foreign language)—has been labeled "rigorous" (McCormick 1999), even though three units of mathematics could amount to no more than plane geometry and the science in question could lack any laboratory components. After the publication of the original *Tool Box*, the literature added criteria for highest level of math, core laboratory science, and Advanced Placement course work to the judgment of "rigor," and sought a trichotomous presentation with labels such as "core curriculum or less," "mid-level," and "rigorous" (Horn and Kojaku 2001).

Quite frankly, the word "rigorous" is somewhat of a misnomer since a course requiring a high concentration of intellectual effort can be presented in a relaxed manner with comparatively low standards for success. Put another way, calculus or laboratory chemistry, for example, can be taught in a very laid-back fashion, while an otherwise "ordinary" survey of U.S. history can require the search for, discovery, and cataloguing of original source material, readings in archival methods, and frequent examinations and project presentations with criterion-referenced grading standards. Both the original *Tool Box* and *The Toolbox Revisited* prefer the term, "academic intensity," defend the continuous variable of academic curriculum intensity as a more flexible language of accounting, and decline to invoke labels of "college qualified," "at risk," and others.

The academic curriculum intensity variable is called HSCURRQ. It takes a weighted distribution of NELS:88/2000 students across 31 levels of academic curriculum intensity and quality (there were 40 levels in the records of the High School Class of 1982, the subjects of the original *Tool Box*), and divides the distribution by quintile. Each level of academic curriculum intensity is a distinct configuration of numbers of Carnegie units[23] earned in core academic areas and other distinct notations about students' course of study. For example, in both data sets, at the highest level, one finds students who, between grades 9 and 12, accumulated.[24]

3.75 or more Carnegie units of English;
3.75 or more Carnegie units of mathematics;
highest mathematics of either calculus, precalculus, or trigonometry;
2.5 or more Carnegie units of science *or* more than 2.0 Carnegie units of core laboratory science (biology, chemistry, and physics);
more than 2.0 Carnegie units of foreign languages;
more than 2.0 Carnegie units of history and/or social studies;
more than 1 Advanced Placement course; and
no remedial English; no remedial mathematics.

---

[22]A Carnegie unit is the basic credit system for U.S. secondary schools. It is generally recognized as representing a full year (36–40 weeks) in a specific class meeting four or five times per week for 40–50 minutes per class session (Martinez and Bray 2002).

[23]It is important to note that the Carnegie unit thresholds indicated, e.g., 3.75 units of English, are not determined *a priori*, but rather from the empirical distribution of Carnegie units standardized across the NELS high school transcripts in their edited version. See the descriptive windows for all the high school curriculum variables on the NCES data sets in CD # 2003-402 and its June 2004 Supplement.

[24]For mean numbers of Carnegie units earned in major curriculum areas, see Appendix L, table L6.

These are minimums. In fact, at the highest level of academic curricular intensity, students had accumulated an average of 4.30 Carnegie units of English, 4.34 units of mathematics (94 percent having reached precalculus or calculus), 3.63 units of core laboratory science, 3.76 units of foreign languages, and 3.79 units of history and other social studies, along with an average of three AP courses. That is an impressive portfolio.

To this particular configuration, the NELS:88/2000 version of the highest level of academic curriculum intensity adds any Carnegie units in "computer science," a far more frequent and integrated elective in the high school curriculum by 1990, when the NELS students were in the 10th grade, as opposed to 1980, when the High School & Beyond/So students were in the 10th grade (the mass availability and marketing of PCs began in 1984).

Each subsequent level in a descending logical cascade subtracts something from this configuration (see Appendix F) until a relatively smooth distribution is achieved. Nothing is perfect in these algorithmic adjustments; and whatever lumpiness in distribution remains is assuaged in the quintile version.

In light of recent literature on the effects of AP course-taking versus scores on AP examinations (e.g., Geiser and Santelices 2004; Klopfenstein and Thomas 2005), it is important to note that in both the original *Tool Box* and in this study, AP course work is *not* treated as a discrete variable, rather as *part* of the overall index of academic curricular intensity. However, in a moment we will demonstrate what happens when AP is invoked as a distinct independent variable in alternative constructions of the first step of our core logistic model.

The basic critique of this account of high school curriculum has much merit: Numbers of courses (expressed in Carnegie units) in specific subject areas are not equivalent to high content standards or performance standards in those courses (Barth and Haycock 2004). In the cascading curriculum levels of the Academic Intensity variable, a student could accumulate three units of watered down history and social studies and still have three units. A national transcript accounting has no way of knowing what is demanded in thousands of history and social studies courses offered in 1100 high schools, a point made in the staff research for *A Nation at Risk* (see Adelman 1983). The only domestic examples available for those who argue for test-driven high content standards in individual high school subjects such as U.S. history or chemistry or Algebra 2 are the College Board achievement tests (now called SAT II) and the New York State Regents. Some other states (e.g., Michigan) have tests in place for merit-based scholarships that cover broad areas of the curriculum (e.g., math, science) and language skills (reading, writing) but not specific subjects. In this respect, they are closer to the ACT examination, though at a less demanding level (Bishop 2004). The high school transcripts that serve as our evidence are very inconsistent in entering SAT II subject exam scores, so we have nothing on which to rely for an external validation of content. Getting beyond course titles to content standards is addressed in Part VI of this study.

Altonji's work (1996) offers a second important critique. He would have us control high school curriculum variables for school effects and "quality of courses," but admits that whatever one tries for proxy measures, the results would be "imperfect." Altonji draws our attention to the fact that more than half the variance in the mean number of Carnegie units earned in academic

subjects by the NLS-72 cohort[25] was across schools, indicating disparities in opportunity to learn, teacher quality, and student talents and proclivities. One might put Altonji's conclusion more baldly: Students from higher SES backgrounds attend high schools that serve similar students, schools in which parental expectations and involvement are high, and schools in which curriculum offerings and teacher quality follow SES demands and can afford to do so because the tax base is higher. These students tend to enter college and earn degrees at higher rates than students from "lesser" backgrounds and from schools that accompany those backgrounds, therefore, the influence of the academic intensity of high school curriculum will be overstated.

The implicit response of the original *Tool Box* made explicit in *The Toolbox Revisited* is that there are inequities in opportunity to learn and proclivity to learn that are reflected in the geo-demography of schools, but in a logistic account of bachelor's degree attainment in which the results are reported with the Delta-p statistic, socioeconomic status will modulate some of the effects of curriculum. The message encourages all high schools to offer the requisite curricula, to make sure they have teachers who can deliver that curricula, to believe that their students can all reach higher levels of academic intensity in preparation, and to encourage their students to do so—no matter what students' intentions for subsequent education or work may be. As the principles of the *No Child Left Behind* legislation are applied in high schools, this is a large part of what they mean.

Highest level of mathematics and changes in high school course-taking

In comparing the high school records of the HS&B/So (High School Class of 1982) with those of the NELS:88/200 (High School Class of 1992), and looking only at earned Carnegie units, what we principally witness is an improvement of precollegiate preparation of students in mathematics

Table 4. Percentage of 1982 and 1992 12th-graders in academic high school programs whose high school curriculum fell below selected content and intensity thresholds

	Class of 1982		Class of 1992	
Curriculum markers	**All 12th-graders**	**In academic program**	**All 12th-graders**	**In academic program**
Percent of students with:				
Highest level of mathematics *less than* Algebra 2	60.2 (0.78)	35.4 (1.02)	37.7 (1.11)	24.2 (1.24)
Maximum of one year of core laboratory science	60.1 (0.82)	37.1 (1.04)	34.3 (1.17)	21.0 (1.22)
Maximum of one year of foreign language	28.3 (0.88)	14.3 (0.75)	41.5 (1.30)	28.4 (1.47)

NOTES: "Core laboratory science" is confined to biology, chemistry, and physics. Standard errors are in parentheses. Weighted N for students in academic program: HS&B/So = 1.5M; NELS:88/2000 = 1.8M.

[25]The National Longitudinal Study of the High School Class of 1972, the first, most elaborate, and longest (1972–86) of the NCES grade-cohort longitudinal studies

and science, a change that affects the amount of remediation necessary in four-year colleges, as well as mathematics course-taking at the college-level (Adelman, Daniel, and Berkovits 2003). We also note an unsettling increase in the percentage of students taking a maximum of one year of foreign language course work (though that percentage spread might be mitigated somewhat if we accounted for the increase in bilingual heritage language users between the two cohorts). Table 4 sets forth some basic threshold markers in these curricular areas.

Thresholds are suggestive, but not conclusive, of the shape of change in curricular preparation. By reverse logic, table 4 says only that X percent of students are getting beyond point Q in secondary school study. It does not say how far beyond, and that may make more of a difference in academic momentum. The mathematics analysis in the original *Tool Box* was a proxy for the general metaphor of momentum, and it may be instructive to compare the results of those calculations—a distribution and a logistic—to what emerges from the NELS:88/2000 involving all the rungs on the "math ladder." Tables 5, 6, and 7 do so, confining their universes only to students who were in the 12th grade in the year they were scheduled to be in the 12th grade. They do not restrict the universes to those who entered postsecondary education, let alone to those attended four-year colleges at some time. These are very inclusive groups.

Table 5 confirms other observations in these data sets: The efforts following *A Nation at Risk* to move students further ahead in high school mathematics had positive results. Higher proportions of students were reaching Algebra 2 and higher levels. Bachelor's degree attainment rates for those who moved at least one step beyond Algebra 2 in high school were stable, but declined at every level at or below Algebra 2. Table 5 provides a framework that needs to be validated in a more convincing way, and that is the purpose of table 7. Table 7 presents the results of logistic analyses and does so in odds ratios (departing from the presentation of other logistics in *The Toolbox Revisited*) to match the way in which this table was presented in the original *Tool Box* study.[26]

From the write-ups and presentations of the original *Tool Box* study a principle for high school curriculum guidance arose: "One step beyond Algebra 2 doubles the odds that you will earn a bachelor's degree." What does that mean, i.e., how does one read table 7? An odds ratio indicates that every unit of change in an independent variable (in this case, each step up the math ladder) increases the odds of X happening versus the odds of X *not* happening by Y (the odds ratio). For table 7, the data for the full model—using only highest mathematics and socioeconomic status quintile—are presented first, in bold. In both cohorts, the odds ratio says that every step up the math ladder multiplies the odds of earning a bachelor's degree by roughly 2.5 versus an odds ratio for each step up the socioeconomic status quintile measure of 1.68 (for the class of 1982) and 1.78 (for the class of 1992). These data are statistically significant ($p < .05$ or better).

[26]The High School Class of 1982 data in table 7 are slightly different from those in the previous presentation in *Answers in the Tool Box* (table 6, page 17) because a more accurate 12th-grade flag for that data set has been developed to match the NELS:88/2000.

Table 5. Bachelor's degree attainment rate by highest level of mathematics reached in high school by 1982 and 1992 12th-graders

	Class of 1982		Class of 1992	
Level of math	Percentage reaching this level of math	Earned bachelor's	Percentage reaching this level of math	Earned bachelor's
Calculus	5.2 (0.36)	82.1 (2.45)	9.7 (0.54)	83.3 (2.72)
Precalculus	4.8 (0.37)	75.9 (2.43)	10.8 (0.65)	74.6 (2.04)
Trigonometry	9.3 (0.51)	64.7 (2.32)	12.1 (0.81)	60.0 (3.32)
Algebra 2	24.6 (0.75)	46.4 (1.54)	30.0 (1.08)	39.3 (2.31)
Geometry	16.3 (0.65)	31.0 (1.92)	14.2 (0.87)	16.7 (1.87)
Algebra 1	21.8 (0.69)	13.4 (1.33)	16.5 (0.92)	7.0 (1.24)
Pre-algebra	18.0 (0.66)	5.4 (1.19)	6.7 (0.53)	3.9 (1.34)

NOTES: Standard errors are in parentheses. The columns for level of math may not add to 100.0 percent due to rounding.
SOURCES: National Center for Education Statistics: High School & Beyond/Sophomore Cohort (NCES 2000-194) and NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The balance of the table takes each level of high school mathematics, and runs a logistic regression *for that level*, with bachelor's degree completion as the dependent variable, and SES quintile as the sole control. For the class of 1982, reaching calculus in high school increased the odds of earning a bachelor's degree by a very impressive 8.18 to 1. For the class of 1992, the odds ratio for calculus was still in the same range at 7.52 to 1. The parameter estimates for the calculus line are almost identical (2.102 versus 2.018). These are consistent results.

When one looks at the columns in table 7 for the class of 1982, one notices that the sign of the parameter estimate moves from negative to positive territory between geometry and Algebra 2, and the value of the parameter estimate rises above 1.0 between Algebra 2 and trigonometry. The odds ratio more than doubles in each of those steps, but only in the step between Algebra 2 and trigonometry (the "one step beyond") is the parameter also positive. For the class of 1992, all those relationships move up one rung on the "math ladder," principally because a higher percentage of this group (than the percentage for the class of 1982) reached precalculus or calculus while a lower percentage failed to get as far as Algebra 2. The critical boundary for math momentum now lies firmly beyond Algebra 2.

But therein lies the rub, for not everyone has the chance to reach beyond Algebra 2. Differential lack of opportunity-to-learn was a major theme in the original *Tool Box* and is just as prominent a theme in this study of a cohort a decade later. Table 6 illustrates this unhappy situation. It asks what proportion of students—by race/ethnicity and socioeconomic status quintile—attended high schools that offered key math courses beyond Algebra 2.

If mathematics momentum is as important as we contend it to be, one can see the ripples of opportunity—or lack of opportunity—that start in high school offerings. In the matter of calculus, Latino students and those from any socioeconomic status quintile other than the highest are at a distinct disadvantage with respect to the opportunity even to confront the subject. African-American students join the other groups in less access to both trigonometry and statistics. While this issue will be revisited, it deserves underscoring here: The task of providing quality secondary school curricula to *everybody*, the *paths* to AP, the *paths* to the kind of learning challenges students will face in higher education, is enormous. If the promise of *No Child Left Behind* is to be realized at the secondary school level, it is first and foremost through the equitable provision of opportunity-to-learn.

Table 6. Percentage of 1992 12th-graders who attended high schools that offered courses[a] in statistics, trigonometry, and calculus, by race/ethnicity and socioeconomic status quintile

	Percent attending high schools that offered:		
Demographic group	Calculus	Trigonometry	Statistics
Race/ethnicity			
White	58.6 (1.67)	76.9 (1.29)	27.7 (1.62)
African-American	50.8 (4.14)	67.0 (3.90)	19.5 (2.71)
Latino	44.6 (4.04)	59.9 (3.55)	18.2 (2.44)
Asian	61.3 (4.31)	71.9 (3.61)	30.1 (3.94)
Socioeonomic status quintile			
Highest quintile	71.6 (1.93)	83.1 (1.64)	34.0 (2.30)
2nd quintile	56.2 (2.32)	73.2 (2.13)	27.1 (2.01)
3rd quintile	54.1 (2.39)	71.4 (2.33)	24.9 (1.92)
4th quintile	49.3 (2.46)	70.3 (2.28)	20.3 (1.80)
Lowest quintile	43.5 (2.86)	63.7 (2.66)	18.5 (2.06)

[a] Responses are based on surveys of school administrators and math teachers of NELS students in 1990. Where the administrator did not answer the question, the math teachers did not indicate that they taught the subject, and students did not earn any credits in the subject, the calculation assumes that the school did not offer the subject. This approach may underestimate the percentage of high school offering the subjects at issue.

NOTES: Standard errors are in parentheses.

SOURCES: National Center for Education Statistics: NELS:88/94 (NCES 96-130), and NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

Since "highest high school mathematics" is a critical sorting component in the construction of the composite variable describing the academic intensity of a student's secondary school curriculum, the ramifications of more students completing courses beyond Algebra 2, it is hypothesized, will ironically diminish (however modestly) the explanatory power of curriculum and raise the power of academic performance (class rank/GPA). To illustrate with a metaphor: If it was said that a student who reaches precalculus in high school and earns a C has a better chance of finishing a bachelor's degree than a student who gets only as far as Algebra 2 with an A-, we now have to raise the bar for performance in precalculus to at least a B- in order for the prediction to hold.

Table 7. The math ladder for 1982 and 1992 12th-graders: Odds ratios and parameter estimates of earning a bachelor's degree at each rung, controlling for socioeconomic status quintile

	1982 12th-graders				1992 12th-graders			
Variable	Odds ratio	parameter estimate	Adjusted standard error	*p*<	Odds ratio	parameter estimate	Adjusted standard error	*p*<
Highest math	**2.56**	**0.938**	**.0426**	**.01**	**2.50**	**0.918**	**.0467**	**.01**
Socioeconomic status quintile	**1.68**	**0.520**	**.0359**	**.02**	**1.78**	**0.571**	**.0449**	**.05**
By highest level of mathematics:								
Calculus	8.18	2.102	.0426	.01	7.52	2.018	.1936	.05
Precalculus	6.34	1.846	.1895	.05	4.91	1.591	.1592	.05
Trigonometry	3.76	1.352	.1267	.05	3.05	0.860	.1422	.10
Algebra 2	1.82	0.599	.0867	.05	0.89	-0.115	.1030	†
Geometry	0.63	-0.468	.1108	†	0.24	-1.434	.1812	.10
Algebra 1	0.19	-1.666	.1386	.02	0.07	-2.688	.2788	.10
Pre-algebra	0.06	-2.778	.2614	.05	0.05	-3.088	.6684	†

† Variable did not reach the minimum level of significance (p < .10) in a two-tailed test.
NOTES: For both 1982 and 1992 12th-graders, the universe consists of all students for whom highest mathematics in high school could be determined, SES data were available, and highest postsecondary credential at the end of the cohort study period was known. Root design effect for the high school class of 1982 (HS&B/So cohort)=1.59; root design effect for the high school class of 1992 (NELS:88/2000 cohort)=1.98. NELS:88/2000 goodness-of-fit data for the full model: G^2 = 8289.25; *df* = 9135; G^2/df = 0.91; percent concordant probabilities predicted = 84.3. HS&B/So cohort goodness-of-fit data for the full model: G^2 = 8371.74; *df* = 9288; G^2/df = 0.892; percent concordant probabilities predicted = 80.0.
SOURCES: High School & Beyond/Sophomore Cohort (NCES 2000-194); NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The general improvement in the high school curriculum profile of the NELS:88/2000 cohort is reflected, at least among students who subsequently attended a four-year college at any time, in diminished postsecondary remediation for that population. Table 8 sets out the distribution of what in the original *Tool Box* study was called the "remedial problem," a logical cascade that distinguishes not only the amount of remediation a student takes in college, but also the kind of remediation at issue. The logical cascade begins with remedial reading, then sorts out those students whose only remediation consists of one or two courses in mathematics, then divides the balance of the remedial population between those who required more than two remedial courses and those who required only one. The type of remediation at issue for both these residual populations is usually writing, but also includes courses devoted to basic study skills and general developmental work. If the population included students who never attended a four-year college, this distribution would look very different.[27]

Table 8. Percentage of 1982 and 1992 12th-graders who attended a four-year college at any time, by type and amount of remedial courses taken in postsecondary education

Type and amount of remediation	High School Class of 1982	High School Class of 1992
Any remedial reading	10.0 (0.56)	7.8 (0.72)
Remedial math only (1–2 courses)	14.0 (0.65)	9.8 (0.65)
More than 2 remedial courses of any kind other than reading	14.5 (0.72)	8.9 (0.64)
Only 1 remedial course other than reading	9.0 (0.50)	6.5 (0.41)
No remedial courses	52.5 (1.04)	66.9 (1.07)

NOTES: (1) Standard errors are in parentheses. (2) Columns may not add to 100.0 percent due to rounding.
SOURCES: High School & Beyond/Sophomore Cohort (NCES 2000-194) and NELS:88/2000 Postsecondary Transcript Files (2003-402).

[27]Among all NELS:88/2000 students who participated in the 1992 survey and subsequently attended *only* community colleges, 64.5 percent (s.e. = 1.88) took at least one remedial course and 43.7 percent (s.e. = 1.98) took more than one. Among those who attended only sub-baccalaureate trade schools, which often do not require remediation, 32.4 percent (s.e. = 5.89) took at least one remedial course and 21.9 percent (s.e. = 6.07) took more than one. There is a considerable difference between the norms and requirements of community colleges versus those of other sub-baccalaureate institutions in the matter of remediation, and we should not mix the two in analyses of remediation.

Summary of high school curriculum and performance variables

To remind the reader of our tools before heading into Step 1 of the logistic narrative: For the high school curriculum components of the analysis we have a composite variable called HSCURRQ, and four variables set forth in Part II above describing discrete components of HSCURRQ that we can test as proxy measures for the composite—highest level of mathematics, science momentum (a combination of highest math and core laboratory science credits), foreign language credits, and number of Advanced Placement courses. In a moment all these will appear in a correlation matrix that will provide a preview of how they might play out in multivariate analyses.

For our other performance measures, we bring forward from Part II a quintile presentation of the student's high school class rank/GPA, and a quintile presentation of senior year test score.

Academic Resources

The original *Tool Box* advanced a notion explored and developed by Karl Alexander of Johns Hopkins and his associates in numerous exemplary contributions to the research literature: A student's academic background was far more important than demographic variables such as gender, race/ethnicity, family composition, and socioeconomic status in relation to test performance (Alexander and Pallas 1984), entering higher education (Thomas, Alexander, and Eckland 1979), and, in one study, degree completion (Alexander, Riordan, Fennessey and Pallas 1982). How does one reflect a composite idea of "academic background" of students coming out of high school and into postsecondary education? The key measure of Academic Resources (or ACRES, as the original *Tool Box* variable was called in order to elicit the idea of academic cultivation), combined curricular record, academic performance (class rank/GPA) as an indicator of student effort, and an external measure in the form of performance on tests of general learned abilities. These three components, as we have seen, are set out in quintiles. To get a preliminary idea of their relative strength in relation to bachelor's degree completion and to equalize the conditions of judging degree-completion rates by performance quintiles, table 9 takes all on-time high school graduates in 1992 and indicates the percentage who completed a bachelor's degree by December 2000 by quintile of each of the three components of Academic Resources. To be included in table 9, the student's record had to contain positive values for all three components.

Table 9 offers some hints of what multivariate analysis will confirm. Compared to the distributions for academic curriculum intensity and class rank/GPA, the test score quintile variable yields weaker degree completion rates in its highest two quintiles. This is a clear sign that the test score quintile will not have as strong an association with degree completion as the curriculum and performance factors. At first glance, it looks as if class rank/GPA will be fairly dependable, but it has one minor bump. The reader is directed in table 9 to the percentage of eventual bachelor's recipients from the lowest quintile of class rank/GPA (13 percent) compared to the percent of bachelor's degree completers in the lowest quintile of test scores and academic curriculum (about 9 percent in both cases). The differences are statistically significant in a

descriptive account such as that of table 9, but how meaningful they turn out to be must await a multivariate context. In the meantime, one would posit that the class rank/GPA measure may not prove as strong as the curriculum measure.

Table 9. Percentage of on-time 1992 high school graduates who continued their education in any postsecondary institution who completed bachelor's degrees by December 2000, by quintile performance in the three component variables of Academic Resources

	Percent completing bachelor's degree				
Population	Quintiles of Academic Resources components				
	Highest	Second	Third	Fourth	Lowest
All on-time1992 high school graduates who continued to postsecondary education at any time					
Curriculum	81.7 (1.50)	60.5 (2.14)	35.5 (1.93)	23.4 (1.99)	8.7 (1.37)
Class rank/GPA	78.8 (1.47)	59.1 (2.24)	40.3 (2.11)	25.7 (2.16)	13.0 (1.94)
Senior test score	74.9 (1.72)	53.9 (1.92)	37.2 (2.16)	26.7 (2.41)	8.9 (1.31)

NOTES: Standard errors are in parentheses. Weighted N = 1.6M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

A multivariate analysis involving these variables, in fact, confirms our suspicions, and its results are presented in table 10. The model is the foundation for construction of the composite variable, Academic Resources, and is derived from ratios of the standardized beta estimates of the three high school performance indicators produced by a logistic regression with bachelor's degree attainment as the dependent variable and no controls (the logistic regression itself can be found in Appendix L, table L7). The change in these ratios between those for the High School Class of 1982 and those for the High School Class of 1992, while still leaving academic curriculum with the highest weight, narrows the gap between curriculum and performance, and lowers the strength of test scores as a component of Academic Resources. Given the differences in overall participation in the variable, i.e., the proportion of 12th-graders for whom all three components have positive values, some of the change may be an artifice of the NELS:88/2000 data set. But the principal message is one observed when commenting on the change in the distribution of students by highest level of mathematics studied in high school: The higher the average level of mathematics attainment, the more student effort, reflected in grades, will count. This theme will continue to play out when our story crosses the matriculation line into postsecondary education; and it was one of the principal points made by DesJardins, McCall, Ahlburg and Moye (2002) in their critique of the original *Tool Box* study.

When using all three measures—curriculum, class rank, and ACT test score—in a traditional linear analysis predicting first-year college grades, Pike and Saupe (2002) found curriculum to be the strongest, though their curriculum variable was dichotomous (students either meeting or not meeting the entrance specifications for a selective state university), which would naturally increase its power. Even when they introduced indirect effects of high school characteristics —control (private/public), size, mean ACT score of students, and mean proportion of students who attended the university—the parameter estimates for this curriculum variable were significantly greater than those for test scores or class rank. While *The Toolbox Revisited* is not in the business of predicting first-year grades, it is gratifying to note research that has similar respect for the propulsive power of course of study.

Table 10. Component weights of the high school Academic Resources variable for 1982 12th-graders and 1992 12th-graders who presented positive values for all three components

Components of Academic Resources	1982 12th-graders	1992 12th-graders
Academic curriculum intensity	.41	.42
Classrank/GPA	.30	.33
Senior test score	.29	.25

NOTE: Columns will add to 1.00.
SOURCES: High School & Beyond/Sophomore cohort (NCES 2000-194), and NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

A second message bears repeating from its formulation in the original *Tool Box*: Student effort in curriculum participation and performance over the three *years* of high school (grades 10 to 12) reflected in the transcript data is worth considerably more than performance on a three-*hour* test on a Saturday morning. Test scores are a natural consequence of the academic intensity of curriculum and quality of student effort reflected in grades, and the weakening position of the test score variable in the ACRES configuration for the NELS:88/2000 cohort is a natural outcome of improvements in academic curriculum participation of the post-*A Nation at Risk* era.

Correlations

Now that we have all the precollegiate variables explained and in place, the process of bringing zoom and macro lenses of multivariate analysis to bear begins. The first stage sets forth a correlation matrix of precollegiate academic variables including three outcomes: on-time high school graduation, basic postsecondary "access," and bachelor's degree completion. Table 11 presents the Pearson's *r* results. Some of these correlations are weak, suggesting that one or both of the variables in question will not add to the explanatory power of a logistic regression. On-time high school graduation, for the most noted example, is not related to anything (this was also true in the parallel correlation matrix in the original *Tool Box*). Other relationships are not surprising, e.g., Advanced Placement has almost no bearing on entering postsecondary education (96.7 percent [s.e. = 1.48] of NELS 12th-graders with any AP courses entered the postsecondary sphere, versus 75.9 percent [s.e. = 1.01] of those with no AP course work).

Table 11. Correlations of major precollege Academic Resources variables and high school graduation status, college entry, and bachelor's degree attainment by December 2000 for 1992 12th-graders

	Curriculum intensity quintile (CURRQ)	AP courses (APCRS)	Highest math (5 levels) (HMATH)	Science momentum (3 levels) (SCIMOM)	Foreign language (3 levels) (FLAN)	Class rank/GPA quintile (RANK)	Senior test quintile (TEST)	On-time HS grad, standard diploma (ONTIME)	Post-secondary entry (PSENT)
CURRQ	-----	0.368	0.777	0.774	0.645	0.572	0.581	0.167*	0.352
APCRS		-----	0.438	0.366	0.270	0.326	0.317	0.050*	0.111*
HMATH			-----	0.869	0.519	0.618	0.634	0.124*	0.301
SCIMOM				-----	0.489	0.594	0.578	0.118*	0.279
FLAN					-----	0.430	0.510	0.146*	0.338
RANK						----	0.566	0.185*	0.298
TEST							-----	0.138*	0.313
ONTIME								-----	0.168*
PSENT									-----
BACHELOR'S	0.524	0.319	0.538	0.530	0.451	0.493	0.469	0.129*	0.332

NOTE: All estimates except those noted with an asterisk are statistically significant at p<.05 or better.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

True to its position in the construction of the composite academic curriculum intensity variable (abbreviated here as CURRQ), in fact, Advanced Placement does not exhibit as strong a correlation with the composite as do the mathematics, science momentum, and foreign language components. Why? Because AP is invoked as a sorting criterion in only six of those 31 levels of academic curriculum intensity (see Appendix F), while highest mathematics is invoked in 25 levels, foreign languages in 18, and core laboratory science or all science in 30. Common sense says that we will find higher correlations of these other components with the composite curriculum variable.

But among those other components, the correlation between the highest level of mathematics and science momentum (which includes highest math in its definition) is so strong (0.869) as to set off collinearity bells. The clear message is to use only one of them in any multivariate analysis. The highest level of mathematics was dropped because the variable represents only one curricular area, whereas SCIMOM carries two. Likewise, following Pedhazur's (1982) rules of thumb for identifying potential collinearity problems from correlations, table 11 advises that if we use the high school academic curriculum index, we should not invoke either highest level of math or science momentum in the same multivariate model.

The only other observations of the correlation matrix of table 11 worth special attention are:

- When bachelor's degree completion is the reference point, the relative correlations of the curriculum, class rank/GPA, and test score variables are in roughly the same relationship observed in the more complex construction of the composite Academic Resources variable: Curriculum exhibits the strongest correlation, followed by class rank/GPA, followed by test score.
- However, when the referent variable is simply entering postsecondary education, (a) the correlation coefficients are much lower, and (b) the test score variable is slightly stronger than class rank/GPA.

The bottom line of these two conclusions: What counts for completion will be more potent than what counts for mere entrance (the "easy part," in the words of Venezia, Kirst, and Antonio, 2003).

Step 1: The First Logistics

In the commentaries and critiques of these aspects of the original *Tool Box*, two potent questions were raised:

> 1) Is a composite variable such as Academic Resources, a variable that yokes together very different types of measures (a basically qualitative curriculum index, class rank and GPA, test score), as convincing as these measures taken separately in any multivariate account of degree completion (DesJardins, McCall, Ahlburg, and Moye 2002)?
>
> 2) Unlike class rank/GPA and senior test score, the academic curriculum intensity variable is built from components, some of which are high profile in their own right, e.g., Advanced Placement and highest level of mathematics reached in high school. If we substitute the major components for the composite in an account of degree completion, will they be as convincing?

In light of these questions, three distinct ways of setting up the first step in the progression of logistic analyses that lead us to appreciate what makes a difference (and how much of a difference) in completing a bachelor's degree for students who attended a four-year college at any time were explored. The first step covers both student demographics and high school performance.

What happens to all those demographic variables in the "demography only" logistic of table 3 when these three competing approaches were tried out? With the exception of gender, race/ethnicity, and becoming a parent by age 20, the minute the high school performance variables enter, the demographic variables disappear. Taken individually, none of them—first postsecondary generation status, second language dominant, recent immigrant status, family income, number of siblings, and urbanicity of community in which the student's high school was located—meet the statistical criteria for either entering or staying in the logistic models employed in this study. But two of these variables, family income and level of parents' education, play dominant roles in the construct of socioeconomic status, which itself more than qualifies for the logistic treatment.

Repetition of a special note on the components of the high school academic curriculum intensity variable is necessary in the context of this first step in the logistic narrative. With the exception of Klopfenstein and Thomas (2005), a spate of recent reports and commentaries on the Advanced Placement program (e.g., College Board 2005) claim that the original *Tool Box* demonstrated the unique power of AP course work in explaining bachelor's degree completion. To put it gently, this is a misreading. AP is only a *component* of the academic curriculum intensity in both the original *Tool Box* and this replication. But to test the misreadings, AP was tried out as one of three variables that might serve as proxies for curriculum intensity. The other two variables tested as substitutes were a measure of momentum in science (SCIMOM) which includes elements of HIGHMATH and Carnegie units earned in both core laboratory science and all science courses, and number of Carnegie units earned in foreign languages.

So, three distinct approaches to logistic regression models were tried out for Step 1. The first, table 12, keeps the composite variable Academic Resources, and includes nothing else. The second divided Academic Resources into its three components. And the third dropped the high school academic curriculum intensity variable and replaced it with its three proxy components: science momentum, foreign language study, and AP.

Which one of these three versions should be carried forward in the stepwise analysis? In the first version (table 12), maintaining the composite of Academic Resources, only Academic Resources and socioeconomic status quintile are statistically significant (though with a p value of <0.10, SES is a barely influential presence) The Delta-p statistic says that each step up the five-quintile ladder of Academic Resources improves the probability of degree completion by about 15 percent. The Delta-p applied to socioeconomic status quintile says that for each step the probability of degree completion increases by about 7 percent. Expectations do not make a difference, and the demographic variables, while all carrying negative parameter estimates, do not meet the criteria for statistical significance either. Message: At this stage, and in this formulation, the composite representation of student learning in high school, Academic Resources, is a very persuasive construct.

The second and third versions of the Step 1 logistic can be found in Appendix G, and both are far less convincing. In the second version, Academic Resources was divided into its three components: curriculum, performance (class rank/GPA), and test score. The test score component, with a t statistic of 0.35 (far below the threshold requirement of 0.765), disqualifies this version from the logistic narrative. This result also reinforces our previous observation that when both academic curriculum participation and the quality of student effort within that curriculum (grades) improve, test scores will automatically rise and paradoxically become less important with reference to the dependent variable of degree completion.

In the third version of Step 1, of the three proxy variables for high school academic curriculum intensity, only science momentum (that combination of highest level of math and number of Carnegie units in core laboratory science) emerged as statistically significant. Neither Advanced Placement nor foreign language study reached the threshold level of significance, and, with a t statistic of 0.75, foreign language study was on the borderline of disqualification in terms of further consideration. The senior test score quintile variable did not even meet the minimum statistical criterion for entrance. Had we taken this version forward into subsequent stages of student history we would have only one proxy for high school curriculum (science momentum), and no traces of the external measurement of general learned abilities that the senior year test

score quintile conveys. At least the composite index of high school performance, Academic Resources, includes a trace of external assessment.

Table 12. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time—demographic and high school background, version 1: Using the composite variable for high school Academic Resources

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p

Summary decision: The composite variable, Academic Resources, stays in the logistic narrative; other versions of representing high school performance fail.

THIS PAGE INTENTIONALLY LEFT BLANK

Part IV
Matriculation and Beyond: The Features of Postsecondary History

On reflection, the original *Tool Box* made a mistake in the order and boundaries of the blocks of variables entered in its analysis. Following high school background, and tracking students who ultimately attended a four-year college at any time, it jumped first to financial aid, for which the High School & Beyond/Sophomore data set contained detailed information (including unobtrusive Pell Grant files) covering the first four years of a student's postsecondary history. It then considered a configuration of attendance patterns that covered everything from the timing of entry to postsecondary education to extended aspects of attendance such as whether the student *ever* left his or her first institution of enrollment and *never* returned to that institution. Thirdly, it followed this mixture of time periods with a block of first-year performance indicators. The order and content of these three blocks of variables scrambled time and student history.

The Toolbox Revisited unscrambles that sequence so that momentum can be more clearly observed. We begin with the transition from secondary school to postsecondary matriculation, and focus on timing of entry and type of first institution. We then move on to first-year performance, the importance of which is fully justified by the research literature. Only after accounting for the first year do we confront financial aid (which, in the NELS:88/2000 data set, covers only the first two years of post-high school history, and is the weakest section of the study, by far).[28] Longer-term attendance patterns and extended performance (curriculum and trends in grades) come later, as they should.

In shaping the universe for analysis so that a full history is visible, one minor change to the boundaries will be exercised. The NELS:88/2000 cohort was scheduled to graduate from high school in the spring of 1992. Not all of them did, so the upper boundary for high school graduation will now be set at December 1996. Very few cases are affected,[29] but, as the NELS history ends in December 2000, the point of changing the upper boundary is to allow enough time for late high school graduates to build a postsecondary history.

In entering this sequence, the reader should note that the master program generating the mass of student-level variables included on the restricted NCES data sets of transcript-based files for both the HS&B/So cohort and the NELS:88/2000 was basically the same, hence, there were no

---

[28]Financial aid comes *after* first-year performance because the story line is more interested in the potential relationship of aid to completion among those who are *already enrolled.* If the topic was initial access, then the financial aid package for the first year would be part of the postsecondary entry configuration of variables. The NELS:88/2000 unfortunately does not allow us to distinguish modes of financing postsecondary education in the first year from those of the second year.

[29] Those who earned a high school diploma of any kind *after* December 1996 constituted 2.7 percent of all 1992 12th-graders (s.e. = 0.16) and 0.7 percent of all 1992 12th-graders who subsequently attended a four-year college (s.e.= 0.16).

algorithmic differences that would account for change in student behaviors such as attendance patterns and academic performance. There are minor exceptions, and these will be noted in the narrative.

Step 2: Matriculation

The research literature has long held that where one starts out in higher education has enormous consequences, particularly with reference to completing degrees (Velez 1985). The vast majority (78.7 percent; s.e. = 1.15) of the universe under study here started out in a four-year college. Do any characteristics of that first institution stand out in multivariate analysis?

Only selectivity of the first institution was admitted to the Step 2 logistic model (the fact that the institution was a four-year college was not admitted). To be sure, there are other characteristics of the first institution of attendance. But if the dichotomous "selective" variable turns out to have but modest, if any, significance in the account, it is unlikely that other stock institutional characteristics—size, control, residential/commuter ratio—will have any influence, either. The best of the institutional characteristics variables in the literature is probably Stoecker, Pascarella and Wolfle's (1988) "size." This is not a simple measure, rather a factorial scale that includes total enrollment, student/faculty ratio, and public control. However attractive the concept, institutional size rarely breaks through as a stand-alone factor in literature with large national samples because of student taste—some like it large, some like it small—and taste is too variant. All this does not mean that where one starts out is irrelevant to completion, rather it directs our attention to other features of student academic history. More to the point, with 64.8 percent (s.e. = 1.06) of NELS:88/2000 students who attended a four-year college at some time attending more than one institution, and 26 percent (s.e. = 1.01) attending more than two, the task of ascribing influence to institutional characteristics is daunting (for a discussion of this issue, see pp. 81–84).

In addition to the selectivity variable (SELECT), Step 2 includes NODELAY, a marker for direct entry to postsecondary education following high school graduation. It also includes a new variable, ACCELCRD, made possible by the construction of the NELS:88/2000 postsecondary transcript file to reflect the practice of dual-enrollment that expanded during the period the High School Class of 1992 was attending high school and that has become much more visible since then. ACCELCRD sums all college credits earned by course work prior to high school graduation, along with credits earned by examination—including AP, the College Level Examination Program (CLEP), and institutional challenge exams. Most of these credits were earned either prior to matriculation or during the first term of enrollment, though some were earned at later points in the student's undergraduate career. A previous brief analysis of this phenomenon (Adelman 2004a, pp. 55–56) suggested that acceleration might have a bearing on degree completion since the descriptive data indicated a positive relationship between the number of "acceleration" credits earned and both (a) high school academic curriculum intensity quintile and (b) selectivity of the first institution attended.

Table 13 sets forth the relationships of the variables in play at the postsecondary matriculation stage to bachelor's degree completion for students who attended a four-year college at any time. Academic Resources is still in a commanding position, and the Delta-p statistic indicates that with each step up the quintiles of Academic Resources the probability of completion increases by 12.8 percent. Socioeconomic status quintile is still significant, though again, marginally so. Of all the new variables, no delay of entry alone is statistically significant, and its Delta-p says that students who enter college directly from high school increase the probability of bachelor's degree attainment by 21.2 percent, a very persuasive marker.

Table 13. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary entry phase

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p

[a] Variables did not meet threshold criterion for statistical significance

NOTES: Statistically significant variables are highlighted in bold. Standard errors adjusted by root design effect = 2.19. G^2 = 5060.17; *df* =4913; G^2/df = 1.030; X^2 (df) = 1101.0 (9); pseudo R^2 = 0.2127; percent concordant predicted probabilities = 78.5.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The selectivity of the first institution of attendance, while yielding a positive parameter estimate, does not reach the threshold of significance, and the *t* value for acceleration credits, at 0.73, falls just below the threshold for retention in the overall statistical model. The case of acceleration credits is one for which the author hoped for a better outcome, but once a rule is set, it is observed: The variable is dropped from subsequent steps. The demographic variables are

retained, but don't tell us much. And education expectations barely stays under consideration with a *t* value of 0.78. Beattie's human capital analysis (2002) downplayed education expectations as a central feature of explaining outcomes, particularly in consideration of group differences. It turns out that, even with a more sophisticated variable (our "anticipations") than the customary way of marking "aspirations," Beattie is right.

Step 3: First-Year Performance

Now that we have our universe of 1992 12th-graders in college, no matter where they started out, the most prominent initial marker of progress is a configuration of first-year academic performance indicators—and by "first year" is meant the *first calendar year* following the month in which the student first enrolled in their "true" first postsecondary institution after high school graduation.[30]

Most research on the critical first year of postsecondary education takes as its subjects students who start out in the fall term, and, by custom-and-usage, measures of retention (whether term-to-term or year-to-year) begin with fall enrollments. The transcript data, however, teach us that not all students commence postsecondary study in the fall term, and that there is a modest bias in drawing a universe based on fall term beginners only. For all 1992 12th-graders who entered postsecondary education at any time, 82.1 percent (s.e. = 0.83) started in the fall term, 5.8 percent (s.e. = 0.46) started in the summer term, and 12.1 percent (s.e. = 0.71) began in the winter or spring terms (depending on local academic calendars). While the full data on first term of entrance are presented in Appendix L, tables L8a and L8b, it is important to note here that Latino and African-American students are less likely than white students to commence postsecondary study in the fall term, and the same is true when students from lower socioeconomic status quintiles are compared with students from the highest socioeconomic status quintile. Any measure of retention or completion that confines its universe to students who began their postsecondary careers in the fall term is, to put it gently, grossly incomplete.

The cumulative number of variables qualifying for the logistic narrative increases by 50 percent when our field of vision opens out to first-year performance. The logistic model of the original *Tool Box* included three first-year performance variables, two of which were major contributors to understanding degree completion, and are carried forward: a marker for earning less than 20 credits in the first calendar year and a tag for students whose first calendar year GPA fell in the top 40 percent of the GPA distribution for that period. *The Toolbox Revisited* adds dichotomous variables indicating whether the student took any remedial courses in the first calendar year, and

[30]The "true" first institution of attendance excludes (1) colleges and community colleges in which the student was enrolled prior to high school graduation; (2) institutions in which the student was enrolled during the summer immediately following high school graduation and prior to fall term postsecondary entry (unless the institution was the same in both periods); and (3) "false starts," that is, cases in which the student enrolled, but then withdrew during the first term of attendance, only to enroll and complete course work in a different institution at a later point in time (in these cases, the second institution is the "true first institution"). The true first *date* of attendance is the first month of enrollment at the true first institution.

whether the student earned any credits in college-level mathematics during that period. The mathematics variable, identified as potentially potent by Astin and Astin (1993), represents a major departure in the way *The Toolbox Revisited* approaches its subject, for it introduces the potential association of *postsecondary* curriculum with degree completion (the original *Tool Box* did not raise this issue).

The first calendar year of attendance is the year in which students' preparation for postsecondary education is most sorely tested (Pascarella and Terenzini 1991), and in which both remediation and college-level mathematics study serve as indicators of that preparation. The lower division curriculum sets out course "gateways" through which students must pass in both universities (Hanson 1998) and community colleges (Boughan 2001). Every school can identify its list from high enrollment courses[31] and there is no question that most of these gateways require a direct connection to the content of high school curricula that define "readiness." Remediation stalls student momentum toward those gateways; college-level mathematics itself is a gateway.

In a different approach, American College Testing (2004) defines "college readiness" as a remediation-free postsecondary experience, and sets its benchmarks for "readiness" as

> . . . The level of achievement [based on ACT test scores] for students to have a high probability of success (a 75 percent chance of earning a course grade of C or better, a 50 percent chance of earning a B or better) in such credit-bearing college courses as English Composition, [College] Algebra, and Biology. . . (p. 1).

With all due respect to ACT, earning a C—or even a B—in college algebra is not why most students go to school. There are better ways to benchmark, starting with the Academic Resources index of total high school performance in which curriculum (including highest level of mathematics reached in secondary school) dominates and test scores do not. Instead of a grade in a single course, we then acknowledge the proportion of students who completed credits in *any* of five core college-level math courses during the first year of attendance, and, among those who became non-incidental students (i.e., earned at least an adjusted semester's worth of credits), the proportion who *ever* completed credits in those courses. In table 14, one notes right away that among those who start in community colleges and complete college-level math courses in the first year, college algebra is the dominant math course. Among those who start in four-year colleges, it is not the dominant math course, even though it ranks at the top in terms of student participation.[32]

---

[31]Hanson's (1998) list from the University of Texas at Austin ranges from Ecology, Evolution, and Society, to Introduction to U.S. and Texas Government, to General Psychology, to Calculus I and II for Science and Engineering Students.

[32]For more discrete details on credits earned in college-level mathematics, the reader is directed to table L9, Appendix L.

Ironically, the ACT study helps explain why curriculum quality emerges as more influential than test scores in building the Academic Resources composite, and justifies continuing to track curriculum (in this case, using mathematics momentum) across the matriculation line. The test scores are dependent variables that respond directly to increases in the concentration and level of study in each of the major secondary school content areas (see, e.g., Florida Department of Education 2005). The ACT study sees value-added in each step up the math curriculum ladder in terms of scores on the ACT math test. So when the dependent variable is degree completion, it is this curriculum—more than the test score—that sets the value-added tone.

Table 14. Percentage of 1992 12th-graders who earned credits in five categories of college-level mathematics courses in the first calendar year of attendance, and among non-incidental students,[a] the percentage who ever earned credits in those five categories, by type of institution first attended

College-level math category	Percent completing during first calendar year of attendance, starting in:		Among all students earning more than 10 credits, percent who ever earned credits in
	Four-year colleges	Community colleges	
College algebra	21.7 (1.01)	17.0 (1.19)	28.2 (0.92)
Precalculus	18.6 (0.85)	4.9 (0.77)	17.4 (0.69)
Calculus	17.6 (0.96)	1.6 (0.26)	16.8 (0.74)
Finite mathematics	4.6 (0.54)	0.9 (0.30)	6.4 (0.46)
Statistics, probability	5.3 (0.42)	2.3 (0.58)	19.6 (0.82)

[a] A non-incidental student is defined as one who earned more than 10 undergraduate credits.
NOTES: Standard errors are in parentheses. Weighted Ns: four-year college beginners = 1.14M; community college beginners = 789k; all who earned more than 10 credits = 1.84M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

But does that mean that curriculum continues to have the same influence in a postsecondary setting? The issue comes up twice in the sequence of logistic models, first in table 15, which presents the results of the Step 3 logistic: first-year performance variables. What do we see?

- Earning less than 20 credits in the first calendar year following postsecondary entry is a distinct drag on degree completion. The Delta-p says that falling below the 20-credit threshold lessens the probability of completing a bachelor's degree by a *third*!

- First-year grades, a proxy for both student effort and acclimation to the academic demands of a new environment (Pascarella and Terenzini 1991), move in the opposite direction from low credits: If one's first-year GPA falls in the top two quintiles, the probability of earning a degree increases by nearly 22 percent.

Table 15. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: First postsecondary year performance

† Variables did not meet threshold criterion for statistical significance
NOTES: Statistically significant variables are highlighted in bold. Standard errors adjusted by root design effect = 1.78. $G^2 = 4411.64$; $df = 4764$; $G^2/df = 0.926$; X^2 (df) = 1516.37(12); pseudo $R^2 = 0.2893$; percent concordant predicted probabilities = 83.3.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

- Academic Resources and socioeconomic status are the only other statistically significant variables. The Delta-p story for socioeconomic status quintile remains at roughly the same level: Each step up the SES ladder increases the probability of degree completion for this population by 6 percent or so. The Delta-p strength for Academic Resources, however, falls from 12.8 percent in the postsecondary entry model to 7.5 percent here, a natural consequence of the introduction of other competing curricular and grade-based variables.

- The two new curricular variables for remediation and college-level mathematics produce *t* statistics that justify carrying them forward, but do not reach even a threshold statistical significance level of $p<0.10$.

In the last observation there is a surprise that calls out for explanation. The parameter estimate for remediation in the first year is positive, not negative as conventional wisdom would assume. Students in this group who took any remedial courses in the first year earned bachelor's degrees at a 48.7 percent rate (s.e. = 2.70) compared to 69.9 percent (s.e. = 1.26) of those who did not take remedial courses in the first year (not in table). That is a significant and meaningful difference from which, one might assume, remediation would be a negative. But there are other variables in this model that determine the sign and strength of the parameter estimate and its statistical significance. In a study of the academic careers of traditional-age community college students, the author found that remediation (one dichotomous variable marking any remedial reading, and one multi-level variable based on type and number of remedial courses) did not affect either transfer or (for students who did not transfer) completion of an associate degree (Adelman 2005a). Other recent research, using a very sophisticated targeting of students whose need for remediation may differ according to the school they enter, goes beyond the finding that remediation is not a drag on degree completion to demonstrate that, in terms of persistence, remediation yields decidedly positive results (Bettinger and Long 2005). Two studies do not make for a definitive conclusion, but the evidence that students who successfully pass through remedial course work gain momentum toward degrees is beginning to build.

As for the other variables in the Step 3 model, we note that NODELAY drops out of the statistically significant range with an indirect message of "once a student is in college, their performance counts more than when they arrived." In other words, the ramifications of delayed entry can be overcome, but only with the kind of considerable effort reflected in first-year credit accumulation and first-year grades. The reader will note of table 16, however, that when financial aid variables are part of the logistic model, NODELAY rises back above the significance threshold.

Step 4. Adding Financial Aid to the Equation

There is a major difference between the High School & Beyond/So and NELS:88/2000 data sets in the nature and temporal coverage of financial aid information. For the HS&B/So, an unobtrusive Pell Grant file provided data on at least one type of grant-in-aid. Student reports covered four years (1982–86) of other types of grants-in-aid, loans, and work (including, but not confined to, college work-study from all sources) while enrolled. Three dichotomous variables resulted: GRANT, LOAN, and STUWORK. In the original *Tool Box* study, based on the HS&B/So data, GRANTS and STUWORK were modestly significant contributors to the explanation of bachelor's degree completion in both the financial aid and attendance pattern steps of the model, but fell below the threshold of statistical significance as soon as first-year and extended performance factors were taken into consideration.

The NELS:88/2000 financial aid information covered the period 1992–94 only, i.e., the first two years following the modal high school graduation date for the cohort. In the initial input versions of the data in 1994 (the third NELS follow-up survey), the information was provided by students for each institution attended, and in answer to the question, simply phrased, "besides your previous savings, how are you paying for this?" The options were grants, loans, work, parents, and other forms of aid. For students who attended more than one institution during the 1992–94 period, it is thus possible for different combinations of financial aid types to be attached to the

discrete attendance cases. For our purposes, if a student reported using any one form of financial aid or support (grants, loans, work-study or campus job) at *any* institution attended, a positive entry was recorded for that *type* of financial aid or support for that student.

Table 16: Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary financing

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

For those who ask about the importance of initial financial aid package offerings to students' choice of where to enter the postsecondary system, the NELS:88/2000 is of little help. The Beginning Postsecondary Students longitudinal study of 1995/96–2001, on the other hand, has the data elements but does not provide convincing guidance: For traditional-age students (i.e., those who began at age 20 or younger)in the BPS95/96–2001, 7 percent (s.e. = 0.7) of those who

started at four-year colleges and had applied to more than one school and 3.4 percent (s.e. = 1.6) of those who started at community colleges and had applied to more than one school said the financial aid package was the principal reason for their selection.[33] Such percentages do not merit further inquiry.

We come to Step 4 of the logistic model, then, with a weak collection of dichotomous financial aid variables, and the results must be judged in that light. As table 16 reveals, only the variable indicating whether the student received College Work-Study funds from any source or held a campus job was even admitted to the *Toolbox Revisited* model, and even then, produced a *t* statistic of 0.66, below the 0.765 required for carrying forward to the next step. Before that next step is taken, though, this narrative needs an important pause.

A Critical Pause for the Second Calendar Year

The literature on postsecondary persistence, retention, and attrition has historically taken its pauses and measures at the end of the student's first academic year. A more constructive notion for plotting the path of academic momentum on the far side of the postsecondary matriculation line may be to give students two full calendar years following the initial date of enrollment before taking their progress pulses, yet the research on this possibility has been surprisingly limited to date (see Smith 1995, and Nora, Barlow and Crisp 2005).[34] Looking backwards from the final degree completion status of our NELS:88/2000 universe to mark cumulative change to the end of the second calendar year following entry on key indicators provides a richer framework for advisement.

"Retention" and its paradoxes

No national database will support the assertion that a quarter of four-year college entrants and half of community college entrants "do not return for their second year" (Kazis 2004, p. 4). Contrary to this negative conventional wisdom, the proportion of students in the universe for this study who "persisted" to the second postsecondary year is substantial. The definition of "persistence" is active and student-centered, marks a calendar academic year as July 1 through the following June 30, and runs as follows:

> Whenever the student first enrolls and earns credits in postsecondary education (summer, fall, winter, spring) marks the first academic calendar year of their postsecondary history.
>
> If the student enrolls and earns credits at *any* time and at *any* institution during the next academic calendar year, that student has "persisted."

---

[33]National Center for Education Statistics, BPS95/96–2001 Data Analysis System; NCES 2003-173.

[34]Nora, Barlow, and Crisp (2005) offer a potentially promising analysis of a cohort at one nonselective four-year institution that is undercut somewhat by lack of data on age distribution and the fact that retention and six-year graduation rates are confined to that institution. But the authors include cumulative GPA to the second year, enrollment intensity, remediation, three core courses (what this study calls "gateways"), and a rough course withdrawal factor—all of which speak in favor of their approach.

"Retention," which puts the student in a passive role vis-a-vis a specific institution, is not the right word to describe this sequence: It's "persistence." There are two important points to underscore: (1) This definition reveals an extremely high rate of persistence, but (2) whether we talk about institutional "retention" or student "persistence," the true measure is not the fact of the event, rather the *quality* of the student's record going forward. The second academic calendar year offers students the opportunity to recapture any lack of momentum of the first. In that respect, the second year may be even more important than the first.

The unhappy paradoxes of retention rates and retention quality[35] are revealed in table 17. The universe for the table is confined to students with complete records. The proportion of students who enrolled sometime, somewhere in the second academic calendar year following entrance to postsecondary education is about 90 percent for all NELS:88/2000 postsecondary students and 96 percent for those with standard high school diplomas who subsequently attended a four-year college at some time (and in this group, just about everybody who started in community colleges). These data ought to destroy the mythologies of low first-to-second year retention (which, by the formulas most commonly applied, include only students who started full-time and in the fall semester and returned to the same school the following fall semester). This account gives students credit for persisting, and gives students who started in sub-baccalaureate trade schools credit for earning a certificate in their first year and then going on their way.[36]

However, this account also shows that, even when one confines the universe to the group being followed in *The Toolbox Revisited*, roughly one out of five entered the second year with low credit momentum, and roughly one out of six carried low first year GPAs. The overlap, too, is considerable: 40 percent of those coming out of their first year with fewer than 20 credits were also in the bottom quintile of first year GPA (not in table). Low credit momentum is also due to the number of courses taken in the first year, with 41.7 percent (s.e. = 2.46) of those who earned less than 20 credits attempting seven or fewer courses—a proxy for part-time status—versus 2 percent (s.e. = 0.27) of those who emerged with 20 or more credits. The reason for counting course attempts and not credit attempts is a by-product of the volume of remedial courses (which do not carry additive credits). Half of the low first-year credit group were tied up in remediation, versus 17 percent of those who reached or exceeded the 20-credit threshold.

---

[35]As Tinto (1987) noted, "The point of retention efforts is not merely that individuals be kept in college, but that they be retained so as to be further educated." (p. 136) Poor retention quality significantly lowers the odds of further education.

[36]The persistence rates for all 1992 12th-graders noted in this paragraph are slightly different from those previously reported (Adelman 2004a, table 3.4, p. 42), where the weight for known postsecondary participants (not the weight for students with complete records) was used.

Table 17. Percentage of 1992 12th-graders with complete postsecondary records who persisted in postsecondary education from their first calendar year of enrollment to a second calendar year, by type of institution first attended, and, of those who persisted, percentage with lagging first-year performance

Student group	Persisted	Earned one-year certificate	Did not persist	Of those who persisted, first-year performance indicators: Less than 20 credits	In lowest GPA quintile
All 12th-graders	89.7 (0.57)	0.9 (0.13)	9.4 (0.55)	33.2 (1.12)	17.4 (0.81)
Type of first institution					
Four-year college	95.2 (0.59)	0.1 (0.03)	4.7 (0.59)	15.9 (0.91)	15.2 (0.86)
Community college	84.0 (1.12)	0.4 (0.10)	15.6 (1.11)	60.7 (1.93)	21.5 (1.76)
Other sub-baccalaureate	71.5 (3.06)	14.8 (2.52)	13.7 (2.01)	31.4 (5.17)	11.9 (2.70)
All with standard high school diploma by December 1996 who attended a four-year college at any time	95.8 (0.50)	0.1 (0.03)	4.2 (0.50)	21.9 (0.98)	15.5 (0.88)
Type of first institution					
Four-year college	95.2 (0.59)	0.1 (0.03)	4.7 (0.59)	15.9 (0.91)	15.2 (0.86)
Community college	97.9 (0.87)	2.1 (0.87)	#	44.0 (2.93)	15.7 (2.72)
Other sub-baccalaureate	Low N[a]	Low N[a]	Low N[a]	Low N[a]	Low N[a]

Rounds to zero.
[a] Reporting standard not met.
NOTES: Standard errors are in parentheses. Row totals for the three persistence/retention columns may not add to 100.0 percent due to rounding. Weighted N for all 12th-graders with complete postsecondary records: 1.88M; for all 12th-graders with complete postsecondary records who attended a four-year college at any time and who earned a standard high school diploma by December 1996: 1.38M

Momentum at the end of the second calendar year

First-year background certainly helps explain some of what transpires in student histories by the end of the second year. Tables 18 and 19 offer a skeleton of two-year performance so that future research on the momentum hypothesis can become more sophisticated than this outing. The information is presented in two separate tables to make sure the messages are clear. The most overwhelming phenomenon to note in table 18 is that by the end of the second calendar year, those who never earned their bachelor's degree were already 25 credits behind those who did (57.4 credits earned by those who eventually received a bachelor's degree versus 31.6 for those who did not earn the degree), and for those who were behind, there was no difference between starting in a four-year college and starting in a community college. One set of "culprits" was attendance pattern related: lower percentage full time, lower percentage continuously enrolled, lower percentage getting to and beyond 20 credits in the first calendar year. All these factors decrease the probability of completion.

Credit momentum is clearly in play. For the universe of this study, the mean number of credits earned within two calendar years of the date of entry was 49.5 (s.e. = 0.51). It takes a lot of work in the second calendar year for those whose additive credit totals in the first year were less than 20 to reach that mean, and only 3.6 percent (s.e. = 1.03) did, compared with 77.6 percent (s.e. = 1.02) for those who earned 20 or more credits in the first year.

But a second set of negative vectors is clearly that of academic performance. In table 18 the spread in mean grade point average between those who eventually earned the degree and those who did not is substantial by the end of the second year, and it is not surprising that nearly one in five of those who never earned any credential had already become status dropouts (see table 19). The data remind us of a common sense fact that few analysts or commentators ever acknowledge when writing about student academic careers after high school: A measurable proportion of postsecondary students will not perform well (for GPAs of status dropouts, by timing of permanent departure from postsecondary education, see Appendix H, table H4). Higher education has standards, and some students will, in fact, be placed on academic probation or be formally dismissed for academic reasons, i.e., flunk out. These compressed signals are not as likely to be entered on official records as graduation with honors (*cum laude*, etc.). [37]

[37]Compressed signals are used to mark extremes of academic performance. The American Association of Collegiate Registrars and Admissions Officers has reported that 90 percent of its member institutions enter graduation with honors on transcripts (AACRAO 2002), and, in a 2005 survey of transcript practices , found that 70 percent enter academic probation or dismissal (www.aacrao.org/pro_development/surveys/transcript05.htm).

Table 18. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, credits earned and GPA at the end of the second year following initial enrollment in postsecondary education, and extended postsecondary attendance and performance markers, by ultimate bachelor's degree status

Selected attendance and academic performance markers	Of those who earned bachelor's		Of those who attended a four-year college, but did not earn bachelor's	
Earned 20 or more credits in first year	90.8 (0.79)		46.8 (1.88)	
Always full-time	79.3 (1.04)		37.9 (1.85)	
Continuously enrolled	93.5 (0.58)		45.7 (1.93)	
Cumulative credits and GPA two years from entry				
	average credits	mean GPA	average credits	mean GPA
All students in universe	57.4 (0.35)	2.91 (0.14)	31.6 (0.86)	2.13 (0.36)
Started in four-year college	58.8 (0.30)	2.92 (0.14)	32.1 (0.85)	2.03 (0.39)
Started in community college	49.2 (1.30)	2.84 (0.42)	31.6 (2.20)	2.37 (0.81)
If no remedial courses in first year	58.8 (0.36)	2.97 (0.14)	34.1 (1.13)	2.19 (0.32)

NOTES: Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table 19 serves another function in the narrative, namely, to look back from the end of the longitudinal study in December 2000, and ask what percentage of postsecondary students were no longer enrolled and had not earned a credential of any kind, by timing of the gap between their first month and last month of enrollment? These students are called "status dropouts" (though they may return to postsecondary education at a later date). While the general subject of timing and reasons for departure is elaborated in Appendix H, table 19 looks at the eventual dropout population only by their status at the end of the second year of attendance. It says, very simply that:

(a) of those who never earned a credential, 23 percent became status dropouts by the end of the second year;

(b) of all those who ultimately became status dropouts over an 8.5 year period, roughly a third did so by the end of the second year;

(c) for those who dropped out in either the first or second year, GPAs were decidedly below thresholds required for degrees, but

(d) when asked why they left without a degree, less than 6 percent cited academic reasons (also see Appendix H, table H2).

Yes, the status dropout rate proves higher during the first year than the second, but by the end of the second year, the loss of academic momentum is very evident.

Table 19. Status dropout rates at the end of the second year following initial enrollment in postsecondary education of 1992 12th-graders who attended a four-year college at any time, and allied academic performance data

Timing of departure	Percent of those who never earned a degree who became status dropouts	Percent of all who ultimately became status dropouts	Mean grade point average at end of enrollment	Percentage of dropouts who said they left for academic reasons
Left postsecondary without credential, never returned:				
during first 11 months	13.1 (1.62)	19.1 (1.33)	1.68 (0.81)	5.9 (1.92)
during months 12–23 after first enrollment	10.3 (1.26)	13.3 (1.56)	1.98 (0.68)	5.6 (1.40)

NOTES: Standard errors are in parentheses. Weighted N for status dropouts in first two years = 103k.

Curriculum gateways

As significant in the panorama of student performance through the end of the second calendar year are rates of participation in specific courses identified as curricular gateways in four-year colleges by Hanson (1998) and in community colleges by Boughan (2001). The taxonomy of postsecondary courses used to code the transcripts for both the High School & Beyond/ Sophomore cohort and the NELS:88/2000 data files includes over 1100 discrete course categories[38] of which 645 were used to answer the following question: "What percentage of students in the *Toolbox Revisited* universe successfully completed credits in each course category between the month they first entered postsecondary education to a point two calendar years later?" Table 20 presents the 25 academic course categories[39] in which the highest percentage of those who eventually earned bachelor's degrees garnered credits during that time span, and for each course category, also presents matching percentages for students who attended a four-year college at any time but who did not complete a bachelor's degree.

[38]The most recent version, *Taxonomy of Postsecondary Courses Based on the National Transcript Samples, 2003*, is available at www.ed.gov/rschstat/research/pubs/empircurr/index.html.

[39]Though their enrollments were substantial, physical education activities, health information, physical conditioning, orientation, and personal development courses were excluded.

Table 20. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, course participation rates by the end of the second year following initial enrollment in postsecondary education, by ultimate degree status

	Percentage of students who earned credits by the end of the second year following initial enrollment	
Course	Earned bachelor's	Did not earn bachelor's
English composition	82.3 (1.03)	53.4 (1.40)
General psychology	61.5 (1.18)	32.2 (1.19)
General biology	35.2 (1.24)	12.4 (0.87)
Introduction to sociology	34.4 (1.12)	19.6 (1.08)
U.S. history surveys	32.6 (1.22)	14.9 (0.97)
Micro/macroeconomics	30.3 (1.14)	9.3 (0.88)
General chemistry	30.1 (1.05)	7.5 (0.74)
College algebra	26.7 (1.20)	13.9 (0.94)
U.S. government	25.3 (1.12)	10.4 (0.74)
Calculus	23.7 (1.11)	3.2 (0.43)
Precalculus	22.4 (0.95)	5.8 (0.68)
Oral communication	20.4 (1.03)	11.0 (0.72)
Introduction to philosophy	18.9 (1.05)	5.0 (0.49)
Literature: general	18.9 (1.03)	5.0 (0.56)
Spanish: intro and intermed	18.8 (1.01)	5.9 (0.61)
Western civilization	17.0 (0.93)	6.5 (0.62)
Introduction to computing[a]	15.8 (0.90)	10.9 (0.81)
Introductory accounting	15.7 (0.81)	7.2 (0.56)
Statistics (mathematics)	14.4 (0.79)	3.7 (0.68)
World civilization	12.1 (0.93)	4.0 (0.50)
General physics	12.1 (0.83)	2.3 (0.42)
Public speaking	11.2 (0.78)	6.2 (0.67)
Music appreciation	10.9 (0.84)	3.8 (0.45)
Drama criticism/history	10.7 (0.73)	2.9 (0.46)
American literature	10.3 (0.71)	1.7 (0.28)

[a] This is not "introduction to computer science."

NOTES: Standard errors are in parentheses. Weighted N for bachelor's recipients = 935k; for those who did not earn bachelor's = 513k. All row estimate comparisons are significant at $p<.05$.

SOURCE: National Center for Education Statistics: NELS:88/2000 postsecondary transcript files (NCES 2003-402 and Supplement).

This is a story that moves curriculum details forward from high school. It is empirically-driven, which is to say that the volume of course participation identifies the gateways for both community college transfer students and those who started in four-year colleges in the NELS:88/2000 cohort. Given the disparity in the number of credits accumulated by the end of the second academic calendar year between those who eventually earned the bachelor's degree and those who did not, the spreads in participation rates in these 25 course categories are not surprising. The ratios of these percentage participation rate contrasts are 7:1 in calculus, 6:1 in American literature, 5:1 in general physics, 4:1 in general chemistry, and more than 3:1 in precalculus, micro/macroeconomics, introduction to philosophy, general literature surveys, statistics, history/criticism of drama, and world civilization. These courses cover the full range of traditional lower-division distribution requirements (akin to pick one from bin A, two from bin C, etc.) in four-year colleges and general studies associate degree requirements (the bulk of the transfer curriculum) in community colleges, with the standard non-remedial English composition and college algebra the most visible gateways for the community college group (Boughan 2001).

The list of 25 discrete categories in table 20 invites aggregation and, with aggregation, the inclusion of other lower division courses that serve gateway roles. For example, there are four college-level mathematics courses among the 25, and they certainly can be aggregated as we have already done in our assessment of first-year performance. General biology is not the only introductory biology course category in the taxonomy used. Some institutions still use a zoology-botany sequence; others open the study of life forms with cellular biology; others, still, offer the option of human biology as a starting point. All of these course categories are in the taxonomy, and joining them with general biology in an aggregate allows a broader and more accurate coverage of participation in gateways to upper division course work requiring a grounding in the biological sciences.

Table 21 takes this alternative approach to describing the curricular participation of students who earned bachelor's degrees and those who did not. Table 21 uses 14 aggregate gateways, two of which are single-course categories repeated from table 20 (general psychology and micro/macroeconomics). While Appendix I provides a listing of all course categories under each aggregate, a few notes are necessary in the text:

- Humanities other than literature covers multidisciplinary introductions to the humanities, introduction to philosophy, ethics, and introduction to religious studies (usually a comparative religions survey). It does not include foreign languages.

- "Foundation business" is included for two reasons. First, business fields have historically claimed the largest percentage of majors among traditional-age bachelor's degree completers and a substantial proportion of associate degrees awarded to traditional-age students by community colleges (Adelman 2004a, tables 5.1, p. 61 and 5.4, p. 65). Secondly, prospective business majors appear to take at least one introductory gateway course in the area during their first two years (introduction to business, business law or business legal environment, and/or introductory accounting).

Table 21 displays not only the percentage of students in the bachelor's and no-bachelor's groups who earned credits in each of the 14 aggregates, but also, for those who earned any credits in the aggregates, the average number of credits earned. The reader will notice first, that the use of aggregates narrows the difference in participation rates between the two groups. For example, in the category of standard English composition, the difference in participation rates between those who eventually earned a bachelor's degree and those who didn't is 82.3 percent to 53.4 percent (table 20); but when the category becomes "college-level writing," and includes technical writing, creative writing, and advanced essay, the participation difference narrows to 84.5 percent to 68.6 percent. That is still a significant gap, though not as severe as others in table 21. For the record, the credits earned in the aggregates of table 21 account for 59 percent of all credits earned by students in this study during their first two years of postsecondary education.

Table 21. Of 1992 12th-graders who earned a standard high school diploma by December 1996 and attended a four-year college at any time, participation rates in lower-division course category aggregates and average number of credits earned in each aggregate by the end of the second year following enrollment in postsecondary education, by ultimate degree status

	Earned bachelor's degree by December 2000		**Did not earn bachelor's degree by December 2000**	
Course aggregate[a]	Percentage completing credits	Average credits earned	Percentage completing credits	Average credits earned
College-level writing	84.5 (0.95)	4.96 (.046)	68.6 (2.05)	4.83 (.091)
Oral communication	35.6 (1.21)	3.38 (.054)	26.2 (1.59)	3.15 (.080)
Computer-related	24.5 (1.03)	3.42 (.057)	17.2 (1.52)	3.31 (.091)
Intro biological sciences	42.1 (1.25)	5.21 (.088)	22.3 (1.53)	4.96 (.160)
Intro physical sciences	40.2 (1.15)	7.46 (.142)	15.8 (1.33)	5.79 (.223)
College-level mathematics	70.5 (1.20)	6.30 (.103)	37.5 (1.87)	5.34 (.225)
Core history	56.0 (1.27)	3.04 (.132)	34.6 (1.82)	4.13 (.099)
General psychology	61.5 (1.18)	3.33 (.030)	42.0 (1.95)	3.32 (.082)
Micro/macroeconomics	30.3 (1.14)	4.69 (.088)	13.1 (1.35)	3.86 (.112)
Humanities except literature	38.2 (1.24)	4.20 (.140)	19.1 (1.50)	3.55 (.124)
Literature	45.1 (1.30)	4.48 (.087)	19.8 (1.39)	3.84 (.144)
Core social sciences	62.6 (1.27)	4.57 (.080)	42.8 (1.85)	4.22 (.115)
Visual/graphic arts	17.3 (0.96)	5.12 (.230)	10.1 (0.98)	5.47 (.488)
Foundation business	19.9 (0.88)	5.17 (.120)	14.2 (1.41)	4.86 (.227)

[a]For a listing of courses under each aggregate, see Appendix I.

NOTES: Standard errors are in parentheses. Weighted N for those who earned bachelor's degrees: 935k; for those who did not earn bachelor's degrees: 513k.

SOURCE: National Center for Education Statistics: NELS:88/2000 postsecondary transcript files (NCES 2003-402 and Supplement).

At the same time—and with few exceptions—the differences in average credits earned in the 14 aggregates are negligible, statistically insignificant, or meaningless—or all three of the above. In other words, when students who did *not* earn a degree took courses in these aggregates, they earned credits at the same rate as those who *did* earn the degree. The problem is still that a much lower percentage of those who did not earn degrees even pass through these gateways.

What does this account of the second calendar year mean?

The sequence of steps of the logistic narrative of what matters in degree completion in *The Toolbox Revisited* moves from first-year performance (with an apostrophe of financial aid considerations) to longer-term vistas of attendance patterns and extended performance. It does not make a distinct stop at the end of the second year. And yet by the end of students' second year, a significant spread in credit generation, academic performance, and curricular participation has opened up between those who eventually completed bachelor's degrees and those who did not. An event history account appropriate to the analysis of withdrawal (e.g., DesJardins, Ahlburg, and McCall 1999) would include a measurement at this point. So as the logistic narrative heads into consideration of attendance patterns (Step 5), the reader might ask what would happen if we took first year-credits and first-year GPA and replaced those variables with *second*-year cumulative measures.

An experimental logistic was constructed in response to that hypothetical question (see Appendix L, table L10). What happened? The Delta-p statistic for the credits variable barely budged and the Delta-p for GPA declined but slightly, i.e., at first glance, it doesn't make a difference whether one uses first- or cumulative second-year measures. At the same time, though, the strength of that cumulative second-year credits substitute[40] wreaked havoc on critical variables that would otherwise be highlighted under attendance patterns, e.g., community college transfer and four-year-to-four-year transfer. As we will note in a moment, disentangling the consequences of different kinds of multi-institutional attendance is more critical to the analysis of degree completion than status at the end of the second year.

What about the gateway lower-division courses taken by the end of the second calendar year? Are any of them key portals to degrees? Beyond college-level writing (a requirement) and college-level mathematics, this is not a fair question, for the answer depends on a student's major and the requirements of the degree-granting department. Consider an English major who took general physics, the introductory micro/macroeconomics sequence, and introduction to design to satisfy distribution requirements. None of these courses (which are gateways to upper-division offerings in other fields) is a portal to completing a degree in English, though one could argue that they provide literature majors with analytic tools, reference points, and contexts that can only

[40]The variable for cumulative credits to the end of the second calendar academic year was constructed in a manner different from the dichotomous presentation of first calendar academic year credits. Cumulative credits is a categorical variable with four levels based on empirical mean credits earned and standard deviation (49 and 19 respectively): 0–29, 30–49, 50–69, and 70 or more.

enrich their interpretive powers. In fact, it could also be argued that the distribution courses gathered in the 14 aggregates of table 21 are secondary in propulsive power to the second level of course work in specific fields. For example, "everybody" takes general psychology, but those who log experimental psychology and developmental psychology are establishing a beachhead in the field, and those courses become the real portals to the degree.

One might use the number of curricular "gateways" through which students had passed by the end of their second calendar academic year as an independent variable, but the national samples with which we work in grade-cohort longitudinal studies would require consensus of academic administrators as to the curricular locations and expected threshold numbers of these gateways, and that consensus is simply not available. In fact, given the variety of presentations of postsecondary curricula across over 3,000 degree-granting institutions, that consensus may be impossible. This is ultimately a matter for local configuration and analysis (for a course cluster approach, see Zhai, Ronco, Feng, and Feiner 2001) as well for future research that would revisit the differential course work hypothesis in *postsecondary* contexts that appeared in the literature a decade ago (e.g., Ratcliff et al. 1995; Kroc, Howard, Hull, and Woodard 1997). As this pause in the narrative of *The Toolbox Revisited* demonstrates, though, those analyses cannot be profitably engaged on the basis of the student's first-year work alone. The second year is just as important.

Step 5: Postsecondary Attendance Patterns

One of the principal contributions of *Answers in the Tool Box* was to document, on a national scale, what college and community college registrars, institutional research officers, and enrollment managers had known for some time: the increasingly complex enrollment patterns of postsecondary students (Hearn 1992; Kearney, Townsend, and Kearney 1995). This complexity has steadily accelerated since the 1970s, when the first high school cohort tracked by the National Center for Education Statistics attended college (for historical comparisons of multi-institutional attendance patterns, see Appendix L, table L11). It is not merely a case of the proportion of non-incidental[41] undergraduates attending more than one school increasing from 47 to 57 percent;[42] it is more a question of *how* they attended more than one school, and in what combinations and order (Adelman 2004a, pp. 45–50).

The most critical distinction on this dynamic landscape is between transfer and multi-institutional attendance. Transfer is a migration that is formally recognized by system rules, a sequential movement from a *de jure* status in one institution to a *de jure* status at a second institution (or third, or fourth). Furthermore, the student's stay at the second institution is not a short visit. So, for example, the beginning community college student who earns 46 credits at the first school and 5 credits at the second is a multi-institutional student not a transfer student. In the context of

---

[41]"Non-incidental" means students who earned more than 10 credits in their undergraduate careers. Those who earned 10 or fewer credits do not accumulate enough history for analysis of attendance patterns.

[42]Kuh et al. (2001) found that 53.2 percent of the 32 thousand seniors who participated in the 2000 National Survey of Student Engagement had attended more than one institution.

a four-year student's history, earning 102 credits at the first school (ultimately, the degree-granting school), 21 credits at a different four-year college and 9 credits at a community college along the way, involves a situation in which *credits* are transferred, not the student. But the student who begins at a community college and earns 44 credits at the community college before attending a four-year college, then earns 55 credits from the four-year college and is still enrolled at the four-year college at the end of our tracking period is a transfer student.

Whether and how students attend more than one school may also depend on student performance in the first calendar year of enrollment. Using the five-year Beginning Postsecondary Students longitudinal study of 1989–94, McCormick (2003) demonstrated that for students who started in four-year institutions, the higher the first-year self-reported GPA, the more likely the student would stay put, whereas for students who started in two-year colleges, a higher GPA was associated with transfer, hence, with multi-institutional attendance. Do these findings hold up in a transcript-based longitudinal study such as the NELS:88/2000? Table 22 outlines the corroboration: For four-year college students, McCormick's observation is unconditionally seconded; for community college students, the difference between attending one school and two schools strongly supports the argument.

Table 22. Relationships of grade point average (GPA) in the first year of attendance to number of institutions attended by 1992 12th-graders, by type of first institution attended

Type and number of institutions	First year GPA
Started in four-year college	
One institution	2.74 (0.03)
Two institutions	2.61 (0.04)
Three or more institutions	2.53 (0.04)
Started in community college	
One institution	2.39 (0.05)
Two institutions	2.59 (0.04)
Three or more institutions	2.45 (0.09)

NOTES: Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The students in the subject universe of this study were even more mobile than the NELS:88/2000 cohort as a whole: 35.9 percent (s.e. = 1.17) attended only one institution, compared with 46.2 percent (s.e. =1.04) of all NELS students who earned any postsecondary credits. And our subjects were more likely to attend *more than two* institutions than the larger universe (25.3 percent (s.e. = 1.15) versus 20 percent (s.e. = 0.81). This higher degree of

mobility invites us to identify the deeper structures of attendance so that we can better sort the relationships between starting point, performance, migration, and degree completion.

For those students who attended more than one school, table 23 lays out some basic patterns. One should be very careful in reading them. The universe consists of the 64 percent of 1992 12th-graders who not only attended a four-year school at any time *but also* attended more than one institution as undergraduates. Institutional mobility is built into the definition. It is not surprising (in fact, it is outrightly redundant) that reverse transfers do not earn bachelor's degrees and that classic community college transfers who earn bachelor's degrees receive them from an institution other than the one first entered.

Those obvious observations aside, the most intriguing students in this configuration are what de los Santos and Wright (1990), Borden (2004), and others have called "swirlers." The basic definition of "swirling" follows a pattern first observed in the High School & Beyond/ Sophomore cohort data and was labeled "alternating sectoral enrollment." In this pattern, the student starts in either a four-year college or a community college, and moves back and forth between them for at least one cycle, accumulating more than 10 credits from both sectors in the process. In the sample isolated in table 23, 63 percent of these cycles began in four-year colleges

Table 23. Combinations of institutions attended by 1992 12th-graders who attended a four-year college at any time who also attended more than one school, and percentage earning bachelor's degrees under each combination

		Earned bachelor's degree	
Institutional combination	Percent attending	Total	From other than first institution
Two or more four-year colleges	31.8 (1.41)	82.3 (1.52)	42.3 (2.57)
Reverse transfer (four-year to community college)	9.7 (1.00)	<0.1 (0.42)	N.A.
Community college to four-year college (including classic transfers)	24.0 (1.37)	58.1 (2.97)	99.7 (0.26)
Alternating sectoral enrollment ("swirling")	15.4 (1.24)	39.1 (3.77)	69.7 (4.55)
Four-year-college-based student attending community colleges for incidental course work	14.3 (1.01)	86.4 (2.32)	24.6 (4.39)
Other combinations	4.7 (0.62)	4.6 (1.42)	45.1 (13.5)

NOTES: Standard errors are in parentheses. Column for attending may not add to 100.0 percent due to rounding. Weighted N=753k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

and 37 percent in community colleges (s. e. = 3.98; not in table). Furthermore, 57.6 percent of the students engaged in just one cycle of alternating enrollment while 42.4 percent rotated through two or more alternating cycles of attendance (s.e. = 4.05; not in table). Among the major categories of students who attended more than one school in table 23 there is a broad range of bachelor's degree completion rates (39 to 86 percent), and the "swirlers" are at the low end of that range.

What's the point? Attendance patterns, as accounted for in the history of the High School Class of 1982 (the HS&B/So), presented paradoxes. As a dichotomous variable in the original *Tool Box*, multi-institutional attendance evidenced no association with bachelor's degree attainment; classic community college transfer bore strong and positive fruit; but the more general phenomenon of attending more than one institution and not returning to the first institution of enrollment evidenced a strong negative relationship to degree completion. These paradoxes are unwound in table 24, the logistic account of the associations between the increasingly complex postsecondary attendance patterns of the 1990s and degree completion.

As befits the topic of attendance patterns, the variables considered and admitted to the Step 5 logistic model are those of time and place:

Ever part-time:	flagging those students who, at some time in their undergraduate careers, enrolled part-time in an academic term other than a summer term;
Summer:	number of credits earned during summer terms in three bands: none, 1–4, and more than 4;
Classic transfer:	community college to four-year after earning more than 10 credits from the community college;
Four-to-four:	four-year college to four-year college transfer; and
Multiple schools:	marking students who attended more than one institution, whether they formally transferred or not.

Actually, one major time-related attendance pattern variable is purposefully left out of the equation, continuous enrollment—or NOSTOP, as it is abbreviated. NOSTOP was one of the most powerful of the postsecondary history variables in the original *Tool Box*. Given the length of the grade-cohort postsecondary histories in the longitudinal studies,[43] a student was allowed a one-semester (or its equivalent, and exclusive of summer terms) stop-out period and still considered continuously enrolled. When this variable is entered into the logistic model, its positive value and extraordinary statistical significance do not permit us to ascertain fully how

[43]Up to 12 years for the High School Class of 1972 (NLS-72), 11 years for the High School Class of 1982 (HS&B/So), and 8.5 years for the High School Class of 1992 (NELS:88/2000).

Table 24. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Postsecondary attendance patterns

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p

† Variables did not meet threshold criterion for statistical significance.

[a] Set in three bands: 0, 1–4, and more than 4.

NOTES: Statistically significant variables are highlighted in bold. Standard errors adjusted by root design effect = 1.76. G^2 = 3749.31; *df* = 4759; G^2/df = 0.788; X^2 (df) = 1984.37(17); pseudo R^2 = 0.3813; percent concordant predicted probabilities = 88.1.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

the other variables in the model are interacting. Its strength deflates the associative contribution of other factors in student performance that might better illuminate the dynamics of degree completion. Hence, in *The Toolbox Revisited*, we set aside NOSTOP until the last possible moment, the final Step 7.

All five attendance pattern variables introduced in table 24 break the barriers of significance at this stage of model-building:

- Ever part-time: Whether the student was ever part-time, a decidedly negative influence on degree completion. The Delta-p statistic tells us that part-time status reduces the probability of completion by over 35 percent. While previous research has documented the extent to which part-time enrollment pulls students off the "persistence track" (Carroll 1989), the 35 percent reduction in probability seems high given the fact that nearly half of the NELS:88/2000 postsecondary students were part-time at some time. Students are inconsistent in their understanding of what part-time means, and under a more generous definition of the concept, the reduction in probability dropped to 30 percent—still a puzzlingly high number (see definition of PARTTIME in the Glossary).

- Summer-term credits: The more, the better. That is, each step up the short ladder of summer-term credits increases the probability of completion by 14.4 percent.

- Classic community college transfer: The significance of transfer is solid at $p < .05$, and the Delta-p says that the probability of completion for a transfer student increases by 21 percent. At one point in the construction of this variable for the NELS:88/2000 cohort, a flag was added to indicate whether the student's first enrollment at the four-year college occurred within four years of entry to the community college. This attempted refinement of a time-sensitive variable did not change its position in the Step 5 logistic model. Given the fact that many students who ultimately transfer move back and forth between community colleges and four-year institutions, it is very difficult to determine the precise moment of transfer, i.e., the season on the academic clock at which both institutions recognize a permanent change in status for the student. A flag for first date of attendance at the four-year school does not help.

- Four-year to four-year transfer: This variable is not as strong as community college transfer. Its statistical significance is marginal at $p < .10$. The Delta-p says that those who started in a four-year college and transferred to another four-year college increased the probability of earning a bachelor's degree by 15 percent. Some 18.5 percent (s.e. = 0.86) of those who started in four-year colleges transferred to another four-year college. In comparing those who transferred to those who didn't, one could say only that the more selective the first institution attended, the less likely the student would transfer.[44]

[44]Only 5.4 percent (s.e. = 1.54) of NELS students who started in highly selective four-year colleges transferred to another four-year college, versus 15.7 percent (s.e. = 1.71) for those who began in selective institutions and 20.0 percent (s.e. = 0.99) for those who started in nonselective four-year schools.

- Multi-institutional attendance: In the steps of the logistic model of the original *Tool Box*[45] in which it appeared, the parameter estimates for this variable were -0.009, 0.015, and -0.077, and with odds ratios ranging from 0.93 to 1.02. All these data are basically flat and inconsequential. The situation in *The Toolbox Revisited* is different. In light of the two transfer variables and the ostensive intersection of multi-institutional attendance with transfer, what does this variable say by coming out of a logistic model with a Delta-p indicating that attendance at more than one school reduces the probability of earning a bachelor's degree by about 16.5 percent? While further probing of the issue is advised, it appears that the message of the three variables (community college transfer, four-year to four-year transfer, and multi-institutional attendance) is that formal transfer is more effective than broader patterns of multi-institutional attendance, including simultaneous enrollment and "swirling." This common sense encourages institutions to track and guide apparent nomads toward formal transfer.

Of the other statistically significant variables in this step, even though Academic Resources and socioeconomic status quintile are receding in time, they are not so receding in strength, and are very much with the explanation of degree completion. In this new configuration, no delay of entry to postsecondary education and first-year grades are actually stronger than they were in Step 4 in their positive parameter estimates and Delta-p statistics. The negative consequences of earning fewer than 20 credits in the first calendar year following initial enrollment is also among the continuing statistically significant variables, though with a lower parameter estimate and Delta-p statistic than observed in tables 15 (first-year performance logistic) and 16 (financing logistic). What counts continues to count.

And what counts less but remains statistically acceptable for presentation includes: (a) the set of basic demographic variables that has been in the logistic narrative from the beginning, (b) education expectations (which are proving far weaker for the High School Class of 1992 than they were for the High School Class of 1982), and (c) two curricular features of the first year of postsecondary attendance (remedial course work and credits in college-level mathematics) that are about to be reconstructed in Step 6, when we extend the temporal scope of curricular experience to a student's entire undergraduate career.

Step 6: Extended Postsecondary Performance

Both the attendance pattern variables and those covered in this step (and the next) are distinguished from first-year performance considerations (Step 3) by the temporal reach of the observed behaviors. All the variables from Step 5 are carried forward. We then ask what additional key academic measures span the full range of a student's undergraduate history—from entrance through the first calendar year of attendance, and beyond.

As previously noted, consideration of continuous enrollment has been set aside for the last step in the logistic model sequence. Of other extended performance variables, what was called the "DWI Index" in the original *Tool Box* and is described more prosaically here as the ratio of courses from which the student withdrew or repeated to all courses for which the student

[45] Adelman (1999), table 39, pp. 80-81.

enrolled, also is set aside for the last step, as it is another case of a very strong variable that would overwhelm other extended performance measures that the reader should see play out.

The block of variables entered for the first time in Step 6 includes two reconstructions of curriculum-related factors originally presented within the confines of the first calendar year of attendance: type and extent of remedial problems (replacing first-year remediation), and cumulative credits in college-level mathematics (replacing first-year credits). "Remedial Problem" (see page 34 and table 8 above and description in the Glossary, p. 190) was not admitted to the model, while cumulative mathematics credits was easily admitted.

The variable marking the *trend* in cumulative student grade point averages at three points in time is an improvement over its predecessor in the original *Tool Box* (which offered only two points of reference). Event-history analysts would no doubt want to see more points than three, but more points than three would result in the loss of more students than the 22 percent already lost by insisting on three (due principally to cases in which the true date of first attendance could not be determined).

Table 25 offers a descriptive account of the three trend populations (rising, flat, and declining) in terms of average cumulative GPAs at each measurement point, the average elapsed undergraduate time period (in years) that is covered by those three markers, and the proportion of each group that earned a bachelor's degree. The purpose of presenting table 25 is to demonstrate that the permutations of relationships between GPAs at the three moments of measurement work, and the results evidence *prima facie* sense. Students with rising GPAs are more likely to earn bachelor's degrees than those in the other two groups, and students with falling GPAs seem more likely to spend more time as undergraduates (though the differences here are not great). The reader will also note that for the plurality of students, grades were flat over an average undergraduate stay of roughly four and three-quarter calendar years.

Table 25. Three trends in postsecondary grade point average (GPA) of 1992 12th-graders who attended a four-year college at any time through December 2000 and offered complete postsecondary records, by GPA at three points in time, average undergraduate time, and percentage earning bachelor's degree

	Average GPA					
GPA trend	First calendar year	First two calendar years	At end of undergraduate career	Average elapsed undergrad time	Percentage earning bachelor's degree	**Percentage of all in group**
Rising	2.43 (0.30)	2.64 (0.28)	2.93 (0.18)	4.76 (0.57)	73.5 (1.80)	**37.0 (1.09)**
Flat	2.72 (0.25)	2.63 (0.27)	2.73 (0.26)	4.79 (0.59)	65.5 (1.63)	**43.9 (1.10)**
Falling	3.09 (0.29)	2.90 (0.29)	2.70 (0.30)	4.92 (0.81)	63.8 (2.38)	**19.1 (0.89)**

NOTES: Standard errors are in parentheses. Column for percent of all in group may not add to 100.0 percent due to rounding. Weighted Ns: rising GPA = 415k; flat GPA = 486k; falling GPA = 215k.

Changing majors: Not a rare phenomenon

St. John et al. (2004) complained that research on persistence pays inadequate attention to college major. Agreed. There are a number of problems with the extant research when major is an issue, not the least of which is the definition of "persistence" as within-year, i.e., fall to spring, and no attention to *change*-of-major. Stoecker, Pascarella and Wolfle (1988) paid considerable heed to major field, found some race-by-field interactions in a structural equation model, and did so within the context of a nine-year longitudinal study with degree completion as the dependent variable (a better framework than that used by others). But they faced problems of tracking change of major, moment of decision on major, the problem of students who drop out without a major, and the exclusion of community college transfers.

In response to these difficulties, the Step 6 extended postsecondary performance model tried out a variable that marks change of major. This variable was not accepted into the model, principally as a by-product of overlapping characteristics with the community college transfer variable, as virtually all community college transfers "change major" from general studies to a specific field on entrance to a four-year college (see Glossary, p. 191). But it is worth noting that 50 percent (s.e. = 1.26) of NELS:88/2000 bachelor's degree recipients changed majors at least once, and that this estimate comes very close to Simpson's (1987) estimate of 48 percent for a 1976–84 cohort. The 50 percent mark thus appears to be a strong reference point.

All the elements are now in place for the stage of analysis that examines student histories through the end of their undergraduate careers (with the exception of continuous enrollment and the ratio of withdrawals and repeats to all courses). The logistic for Step 6 is presented in table 26. There are three major observations:

> 1) Race/ethnicity, never statistically significant in steps 1 through 5, does not even qualify for entry under extended postsecondary performance. Performance variables overwhelm demography. At this key inflection point in the analysis of degree completion, it appears race/ethnicity doesn't matter (Light and Strayer 2002), though it may be operating as an indirect effect through other variables. But to test what happens in a different way, the Step 6 logistic model was run defining "minority" separately for each of the four major race/ethnicity groups. This test was run at this point in the logistic narrative because Step 7 introduces two very powerful variables that would bury race/ethnicity indicators. The model itself emerged significant for white students, but not for African-American, Latino, or Asian students. For white students, all the significant variables in table 26 were the same except for four-year to four-year transfer, which dropped below the threshold of significance. For Latino students, the only statistically significant variable within a nonsignificant model (t = 1.37 with 10 degrees of freedom) was whether the student had ever been part-time. For African-American students, the only statistically significant variables within a nonsignificant model (t =1.70 with 13 degrees of freedom) were summer-term credits and whether the student had ever enrolled part-time. For Asian students, nothing was significant within a nonsignificant model (t = 0.34 with 13 degrees of freedom).

† Variables did not meet threshold criterion for statistical significance

[a] Set in three bands: 0, 1–4, and more than 4.

NOTES: Statistically significant variables are highlighted in bold. Standard errors adjusted by root design effect = 1.76. G^2 = 3355.32; *df* = 4632; G^2/df = 0.745; X^2 (df) = 1965.7 (18); pseudo R^2 = 0.3984; percent concordant predicted probabilities = 89.3.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

2) The new cumulative college-level math credits variable proves its worth, with a Delta-p statistic that says for every move up the credit-range the probability of earning a bachelor's degree increases by 11.8 percent, putting it in the same range of influence as summer-term credits and trend in grades.

3) When trend in grades is added to the variable block, the influence of first-year grades increases, in part because, by definition, a rising GPA trend requires a lower starting point. In fact, the first-year GPA quintile factor is twice as strong, measured in Delta-p, than the trend.

We also note variables carried forward and remaining statistically significant in the model:

- As predicted, Academic Resources continues to lose some of its power as students move further away in time from high school performance. There are too many intervening experiences. In Step 1, the Delta-p said that for each rung up the quintile Academic Resources scale, the probability of earning a bachelor's degree increased by nearly 15 percent (see table 12 above). At this point, that increase in probability is 6.6 percent. Tested separately (see Appendix J), the tolerance collinearity statistic for Academic Resources dipped close to a 0.50 mark that was set for a caution light. While still acceptable, the tolerance statistic indicates that, at this point in a stepwise logistic with 17 other variables, a Venn diagram would show the circle for Academic Resources overlapping (but not eclipsing) many of the other variables in the model.

- Socioeconomic status quintile continues to evidence some explanatory power, and with a Delta-p that basically doesn't change from model to model. In this model, moving up each step of the SES quintile ladder increases the probability of earning a bachelor's degree by 6.5 percent. SES would assume a more significant dynamic, as Cabrera, Burkum, and LaNasa (2005) have demonstrated with the HS&B/So cohort, if one entered the entire logistic narrative by SES quintile, and the elaboration of that dynamic will be left to future research.

- The echoes of first-year credit generation are still noteworthy. The Delta-p says that dropping below 20 credits will decrease the probability of bachelor's degree attainment by 22.4 percent.

- Whether the student was ever part-time remains a very strong negative, with a Delta-p unchanged from its first appearance in the attendance pattern model.

- Earning credits during summer terms is still good advice, though each step of that variable now adds 11.2 percent to the probability of earning a bachelor's degree, as opposed to 14.4 percent when it was first introduced under attendance patterns.

- Both the classic community college transfer variable and the four-year-to-four-year transfer variable stay in the model with positive contributions to the

probability of degree completion of 18 percent and 15 percent respectively, even as the multi-institutional variable strengthens with a negative parameter estimate and a restraining influence of 22 percent on the probability of degree completion. This tension continues to challenge analysis.

The only other variable carried forward, but losing statistical significance is that indicating no delay of entry. No delay, which has bounced above and below the line of statistical significance, now drops below.

Lastly, what has not counted in previous steps of the model still does not count: education anticipations, selectivity of first institution, first year remediation, gender, and parenthood.

Three major themes emerge in this penultimate step of logistic analysis:

- The combination of the strength of Academic Resources (composite high school performance, dominated by academic curriculum intensity) and cumulative college-level math credits underscores the power of curricular momentum on both sides of the matriculation line.

- A group of attendance and performance factors, including part-time status at some point, low credit momentum coming out of the first calendar year of enrollment, and multi-institutional attendance apparently colored by "swirling" and not formal transfer, are strong restraints on academic momentum.

- Validating the event history critique of the original *Tool Box* offered by DesJardins, McCall, Ahlburg, and Moye (2002), two measures of GPA—first-year and trend—reflecting the quality of student effort, are very positive contributors to degree completion. The stronger position of the class rank/GPA quintile variable within Academic Resources reinforces this message. Grades count; and yes, there is a competitive message here, since our GPA scales and quintile breaks are relative, not absolute.

Step 7: Final Factors

The very last step in the logistic narrative takes all 17 variables from the extended postsecondary performance model of table 26, and adds the two strongest variables from the original *Tool Box* analysis. One of these, a dichotomous variable for continuous enrollment called NOSTOP, is a staple of analyses of postsecondary careers (e.g., Carroll 1989; Astin 1993; Horn 1998; Berkner, He, and Cataldi 2002).

The second of these notable variables is not such a staple of analysis. It is the ratio of courses from which the student withdrew *without penalty* and those the student repeated to all courses in which the student enrolled. This is a rare topic in the higher education literature, and was last

seen in the major journals in Adams and Becker (1990), though the number of course withdrawals appears on the check list of elements in analyses of time-to-degree (Knight 2002, 2004b). The ratio counts course attempts, not credits. Withdrawals without penalty are not the same as courses "dropped" within set periods most colleges and community colleges mark for "drop-and-add," and dropped courses are not included in the ratio. As for no-credit repeats: Less than 4 percent of respondents to the 2002 survey of grading practices conducted by the American Association of Collegiate Registrars and Admissions Officers indicated their institutions did *not* allow repeats; fully 55 percent indicated that a student could repeat *any* course for a better grade; and 55 percent indicated that students could repeat a course as often as they liked (AACRAO 2002). These proportions suggest a very lenient environment. Nothing here involves penalty grades. These are all cases of noncredit grades. The variable WRPT Ratio is dichotomous: On one side of the dividing line are students who withdrew from or repeated 20 percent or more of all courses for which they enrolled.

Table 27 presents the final step of the logistic model for *The Toolbox Revisited*. The power of the last two variables entered is instantly obvious:

- Withdrawing from or repeating 20 percent or more of courses decreases the probability of earning a bachelor's degree by nearly half!!!

- Remaining continuously enrolled increases the probability of degree completion by 43.4 percent.

As a consequence of the introduction of NOSTOP and the WRPT Ratio, remediation in the first calendar year, a weakening variable from the point of its introduction, is forced out of the model. Its attempted replacement, the more elaborate description of type and intensity of undergraduate remedial problems (REMPROB), was tried out again, and again did not qualify to enter the model. As noted previously, remediation appears to be a neutral factor in this account.

The marker for earning less than 20 credits in the first year of attendance, previously a strong contributor to the model, is turned on its head in the final step, and drops below the threshold of significance. Why? Principally because, as table 28 demonstrates, nearly 60 percent of those who wound up withdrawing from or repeating 20 percent or more of the courses for which they registered were *already withdrawing from and repeating 20 percent or more of their courses in the first year*. When one withdraws without penalty, one earns zero credits. When one repeats a course, one earns credits only once (assuming one passes, of course). What the relationships in table 28 strongly suggest is that low credit production in the first year is a logical consequence of withdrawal and repeat behavior. If we allow negative momentum to start early, the consequences will snowball. The phenomenon argues for more intense academic advising and monitoring, more accurate placement, and (in some cases) more sensible credit loads in the first calendar year of enrollment.

Table 27. Logistic account of factors associated with earning a bachelor's degree in the history of 1992 12th-graders who attended a four-year college at any time: Final factors, with complete academic history

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p

Lastly, the variable marking swirling multi-institutional attendance continues to be negative —though marginally significant with $p <. 10$—in table 27 at the same time that both community college transfer and four-year-to-four-year transfer variables fall out of significance altogether. In this final accounting, then, all three type of multi-institutional accounts fade in associative power in the face of behaviors that transcend institutional effects: continuous enrollment and academic performance reflected in grades.

Table 28. To what extent does the final ratio of undergraduate course withdrawal and no-credit repeat grades reflect the ratio and volume of withdrawal and no-credit repeat grades in the first calendar year of enrollment? Answers from the history of 1992 12th-graders who attended a four-year college at any time

Final ratio of withdrawals and no-credit repeats to all courses attempted	Percent for whom first-year withdrawal and repeat ratio was 20 percent or higher	Number of withdrawals and no-credit repeats in the first year		
		None	One	Two or more
Less than 20 percent	5.4 (0.60)	66.7 (1.15)	22.7 (1.06)	10.6 (0.71)
20 percent or higher	57.5 (3.93)	13.7 (2.05)	20.3 (3.17)	66.0 (3.62)

NOTES: Standard errors are in parentheses. Weighted N for those with a ratio of no-penalty withdrawals and no-credit repeats to all courses attempted of 20 percent or higher: 106k; of those with a ratio below 20 percent: 1.08M.

Summing Up the Logistic Narrative

Parts III and IV of *The Toolbox Revisited* have walked the reader, sometimes painstakingly, through the consideration of independent variables for each of the seven roughly chronological steps from high school background to extended postsecondary performance. At the end of each step, a logistic account of what was associated with completion of bachelor's degrees for 1992 12th-graders who attended a four-year college at any time was offered. The logistic account applied to students' histories as of that particular moment only. Step 7, of course, offered the concluding account.

But to judge the full sweep of these seven steps, we ought to see them together in the same table. Table 29 allows summative statements about the changing strength of independent variables, the continuity of what counts, and required goodness-of-fit statistics for the whole model. Let's start with the goodness-of-fit statistics because they validate the model. The reader can find them at the bottom of the second page of the table. Everything that is supposed to happen in a stepwise logistic model (Cabrera 1994; Menard 1995) happens. The G^2 (also called the "maximum likelihood function") falls with each step; G^2/df (degrees of freedom in this calculation is the product of the unweighted number of students in the model minus the number of variables

in the model) also falls with each step, though perhaps too much in Step 7. The chi square statistic is a little more erratic, but rises as it is supposed to. So do the pseudo R^2 and the percent of concordant probabilities predicted at each step. These results are a relief to any analyst .

Table 29 includes all the variables that were entered at any of the seven steps of the logistic account, even if they were not carried forward to subsequent steps because they did not meet the *t* statistic threshold criterion that was set at 0.765. In this manner, we can see where these variables were introduced and where they fell out of the model (the first "X" in the table marks the spot). Race/ethnicity is the most noted example because it was present from the beginning, and even though it was never statistically significant, it qualified to be retained until extended postsecondary performance variables were introduced. In Step 7—and because race/ethnicity is a sensitive factor in public discourse on education—another approach was tried out whereby each of the four major race/ethnicity groups was treated as an independent variable in the model. Only the Asian student variable qualified for entry, but wound up with a *t* statistic less than 0.50.

Another "casualty"—though for a very different reason—is the variable describing credits in college-level mathematics in the first calendar year. This variable was purposefully replaced in Step 6 (extended postsecondary performance) by cumulative credits in college-level mathematics across the student's entire undergraduate career because it was more appropriate to the temporal framework. First-year college-level math was never significant, but its more expansive replacement was, as might be expected from comparative participation rates in college-level mathematics by the end of the *second* calendar year of enrollment (table 21).

Another virtue of the presentation in table 29 is that because all statistically significant variables are highlighted in bold, the reader can swiftly identify what was consistently meaningful among the potential associations with bachelor's degree completion for this group of students. From the moment of their introduction, the following factors met the criteria:

- Academic Resources quintile
- Socioeconomic status quintile
- Low (less than 20) credits in the first calendar year of attendance
- First calendar year GPA
- Summer-term credits
- Ever part-time
- Trend in GPA
- Cumulative "career" credits in college-level mathematics

And no delay of entry to postsecondary education from high school evidenced positive and significant association with degree completion in half the stages of the logistic narrative in which it was in play.

When one adds the withdrawal/repeat ratio and continuous enrollment (which appear only in the last step of model-building), some rough themes emerge. Of the ten independent variables, three involve **uses of time** (continuous enrollment, ever part-time, summer-term credits); and four clearly reflect different aspects of **academic performance** (high school Academic Resources, first-year GPA, trend in grades, low-credits in the first year, and the withdrawal/repeat ratio).

Under the temporal theme, no delay of entry floats in and out of statistical significance. Some might say, e.g., of no delay of entry, that the fact a variable is significant in one step of the logistic and not in another "does not always mean that different effects are operating" (Anaya 1999, p. 507). One of the reasons that the logistic narrative provides collinearity statistics (see Appendix J) is to reassure the reader that, for whatever reason a variable ducks in and out of significance, it is not because it is excessively tangled up with other variables. The "tolerance" collinearity statistic for no delay of entry is consistently in the high comfort zone.

Summary of Parts III and IV: Investment Behaviors

When we look across the series of ingredients that rise to the top of strength of association with degree completion, we can interpret them in terms of what Noxel and Katunich (1998) called an "investment model," though this author prefers "investment behaviors," a microscale version of human capital. Once the modest consequences of socioeconomic status are accounted for, each step offers students a set of decisions that require the commitment of time and effort likely to yield a future benefit. These decisions move students, sometimes smoothly and sometimes less so, toward the degree. The choices made, beginning with high school curriculum (from the available curriculum—which is an opportunity-to-learn issue) and quality of effort in high school (reflected in class rank/GPA), allow subsequent leverage. Entering a postsecondary institution directly from high school, earning 20 or more credits in the first calendar year of enrollment, and performing well enough in that first calendar year to fall in the top 40 percent of a GPA distribution build on previous investment, and are all signs of commitment. Subsequent choices that may not be reflected in a bounded period of time, such as excessive course withdrawals, prove to be poor decisions with negative returns, breaking accumulated momentum. Other configurations of choice, including summer-term credit generation, meeting the challenge of college-level mathematics, effort that yields a rising GPA, and most of all, remaining continuously enrolled, all reflect continuing leverage of attainment. This is what academic momentum is all about.

Tinto's (1987) approach is just as direct: Students have responsibilities, and are expected to invest time on behalf of their own learning. Yes, in his words, students have the right "to refuse education" (p. 135), but since the primary commerce of the institution is education, those who refuse should not be surprised if (in his very delicate phrasing) the institution exercises its "right . . . to be selective in its judgments as to who should be further educated" (p. 135). One begins to see why student choice (and the responsibility inherent in student choice) emerges not only as a dominant theme of *The Toolbox Revisited* as well, but as the principal challenge to academic advising and counseling from secondary through postsecondary education.

One grants that a great deal more is going on in the lives of traditional-age students at the same time. They are not bloodless. The literature on persistence has included not only a mass of psychological and social considerations (Harmston 2004; Hu and St. John 2001; Kahn and Nauta 2001; Robbins et al. 2004), but also basic aspects of maturation such as physical fitness (Zhang and Richards 1998), nutrition, roommate conflicts, dating problems, time management (Purcell and Clark 2002), and personality-environment congruences and dissonances (Feldman, Smart, and Ethington 2004). Studies such as Stage's investigation of "motivational orientation" (1989) are also valuable in that they override stock demographic explanations and identify "subsets of college students who might react similarly to college experiences" and, hence, assist advisers and student service personnel. Our data sources do not include these factors.

What the Literature Calls "Institutional Effects"

A major strand of the literature on postsecondary retention derives from Tinto's (1987) constructs of academic and social integration, constructs that contributed to the emergence of the National Survey of Student Engagement (Kuh 2001) and its use by hundreds of institutions in assessing the effects of environments on student behaviors. The reason Tinto's work generated such a continuing elaboration and response is a combination of its elegance and *prima facie* common sense. At whatever age they start out, entering postsecondary students are not empty vessels; they come with demographic characteristics and high school experiences (and, if there is a gap of years between high school graduation and postsecondary entry, work experiences and family formation as well) that condition and shade where and how they enter the postsecondary system. Once at an institution, these background characteristics interact with the academic processes and social environment of that institution to yield varying degrees of determination to persist and complete credentials. Institutional culture, including habits of faculty interactions with students outside of the formal classroom and opportunities for a variety of peer group interactions, plays a significant role in Tinto's models of academic and social integration.

It is not surprising that the mass of studies drawing on Tinto's work are institution-specific or use institutional characteristics as independent variables. To attain enough depth on all these features of student lives so that direct and indirect influences can be mapped through path analysis requires extraordinary probing, which is best carried out in institutional contexts where adequate samples can be assembled. Even if we employed hierarchical linear models to illuminate the relationships between nested characteristics of individuals within institutions and outcomes such as GPA, we would need much larger samples of students within each institution than the NELS:88/2000 provides.[46]

---

[46]In a case of a continuous dependent variable for student engagement, and sets of independent variables describing both student and institutional characteristics (half of them continuous), Porter (2005) demonstrates the statistical superiority of multilevel analysis versus Ordinary Least Squares analysis. There are three significant differences between Porter's illustration and the story line of *The Toolbox Revisited* : (1) the dependent variable (bachelor's degree attainment) and most of the independent variables in this data essay are dichotomous, hence, our method is logistic, not linear, (2) Porter's model assumes that students attend only one institution, whereas more than half the students in this analysis attended two or more, and (3) while multilevel analyses can create models for institutions "even for schools with few student observations" (Porter 2005, p. 110), of the 3,258 institutions in the NELS:88/2000 postsecondary transcript files, 1,003 had only one student in the sample. An institution-level model with a population of one is out-of-scope.

With the student as the unit of analysis, and 25 percent of the students in the universe we are examining attending *more than two* institutions as undergraduates, the calculation of institutional effects becomes problematic. For the students who attended only one four-year college, the weighting of institutional characteristics such as those Titus (2004) admits into his analysis of three-year persistence at the same institution (e.g., control, size, selectivity, degree of residentiality, and percent female, etc.) are fairly easy to plot. But for those who attended more than one institution, a weighting scheme for the influence of each institutional characteristic based on the proportion of undergraduate time each student spent in different institutions would be necessary. For a student who earned 26 credits at a community college, 30 credits at a four-year baccalaureate residential college, and 75 credits at an urban university, the ratios would dilute the very meaning—let alone effect—of any single institutional characteristic. This example is not a fantasy. Consider, for example, the credit accumulation at each school attended by two sets of students from the NELS:88/2000 who attended three institutions as undergraduates (fig. 2).

Figure 2. Examples of credits earned at each institution attended by 1992 12th-graders who earned standard high school diplomas by December 1996, attended a four-year college at some time, earned a bachelor's degree, and attended three institutions as undergraduates, by type of transfer

	Credits earned at each school attended		
Student cases	School #1	School #2	School #3
Community college transfers			
#1	66 (community coll)	34 (four-year)	62 (four-year)
#2	32 (community coll)	28 (community coll)	90 (four-year)
#3	41 (community coll)	18 (four-year)	64 (four-year)
Four-year-to-four-year transfers[a]			
#1	24	36	92
#2	36	21	88
#3	25	30	79

[a] All three schools attended by these three students were four-year colleges.
SOURCE: National Center for Education Statistics. NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

How does one evaluate indirect effects of institutional characteristics and experiences (class size, contact with faculty, peer group interactions, etc.) for these students? Does one weight each potential effect by the percentage of credits earned at each school in relation to all credits earned? Can one somehow arrive at a consolidated index for each effect across schools? How would one compare these indices to those for students who attended only two institutions? To those for students who attended only one? All six of the students in figure 2 above earned bachelor's degrees. For students who did *not* earn bachelor's degrees but who attended three institutions,

what is the minimum threshold of credits one would set at each institution attended before trying to determine the range of institutional characteristics and student experiences that might have some degree of association with the dependent variable? Across all patterns of inter-institutional "traffic" (Astin and Astin 1993), is there a common effects metric that encompasses mere excursions (incidental attendance at second or third institutions), true migration (formal transfer), and the nomadic behavior described as "swirling"? The author tried to develop a descriptive framework of excursion, migration, fragmentation, and discovery for this task, but with less than satisfactory results (Adelman 2004b). Certainly, there are more sophisticated models that can address the rhetorical questions above, but they risk both neglect or devaluation of life-changing experiences at institutions where a student spent comparatively little time and earned few credits, and false identification of effects that can be very fleeting.

Postsecondary student attendance patterns have rendered consolidated institutional-effects analyses moot. For that reason, these analyses are best carried out within the context of individual institutions (no matter where else the student goes to school). This study does not belittle the constructs of institutional effects and assessment efforts such as those of the National Survey of Student Engagement (NSSE) at all. For college and community college administrators, these assessments count a great deal in determining the kinds of environmental adjustments likely to intensify student involvement with institutional services as well as to heighten student satisfaction with instruction, even if the student is present for only 24 credits.

Even so, many of the variables of institutional effects analyses (and that includes high schools as well as colleges and community colleges) are sufficiently beyond the control of administrators so that the practical implications of whatever paths one delineates as productive are limited. Yes, high schools can change the structure of opportunity-to-learn, e.g., by not even offering arithmetic or watered-down pre-algebra and simultaneously conveying a clear message to students that they can meet the challenge of higher level math (Lee, Croninger, and Smith 1997). And the postsecondary level can follow suit, e.g., community colleges can refuse to teach arithmetic or basic algebra. Neither of these strategies is micromanagement, and, however some may wish otherwise, neither is likely to be implemented on a large scale. At the postsecondary level, the very conditions of control shift: An administrator cannot change the fact that the institution was not the student's first choice and that he or she is determined to transfer from the moment of first registration; there is no drug to prescribe for a student with severe homesickness; one cannot—and should not—prevent the student from changing majors for the second time; no college authority has any influence on the romantic life and angst of 20 year-olds that may affect their involvement with academic pursuits (Okun, Taub, and Witter 1986); administrators can't sand down every potentially hard edge of their schools. Furthermore, there is a natural capacity limit to truly meaningful contact with faculty outside the classroom. To use examples from the National Survey of Student Experience, how many faculty can deans deploy for student participation in faculty research projects or for students to work with faculty on committees and

student life programs?[47] The larger and/or less residential the institution, the less the opportunity for student-faculty interaction in other than casual or ritualistic activities (Hu and Kuh 2002).

To repeat: The NELS:88/2000 does not reach the details of student development or institution-specific student experiences accounted for in other research lines. The elaborate connections between student background characteristics, social and psychological predispositions, initial perceptions and responses to a particular postsecondary environment, strength of goal commitments, etc. in relation to not only the fact but also the pace of student progress toward a credential—all of which have been explored and documented by the touchstone giants of postsecondary student outcomes research (Astin, Pascarella and Terenzini, Cabrera, Tinto)—lie beyond the scope of national longitudinal studies. That is not an excuse for the "economic" reading, broadly construed, of academic momentum. We all know that the many investment decisions made by students along their paths through postsecondary education do not occur in social and psychological vacuums. But the archival data on which this study draws isolate moments in which student choice intersects the structures of opportunity offered by institutions whose first order of business—and first order reason for existing in our society and economy—is the generation, preservation, and distribution of knowledge. This is a story about taking advantage of that mission; it is not a story about growing up, although that happens along the way.

[47]Kuh et al. (2001) reported that less than 20 percent of seniors in 2000 indicated experiencing these modes of nonstandard faculty contact. By 2004, that proportion had not changed, while 58 percent of seniors indicated they had talked often or very often with faculty outside of class about their grades (a ritualistic interaction that shouldn't carry much weight in assessments of student/faculty contact). See www.nsse.iub.edu/~nsse/2004_annual_ report/html/responses _senior sfi.html. (Accessed 7/31/05).

Part V
Closing the Gap

One of the principal objectives of the *No Child Left Behind* legislation as it works its way through grades K–8 is to close the gaps in achievement between minority and majority students. When that objective is extended to high schools, as this essay underscores in Part III above, we have no adolescent left behind. And when extended to postsecondary schooling, as the logistic narrative has done, our objective is to leave no young adult behind, either. While race/ethnicity itself was not a significant variable in that narrative, the fact of an unhappy gap remains in degree completion—which means that there are residual echoes of experience by race/ethnicity that affect education outcomes. It is not the intention of this monograph to explore these echoes (there are far more sophisticated techniques and far more knowledgeable researchers than the author to engage in that task). But if we focus on the academic story line, we can at least draw some parameters of possibility for assisting minority students.

Two issues attendant on this observation are now addressed: our confidence in degree completion rates, and what might contribute to closing the gap between majority and minority populations in degree completion.

Bachelor's completion rates: Some remarkable agreements

The most prescient and eloquent statement of the problems attendant on our romance with graduation rates was offered a decade ago by Ronco (1996):

> Performance, even in relatively straightforward terms like graduation and retention, eludes our attempts to measure it. Students no longer march lockstep through four years of college to graduation. The educational model of the new millennium will likely be characterized more by lifelong learning, where students move among various kinds of higher education institutions, stopping in and out as their lifestyles and educational needs dictate. Enrollment patterns like these make indicators like four- or even six-year graduation rates for first-time, full-time freshmen largely irrelevant. Transfer students deprive both the sending and receiving institution of retention and graduation credit. (p. 1).

But accepting the object of policy affections for a moment, the most enduring context for the analyses of *The Toolbox Revisited* involves what its predecessor called the Dow Jones Industrial Average accountability measure of U.S. higher education: the proportion of entering undergraduates who earn a bachelor's degree. There are very few truly reliable national portraits of degree completion because there are very few data sources of convincing scope and magnitude. The task requires a longitudinal study with a tested sampling design and matching weights. The technology for a full census of completion does not yet exist.

Ewell (2004) has reminded us that a *student-based* indicator of completion leads to assessments of the benefits of higher education to the entire society and economy. An *institution-based* indicator does none of that, though there is no question that the institution is responsible for contributing to the student's discovery of intellect and path to attainment. While the student is obviously more important, institutions are partners.

There are three recent national accounts of bachelor's degree completion for students who started out in postsecondary education together that can demonstrate how these two indicators, student and institutional, play out.[48] Each account comes from a different data set:

1. The NELS:88/2000 that is the subject of *The Toolbox Revisited*. To repeat its major characteristics: The temporal term is a maximum of 8.5 years (1992–2000) from the month of entrance, no matter when that happens and at what enrollment intensity (full-time or part-time). This is a grade cohort, with all students roughly the same age.
2. A six-year longitudinal study, based on the Cooperative Institutional Research Project's (CIRP) data, that followed 1994 entering college freshmen to 2000 (Astin and Oseguera 2002). While dominated by traditional-age students, this cohort is not wholly homogenous in terms of age at entrance, but is confined to those who started out, full-time, at 262 four-year colleges, weighted to represent beginning full-time freshmen at all public and not-for-profit private four-year colleges (for-profit four-year colleges are not included).
3. Another 6-year longitudinal study, 1995/6 through 2001, conducted by NCES as a spin-off from the massive Congressionally-mandated National Postsecondary Student Aid Study. We have used this data set, the Beginning Postsecondary Students longitudinal study, previously. Beginning students of all ages and enrollment intensities (full-time, part-time, and mixed) are included.

Let us set these three data sets side-by-side, adjust the two NCES databases to match both each other and the CIRP database, and then assess how much they disagree with each other. We will confine both the NELS:88/2000 and the BPS 95/96–2001 to those who started out in four-year colleges, limit the dates of entry of the NELS:88/2000 cohort to the same year (1992) and, most importantly, put an upper bound on age at date of entry in the Beginning Postsecondary Students of 20. Table 30 offers these comparisons.

---

[48]There are other large longitudinal studies of degree completion, but their samples of institutions and students are not representative. For example, Saupe, Smith and Xin (1999) used the Consortium for Student Retention Data Exchange information from 174 public four-year colleges to track six-year (1989–96) institutional graduation rates. While these 174 institutions enrolled nearly half of entering four-year college students in 1989, they represent a class, not a universe. For another, but more dated example, Stoecker, Pascarella, and Wolfle (1988) used a 1980 CIRP follow-up to an initial 1971 sample of roughly 10,000 students who had attended only one four-year college in the interim. Some 487 college and universities were represented. Stocker, Pascarella, and Wolfle were interested in institutional effects, so their restriction of the universe to students who had attended only one school is justified, and their findings revealing. But that doesn't justify using the conclusions as a generalized model of degree completion—certainly not under contemporary conditions of student mobility. For state-level postsecondary longitudinal studies, only Florida has produced data sets comparable to the national accounts.

Given the conditions under which degree completion is judged, the conclusions of these three data sets do not differ that much from each other. We can say that roughly a third of traditional-age students who start in a four-year college will earn a bachelor's degree from the *same* school in the traditional four-year period, and that between 54 and 58 percent will earn the degree from the same school in which they began within six years of entry. When the option of earning a degree from a *different* four-year college than the one in which these students commenced study is included (in the NELS:88/2000 and BPS 95/96–2001), six-year degree completion rates for traditional-age students are in the 62–67 percent range. Only when the temporal boundaries are extended to 8.5 years in the NELS:88/2000 does degree attainment for those who started in four-year colleges approach 70 percent, and Florida state longitudinal studies show a similar rate (Johnson, Coles, and Thomas 2004).

Table 30. Bachelor's degree completion rates for students who began in four-year colleges according to three different national longitudinal studies of the 1990s

	Percent completing bachelor's degree		
Bachelor's degree completion modes	NELS:88/2000 1992–2000	Cooperative Institutional Research Project (CIRP) 1994–2000[a]	Beginning postsecondary students 1995–2001
Bachelor's from same school in 4 years	30.9 (1.14)	36.4	33.1 (1.3)
Bachelor's from a different school in 4 years	3.0 (0.30)	Not available	2.3 (0.3)
Bachelor's from same school in 6 years	52.9 (1.27)	57.6	53.7 (1.2)
Bachelor's from a different school in 6 years	11.3 (0.79)	Not available	8.1 (0.4)
Bachelor's from same school in 8.5 years	55.3 (1.24)	60.6[b]	Not available
Bachelor's from different school in 8.5 years	14.1 (0.84)	Not available	Not available
Total degree completion:	69.3 (1.16)	60.6[b]	61.8 (1.2)

[a] As reported in Astin and Oseguera (2002). Standard errors are not available.
[b] In Astin and Oseguera, this cumulative figure includes students who were still enrolled at their institution of first attendance at the end of six years.
NOTES: Standard errors for the NELS:88/2000 and BPS95/96–2001are in parentheses.
SOURCES: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement) and Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-173). Astin and Oseguera (2002).

Degree Completion: How High Can It Go?

If roughly seven out of ten traditional-age students who start in a four-year college—and roughly two out of three who ever attend a four-year college—graduate within eight and one-half years, how likely is it that the rate will improve, by how much, and among what groups? When looking back at the factors consistently contributing to bachelor's degree completion in table 29 and asking which are most subject to change by external parties with little to modest, but creative, effort, a few stand out, and encourage speculation. All depend on student response. In the words of Tinto's (1987) astute guidance:

> Though . . . institutions owe each admitted student an equal degree of attention, it does not follow that institutions should be held accountable for the equal education of all admitted students. To absolve . . . [students] of at least partial responsibility for their own education is to make a serious error. (p. 135)

Let's look at each of the more promising levers, and then explore what the configuration of change in behaviors and policy might suggest for upper boundaries of degree completion and the closing of the gap in completion among race/ethnicity groups.

1) **Less than 20 credits in the first calendar year of enrollment**: Approximately nine percent of those who entered four-year colleges at any time earned between 15 and 19 credits in their first calendar year, with African-Americans and Latinos overrepresented.[49] Within this group, only 35 percent (s.e. = 3.05) earned bachelor's degrees compared with 77.7 percent (s.e. = 0.99) of those who earned 20 or more credits. Fifteen to nineteen credits is close enough to 20 to be optimistic: If we know more about who students are and where they come from, colleges and community colleges can target dual enrollment efforts to yield at least six additive credits for these students, thus pushing them across the 20-credit line. But we do know something about these students, and our optimism must be tempered by the facts that 15.3 percent (s.e. = 2.49) of them were assigned to remedial reading in their first postsecondary year, an overlapping 34.5 percent (s.e. = 3.93) never reached Algebra 2 in high school, and only 27.9 percent (s.e. = 2.96) earned any college-level mathematics credits in that first year. For the residual group (about six percent of those who enrolled in a four-year colleges at any time), suburban high school students from the Pacific and Southwest Central census divisions[50] are overrepresented, and provide some geo-direction for dual-enrollment policy targeting.

---

[49]Some 7.4 percent (s.e. = 0.56) of white students earned between 15 and 19 credits in their first calendar year of attendance, compared with 11.1 (s.e.=1.86) of African-Americans and 18.5 percent (s.e. = 3.30) of Latinos.

[50]The Pacific census division includes California, Oregon, Washington, Alaska, and Hawaii; the Southwest Central encompasses Texas, Oklahoma, Arkansas, and Louisiana.

2) **Ratio of non-penalty withdrawals and no-credit repeat courses to all courses attempted**: For about 10 percent of the NELS:88/2000 cohort who attended a four-year college at any time, this ratio was 20 percent or higher. That is, this group of students withdrew from or repeated at least one out of every five courses in which they enrolled, behavior negatively associated with degree completion. Compared with white students, all minority groups are overrepresented.[51] What would happen if institutions limited the number of no-penalty withdrawals and no-credit repeats students were allowed to accumulate, converting these cases above a given threshold to penalty grades? This is a risky proposition and difficult to model because we do not always know why students withdraw from courses after the customary drop/add periods (Adams and Becker 1990). Students repeat courses to earn better or passing grades. In the case of remedial work, the repeat is required, and the list of courses with the highest ratios of withdrawal and repeat grades is dominated by remedial offerings (Adelman 2004a, table 6.6, p. 84). In other cases, repeats are a luxury. Since no-penalty course withdrawals and no-credit repeats increase time-to-degree measurably for those who earn degrees (Adelman 2004a, table 6.2b, p. 79; Knight 2004b; Noxel and Katunich 1998), and since these behaviors have a rippling effect by blocking other students from seats, often in high demand courses, it is in institutions' self-interest to limit the practice. Intensified advisory care to student credit loads (Szafran 2001) and more precise placement criteria should help.

A good example of the way this might work is provided by Eno, McLaughlin, Brozovsky, and Sheldon (1998), who predicted difficulty ratings for specific courses likely to be taken by entering freshmen in their institution on the basis of both overall high school GPA and, more importantly, grades in specific high school courses. The hypotheses for each student within each course were then set against the empirical record of students' actual performance in the college course at issue. The information assists students' advisers with indications of which courses a student might find particularly difficult. The likelihood of no-penalty withdrawals or no-credit repeat grades is attenuated by delaying students' engagement with those courses until they have gathered the requisite momentum elsewhere in the college curriculum.

3) **Use of summer terms**: As table 31 suggests, earning more than four credits during summer terms may have a considerable influence on the degree completion rates of African-American students in particular. That is, 78.2 percent (s.e. = 4.12) of those who started in four-year colleges and exceeded this threshold earned bachelor's degrees, compared with 21.2 percent (s.e. = 4.59) of those who did not earn summer-term credits at all. The difference was also significant for white students, but not to the same degree. Parallel comparisons for Latinos and Asians were not statistically significant.

---

[51]Some 8.3 percent (s.e.= 0.68) of white students were in the high ratio category, versus 12.2 percent (s.e. = 3.04) of Asian students, 12.3 percent (s.e. = 1.96) of African-American students, and 19.6 percent (s.e. = 3.56) of Latinos.

Table 31. Of 1992 12th-graders who started their postsecondary careers in four-year colleges, percentage who earned bachelor's degrees by December 2000, by number of credits earned in summer terms, by race/ethnicity

	Percentage earning bachelor's degrees by December 2000		
	Number of summer-term credits		
Race/ethnicity	None	1–4	More than 4
All	56.2 (1.99)	68.1 (2.78)	79.7 (1.29)
White	59.8 (2.22)	74.2 (2.58)	82.2 (1.19)
African-American	21.2 (4.59)	42.5 (10.3)	78.2 (4.12)
Latino	48.6 (7.14)	28.3 (7.15)	56.4 (6.21)
Asian	66.8 (10.3)	70.0 (13.0)	77.9 (7.08)

NOTES: Standard errors are in parentheses. Weighted N=1.14M.
SOURCE: National Center for Education Statistics: NELS:88/2000 postsecondary transcript files (NCES 2003-402 and Supplement).

Summer-term enrollment that results in more than four additive credits works for just about everybody (we saw that in the multivariate analyses). While it surprisingly does not shorten time-to-degree for those who earn degrees (see Appendix K), summer credits are associated with higher graduation rates for everyone except Latino students. It is thus in an institution's self-interest to encourage the use of summer-term work, either at the institution itself or at another school. Ways of approaching this goal shy of tuition discounting include moving some of the offerings of high demand courses from the traditional academic-year terms into the summer term, offering summative course work in the major in the summer term, and recruiting students for credit-bearing internships and cooperative education placements in the summer terms. Academic administrators in cooperation with strategic enrollment managers can be very creative.

4) **The high school curriculum component of Academic Resources:** One of the more dramatic illustrations of the potential influence of high school performance on bachelor's degree attainment in the original *Tool Box* isolated four major race/ethnicity groups, confined each to those who entered a four-year college directly from on-time high school graduation, and compared two estimates: the bachelor's degree attainment rate for everyone versus the bachelor's degree attainment rate for those who were in the top 40 percent on each of the three component measures of Academic Resources (curriculum, class rank/GPA, and senior year test score). Though undercut by the fact that, in multivariate analyses, race/ethnicity does not play much of a role in bachelor's degree completion, the cross-tabulation of these estimates suggested that the criterion-referenced curriculum variable had the potential to boost African-American degree completion by 28

percent and Latino degree completion by 18 percent (though that datum was statistically shaky) and white students' degree completion by 10 percent. For Asian students of the period, test scores made more of a difference than either curriculum or class rank/GPA.

Class rank/GPA and senior year test score are not criterion referenced, and while performing better in high school in terms of grades and tests improved degree completion in the original *Tool Box*, it was by lesser magnitudes. It was observed that "in a happy paradox, *everybody* can be in the 'highest 40 percent' on the [criterion-referenced] curriculum measure," whereas that is not true for test scores or class rank (Adelman 1999, p. 85). Content counts, particularly for minority students, and the influence of special preparation programs supports that conclusion (Ishitani and Snider 2004)

Does this analysis still hold, particularly as we have already observed improvements in academic curriculum participation by the High School Class of 1992 compared with the High School Class of 1982 (see tables 4 and 5 above)? That depends on what else is in the mix of factors associated with degree completion, and unlike the original analysis of this feature in *Answers in the Tool Box*, the other factors are matters of *postsecondary* entry and *postsecondary* academic behavior.

How might the four factors just highlighted, along with direct entry to higher education following high school graduation, cumulatively influence bachelor's degree completion for the core universe of this study, the subjects of table 29? To remind the reader just who these students are:

- they were 12th-graders in 1992;
- they earned a standard high school diploma (not a GED) by December1996 (as the NELS transcript records conclude in December 2000, an honest account of degree completion should allow the student at least four years to reach that mark);
- they attended a four-year college at any time (20 percent started in community colleges, and those who started in community colleges earned an average of 52 credits [s.e. = 1.58] from community colleges and 59.5 credits [s.e. = 1.92] from four-year colleges); and
- their postsecondary records were complete, i.e., no transcripts were missing.

Table 32 takes this group, and first sets down a base bachelor's degree completion rate for the entire cohort by four major race-ethnicity groups.[52] The table then enters five key conditions influencing degree attainment that are subject to the initiatives and control of second parties, and marks the *potential* bachelor's degree completion rate for students meeting the thresholds of those cumulative conditions. As each condition is added to the cumulation, the universe narrows for the NELS:88/2000 cohort, and as it narrows, hypothetical degree completion rates rise. One could choose a different sequence of conditions, but the bottom line would be the same.

[52]There were too few American Indians in the base group to follow through a narrowing population as conditions for academic momentum were added.

Table 32. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete, by race/ethnicity

	Percentage earning bachelor's degree				
Cumulative conditions	**White**	**African-American**	**Latino**	**Asian**	**All**
1)Baseline, no conditions	**67.6 (1.18)**	**52.1 (4.26)**	**45.4 (3.74)**	**67.9 (4.71)**	**64.6 (1.12)**
2) No delay of entry	71.0 (1.22)	54.6 (4.49)	50.5 (3.79)	68.2 (4.89)	67.9 (1.15)
3) No delay, top 40 percent of high school curriculum, and highest high school mathematics above Algebra 2	85.6 (1.50)	65.9 (8.57)	69.2 (6.33)	91.5 (1.96)	84.1 (1.40)
4) No delay, top 40 percent of high school curriculum, and more than four credits in summer terms	90.6 (1.31)	84.6 (5.95)	69.2 (8.12)	92.6 (2.27)	89.1 (1.30)
5) No delay, top 40 percent of high school curriculum, more than four credits in summer terms, and 20 or more credits in first calendar year of attendance	92.6 (1.23)	88.2 (5.28)	71.9 (9.07)	93.9 (2.16)	91.4 (1.24)
6) No delay, top 40 percent of high school curriculum, more than four credits in summer terms, 20 or more credits in first calendar year, and less than 10 percent of grades were withdrawals or no-credit repeats	95.5 (0.98)	94.3 (4.62)	79.4 (11.1)	95.3 (2.20)	94.6 (1.07)

NOTES: Standard errors are in parentheses. Weighted Ns for each cumulative step: (1) 1.45M; (2) 1.33M; (3) 712k; (4) 621k; (5) 310k; (6) 273k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

These are statistical coincidences, not causes. The subjunctive is very strong in this presentation. The standard errors indicate that not all these changes would be statistically significant, particularly for minority students, but that phenomenon, too, is a consequence of a shrinking population at each step. No delay of entry is invoked as the first condition because it results in the least shrinkage**,** leaving a larger population with which to assess the other four factors.

All five conditions of table 32 are criterion-referenced. That is, everyone can meet those conditions; everyone can cross those thresholds. The populations could be much larger. Does that mean that future degree completion rates will look like those in this table if everyone meets the criteria on all five counts? No: We know that not everybody will make it. We have already marked and acknowledged that some students will flunk out or become status dropouts for other reasons. But the table suggests just where the improvements are likely to be dramatic—and for whom. Some examples, by race/ethnicity, would be instructive.

For **Latino** students, high school academic curriculum attainment and entering college directly from high school provide the greatest leaps in degree completion, narrowing the gap with white students from 22.2 percent in the base rate to 16.4 percent. But little else narrows the gap much further. Postsecondary summer-term participation, for an obvious case, yields something of a zero, and getting across the 20-credit line in the first year of attendance appears to do little for Latino graduation rates (though if the sequence of conditions were different, it would do more). If we are looking carefully at this fastest growing population in the United States, we pour our efforts into high school preparation above everything else. A decade from now, we will be able to assess better whether postsecondary behaviors become more impressive contributors.

For **white** and **Asian** students, moving into the top 40 percent of the high school academic curriculum intensity index and completing high school mathematics beyond Algebra 2 also is the strongest engine among these variables for boosting college graduation rates. Earning more than four summer-term credits adds something for white students, but nothing to speak of for Asian students. The other factors may contribute minor momentum, but once one reaches a hypothetical 90 percent completion rate, subsequent improvements are not meaningful.

For **African-American** students, who start out at a higher bachelor's degree completion rate than do Latinos, the high school academic curriculum factor does not close the degree completion gap by a statistically significant amount, but earning more than four credits in summer terms offers a stunning boost, narrowing the completion gap vis-a-vis white students from 15.5 percent to 6 percent. The momentum provided by this high-octane persistence behavior continues through the first calendar year credits criterion and avoidance of no-penalty withdrawals and no-credit repeat grades until, at the bottom line of the hypothetical rates set forth in table 32, African-American degree completion rates would be no different from those of whites and Asians.

What did African-American students in the NELS:88/2000 cohort universe who attended a four-year college at any time study during summer terms? A transcript-based account can be very revealing—and in this case, positively so. Using 110 aggregate course categories, table 33 displays the 15 categories accounting for the highest percentages of summer-term credits earned.

Table 33. Percentage of credits earned during undergraduate summer terms by African-American 1992 12th-graders in aggregate course categories

Category	Percent of total summer-term credits
Business other than accounting and administrative science	5.5
Chemistry	5.1
Physical education activities/health information	4.9
College-level mathematics[a]	4.1
College-level writing[b]	3.7
General biology	3.3
Psychology other than general psych	3.0
Physics	2.8
U.S. history surveys, American Civilization	2.8
Micro/macroeconomics	2.6
Accounting	2.5
Calculus	2.5
Foreign languages	2.4
Liberal studies/general humanities/general social science	2.1
Oral communication/public speaking	2.0
Total for top 15 categories	46.7

[a] Includes college algebra, finite mathematics, precalculus, and statistics.
[b] Includes standard English composition, technical writing, creative writing, and advanced essay.
NOTE: The calculation is a "credit ratio" in which the unit of analysis is the course category. All student-weighted earned credits from all course categories are added, with the total a finite glass of 100 percent that becomes the denominator for subsequent calculations. No standard errors are produced.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

This is a very respectable list for anyone. It advises advisers: Point out to African-American students that their peers have proved (a) summer-term credit production is a benefit, and (b) the student can concentrate in the summer terms on the kind of critically demanding and critical gateway courses that might not otherwise be in as intense focus during an academic year term. The learning goes deeper under single-subject concentration. Examples include organic chemistry, calculus, and experimental psychology. To repeat: There are values in summer-term credit production for everybody, but if summer-term credit production looks like it benefits a particular group more than others, that needs to be said. If we don't know why the benefits seem more significant for African-American students, let us submit the issue to future research.

Is the story for low-SES students the same?

Reviewers of drafts of this document asked whether the same type of analysis could be performed by socioeconomic status, since we know that the gap in degree completion between the highest and lowest SES quintiles is far wider than any pair of race/ethnicity comparisons (Adelman 2004a, table 3.1, p.34). The lowest SES quintile group is small: only 6 percent of the

1.43 million 1992 12th-graders who graduated from high school by December 1996 with a regular diploma and who attended a four-year college at some time. These students completed bachelor's degrees at a rate of 35.9 percent, compared with 55.4 percent for students in the middle (3rd) SES quintile, and 79.7 percent for students in the highest SES quintile. Perhaps the best illustration of what might close the gap for them is to compare their hypothetical rates of completion with students from the middle and highest quintiles, and table 34 does so. We use the same levers as variables because they are subject to second-party action. But we have to stop after the step where summer-term credits are added in because (a) in extending the data beyond the boundaries of table 34, subsequent variables in the cumulative sequence (first-year credit threshold and withdrawal/repeat limits) do not add anything to the degree completion rates of low-SES students, and (b) the standard errors of the estimates have risen to the point at which comparisons between the lowest SES quintile group and the middle group are not statistically significant. The data of table 34, though, send clear messages: Despite obviously great limitations inherent in low socioeconomic status, the most promising engine of momentum for

Table 34. Hypothetical cumulative consequences of variables critical to bachelor's degree completion for 1992 12th-graders from the lowest, middle, and highest socioeconomic status quintiles who earned a standard high school diploma by December 1996, attended a four-year college at any time, and whose postsecondary records were complete

Cumulative conditions	**Percentage earning bachelor's degree**		
	Lowest SES quintile	**Middle (3rd) SES quintile**	**Highsest SES quintile**
1) Baseline, no conditions	35.9 (3.74)	55.4 (2.34)	79.7 (1.50)
2) No delay of entry	39.9 (4.18)	59.7 (2.47)	81.3 (1.46)
3) No delay, top 40 percent of high school curriculum, and highest high school mathematics above Algebra 2	58.7 (6.14)	72.5 (3.71)	89.0 (1.21)
4) No delay, top 40 percent of high school curriculum, highest high school math above Algebra 2, and more than 4 credits in summer terms	59.6 (9.73)	82.2 (5.26)	91.2 (1.25)

NOTES: Standard errors are in parentheses. Weighted Ns for each cumulative step: (1) 1.43M; (2) 1.31M; (3) 546k; (4) 260k.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402).

these students is a strengthened high school curricular background, and achieving that objective requires greater attention to the provision of curriculum and the quality of learning environments in schools attended by these students, no matter where those schools are located. Even then, the degree completion gap between the lowest and highest SES quintile would be 32 percent.

The bottom line on degree completion

In reporting the proportion of college students who complete bachelor's degrees, there seem to be as many answers as there are observers. A number of rules are recommended:

1. Use transcript-based data sources. They do not lie; they do not exclude.
2. Follow the student, not the institution. Community college transfer students are followed to determine degree completion. Do it for everybody! And if one insists on institutional graduation rates, give the institution credit for students who transfer in. We don't do that now.
3. Do not restrict the universe to students who entered higher education only in the fall term and only full-time (otherwise one excludes half of an entering cohort).
4. Do not mix your 18 year-old daughter and your 34 year-old brother-in-law in the same analytic of degree completion. They live on different planets of life's responsibilities. In other words, institutions should consider ledgers indicating degree completion rates separately by age bracket at the point of entry, and national accounts should follow suit.
5. The only people for whom bachelor's degree completion rates should be calculated are those who actually enrolled at a bachelor's degree-granting institution at some time.

All these common sense rules, respectful of students and their families, were observed in *The Toolbox Revisited*—and in *Answers in the Tool Box* before it.

The elaborate multivariate analyses of Parts III and IV of this essay provided a framework within which academic momentum toward bachelor's degree completion (not toward something else such as first-year GPA or second-year retention) could be tracked and judged, but without race/ethnicity as a vector. When we extract from this framework the most tractable variables and examine their potential repercussions in terms of closing degree completion gaps by race/ethnicity, there is no question that the academic intensity of secondary school curriculum continues to serve as the engine of subsequent academic momentum, and that the use of summer terms for substantive, highly focused postsecondary coursework is an effective booster to that engine. Both these variables are mixtures of the student's use of time and the mastery of content.

But what does "academic intensity" or "an academically 'rigorous' curriculum" really mean? What content, postsecondary as well as secondary, could be labeled as "challenging," that is, the knowledge toward which students eagerly reach as opposed to unenthusiastically slog through? These questions are part of a large missing component in this study. Part VI of this essay will reflect on that component with the greater care it deserves.

Part VI
The Missing Element of This Story

There is (at least) one major missing element of the story line in both the original *Tool Box* and *The Toolbox Revisited*, and some important questions readers might have asked in the course of the logistic narrative that should be addressed. The missing element, a by-product of the limitations of the NCES grade-cohort longitudinal studies database, is content standards in high school curricula. Postsecondary curricula, which are far more complex in organization, offer a different framework for assessing potential student learning.

Beyond Course Titles to Content Standards

In the years following the release of *A Nation at Risk* (1983), a standing one-liner on the lecture and conference circuit ran something like "we've changed the marquée on the theater, but the show inside is still the same." The marquée carried the course titles, and for better or worse, that is what our grade-cohort longitudinal studies transcript files rely on. As Shireman (2004) has concisely put it, "If schools just change the names of the courses . . .students will not have learned anything more" (p. 4). In building the NELS:88/2000 data files, we discovered that in some high schools, "precalculus" on a transcript could mean any mathematics prior to calculus, including Algebra 1. On the postsecondary transcripts we often ran across cases of professorial marketing with course titles such as "Tooth Brush," "Dots to Dinosaurs," "Time After Time," and (yes) "Good Books" that even online catalogues could not explain. The postsecondary transcripts also carried 3-credit courses in topics such as social event planning, daily living skills, and "appreciation of sports" that, when the syllabi were examined online, could be offered to junior high school students. One has to acknowledge the limitations of the data source, in addition to its virtues. But the limitations, in these cases, were serendipitous because the online search for concrete clues to the content of course work was dispiriting.

Over the past two decades, states have paid increasing attention to content standards for elementary and junior high school curricula, and the *No Child Left Behind* legislation has stimulated a period of intense review and refinement of these standards. But as *Achieve* pointed out in its review of state high school graduation requirements (2004), similar detailed sets of content standards at the secondary school level are rare. We get generalized requirements that reference course titles such as "11th-grade English" or "Applied Biology," and have no idea what precise learning objectives will be pursued. There have been exceptions, of course, with mathematics being an often revisited subject and in ways that demonstrated the difference between what should be expected of all high school graduates and what should be expected of entering postsecondary students (California Education Roundtable 1997).

The past five years in particular have witnessed the birth and expansion of a number of large-scale efforts to get beyond Carnegie unit credit counting to comprehensive criterion-referenced statements of what graduating high school students should know and be able to do in order to

"succeed" in postsecondary environments. By "succeed" is meant completing degrees (see, e.g., American Association of Universities 2003; Achieve 2004). We have also witnessed the growth of high profile alternative approaches to secondary-postsecondary transitions such as "early college high schools." These efforts have been aided and abetted by comparative analyses of emerging state high school exit examinations and the content and knowledge-objectives of lower division college courses (Conley 2003; Venezia, Kirst, and Antonio 2003). The American Diploma Project (Achieve 2004) pushes beyond general knowledge-objectives to include samples of college assignments (e.g., profit-maximizing output analyses in microeconomics, pH calculations for a complex solution in introductory chemistry, an essay assignment on Plato's distinction between thinking and belief in introductory philosophy) and workplace tasks (e.g., a bank loan officer's assessment of an application from a corporation for $1.7 million to purchase two corporate aircraft, a report requiring measurements of DC supply voltage for diffusion furnaces in semiconductor manufacturing and analysis of furnace regulator modification costs, and the determination of dosages in an insulin therapy regimen). These are superb examples of digging below the credit count to the stuff of learning.

Granting that the academic quality and intensity of one's high school curriculum is a key determinant of postsecondary success, there is no assurance that either the standards of secondary school performance, content coverage, or challenge of the material will come close to the threshold demands of either four-year or community colleges. For the vast majority of high school graduates, who will not attend selective institutions, the "disconnect" is considerable. Indeed, Venezia, Kirst and Antonio (2003) urge everyone to pay more attention than that to which the media are accustomed to the "broad access colleges," including community colleges, because the service of these institutions to the bulk of the nation's postsecondary learners has the greatest potential to better "the civic and economic well-being" of every state and region (p. 46).

It is with that in mind that the work of the American Diploma Project (2004) is noteworthy because the sample assignments and examination questions selected signal precisely the kind of learning expected of the bulk of the nation's postsecondary newcomers. Such assignments and questions provide clear expectations for students entering community college occupational programs as well as those moving into the general education portions of postsecondary education. The microeconomics problems come from a community college, the chemistry from a research university.

Previews of the future and their risks

In fact, it could be argued that these previews of lower-division postsecondary learning objectives and tasks should be part and parcel of 11th- and 12th-grade curricula, equally accessible to students intending traditional lines to a bachelor's degree and those following career and technical education paths that *may* include the bachelor's, but certainly involve the occupationally oriented community college associate degrees. We can get to these levels through a modest amount of dual-enrollment for many students, but for those for whom dual enrollment is inaccessible, special postsecondary preview modules could be offered either by high school

faculty with the requisite knowledge or by visiting college and community college faculty.[53] Somehow, students should have a taste of what will be expected, and whether their current knowledge and skills puts them at least on the threshold of those expectations, if not beyond. Some may argue that such previews will scare some students away from continuing their education or that some secondary school teachers will resist the intrusion. One has to be optimistic in both cases, and come to the task with the conviction that it's worth the risk. The risk to academic momentum of not providing these opportunities is greater.

While each state bears principal authority and responsibility for linking the curricular pathways of secondary and postsecondary sectors (Venezia et al. 2005), the examples set forth by the American Diploma Project and the "previews of the future" strategies described above do not treat state borders as Maginot lines. And for good reason: Roughly one out of four undergraduates (and one out of three African-American students) in *The Toolbox Revisited* universe started their postsecondary careers in a state other than that in which they graduated high school. The geographic mobility of our traditional-age postsecondary populations suggests that, at the least, multistate regions (e.g., South Atlantic) should be considered productive information zones for providing those concrete signals of expectations and specific examples of quality postsecondary student work.

Moving the messages to students, families, and school teachers

Let's take the best of what is offered by reports such as that of the American Diploma Project and books such as Conley's recent (2005) *College Knowledge*, and move it out to much larger audiences than policymakers and others who habitually read such reports and books. It might be more helpful for each college and community college to include in its information packages for prospective students a sample of those examination questions and assignments in courses typically taken by lower-division students. One might go even further and provide examples of exemplary student responses—even less-than-exemplary student responses—to those examination questions and assignments.

---

[53]Dual enrollment has made huge strides since the NELS:88/2000 cohort went to high school. Some 38 states now have formal policies (Karp, Bailey, Hughes, and Fermin 2004), though these vary widely in terms of what is offered and by whom, who pays tuition, who gets credit toward what, academic eligibility, grade levels, course enrollment limits, and whether credits earned are placed in escrow (though that varies more by institution than state). The 2002–03 NCES survey of dual enrollment practices at postsecondary institutions distinguished between high school students who took courses within formal agreements and those who took courses outside of those agreements. Our NELS:88/2000 transcript data cannot make that distinction, so they lump together all postsecondary credits earned at colleges or community colleges prior to the date of high school graduation.

Kleiner and Lewis (2005) estimate that 813,000 high school students took courses at postsecondary institutions, either within and/or outside of dual enrollment programs and agreements, in 2002–03, compared with the weighted 213,000 NELS:88/2000 students who earned any postsecondary credits through dual enrollment during their high school years (1989–92). While not exactly comparable populations, those figures are testimony to the growth of student participation in these arrangements.

A quarter century ago, the Educational Testing Service worked on developing an experimental examination to assess lower division college competencies across a matrix of cognitive operations (e.g., analysis, synthesizing) and general curricular areas (e.g., science, humanities). Called "Academic Competences in General Education," the questions were open-ended (not multiple-choice) and required responses that could be composed in roughly 10 minutes. For example, one question went something like this:

> Suppose a new method for producing energy had been developed that, when brought on-stream, would have the effect of slowing the rotation of the Earth from 24 to 26 hours. Before we can flip the switch on this new form of energy, an Environmental Impact Statement (EIS) must be filed. What would be the chapter headings and major sub-headings of that EIS ? You need not fill in the details, but the most important questions about the potential effects of a 26-hour day ought to be included.

In a trial of the examination, faculty sorted student responses to questions such as "Earth's Rotation" into piles of descending quality. They then described what the students whose responses were rated most highly did to earn that rating, turned to the second most highly rated collection of responses and arrived at a consensus of what these students did *not* do that the first group did—and so on down the line of the piles of student papers they had rated until a level euphemistically described as "nonresponsive" was reached. The faculty descriptions were subsequently aggregated and ironed out as performance criteria. One could then turn to incoming freshmen with this question, along with an example of a first-rate response and an example of a fourth-rate response (out of seven levels), show them the performance criteria and say, "This is what you can expect to be able to do by the middle of next year; would you be better than the fourth level now?" A light goes on somewhere—or should—when entering students see that what it takes to respond effectively to the "Earth's Rotation" question draws on a selection of knowledge from economics and business, psychology, international relations, world history, cultural anthropology, physical geography, technologies, visual arts—all in addition to the core sciences. More important, the light goes on when students see a good example of how to put all this together in an outline of a document that is as much a product of daily work life as it is a college exercise.

And a similar light can go on among high school seniors as well, nearly all of whom think they are going on to something called "college," but have little idea what that means beyond the fact that they will no longer be bound by school rules. Prospective students are not the only audience for this information: Their families and high school teachers are equal players. Not all parents will understand the assignments, laboratories, and examination questions, but certainly they will sense, from the examples, that postsecondary education is serious business, that their children will not get through with a carefree study schedule, that colleges and community colleges have standards, and that such examples are typical of what their children will learn. Inevitably (being optimistic about this) they will be proud enough at the prospect to ask their children to be prepared. High school teachers reading these assessment "prods" will have to reflect on the extent to which their graduating seniors possess the academic foundations and momentum to

respond successfully. To the extent to which high school teachers have doubts, they may adjust the form and content of their own assignments, laboratories, and examinations. Students are bound to be the beneficiaries of the resulting "postsecondary practice runs."

Postsecondary dimensions of content

At the postsecondary level, the issue of content is somewhat easier to address, but only in the context of a student's entire undergraduate record. We know that students completing organic chemistry enrolled in the course not only with general chemistry as a background, but also mathematics at at least the precalculus level. We know that students completing a course in American economic history would have a very difficult time without prior learning in both U.S. history writ large and the standard introductory micro/macroeconomics sequence. A course in the psychological and cultural components of health care in a community college allied health program will probably not be offered to anyone without previous course work in general psychology. The chances that a fine arts degree candidate's transcript shows an entry for a course in color and color theory without prior foundations and studio courses are remote. In higher education, we can use the second- and third-level courses in a field as rough confirmations of learning at the introductory level. There is a sufficient lattice-work within disciplines to track traces of content from one point on the scaffolding to another. No, the traces inherent in second- and third-level courses in a field are not in themselves content standards, and nuance is expected from school to school, but there is a generalizeable quality to these content cues. In fact, the generalizeable portions of upper-division curricula are what one is likely to see on the Graduate Record Examination Board's subject matter examinations. This topic witnessed a surge of interest in the 1980s (for a paradigmatic analysis, see Oltman 1982), and is worth renewed exploration.

THIS PAGE INTENTIONALLY LEFT BLANK

Part VII
Concluding Messages

Compared to its predecessor, *Answers in the Tool Box*, the preponderance of the *Toolbox Revisited* story has been on the postsecondary side of the matriculation line. Implicitly, it calls on colleges, universities, and community colleges to be a great deal more interventionary in the precollegiate world, to be more self-reflective about the paths they offer from high school through their own territories. It also calls on them both to fortify their institutional research capacities and integrate them more intimately with academic advising and course scheduling. As noted above, we are witnessing measurable ferment on the high school side of the passage, and as the principles of the *No Child Left Behind* legislation move beyond grade 8, we will see more. The higher education sector cannot sleep through these changes.

To students as agents of their own futures

Beyond that fundamental banner of institutional fortification, there are three sets of messages impelled by both studies. The first set is for entering high school students who, when asked, blithely shrug that "of course I'm going to finish college."

1. Just because you say you will continue your education after high school and earn a college credential doesn't make it happen. Wishing doesn't do it; preparation does! So . . .

2. Take the challenging course work in high school, and don't let anyone scare you away from it. Funny thing about it, but you learn what you study, so if you take up these challenges, your test scores will inevitably be better (if you are worried about that). If you cannot find the challenge in the school's offerings, point out where it is available on-line, and see if you can get it that way. There are very respectable Web sites offering full courses in precalculus, introductory physics, humanities, music theory, and computer programming, for example.

3. Read like crazy! Expand your language space! Language is power! You will have a lot less trouble in understanding math problems, biology textbooks, or historical documents you locate on the Web. Chances are you won't be wasting precious credit hours on remedial courses in higher education.

4. If you don't see it now, you will see it in higher education: The world has gone quantitative: business (obviously), geography, criminal justice, history, allied health fields—a full range of disciplines and job tasks tells you why math requirements are not just some abstract school exercise. So come out of high school with more than Algebra 2, making sure to include math in your senior year course work, and when you enter higher education, put at least one college-level math course under your belt in the first year–no matter what your eventual major.

5. When you start to think seriously about postsecondary options, log on to college and community college Web sites and look not so much for what they tell you of how wonderful life is at Old Siwash, but what they *show* you of the kinds of assignments and examination questions given in major gateway courses you will probably take. If you do not see these indications of what to expect, push! Ask the schools for it! These assignments and questions are better than SAT or ACT preparation manuals in terms of what you need to complete degrees.

6. See if your nearest community college has a dual-enrollment agreement with your school system, allowing you to take significant general education or introductory occupational courses for credit while you are still in high school. Use a summer term or part of your senior year to take advantage, and aim to enter higher education with at least six credits earned this way—preferably more.

7. You are ultimately responsible for success in education. You are the principal actor. The power is yours. Seize the day—or lose it!

Given the story lines of *The Toolbox Revisited,* it is obvious that students are partners in their own education fate, and shouldn't wait around for someone else to do something to them or for them.

Public discourse, part 1: Dissonant data and their discontents

The second set of messages is for those who engage in public discourse on education in general, secondary-to-postsecondary transitions, and ultimately, degree completion rates (with all stops in-between). We have some problems here.

Foremost among these problems is the sheer volume of dissonant statistics that are thrown around about student progress, and all the labels of "at risk," "minimal college-qualified," and "failure" that get pasted to populations in the process. The "at risk" labeling default has gone so far as to turn students into "patients," whose "illnesses" must be diagnosed and followed up with early intervention, intensive intervention, and continuous intervention (Seidman 2005, p. 298) that may even continue after graduation—and for "a modest fee" (p. 299). The data dissonance and deficit language cloud perceptions and preclude constructive policy. We all have considerable cleaning up to do.

On any given day, the public will be offered a half-dozen different statistics on high school graduation rates, college-enrollment rates, college completion rates, grades, and time-to-degree. The data will appear in respectable academic journals in articles that were reviewed by peers who often are experts on statistical technique and (at best) novices on the data sources. Or they will appear in publications and on Web sites of respectable organizations, even though they were never reviewed by anyone outside the organization. Anything that appears between respectable

covers is taken as authoritative, and once it moves into the mainstream press and onto the home pages, we read the headlines but not the footnotes. Inference runs rampant.[54]

For any of these statistics, we never ask who is in the denominator: that is, who are we counting, and who are we not counting—and how? As a consequence, what often pours out are scare stories that make for good press and bad policy. The bad data-driven scare story, in fact, has become the preferred narrative. We are scared by stagnant high school graduation rates over a 30 year period during which the size of the grade cohorts declined significantly then expanded dramatically with the baby boom echo, and during which we witnessed increased immigration from countries with mandatory school attendance ages much lower than ours. By an alternative view, it's amazing we have maintained a stable high school graduation rate (the quality of high school curriculum aside). The same alternative view could be advanced with reference to rates of postsecondary credentialing: It's remarkable we are maintaining the same degree-granting rates in the face of significantly higher enrollments (unless, of course, we are awarding an excess of cheap degrees).

Dissonance by age and season: A plea for honest tracking

The source of many unnerving postsecondary stories is one of the most grievous errors in analyses of student progress: including in the denominator students who started their postsecondary careers at age 29, 36, or 47 along with the mass of students who entered the postsecondary universe at age 18 or 19. Common sense says that a 19-year-old and a 31-year-old are on completely different life trajectories, and the national data from the Beginning Postsecondary Students longitudinal studies back up the common sense. When the newspaper story uses the term, "college students," most adults think of their children, not their brother-in-law or their coworker. Community and four-year college administrators know the difference, and provide academic programs, scheduling and services for those different populations.

But what are they to do when the press and the news Web sites complain that nearly half of entering students do not return for their second year or that the graduation rate is *only* 50 percent (thus assuming everyone else is a dropout), and they are called before legislative committees and boards of trustees to explain? There is an enormous difference by age at entry to the postsecondary system in these measures, and an even greater distortion when one restricts the

[54]For example, consider the following statement in a respectable publication: "One of the key reasons that low income students have such low completion rates in postsecondary education is that many work long hours in order to be able to afford college. They struggle to balance work with part-time enrollment in college . . ." (Allen, Goldberger, and Steinberg 2004, p. 222). The data source for this assertion is the National Postsecondary Student Aid Study of 2000, a one-year snapshot that includes no "completion rate" data. Analyses of the NPSAS 2000 data files show that the statement does not reach the threshold of justification unless one divides the population by age bracket. At that point, one finds that, and among traditional-age students (presumably the group referenced by the scare), poor kids are no more likely to be working longer hours at their jobs than anyone else, though they are more likely to use their wages for education expenses. That, at least, is an honest statement—for a snapshot population. And it is not what we really would want to know.

definitions of what it means to "return to" or "graduate from" to those who started in the fall term, full-time, and who came back to or earned a degree from the same school. That denominator knocks out half of traditional-age students from the calculation, and denies the realities of geographic mobility that the Bureau of the Census—let alone NCES longitudinal studies—has documented for the 20-something population (Schachter 2004; Adelman 2005b). Policies designed to "retain" students who have already moved to another state or who are *de facto* ghosts by not being included in the retention denominator in the first place are, at best, wastes of energy.

What is *not* a waste of energy is the task of developing more universal and efficient student tracking systems, and recapturing the headlines from the mongers of scare. There are those who will not accept NCES national longitudinal studies on the grounds that they are samples (no matter how scientific the sampling design), that we can only afford to start one every six or 10 years, and then have to wait for people to age and accumulate academic history by which time, the grievance goes, "the data are old." Impatient to simulate instant longitudinal cohorts, they impute sequences of data from different sources and with denominators that include "projections," and produce shock data that cannot be validated by any sensible reference points, e.g., that only 18 percent of ninth-graders will earn an associate or bachelor's degree within the subsequent ten years (National Center for Public Policy and Higher Education 2004).[55]

But even the best of state tracking systems and the services of the independent National Student Clearinghouse information system that currently (2005) covers about 2900 institutions (and cites a burgeoning interest in including high schools in the universe), will not produce the wealth of information that a NELS:88/2000 or a Beginning Postsecondary Students study yield. This essay cannot recommend policy in these matters, but it can recommend creativity and cooperation, serious reading of the papers and reports from Florida's tracking system (e.g., Whitfield and Howat 1999; Goodman, Latham, Copa, and Wright 2001; Goodman, Copa, and Wright 2004; Johnson, Coles, and Thomas 2004), and reflection followed by activistic innovation, and will wager that the long-term results look better than the scare stories assume.

Public discourse, part 2: The language we use

Language does more than reflect reality—it creates reality as well. There are considerable problems with the language used in describing what happens to students in our education system, and our choice of terms sets boundaries and colors of reality. The boundaries and colors, in turn, condition the terms of policy. Let us illustrate with a few paired terms. These are contrary rhetorics, and this study frankly admits to taking sides in their contention. But it does so in order to urge a positive tone that, not so by-the-way, legislators, superintendents of schools, college presidents and other leaders would prefer to use. The language of leadership is a "can do" language, not a punitive rhetoric.

---

[55]There has never been a national longitudinal study of ninth-graders. But we do have a national longitudinal study of eighth-graders—the NELS:88/2000—with transcripts, not imputations, projections, and dubious math. If we follow these eighth-graders, including high school dropouts, all the way through to age 26, ultimately 34 percent earned either an associate or bachelor's degree (see the full account offered in Appendix L, table L12). That percentage at least puts us in range of doing better. If we accept the putative (and utterly false) 18 percent, we risk abandoning all hope and effort.

"Attrition" versus "Persistence." When "attrition" is the governing term, we worry about students who (it appears) leave school or college, and seek explanations for departure that have included theories of organizational turnover (Bean 1983) and failures of academic and social integration (Tinto 1987). At the first sign of exit—even though the student may return—we turn to negativity. There has to be something wrong here, we say. The student was "at risk," the institution did not respond—we witness a cycle of blame.

When "persistence" is the governing term, we take our directions from students. What did they do that resulted in attainment? What structures of opportunity do we need to offer so that future students can follow the same paths? What do we think works? Can we test it out? This is a far more positive approach. This essay endorses it: Drop "attrition," embrace "persistence"!

"Retention" versus "Persistence." Institutions "retain"; students "persist." If our language is governed by "retention" all we see are institutions determined to hold on to students, keeping them in places that may be unproductive, at all costs, and for the sake of their public ratings. If our language follows student "persistence," on the other hand, we see those individuals making a series of rational choices that take advantage of the opportunities offered by institutions so as both to discover true interests and reach productive ends. Tinto would not object if the rhetoric of leaving an institution was turned into a saga of discovery. Students may go elsewhere; they may take extended time off from higher education; but ultimately they may judge the change as positive and not a result of failure (Tinto 1987, pp. 132–33). In the rhetoric of "retention," students are passive: Something is done to them, and that "something" assumes a deficit model. Under the rhetoric of "persistence" they are actors shaping their fate, with a model of success in mind. Wouldn't anyone rather have success?

"Pipelines" versus "Paths." As Bach et al. (2000) noted—and others have followed—there is no linear path to a degree, particularly for students who start out in community colleges. The default "pipeline" metaphor, used to describe presumably linear learning experiences and environmental sequences, is wholly inadequate to describe student behavior. Pipelines are unidirectional closed spaces, and under the "pipeline" metaphor students are passive creatures (as in "retention") swept along or dropping out of the space completely through leaks at the joints. But student behavior doesn't look like that at all: It moves in starts and stops, sideways, down one path to another and perhaps circling back. Liquids move in pipes; people don't.

At the high school level, for example, a student can acquire momentum in science through a combination of statistics and biology, on the one hand, or physics and calculus, on the other. These are different paths, but who is to say that, once in a four-year or community college, these students could not move in very different directions? The students entering a community college with the statistics and biology background thinking they were heading for further study in allied health fields could easily discover business and computer programming, and transfer to a four-year college to pursue an academic program in management information systems with both quantitative background and empirical habits of mind born of study in the life sciences. The paths to degrees offer many such intersections.

Under the "pipeline" metaphor, we look for easy (sometimes glib) causalities along a single line of explanation. "Paths," on the other hand, allow for multiple analyses and discoveries of tools that suggest (but do not predict) productive routes to education goals. This essay obviously endorses "paths."

Reiterations

Virtually all reviewers of drafts of this study recommended a concluding reiteration of its major themes and conclusions. Three configurations of themes and conclusions stand out in response:

First, there was a story about curriculum, the content of schooling, that was compelling in its secondary school dimensions in the original *Tool Box*, and is even more compelling now on both secondary and postsecondary stages. What you study, how much of it, how deeply, and how intensely has a great deal to do with degree completion. All of this is common sense, but requires equitable execution with emphasis on primary tools, which in this story means that:

- Secondary schools must provide maximum opportunity-to-learn, by which we mean not merely course titles, but course substance. If we seek better preparation for any kind of postsecondary education—occupational, professional or traditional arts and sciences—we have to ratchet up the challenge of content.

- Postsecondary institutions have got to be active players and reinforcers at the secondary school level—particularly in partnership with schools that are not providing or inspiring students—with opportunity to learn at those ratcheted-up levels of content. Pep talks, family visits, recruitment tours, and guidance in filling out application and financial aid forms are not enough.

- Indeed, the first year of postsecondary education has to begin in high school, if not by AP then by the growing dual enrollment movement or other, more structured current efforts (for examples, see Hughes, Karp, Fermin and Bailey 2005). If all traditional-age students entered college or community college with a minimum of 6 credits of "real stuff," not fluff, their adaptation in the critical first year will not be short-circuited by either poor placement or credit overload.

Second, this curriculum story, joined by nuances of attendance patterns that turn out to have significant leverage, continues into higher education. These features of the saga of degree completion are rarely attended to, and all provide tools to enhance completion rates.

- It's not merely getting beyond Algebra 2 in high school any more: The world demands advanced quantitative literacy, and no matter what a student's postsecondary field of study—from occupationally-oriented programs through traditional liberal arts— more than a ceremonial visit to college-level mathematics is called for.

- Academic advisers and counselors have to target every first-time student for at least 20 additive credits by the end of the first calendar year of enrollment. We saw the same consequences in the original *Tool Box*, though now we understand better that the chances of making up for anything less than 20 credits diminish rapidly in the second year. Community colleges have some special challenges here, given increasing rates of transfer among traditional-age students. With 6 credits of dual-enrollment course work, even part-time students can reach 20 credits in the first calendar year, and community colleges enroll the bulk of traditional-age part-time students.

- Excessive no-penalty withdrawals and no-credit repeats appear to do irreparable damage to the chances of completing degrees. This phenomenon was also observed in the original *Tool Box*. Twice advised, institutions might think very seriously about tightening up, with bonuses of increased access and lower time-to-degree.

- More than incidental use of summer terms has proven to be a degree-completion lever with convincing fulcrum. It's part of the calendar-year frame in which students are increasingly participating. Four-year and community colleges can entice students into fuller use of summer terms with creative scheduling.

Third, in contrast to their treatment in the mass of literature on academic progress, students are explicit, rather than implicit, in *The Toolbox Revisited.* They are respected adults playing large roles in their own destinies. What we call "variables" are not bloodless abstractions: they are signs of what students do; and our messages are about where and when the green lights and caution lights will flash along the paths toward degrees. While we trust that school and college actions will not leave them behind, they have equal responsibilities.

Legacy

These are limited beginnings of change in the terms of the enterprise with which any reader of this document is concerned. They are honest terms and do not pretend to predict, rather help us draw a background tapestry against which we can judge just how well we are doing for our children as they cross the cusp of adulthood. The terms derive from the story; the story derives from the wisdom of the U.S. Department of Education in establishing and maintaining its longitudinal studies; and our subsequent discussions and enlightenment derive from the leadership of the National Center for Education Statistics in executing those studies and providing us with archives of information that are the envy of other nations. All of this constitutes an unmatchable legacy.

APPENDIX B

Principal Features of the NCES Grade-cohort Longitudinal Studies

There are four grade-cohort longitudinal studies designed and conducted by the National Center for Education Statistics. Three of these have been completed:

- National Longitudinal Study of the High School Class of 1972 (NLS-72), started with a cohort of seniors in the spring of 1972, concluded in 1986;
- High School and Beyond, with a cohort of seniors in 1980, concluded in 1986, and another cohort of sophomores in 1980 (HS&B), concluded in 1993; and
- National Education Longitudinal Study of 1988, initiated with an eighth-grade class in 1988 (NELS:88), concluded in 2000.

The data from these studies are available in both public release and restricted (license required) form on CD-ROM, with electronic code books (ECBs) listing all variables, with descriptions and distributions.

The fourth, the Education Longitudinal Study of 2002 (ELS:2002), starting with a sample of 20,000 10th-grade students in the spring of 2002, is in progress.

Curtin, Ingels, Wu, and Heuer (2002) offer a figure with a temporal presentation of the four longitudinal studies,[56] highlighting their component and comparison points. Each of the studies begins with a national probability sample involving a stratified sample of schools and a random sample of students within the target grade in those schools. Schools in minority communities are over-sampled. In some cases, the samples are refreshed at later points in the longitudinal study (NELS:88 in 1990 and 1992)[57] and, in some cases, augmented at a later point (NLS-72 in 1973).

Each of these longitudinal studies includes a great deal more information than what is used in *The Toolbox Revisited.* Not all of them are comparable in terms of the depth with which various topics are explored. The surveys of the NLS-72 were focused wholly on students, whereas those

---

[56]Curtin, T.R., Ingels, S.J., Wu, S., and Heuer, R (2002). *National Education Longitudinal Study of 1988: Base-Year to Fourth Follow-up Data File User's Manual* (NCES 2003-323). Washington, DC: U.S. Department of Education, National Center for Education Statistics (http://nces.ed.gov/pubs2002/2002323.pdf, p.3).

[57]As Lucas and Berends (2002) remind us, the high schools attended by students in the NELS study are not a true representative sample. The reason stems from the decision to begin the longitudinal study in the eighth grade. When students move into high schools from the eighth grade (or, in some districts, from the ninth grade), it is impossible for the sampling framework to be based on high schools. Roughly 1,000 middle schools and junior high schools became 4,000 high schools by grade 10, and there was no way to follow the students into all 4,000 of those schools. So the NELS sample was refreshed in 10th and 12th grades to reflect the total enrolled population in those years (Ingels et al. 1994), and , by necessity, the refreshing was based in the high schools in which the vast majority of the existing NELS cohort students were enrolled.

of the subsequent longitudinal studies included parents, teachers, and secondary school administrators. The cognitive tests administered in the 12th grade to the NLS-72 cohort were administered in the 10th and 12th grades to subsequent cohorts, thus enabling measures of intellectual growth. High school course-taking for the NLS-72 was summarized and reported by the school, whereas for the HS&B/Sophomore cohort and NELS:88/2000 high school course-taking was derived directly from transcripts. And the postsecondary transcripts for the NELS:88/2000 were used to fill in missing information from the high school transcripts in that cohort. Labor market histories were far more detailed in the NLS-72 and HS&B/Sophomore cohort than they were for the NELS:88/2000. Military records exist for the NLS-72 but not for any subsequent study. Student financial aid information included an unobtrusive Pell Grant file for the HS&B/Sophomore cohort, and that for the NELS:88/2000 included data from the National Student Loan Data System (though this file requires more cleaning and reconstruction in order to be truly helpful).[58]

Lastly, the shift from paper-and-pencil survey response forms to computer-assisted telephone interviews (CATI) in the1990s constricted the range of questions asked (e.g., there was no time to ask students about reasons for changing majors, reasons for transferring from one college to another, and degrees of satisfaction with different aspects of postsecondary experience), whereas the NLS-72 paper survey forms covered these topics in some depth.

Nonetheless, the archives of these data sets are the richest we have to explore the nature of secondary and postsecondary education and its consequences in the early adult life histories of Americans over the past 30 years.

---

[58]See the brief discussion of financial aid data in the NELS:88/2000 in Adelman, C. *Principal Indicators of Student Academic Histories in Postsecondary Education, 1972-2000.* Washington, DC: U.S. Department of Education, 2004, p. 98.

APPENDIX C

Differences Between the High School & Beyond/Sophomore Cohort and NELS:88/2000 High School Record Variables, and Limited Imputation Procedures for the NELS:88/2000

The principal portions of the data sets in question are secondary school transcripts and allied information derived from survey questionnaires and computer assisted telephone interviews (CATI). The secondary school transcripts were collected and coded by the same contractor for both data sets, but the returns were very different. The High School & Beyond/Sophomore cohort began with a stratified national sample of secondary schools, all of which agreed to participate in the project and provide transcripts, access to teachers and administrators. The NELS:88/2000 began with a national stratified sample of schools with eighth grades, all of which agreed to participate in the project and provide appropriate information. As noted above in Appendix B, when students moved into high schools, the NELS sample was refreshed in10th and 12th grades to reflect the total enrolled population in those years (Ingels et al. 1998), and, by necessity, the refreshing was based in the high schools in which the vast majority of the existing NELS cohort students were enrolled. The analysis file created for this study includes the12th grade refreshed sample, but some of the high schools that were not part of the original stratified sample did not provide transcripts.

At the postsecondary level, on the other hand, the transcript return rate increased from 89 percent for the HS&B/So to 93 percent for the NELS:88/2000 (Curtin, Ingels, Wu, and Heuer 2002), and the proportion of postsecondary participants with complete records increased from 88 to 97 percent.

Editorial processes

The postsecondary transcript-based versions of both data sets were edited by the same person (the author of this study), and with the same rules, a feature that increases reliability at the price of intra-coder bias. If one thinks of two sets of archival documents: secondary and postsecondary transcripts for two cohorts, i.e., four data files, in only one did the editor actually see the paper documents submitted by institutions, namely, the postsecondary transcript files of the NELS. These artifacts contained information that allowed corrections and fill-ins for missing information on the secondary school transcript files, e.g., state location of high school, high school graduation date, high school diploma type, Advanced Placement course credits (by examination), and SAT and ACT test scores. Hence, the presentation of secondary school transcripts on the restricted file with the postsecondary transcript data (NCES CD#2003-402) is more accurate than it is on earlier NELS restricted files. After a year of use, a supplement to NCES 2003-402 was issued in June 2004, containing further refinement of both high school and college transcript-derived variables, in addition to new derived variables.

Missing data and limited imputation

The analysis files for both this study and *Answers in the Tool Box* used high school transcripts with complete records for at least grades 10–12. But the NELS:88/2000 transcript data, as well as test score data, fell short of the HS&Beyond/So coverage, even after preparation of the 2004 Supplement to the original NELS Postsecondary Files that included the second round of corrections and fill-ins of missing information on the high school transcripts.

Table C1. Unweighted percentage of 1982 and 1992 12th-graders missing precollegiate academic performance data

	HS&B/So	NELS:88/2000	After Supplement
Performance variables			
Curriculum measure	18%	14%	14%
Class rank/GPA	13	20	17
Senior test score	9	14	14
One or more measures	**18**	**24**	**21**

SOURCES: High School & Beyond/Sophomore cohort (NCES #2000-194); NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Class rank/GPA, the combined high school class rank/grade point average quintile, is the major problem in the comparison displayed in table C1. In both data sets this variable (called "CLSSRNKQ" for programming purposes) was constructed in the same way, but the input data initially yielded a far smaller universe for the NELS than was the case for the HS&B/So.

The construction of this variable begins with class rank, expressed as a percentile, for students whose high school graduating classes are greater than 10. Class rank was chosen for the base reference because it overrides variability in local grading practices. Not all high schools compute class rank, so for a significant percentage of students, this datum is missing. For these missing cases (as well as for the students from very small high schools), the variable construction turns to high school grade point average (where available, and only for students with three years or more of course work in all high schools attended). In both data sets, all known cases of high school GPA were weighted and set out in quintiles. The missing cases of class rank, by quintile, were then substituted by the GPA quintile (the correlation between the two quintile scales was .84).

However, there are two significant differences in data input between the HS&B/So and the NELS:88/2000. First, the HS&B/So grade point average was for academic courses only, whereas in the NELS, the GPA applied to all courses. Second, by the time of the NELS histories, some high schools evidently were indicating neither class rank nor cumulative GPA of

any kind on transcripts (either that or the original data entry for the NELS high school transcripts did not compute GPA). While 13 percent of the HS&B/So students were missing the combined CLSRANKQ variable, half again of that proportion (20 percent) of the NELS students lacked a CLSSRNKQ value (see Glossary for further details and citations).

This difference would have serious consequences in the replication of the original *Tool Box* hypotheses. The universe of NELS students with positive CLSSRNKQ values was initially smaller than those for the curriculum variable (HSCURRQ) and senior year test score (SRTSQUIN). Since the multivariate analyses of both *Tool Box* studies depend on positive values for all three variables, the composite variable built from a partition of the three would overestimate the value of CLSSRNKQ at the expense of the other two components. In preparing the analysis file for this study, plausible values for missing cases of CLSSRNKQ were imputed when values for both curriculum quintile (HSCURRQ) and test score quintile (SRTSQUIN) were positive and equal, e.g., both were in the third quintile. In these cases, CLSSRNKQ was assigned the same value as the other two variables. The impact of this imputation strategy lowered the unweighted missing cases of CLSSRNKQ from 20 to 17 percent, and the unweighted cases of NELS:88/2000 students missing one or more of the high school performance variables from 24 to 21 percent (see table C1).

Bias and potential imputation.

Even after this revision, a problem remained, and a multiple imputation procedure was followed (Herzog and Rubin 1983). In the original edited version of the NELS high school transcript data that appears on NCES data CD 2003-402 (March 2003), and modified by its June 2004 supplement, some 17.3 percent of the students were missing CLSSRNKQ, 13.8 percent were missing HSCURRQ, and 13.5 percent were missing SRTSQUIN. Under NCES statistical standards, CLSSRNKQ would have to be evaluated, since the proportion of students with non-missing values was less than 85 percent.[59]

The formula used to determine the nonresponse (i.e., missing) bias in these three variables was:

> A*(b-c) where A is the percent of students missing data, b is the percent of those missing data who did NOT earn a bachelor's degree, and c is the percent of those not missing data who did not earn a bachelor's degree.

To obtain the relative bias with respect to the estimate, the result of this formula is divided by b.

The initial nonresponse bias rates for the three variables were:

	Bias	Relative bias
HSCURRQ	0.015	0.021
CLSSRNKQ	0.034	0.049
SRTSQUIN	0.039	0.048

[59]See NCES 2002b.

In other words, for example, if the estimate for the curriculum variable was based only on those with positive values, it would overestimate the percent who did not earn bachelor's degrees by 2 percent. These are all small biases, and would not threaten tests of statistical significance. But the missing cases were less than random: Students who never entered postsecondary education by age 26 or 27 were overrepresented, and those who never graduated from high school or who were still enrolled in high school after the scheduled graduation of the class in 1992 would not show complete transcript records in1992.

In order to increase the number of students with positive and plausible values for all three components of the Academic Resources variable, another limited imputation was undertaken, focused on class rank/GPA. The first question identified, of all students who were in the 12th grade in 1992 and for whom the file showed positive values for both the curriculum (HSCURRQ) and test score (SRTSQUIN) variables:

1) those who also showed a positive quintile value for class rank/GPA (CLSSRNKQ), and were in the *same quintile* on all three measures.	16.6%
2) those who were in the same quintile on both curriculum and test score measures, also had a positive quintile value for class rank/GPA, but the rank of this quintile differed from the others by $\pm$ 1.	13.4
3) those who were in the same quintile on both curriculum and test score measures, but were missing class rank/GPA.	2.7
4) those who were missing class rank/GPA, and whose quintile positions on curriculum and test score measures differed by 1.	2.5
5) those who were in the same quintile on both curriculum and test score measures, also had a positive quintile value for class rank/GPA, but the rank of this quintile differed from the others by > 1.	5.8
6) those who were not in the same quintile on both curriculum and test score measures, whether or not class rank/GPA was missing.	59.0

The focus of imputation was on those members of groups 3 and 4 whose high school transcripts registered 12 or more academic Carnegie units. This small group was then examined for *prima facie* anomalies in variables such as postsecondary attendance, selectivity of first institution of attendance (if any), and postsecondary remedial work. There were none. An algorithm was then developed that assigned a value to CLSSRNKQ, as follows: (1) where HSCURREV = SRTSQUIN, the class rank/GPA quintile was assigned the same value; (2) where the difference between HSCURREV and SRTSQUIN was $\pm$1, CLSSRNKQ was assigned the lower value in half the cases, and the higher value in the other half.

The result reduced the proportion of missing ("nonresponse") cases of CLSSRNKQ from 17.3 to 15.8 percent. The nonresponse bias rates improved as follows:

	Before imputation	After imputation
Bias rate	0.034	0.019
Relative bias	0.049	0.026

The consequent reconstruction of Academic Resources

The proportion of students with non-missing values for all three components of the Academic Resources index rose from 70 to 72 percent as a result of the imputation described above. However small the increase, it required a recalculation of the comparative weights of the three components of Academic Resources, in the following steps:

a) A logistic regression was run with bachelor's degree attainment as the dependent variable, the three components as independent variables, and a universe limited to1992 12th-graders. The ratios of the standardized beta coefficients for each of the independent variables produce the weights for each variable in the composite. The changes between the earlier version of these weightings and the post-imputation version are small, but required, as table C2 shows.

Table C2. Differences in ratios of standardized betas for the three components of the Academic Resources composite, before and after limited imputation of missing class rank/GPA data for 1992 12th-graders

	Partition weight	
Component of Academic Resources	Before imputation	After imputation
Curriculum	41.9	42.4
Class rank/GPA	32.9	32.5
Senior-year test score	25.2	25.1

SOURCE: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

b) Each of the three components is then multiplied by its weight brought forward from the logistic model. So, for example, a student in the third quintile of HSCURRQ is credited with 1.272 points (3*0.424). The points are added, then weighted by the enhanced NELS high school transcript weight for those in the 12th grade in 1992 (F4F2HWT), then set out in quintiles of Academic Resources. The difference in distributions of the values of Academic Resources, before and after imputation, are indicated in table C3.

Table C3. Differences in distribution of 1992 12th-graders across the values of the Academic Resources composite variable, before and after limited imputation of missing class rank/GPA data

	Percent distribution of students	
Values of Academic Resources	Before imputation	After imputation
Missing	29.9	27.9
Highest quintile	14.3	14.6
2nd quintile	13.3	14.3
3rd quintile	14.2	14.7
4th quintile	13.9	13.6
Lowest quintile	14.3	14.9

APPENDIX D

Technical Issues

Accuracy of estimates and standard errors

There are different kinds of statistics in *The Toolbox Revisited*, and all of them are estimates derived from student samples. Two kinds of error occur when samples are at issue: errors in sampling itself, particularly when relatively small subpopulations (for example, American Indians) are involved; and nonsampling errors. Even in surveys as large as the three grade-cohort longitudinal studies used in this monograph, sampling errors can affect estimates of statistical significance.

Non-sampling errors are more serious. A good example of a non-sampling error would be the fact that transcripts are missing for some students in all three grade-cohort studies. The transcripts are missing either because the student did not tell the interviewer that he or she attended the school (and there were no transfer credits on another transcript to identify the school); the school refused to send the transcript; the school could not find the transcript; the information sent by the school was not really a transcript; or while the student may have enrolled at the school he or she never registered for courses and did not generate a record. In this case, we can mitigate the effect of missing transcripts by differential weighting of the population, and, indeed, for both the High School and Beyond/Sophomore and NELS:88/2000 files, the analyst is given a choice of weights, one of which is confined to students with complete records (see the discussion of weights and flags below). Weighting, though, will not address the panoply of nonsampling errors.

The effects of sampling and non-sampling errors ripple through databases. To judge the accuracy of any analysis, one needs to explicate and judge these effects. When the unit of analysis is the student, this is a straightforward issue because the original samples in the longitudinal studies consisted of students. For example, when questions are asked about the proportion of students who earned credits in an aggregate category of courses (e.g., table 21), the questions are about nonrepetitive behaviors of the students who were sampled. The descriptive comparisons in *The Toolbox Revisited* dealing with non-repetitive student behaviors require invocation of the Students'*t* statistic to determine whether the difference between two independent estimates is significant. The formula for computing Students' *t* values is:

$$t = \bullet \bullet \frac{(P_1 - P_2)}{(se_1^2 + se_2^2)}$$

where P_1 and P_2 are the estimates to be compared and se_1 and se_2 are the corresponding standard errors. In this case, if $t \geq 1.96$, one has a statistically significant difference at $p < .05$, a standard marker. For the judgments of statistical significance in all cross-tabulations in this document, an Excel template developed by MPR Associates for the production of reports to the National Center for Education Statistics, was used.

The formula becomes more complex, however, for multiple comparisons among categories of an independent variable such as race/ethnicity. For multiple comparisons, the critical value for *t* rises depending on the number of comparisons that can be made in the family of the independent

variable. For race/ethnicity presented in five categories, there are10 possible comparisons, so the significance level of each test must be $p \leq .05/10$ or $p \leq .005$. To determine the significance level of t values in any comparison of means or proportions, the result should be matched against standard published tables of significance levels for two-tailed hypothesis testing.

When estimates are not independent, a covariance term must be added to the Students' t formula

$$t = \bullet\bullet \frac{(P_1 - P_2)}{(se_1^2 + se_2^2) - 2(r)se_1se_2}$$

where r is the correlation between the two estimates. The determination of correlations requires a statistical software package, such as SAS or SPSS, and the invocation of proper weights for the comparison.

Because none of the longitudinal studies invoked in *The Toolbox Revisited* was based on a simple random sample of students, the technique for estimating sampling error involves a more complex approach known as the Taylor series method. To produce Taylor series standard errors, the estimates presented used AM, a program developed by Jon Cohen and associates at the American Institutes for Research under contract to the National Center for Education Statistics.

Flags and weights

Each of the grade-cohort studies used in this monograph carries a complex set of flags and weights to mark the populations for which estimates are to be generated. The selection of these flags and weights is very important for both the accuracy and meaningfulness of estimates.

For the postsecondary transcript sample of the High School and Beyond/Sophomore cohort (HS&B/So), the process was somewhat complex. Using the weights for the first follow-up survey (1982, the scheduled 12th-grade year for this cohort), three postsecondary transcript weights were developed. The first was based on a ratio of the sum of weights for all students in the 1982 panel who subsequently (in surveys of 1984, 1986 or 1992) claimed to have attended a postsecondary institution to the sum of weights for those for whom a transcript validating the claim was subsequently received. The ratio was then modified by factors derived from the stratification cells in the 1982 survey design to create multipliers that were applied to the raw weights for the students for whom transcripts were received or for whom postsecondary attendance was imputed from survey storylines. This is a generous formulation for all likely postsecondary participants.

The second High School and Beyond/Sophomore weight involved the same procedure as the first but a more restrictive ratio applied to those students for whom a true postsecondary transcript was received. These students are more than "likely" participants; they are "known participants." The third weight followed the same procedure as the second, but confined the population to only those students with complete postsecondary records (i.e., no missing transcripts). This weight is used in analyses of credit production and grades, since complete records are necessary for the analysis of both these features of student academic history. These weights are labeled PSEWT1, PSEWT2, and PSEWT3, respectively.

To accompany these weights for the comparisons that hold the population to students who were in the 12th grade in 1982, a special flag, SENRFLAG, was constructed from variables in the HS&B/So that described student status in 1982. Using the given flag for participation in the 1982 cohort sample would be insufficient and not wholly accurate because not all students were in the 12th grade in 1982, e.g., students who graduated early from high school in 1981. But there were also students who were labeled "early graduates" on the data set (and thus candidates for exclusion from a 12th-grade flag) whose high school graduation date was listed as 1982. Early graduates were excluded, and erroneously labeled "early graduates" were included in the population with SENRFLAG = 1. If these students were not participants in the 1982 panel (even if postsecondary transcripts were received) their weight = 0. Using the 1982 panel weight alone without this flag will not produce an accurate universe of 1982 12th-graders.

For all calculations of HS&B/So data in this document, SENRFLAG = 1, and the appropriate PSE weight invoked.

The weights and flags for the NELS:88/2000 are more complex, still, because the cohort, established in the eighth grade, was "refreshed" twice: first, to be representative of the census of 10th-graders in 1990, and second, to be representative of the census of 12th-graders in 1992. The weights deriving from the 1992 12th-grade refreshing are at the core of weights subsequently developed for the postsecondary transcript sample. The same three postsecondary weight types developed for the High School and Beyond/Sophomores were employed here, but in combination with the 12th-grade (second follow-up survey, or F2) weight and the student's presence in the final (2000) survey panel, F4. In addition, a set of weights based on the NELS high school transcripts in combination with the three postsecondary weight types also was developed when questions arise concerning the relationship between secondary school variables derived from high school transcripts and postsecondary variables derived from postsecondary transcripts.

The most frequently used NELS:88/2000 weights in *The Toolbox Revisited* are:

F4F2P2WT	For all known postsecondary participants who were 12th-graders in 1992.
F4F2HP3W	For all postsecondary participants with complete records who were 12th-graders in 1992 and for whom high school transcripts are also part of the file.
F4F2P3WT	For all postsecondary participants with complete records who were 12th-graders in 1992.

As in the case of the High School and Beyond/Sophomore cohort, a special flag was developed for 12th-graders in 1992. The existing flag on the NELS:88/2000 files excluded over 250 students who, in fact, were awarded high school diplomas in the spring of 1992 and who carry positive weights for the panel (the descriptive windows of the Electronic Code Book for the fourth follow up survey of 2000 offer no reasons or clues for this anomaly). These students are included in the flag, GRADE12A, used in this monograph.

The weighted Ns for samples used in a table are provided in the notes to the tables. Even if the same weight and flag is used on two tables, the weighted Ns may differ slightly because missing values in a particular variable are excluded from the calculations.

Multivariate analyses

For all multivariate analyses in this monograph, special procedures were employed in accordance with the complex sampling designs of NCES longitudinal studies. These procedures are in the spirit, though not exactly to the letter, of those discussed and recommended by Thomas and Heck (2001). Thomas and Heck recommended alternative ways of producing both regression models and their adjusted standard errors in a single step, as opposed to the two-stage procedure used in this study. The reader should be aware that the software employed in this study, AM, correctly estimates standard errors associated with complex, cluster samples.

For any model, an adjusted weight based on the population with non-missing values on all variables in the model was calculated, in the following steps:

1. A weight appropriate to the question was selected. For example, for determinants of transfer from a community college to a four-year college, the weight for NELS students with received postsecondary transcripts, F4F2P2WT, was chosen.
2. A simple tabulation of the dependent variable was then run for students who evidenced positive (non-missing) values for all variables in the model. Call this universe A. The selected weight was invoked.
3. The log of the program for step 2 produces both unweighted and weighted Ns for universe A.
4. The selected weight is then adjusted by what Thomas and Heck (2001) refer to as NORMWT, i.e., the weighted N / unweighted N of universe A.
5. The selected weight is then multiplied by the NORMWT, thus adjusting the effective sample size.
6. The example would look as follows:

   F4F2P2WT / (f4f2p2wtA / unweighted N for A configuration of variables)

7. The result becomes a variable in its own right, a weight with a name, e.g., COREWT1.

A root design effect (DEFT) reflects the effect of departures from simple random sampling, and in the methodology reports for the NELS:88/2000, is calculated for sub-populations on each of a selection of variables (Haggerty et al. 1996; Curtin, Ingels, Wu, and Heuer 2002). For any logistic model in *The Toolbox Revisited*, a DEFT based on the population with non-missing values on all variables in the model was calculated in order to adjust the standard errors produced by statistical packages such as SAS (used in the production of this study). The DEFT is calculated in three steps:

1. The requisite data for a simple standard error are produced by the same equation used for NORMWT, and set out as follows:

$$\sqrt{\frac{p(1-p)}{N}} = \text{s.e.}$$

2. A matching Taylor series standard error is produced by AM software with the same dependent variable and equation, with the population filtered by positive (non-missing) values for the same variables used in the equation in step 1. The Taylor series s.e. takes into account both stratum and primary sampling unit in combination with the weight selected, hence accounting for the complex sampling design.

3. The DEFT = Taylor Series s.e. / simple s.e.

Every discrete multivariate analysis has a unique DEFT. The DEFTs for the NELS:88/2000 are rather substantial, e.g., 1.83, reflecting not only the original sampling design in 1988 but also the successive "refreshings" of the sample in 1990 and (for the analyses in this monograph) in 1992.[60] They are used to adjust the standard errors in the multivariate analyses, and hence reduce the likelihood of overestimating the effects of independent variables. The effect of the DEFT also is reflected in the production of the *F* and *t* statistics, for which the formulas used are:

$$\left(\frac{\beta}{\text{s.e.} \times \text{DEFT}}\right)^2 = F$$

and

$$\sqrt{\frac{F}{\text{DEFT}^2}} = t$$

In the logistic models employed in *The Toolbox Revisited*, the level of significance of the *t* statistic—*p*—for a two-tailed test is determined by reference to a standard table of critical values of *t* that can be found in any statistics textbook.

Collinearity data

This study includes Appendix J with tolerance statistics for collinearity for all the logistic model tables in order to assure the reader that the independent variables included in the models do not exhibit a nearly perfect linear relationship, in other words, that they do not overlap to such an extent that analysis of each variable, taken singly, is impossible. There are sometimes situations in which one variable is part of the definition of another, e.g., family income in relationship to

[60]Curtin, Ingels, Wu, and Heuer (2002) report the mean DEFT for all students in the fourth follow-up (2000) survey of the NELS as 1.954 (p. 209). The range of DEFTs in *The Toolbox Revisited* is 1.76 to 2.19.

socioeconomic status or multi-institutional attendance in relation to transfer. In cases such as these, collinearity statistics are produced as by-products of Ordinary Least Squares regressions for the variables in the logistic models.

Of these by-products, tolerance is the statistic of choice: It measures how well one independent variable can be predicted by other independent variables in the model, and is equal to $1-R^2$ for that variable. Ideally one would want this predictive relationship to be close to 1. The literature (e.g., Belsley, Kun, and Welsch 1980) suggests that there are no hard and fast rules for determining collinearity using either tolerance or its inverse, variance inflation, but that, in general, a tolerance reading of .20 or less evidences collinearity problems. This study adopted a tolerance threshold of 0.50, i.e., any reading above that threshold indicates no serious collinearity problem. Any indication below that point required further investigation of the independent variable(s) in question through correlation matrices. If the variables in question were part of the constructs of other variables, a choice was made as to which variable would be dropped. Dropping independent variables is one of the recommended options when potential multicollinearity arises (Knight 2004).

APPENDIX E

Populations Included and Excluded From the Study Universe

The population subject to analysis in *The Toolbox Revisited* consisted of 1992 12th-graders who subsequently attended a four-year college at any time through December 2000, who earned their high school diploma by December 1996, who presented complete high school transcript records and a senior year test score, whose postsecondary records were complete, and whose socioeconomic status was known. But there are other students who participated in the 1992 NELS:88/2000 survey and who subsequently attended a four-year college at some time who are not part of this population principally because (a) one or more of these data elements were missing or (b) because they were not in the 12th grade in 1992.

It is natural to ask about the demographic characteristics of the students who are excluded from the analysis because they are missing data or because they were not in the 12th grade in 1992, compared with the demographic characteristics of the students who *are* included. In order to compare distributions of this comparative demography, we include all 1992 survey participants.

Considering those who attended a four-year college at some time but were nonparticipants because one or more of the key data elements were missing, key contrasts include:

- A higher proportion of minority students than white students;
- A higher proportion of students who were 20 years old or older in 1992 than those who were less than 20 years old;
- A higher proportion of students from the lowest third of family income distribution than those from higher income levels;
- A higher proportion of first-generation students than those whose parents had either some college or who had earned at least a bachelor's degree;
- A higher proportion of nonnative speakers of English than those from English monolingual backgrounds;
- A higher proportion of those with three or more siblings than those who were either only children or had one or two siblings;
- A higher proportion of those who became parents by age 20 than those who did not;
- A higher proportion of those who had been retained in grade at least once than those who were never held back; and
- A higher proportion of those who came from high schools in urban areas than those from suburban or rural areas.

Some 60 percent of this group was missing only one of the key data elements, but it was a very important one: a high school transcript.

Of nonparticipants because they were not in the 12th grade in 1992, we notice distinctively higher proportions by age (20 years or older), origin in a second language household (though not among nonnative speakers of English), and parental status, and among those who had been retained in grade and those who earned General Education Diplomas.

Table E1. Percentage distribution of participants in the 1992 survey of the NELS:88/2000 by participation status in *The Toolbox Revisited* universe, by demographic and schooling background characteristics

Characteristics	Participants in the universe of this study	Nonparticipants[a] who were 12th-graders in 1992	Nonparticipants[a] who were *not* 12th-graders in 1992
All students	77.8 (1.11)	20.6 (1.05)	1.6 (0.33)
By gender			
Male	76.5 (1.57)	21.3 (1.46)	2.2 (0.57)
Female	79.2 (1.35)	19.8 (1.34)	1.0 (0.22)
By race/ethnicity			
White	81.1 (1.08)	18.0 (1.07)	0.9 (0.20)
African-American	64.3 (4.44)	30.0 (4.04)	5.7 (2.72)
Latino	66.2 (4.11)	29.6 (3.99)	4.2 (1.19)
Asian	73.2 (5.09)	26.6 (5.09)	0.1 (0.09)
American Indian	53.6 (12.8)	43.1 (13.0)	2.4 (2.30)
By age in 1992			
Missing	48.5 (9.15)	51.5 (9.15)	#
20 or older	41.6 (8.56)	47.9 (9.52)	10.4 (4.86)
Under 20	79.2 (1.06)	19.3 (1.01)	1.5 (0.34)
By family income			
Missing	70.8 (3.02)	27.1 (2.55)	2.2 (1.24)
Highest third	81.5 (1.44)	17.3 (1.41)	1.2 (0.37)
Middle third	80.1 (1.79)	19.2 (1.79)	0.7 (0.17)
Lowest third	71.3 (1.74)	25.2 (2.60)	3.5 (1.12)
By postsecondary generational status			
Missing	66.2 (4.08)	33.4 (4.07)	0.4 (0.24)
First generation	73.7 (2.73)	23.8 (2.74)	2.5 (0.68)
Parents had some college	78.3 (1.72)	19.2 (1.60)	2.5 (0.74)
Parents earned bachelor's	81.2 (1.34)	18.1 (1.32)	0.7 (0.27)
By second language background			
Nonnative speakers	68.8 (3.78)	28.9 (3.73)	2.3 (0.81)
From second language households	68.3 (5.48)	22.5 (4.94)	9.2 (4.06)
Monolingual English	79.0 (1.12)	19.7 (1.08)	1.3 (0.35)

See notes at end of table.

Table E1. Percentage distribution of participants in the 1992 survey of the NELS:88/2000 by participation status in *The Toolbox Revisited* universe, by demographic and schooling background characteristics—continued

Characteristics	Participants in the universe of this study	Nonparticipants[a] who were 12th-graders in 1992	Nonparticipants[a] who were *not* 12th-graders in 1992
By number of siblings			
None	76.0 (4.37)	23.3 (4.39)	0.6 (0.31)
One or two	81.8 (1.15)	17.2 (1.13)	1.0 (0.24)
Three or more	71.8 (2.04)	25.5 (1.87)	2.7 (0.84)
By parenthood			
Parent by age 20	64.6 (5.38)	22.5 (4.07)	12.9 (4.62)
Not a parent by age 20	78.3 (1.10)	20.5 (1.07)	1.2 (0.25)
Held back in grade at least once			
Missing	59.2 (6.33)	38.5 (6.21)	2.3 (1.11)
Yes	62.9 (4.85)	30.4 (4.54)	6.7 (2.64)
No	79.9 (1.07)	18.9 (1.04)	1.2 (0.31)
By urbanicity of high school location			
Urban	69.9 (2.36)	27.1 (2.15)	2.9 (0.99)
Suburban	80.1 (1.58)	19.0 (1.57)	0.9 (0.28)
Rural	83.9 (1.71)	14.9 (1.71)	1.2 (0.29)
By type of high school diploma[b]			
Standard	79.0 (1.07)	20.5 (1.06)	0.5 (0.13)
GED	8.7 (2.56)	23.6 (6.49)	67.7 (7.10)

[a] Nonparticipants are defined as students who were either (a) missing data on senior year test score or socioeconomic status or both, (b) missing an in-scope high school transcript, (c) graduated from high school in January 1997 or later, (d) presented an incomplete postsecondary record, and/or (e) were not in the 12th grade in 1992.
[b] A tiny percentage who received a certificate of attendance was included with the GEDs.
Rounds to zero.
NOTES: Standard errors are in parentheses. Universe consists of students who participated in the 1992, 1994, and 2000 follow-ups of the NELS:88/2000 and who attended a four-year college at some time. Weighted N=1.45M.

APPENDIX F

Gradations of Academic Intensity of High School Curriculum

The following figure sets forth the 31 gradations (in descending value) of academic curriculum intensity and quality as used in the development of the Academic Resources index and variable for the NELS:88/2000 cohort. The figures in the boxes represent the minimum rounded number of Carnegie units required for the gradation on a given *row*. Where a cell is empty, there are no minimum requirements. Where a cell indicates "none" (for remedial math and remedial English), it means that no remedial work is allowed for that gradation. Where the cell for AP courses indicates zero, that means the student did not take any AP courses, not a minimum. For the NELS:88/2000 cohort, computer science was not nearly as widely offered as it is today. Therefore, computer-related credits were brought into play only to disaggregate lumps in the distribution. Total high school academic credits is an empirically-derived factor that comes into play only in the very lowest gradations.

The basic five-subject credit thresholds were constructed in the course of examining the edited, coded transcript data for students who were known high school graduates with graduation dates through Dec.31, 1996. The editorial process paid particular attention to all cases that showed less than 16 total high school credits. Where the evidence strongly suggested dissonance with other variables in the student's record, all transcript records from that student's *school* were examined. Where nonstandard credit metrics were found, they were adjusted with reference to state standards for high school graduation (Medrich, Brown, and Henke 1992), and major components (e.g., mathematics, English, etc.) multiplied or divided by as much as (but no more than) two. For example, when a group of students from the same high school showed 40–45 Carnegie units in a state that required 20 for an academic diploma, the editorial process cut those 40–45 units in half—across all subjects in which they were given. The editorial process also Windsorized cases of total Carnegie unit counts above 32, adjusting the major components down one-by-one, and dropped fragmentary transcripts with less than 6 Carnegie unit counts.

As noted in the parallel appendix in the original *Tool Box*:

> These gradations of academic intensity and quality are based on the history of one national high school class that was scheduled to graduate in 1982. The next graduating class for which we possess similar data is that of 1992. While the specific number of Carnegie units, APs, and remedial indicators might change, the basic form and principles of the gradations will probably not change. This presentation of the possibilities of high school curricular attainment is criterion-referenced: theoretically, *everybody* can reach gradation level #1. (p. 114)

The account of curriculum for the class of 1982 had 40 gradations. This account, for the class of 1992, has 31. One implication of the shrinking number of gradations is that, in fact, more students were moving up the academic intensity ladder, clustering at higher criterion-referenced levels.

Table F1 presents the actual mean number of Carnegie units earned in core academic fields, irrespective of the theoretical thresholds, for students in each of the five quintiles of academic intensity derived from the 31 more detailed gradations.

Figure 3. Curriculum components of the 31 gradations of the high school academic intensity measure of the NELS:88/2000, by Carnegie unit minimums

Grada-tion	English	Math	Science	Foreign Langs	Hist and Soc Stu	Highest Math	Remed Math	Remed English	APs	Computer Science	Total Academ Units

29	2.5	1.5	1.0		0.5						
30	2.0	1.0	0.5		0.5						
31											≥6

NOTES: (1) Net 1 means the sum of total mathematics credits minus remedial mathematics credits was 0.5 or less, i.e., if remedial math appeared at all on a student's transcript, it was a major presence; Net 0 means the sum of total mathematics credits minus remedial mathematics credits was more than 0.5, i.e. of remedial math appeared at all on a student's transcript, it was a minor presence.
(2) The figures in the cells for English, math, science, foreign languages, and history and social studies represent the minimum rounded number of Carnegie units required for the gradation on a given row. Where a box is empty, there are no minimum requirements.
(3) An asterisk in a cell for science credits indicates core laboratory science (biology, chemistry, and physics).
(4) The reference points for highest level of mathematics studied in high school are higher than Algebra 2 (>Alg2), Algebra 2 (Alg2), and less than Algebra 2 (<Alg2). Where there is no entry in the cell, there is no highest mathematics requirement for that row.
(5) Minimum requirements for total high school academic Carnegie units, e.g., =>12 and =>6, come into play only in the very lowest gradations of the curriculum distribution.
(6) When the distribution of students across these 31 levels is weighted and then aggregated to quintiles, the quintile breaks are as follows: 1–8 (highest quintile), 9–15 (2nd quintile), 16–20 (3rd quintile), 21–25 (4th quintile), and 26–31 (lowest quintile).

APPENDIX H

The Timing of Departure

When this narrative took up the topic of the second calendar year of student histories and pointed out that roughly one out of five of our subjects had become status dropouts by that point, the question naturally arose: What happens to all those students who leave after the first year—or even the first semester—when most attrition occurs? How does one account for them? We need to provide some corrective data in this excursion, since we considered status dropout status only in the context of the paradoxes of first-to-second year persistence.

With rare exceptions (e.g., Tinto 1987), most attrition studies are (a) short-term, as in first year to second year, without allowing for the fact that students who skip the second year may return in the third or fourth years, and (b) limited to attrition at the same institution, without allowing that the student who can no longer be found at Old Siwash may, in fact, be enrolled at Greentree Valley Community College. Students who leave one school and attend another one are not dropouts—they are most likely transfers. Tinto (1987) made that point a long time ago, and it should be obvious. If they are not transfers, they may be on temporary "excursions" or more sustained voyages that end in either fragments or "discovery" (Adelman 2004b).

Given the systemwide perspective and the length of a longitudinal study such as the NELS:88/2000, a more sophisticated question about withdrawal can be asked, looking backwards from the last month of the longitudinal study (December 2000):

> What percentage of traditional-age students who entered postsecondary education during this period are no longer enrolled—anywhere—and never completed a credential of any kind, by timing of the gap between their first month and last month of enrollment?

This question follows the student—wherever the student goes. It tells us who became a "status dropout" by age 26 or 27 (which does not preclude even these students from returning at a later moment). And it tells us *when* the student became a status dropout, setting up an inquiry concerning the reasons for departure that follows Tinto's (1988) common sense suggestion that these reasons change by point of departure. Table H1 sets forth these data for *all* 1992 12th-graders who entered postsecondary education, by type of institution first attended.

Yes, the highest attrition rate in postsecondary education occurs in the first year (Schutz and Malo 2003), but table H1 shows that the proportion of traditional-age students who leave in the first year and never return is not radically higher than the proportion of those who leave at later points in time, and differs by type of institution first attended. Consider the face validity of these data: The mean number of credits earned by students who ultimately became status dropouts, by period of departure, matches roughly what one would expect—half or less of the full-time norm for the period. Proportion, however, is not the ideal way to assess the phenomenon.

Event-history accounts of attrition offer a more enlightening approach (e.g., Ronco 1996; DesJardins, Ahlburg, and McCall, 1999). The driving force of event history is risk or hazard, as befits a methodology derived from medical history analyses (Singer and Willett 1991), as in:

given the patient's medical momentum and other configurations of the patient's life-style, demography, and environment, when is the patient at risk of dying (the ultimate censoring event) if the patient did not die last year? The flip side of risk in event history is survival. While the purpose of this study stops short of survival analysis, the first step involved in setting up risk modeling involves determining hazard probabilities, and these are instructive in light of the

Table H1. Percentage of 1992 12th-graders who entered postsecondary education and withdrew without completing any credential by December 2000, by timing of withdrawal and institution of first attendance

Withdrawal behavior and its timing	Institution of First Attendance: Four-year	Community college	Other sub-bacc[a]	Mean credits	Percent of all
Left postsecondary without a credential and did not return					
Left within 11 months of first enrollment	4.6 (0.59)	14.6 (1.13)	15.5 (2.77)	9.85 (0.54)	**8.9 (0.58)**
Left within 12–23 months	3.3 (0.41)	11.0 (1.32)	6.5 (1.50)	21.64 (0.99)	**6.7 (0.59)**
Left within 24–47 months	4.9 (0.41)	12.5 (1.11)	4.6 (1.05)	39.88 (1.62)	**7.9 (0.50)**
Left within 48–102 months and not enrolled in 2000	8.7 (0.73)	14.3 (1.23)	4.0 (1.62)	58.29 (2.68)	**10.6 (0.65)**
No credential but still enrolled in 2000	4.7 (0.52)	9.2 (0.94)	1.8 (0.85)	70.98 (3.56)	**6.4 (0.47)**
Earned credential	73.8 (1.09)	38.4 (1.67)	67.7 (3.55)	124.73 (0.90)	**59.5 (1.05)**

[a] Sub-baccalaureate institutions other than community colleges.
NOTES: Standard errors are in parentheses. Columns may not add to 100 percent due to rounding. "Credentials" can be certificates, associate degrees, or bachelor's degrees.

first-year performance variables used in our analysis. That is, if we start at the first month of the first term of attendance and, for each calendar year following that point, asked what percentage of students left the postsecondary system with no degree and had not returned to school by December 2000, changing the denominator for each year to the number of students who remained in the system, we have a "declining risk set" (Ronco 1996) that serves as a rough guideline for the timing of potential dropout. The annual metric is obviously more even than the time brackets chosen for table H1.

The "declining risk set" for this study is presented in table H2. To summarize: For all postsecondary students, the risks of becoming a status dropout are highest in the first year, decline through the fourth year, flatten out through the sixth year, and decline after that. For students who attended a four-year college at any time, the risks of becoming a status dropout are much lower across the temporal board, are slightly higher in the first year, drop and then flatten from the second year through the sixth, and drop again after that. This is only the first step—and hardly the final analysis—of event history, but is perhaps a more accurate way of describing the parameters for understanding the phenomenon of when students leave postsecondary education.

Table H2. Declining "hazard probabilities" for 1992 12th-graders who entered postsecondary education, by calendar year following first date of enrollment

	"Hazard probabilities" for leaving without a degree	
Departure timing for those who never returned by December 2000	All students	All who attended a four-year institution at any time
First calendar year	.102	.039
Second calendar year	.061	.029
Third calendar year	.048	.030
Fourth calendar year	.039	.027
Fifth calendar year	.037	.027
Sixth calendar year	.041	.029
Seventh calendar year	.031	.025
More than seven calendar years	.026	.020

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

The reader of table H1 will note that community college beginners exit sooner than do students who started at four-year colleges, and are more likely to still be enrolled at the end of the longitudinal study period. While there is comparatively little variance in the pace of permanent dropout for students who started in community colleges when the periods between the first and the fourth year are considered, there is no question that beyond that point, attrition slows. The same cannot be said for the pace of status dropout for students who started in four-year colleges: The rate of permanent attrition appears to be stable over time, a finding slightly different from that of the "declining risk set" approach, and a product of the clumping of years in table H1. As for sub-baccalaureate institutions other than community colleges, which specialize in short-term certificate programs, the status dropout rate drops dramatically from the first year to the second and subsequent periods.

Advancing on Tinto's (1988) suggestion, Eaton and Bean (1995) hypothesize that the factors affecting attrition are different for first-year students who withdraw from higher education versus the factors that come into play for students who leave at later points in time. Unfortunately, Eaton and Bean could not investigate that hypothesis because their study was confined to first-year and second-year students at one institution (a public research university), and bracketed

only one year's account of retention/attrition (for a similar inquiry, see Patrick 2001). The NELS: 88/2000 data, on the other hand, offer 8.5 years and a myriad of institutional types in which to explore and detail the boundaries of the issue. As Ronco (1996) notes, the timing and duration of "enrollment events" is a critical framework for identifying factors associated with graduation, transfer, and stop-out—the three modes of "exit" from an institution.

Table H3 provides a framework for future consideration of the differential attrition hypothesis. The literature on the putatively sophisticated economic decisionmaking of adolescents with respect to entering higher education, even in the face of uncertainty of returns (Altonji 1993), can be extended to reasons for leaving a path to postsecondary credentials. As Beattie (2002) points out, human capital theory is not rigid: it recognizes something called individual taste or proclivity that may be only tangentially related to group membership (e.g., ethnicity, gender, family income). At the least, students already in the postsecondary system know that they will eventually be better off for their education efforts (or they wouldn't have been there in the first place). So, what did the students in our universe who did not complete a bachelor's degree program (and who were not still enrolled as degree candidates at the end of the 8.5 year period) tell us of their reasons for leaving, by period during which they became status dropouts?

Table H3. Reasons for leaving postsecondary education without credentials by timing of exit: 1992 12th-graders who entered postsecondary education by December 1996

	Percent offering these reasons for leaving postsecondary education				
Timing of withdrawal	**Finances**	**Job/ Military**	**Academic**	**Personal/ Family**	**Mood/ Lifestyle**
Left postsecondary without a credential and did not return					
Left within 11 months of first enrollment	19.7 (3.10)	14.8 (2.03)	5.9 (1.92)	31.5 (3.51)	25.9 (3.99)
Left within 12-23 months	25.2 (5.19)	11.0 (2.81)	5.6 (1.40)	42.6 (6.19)	12.7 (2.23)
Left within 24-47 months	19.4 (3.60)	17.4 (2.69)	3.6 (0.99)	35.2 (3.78)	20.5 (2.30)
Left within 48-102 months and not enrolled in 2000	17.8 (2.19)	18.9 (2.45)	7.7 (2.46)	29.3 (4.04)	21.2 (3.21)

NOTES: Rows will not add to 100.0 because (a) student responses to questions about reasons for departure are not mutually exclusive, and (b) a category for "other" is not included. Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

When the NELS:88/2000 students were asked (in the spring of 2000) why they left school, they were offered a list of reasons (though only 17 percent of students responding to the question indicated more than one reason). As table H3 indicates, personal and family reasons for departure dominate all other reasons for students who left postsecondary education without a credential between the 12th and 47th month following the first month of enrollment. The same factor ranks at the top versus all other factors except mood/lifestyle for students who left in the first year and students who left after the fourth year. Strictly financial reasons are not as prominent in students' judgment as some contend. "Job/military considerations" might be considered "financial," but there is too much ambiguity in that category of response to leap to that conclusion. Some 6.6 percent (s.e. = 0.47) of the1992 12th-graders subsequently served in the military, but 14.9 percent (s.e. = 4.95) of status dropouts who cited financial reasons for leaving school had served in the military, and an identical 14.9 percent (s.e. = 3.84) who cited "job/military considerations" for leaving had served in the military. If the NELS files had offered a more complete labor market history, we might be able to resolve the ambiguities.

As a partial confirmation of these observations, consider the work of Li and Killian (1999), who surveyed 622 students of all ages and levels who left a large state flagship university in 1997 (present in the winter term but not the following fall) and elicited 45 discrete reasons for departure. First, Li and Killian discovered that 20 percent of these students were not really dropouts at all, rather either transfers to other institutions (principally for reasons of academic program or location) or stop-outs with intentions of returning. Of the remaining students, 43 percent left for academic reasons (e.g., didn't like the program, classes too large, poor performance), 34 percent left for personal reasons (e.g., unstated personal problems, location issues including homesickness, illness, "social" reasons), and 20 percent for financial reasons. Of the financial reasons, Li and Killian advise us that "individual patterns of money management, more than family income" may be responsible for financially-driven attrition (p. 12), and that if we are going to understand attrition at all so that student affairs officers can establish realistic efforts to address what is within the control of the institution to assist, we have to dig below the level of large-scale concepts of academic and social integration. There is a considerable range of reasons that students leave an institution, and, as Li and Killian point out, students usually have more than one reason for departure. We can't control homesickness; we can help students deal with money management.

As for academic reasons for departure, table H4 reveals that compared to those who earned bachelor's degrees, no one in the departure universe was performing very well, no matter when they left, and even though a tiny percentage (see table H3) cited academic reasons for walking away. Braxton, Brier, and Hossler (1988) argue that when students are asked about their reasons for withdrawal in post-hoc surveys, they offer "socially acceptable rationalizations." We should hence be appropriately wary of the percentage distributions in table H3. Given the low percentage of students who cited academic reasons, and GPAs and cumulative credits for the same students that can be described as, at best, marginal, there is some indirect support for this contention.

Table H4. Mean postsecondary GPAs of 1992 12th-graders who withdrew without completing any credential, by timing of withdrawal, and compared with GPAs of those who had not completed a credential but were still enrolled in 2000, and those who earned bachelors degrees by December 2000

	Mean grade point average		
Departure behavior and timing	In first calendar year of attendance	Through second calendar year of attendance	Entire undergraduate record
Left postsecondary without a credential and did not return			
Left within 1st 11 months of first enrollment	2.10 (0.091)	2.10 (0.091)	2.10 (0.091)
Left within 12–23 months	2.30 (0.057)	2.08 (0.058)	1.83 (0.100)
Left within 24–47 months	2.31 (0.049)	2.26 (0.046)	2.03 (0.060)
Left within 48–102 months	2.10 (0.059)	2.02 (0.054)	2.03 (0.050)
No credential, but still enrolled	2.14 (0.069)	2.08 (0.069)	2.19 (0.078)
Earned bachelor's degree	2.89 (0.015)	2.91 (0.014)	3.04 (0.011)

NOTE: Standard errors are in parentheses.

APPENDIX I

Course Categories Included in Aggregates for Participation Rates In the First Two Calendar Academic Years of Attendance

Aggregate	Course categories
College-level writing	English composition; technical writing; creative writing; advanced essay
Oral communications	Oral communications; public speaking/debate; voice
Computer-related	Introduction to computer science; introduction to computing; computer programming: general
Introductory biological sciences	General biology; human biology; cellular biology; zoology: general; botany: general
Introductory physical sciences	General chemistry; general physics; general geology
College-level mathematics	College algebra, liberal arts mathematics, finite mathematics, statistics, precalculus, calculus
Core history	Western civilization, world history, U.S. history surveys, European history 1789–present, Asian history, African history, Latin-American history
General psychology	[single course category]
Micro/macroeconomics	[single course category]
Humanities other than literature and foreign languages	Humanities: general; introduction to philosophy; ethics (philosophy); religious studies surveys; interdisciplinary humanities; arts/humanities
Literature	Literature: general; introductions to poetry, fiction, drama, non-fiction prose; English literature; American literature; Afro-American literature
Core social sciences	Anthropology: general; cultural anthropology; geography: general; introduction to political science; U.S. government; introduction to sociology
Visual/graphic arts	Visual communications; introduction to design; fine arts: introduction; art history; drawing
Foundation business	General business principles; business law/legal environment; introduction to accounting

APPENDIX K

So They Earned a Degree! Now, How Long Did It Take Them?

The second most frequently asked question about U.S. higher education concerns time to degree. Despite accumulating evidence over the past quarter-century, the normative benchmark for completing a bachelor's degree has remained at four elapsed academic years. Our ideal seems not only to get it over with, but to get it over with in normative time. An altruistic argument in favor of the normative is that when students finish in a timely manner, they make room for others, i.e., completion keeps the access channels open. Yet recipients of bachelor's degrees are adults who have made a variety of decisions concerning competing goals and obligations that often do not include finishing a degree in four years. For example, if one looks at all recipients of bachelor's degrees in 1999–2000, and asks when they commenced their studies and how old they were when the degree was awarded, one finds that 62.8 percent (s.e. = 1.5) of the 7.5 percent of bachelor's degree recipients who were over 40 in 2000 started out in postsecondary education before 1980. At a minimum, the elapsed time to degree for these people was 20 years (in fact, the average was over 27 years). Of the 9.2 percent (s.e. = 0.4) of degree completers who were between 30 and 39 in 2000, 73.3 percent (s.e. = 1.7) entered postsecondary education prior to 1990, so, at a minimum, the elapsed time to degree for these people was 10 years (in fact, the average was nearly 15 years).[61]

The key phrase for our purposes is "elapsed time," as that is the customary way of measuring time to degree. It is not surprising that the older the baccalaureate recipient, then more likely that student had taken at least two years off from higher education, and the more likely that their principal reason for doing so was "change in family status," as in becoming a parent and raising children. The reader might consider, in passing, when complaints are raised about excessive time to degree, whether our system of higher education should be "blamed" for providing the opportunity for adults with different life trajectories to return to school and complete degrees, even if the time between initial enrollment and degree award is 15 or more years. That is the practical meaning of elapsed time.

There is an obvious difference between elapsed and enrolled time. When DesJardins, Ahlburg, and McCall (2002) investigated factors leading to "timely graduation," they confined one of their universes to students who had never stopped out—not even for the one term this study allows stop-out without labeling the student a non-continuous enrollee.[62] If we followed this mode of analysis, we could focus in on student *uses* of enrolled time to determine what contributed to and what detracted from year-by-year progress. Knight (2002) includes types and timing of

---

[61] All data in this paragraph were generated from the National Center for Education Statistics: Baccalaureate and Beyond Longitudinal Study, 2000: Data Analysis System.

[62] The research here involved a "competing risks" model in which the histories of students who had never stopped out were compared to the histories of those who had stopped out, hence, embraced both elapsed and enrolled time.

remediation, majors and changes-of-major, course withdrawals and repeats, course failures, credit hours earned and grades in general education courses, hours per week working and studying, and first-year grade point average among variables reflecting different aspects of the uses of time.[63] Volkwein and Lorang (1996) took up the phenomenon of students with extended time-to-degree because they purposefully carried lighter credit loads. Why did they carry less than the 15 credit per semester norm for the institution that served as the site for this study? To enhance GPA (an objective which precipitated dropping difficult courses), and to generate more free time, some of which was for work or family responsibilities, or both. Some respondents also cited difficulty of enrolling in a course "at the time I wanted," a phenomenon familiar to anyone who has worked student registration lines.

We also know that many disciplines require credit hour production that, when translated into standardized semester metrics, exceed the 120 credits that would be produced by students who attended only during the regular academic year and carried a standardized full-time load of 15 credits per semester. In a survey of 91 public universities in all 50 states, Pitter, LeMon, and Lanham (1996) found combinations of university and program requirements ranging from 122–124 credits in social sciences, foreign languages, psychology, mathematics, and protective services, for example, to 130–142 credits in such fields as engineering, architecture, and health professions (e.g., nursing, physical therapy, etc.). They also confirm our observation of five-year bachelor's degree programs in pharmacy, for a noted case, with a median credit requirement of 161. Any requirement above 120 credits will either add time to degree or encourage students to (a) earn credits by examination, including Advanced Placement, (b) attend during summer terms, and/or (c) carry credit loads in excess of 15 per semester in order to graduate "on time".[64] As Garcia (1994) observed, whether the student is a community college transfer or a native student in a four-year college, the "basic recipe" for completing a bachelor's degree within the standard "templates for time-to-degree is to maintain continuous enrollment and to earn more than 30 semester units each academic year" (p. 8). Sounds simple, but the list of diverting phenomena is long, complex, and often best assessed for *indirect* effects, as Garcia has done, using path analysis.

What we learn from these studies of the uses of enrolled time in relation to normative models of time to degree is what to include in both descriptive and multivariate accounts of elapsed time—and elapsed time is the measure used in both the original *Tool Box* and *The Toolbox Revisited.* The descriptive statistics are offered to the reader in Appendix L, table L13, but some basic observations are worth repeating here. First, the mean elapsed time to degree for bachelor's recipients in the NELS:88/2000 was 4.58 calendar years, and the median time (which

---

[63]Knight's list for a "hypothesized model of effects upon total semesters elapsed" (Knight 2002, p. 6) also includes provisions for variables derived from student surveys that are parallel to those used in the National Survey of Student Engagement, e.g., in Kuh et al. 2001.

[64]The small number of NELS:88/2000 bachelor's recipients who completed the degree in three elapsed calendar years or less entered with a mean of 10.6 acceleration credits (s.e. = 2.81) and subsequently accumulated a mean of 12.2 credits during summer terms (s.e. = 1.94).

is probably more meaningful) was 4.24 calendar years.[65] Shorter time to degree is observable among students from the highest quintile of high school Academic Resources, students who first entered highly selective institutions, among those who brought more than four acceleration credits across the matriculation line, and among those who attended only one school. Considerably longer time to degree is observable among those who attended three or more schools, among both community college to four-year college and four-year-to-four-year transfer students, among those who took more than one remedial course, those who were not continuously enrolled, and those who majored in the physical sciences. Most of these relationships confirm common sense.

But it is the multivariate analysis that will tell us what counts, and that is the purpose of table K1. Table K1 presents a linear (Ordinary Least Squares) regression in which the dependent variable, time to degree, is set on a scale with four values: more than 6 calendar years, 5–6 years, 4–5 years, and less than 4 calendar years (which encompasses the normative four-year degree). With one exception, a dichotomous variable indicating whether the student ever engaged in a cooperative education or internship course, the independent variables selected were those previously explored and (in most cases) used in the logistic narrative of Part IV of this study. The statistically significant independent variables are highlighted in bold. How do we read the table? What do we see?

On reading the table: First, the R^2 indicates that this linear model accounts for half the variance in timing of bachelor's degree completion for the NELS:88/2000 cohort. That's a very convincing level. Second, the positive parameter estimates mark variables that add time to degree, while the negative parameter estimates indicate variables that shrink it. Third, the following variables did not meet the significance threshold for entering the model (set at $p < .05$): race/ethnicity, becoming a parent by age 20, multi-institutional attendance, and freshman year remediation.

There is no question of the major contributors to extended time to degree:

1. Excessive no-penalty course withdrawals (W) and no-credit repeats (NCR)—Damaging to degree completion, these are just as damaging to time to degree. Yes, we can keep students continuously enrolled, but if much of that enrollment is nullified by withdrawals and repeats, we have what Tinto calls retention without education. It's worse, though, because every seat at every available hour in every facility of an institution of higher education is at stake, and every seat marked with a W or NCR bars another student from sitting down. When the blocked seats reach a critical mass, general access is impeded as well. This observation is worth repeating.

[65]Broh (1991) presented an intriguing argument for an alternative time to degree calculation that began with the *median*, not the mean, and included students who had not finished the degree but who were still enrolled as degree candidates. In *The Toolbox Revisited*, the median for students who had completed degrees is 4.24 calendar years. Including students who had not earned degrees by December 2000 but who were still enrolled as bachelor's candidates, the median time to degree would be 4.49—very close to the mean of 4.58.

2. Transfer, both classic community college to four-year, and four-year to four-year—As previously noted, transfer often involves a hiatus in enrollment and extra effort to meet prerequisite requirements at the new institution.
3. Change of major—Garcia (1994) observed that the more times the student changed major, the greater the elapsed time to degree. Knight (2002, 2004a, 2004b) also includes multiple changes of major among the set of variables with significant impact on both enrolled and elapsed time.
4. Whether the student was ever part-time—Since our variable for part-time attendance was constructed partly with reference to course withdrawals that, in effect, produced lighter course loads, the result here backs up the conclusions of Volkwein and Lorang (1996).

Table K1. Ordinary Least Squares regression indicating factors influencing time-to-degree for 1992 12th-graders who earned bachelor's degrees by December 2000

And there is no question concerning which variables will contract time to degree: continuous enrollment and no remediation (the highest value of the "total remediation" variable). Socioeconomic status is a marginally significant contributor to lower time to degree, while the position of freshman year GPA quintile as a contributor to extended time to degree is somewhat puzzling.

Of those variables that were admitted to the linear model but failed to reach the threshold of statistical significance, enrollment in cooperative education or internship courses deserves special attention because it raises contrasting policy options with respect to influences on time to degree. Knight (2004b) observes that:

> Timely degree completion is not all that matters in terms of college student outcomes. Both analytical and student self-report evidence supports the fact that enrollment in cooperative education classes, involvement in internships, etc., while extending time-to-degree, significantly improves student learning and skill development, affective outcomes, career prospects, and the like. Significantly reducing time-to-degree could perhaps demand a trade-off against other long-term (and maybe more important) outcomes. (p. 14).

It turns out that the NELS:88/2000 baccalaureate students who engaged in cooperative education or internships or clinical externships did not take longer than others to complete degrees. But Knight is really asking readers to reflect on the principal objectives of conducting a baccalaureate enterprise. The modes of instructional delivery in professional and applied fields, in particular, often include carefully designed, graded experience in occupational environments, involving considerable time commitments that lie beyond the classroom. If we say to a school of engineering, "You can't offer cooperative education any more and cannot require more than 128 credits for a degree," what do we accomplish in terms of the quality of student learning and the quality of engineering graduates?

In contrasting spirit, if we observe institutions in which students can withdraw from courses, without penalty, as much as 10 weeks into a 14-week semester, a volume of withdrawals equivalent to 15 percent of all credits offered by the institution in a calendar year, and the average time to degree for native students at that institution to be well over five calendar years, we would accomplish a great deal by a tightening of course withdrawal policy. Here is a prime candidate for future research governed by quasi-experimental design: Find two comparable institutions (mission, size, demography, distribution of majors), one with lax withdrawal rules, the other with restrictive rules. The hypothesis, from everything learned in this data essay: An institution that restricts course withdrawal policy will witness higher graduation rates and shorter average time to degree.

Table L4. Descriptive relationship of number of credits earned in the first calendar year of attendance by 1992 12th-graders to highest degree earned by December 2000

	Highest degree earned by December 2000				
Number of credits in first year	None	Certificate	Associate	Bachelor's or higher	**Percentage of all students**
0–10	84.6 (1.44)	6.4 (0.98)	5.4 (0.88)	3.6 (0.75	**24.5 (0.94)**
11–19	63.9 (2.27)	4.9 (0.88)	12.0 (1.65)	19.2 (1.70)	**16.5 (0.73)**
20–29	27.5 (1.39)	3.8 (0.75)	8.4 (0.79)	60.3 (1.60)	**31.0 (0.83)**
30 or more	10.6 (0.86)	5.1 (0.66)	7.9 (0.83)	76.5 (1.31)	**27.9 (0.81)**
Among those who attended a four-year college at any time, number of credits earned in first year					
0–10	75.8 (3.15)	4.9 (1.50)	8.8 (2.18)	10.4 (2.11)	**12.4 (0.88)**
11–19	53.9 (2.82)	2.1 (0.55)	12.1 (2.22)	31.9 (2.51)	**14.1 (0.70)**
20–29	24.2 (1.39)	2.0 (0.79)	5.0 (0.62)	68.9 (1.59)	**38.8 (1.01)**
30 or more	8.4 (0.81)	0.6 (0.16)	3.4 (0.48)	87.6 (0.93)	**34.8 (0.94)**

NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding. Weighted N for all 1992 12th-graders = 2.09M; for those who attended a four-year college at any time:1.47M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L5. Percentage distribution of enrollment intensity over six years (1995/96–2001) of students who started out in postsecondary education in 1995/96, by age as of December 1995

Age at entry	Enrollment intensity		
	Full-time only	Part-time only	Both full-time and part-time
All Students	47.0 (1.1)	12.2 (0.8)	40.7 (1.0)
Less than 21	51.8 (1.1)	4.4 (0.5)	43.8 (1.1)
21–23	40.0 (3.8)	18.7 (3.1)	41.3 (1.1)
24–29	30.2 (3.7)	35.5 (4.6)	34.3 (4.2)
30 and older	32.1 (3.1)	42.9 (3.5)	25.0 (2.8)

NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding.
SOURCE: National Center for Education Statistics: Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-171).

As the reader will notice, about 48 percent of traditional-age students in the BPS longitudinal study of 1995/96-2001 told us that they attended part-time at some point in their undergraduate careers. In contrast, only 38 percent of the NELS:88/2000 postsecondary cohort indicated in their 2000 CATI interviews that they had attended part-time at any time. Are the two cohorts, three years apart in their modal starting date, that different? No.

NELS:88/2000:

Part-time by student report	37.7
Part-time by transcript evidence	9.7
Total part-time	47.4

BPS95/96–2001 students who started before they were 21:

Always part-time	4.4
Mixed full-time and part-time	43.8
Total part-time	48.2

So a dichotomous variable indicating whether the student *ever* attended part-time can be included in the logistic model in Step 5 (attendance patterns).

Table L6. Mean Carnegie unit credits earned in grades 10–12 by (a) all 1992 12th-graders and (b) by those of known socioeconomic status who attended a four-year college at any time and for whom high school transcript records and senior year test scores were complete

	Mean Carnegie units earned by:	
Category of earned credits	All 1992 12th-graders	All 1992 12th-graders who are the subjects of *The Toolbox Revisited*[a]
All high school credits	17.93 (0.09)	18.74 (0.09)
All academic credits	16.06 (0.09)	17.13 (0.09)
All vocational credits	1.28 (0.03)	1.01 (0.03)
English	4.11 (0.02)	4.18 (0.02)
Mathematics	3.39 (0.03)	3.61 (0.03)
Foreign language	1.98 (0.04)	2.31 (0.04)
Science	3.14 (0.03)	3.39 (0.03)
Social sciences	3.55 (0.03)	3.64 (0.03)

[a] These students are the same as those described under (b) in the title of this table.

NOTES: Standard errors are in parentheses. Weighted N for all 1992 12th-graders: 2.62M. Weighted N for 1992 12th-graders who graduated from high school by December 1996, attended a four-year college at any time, and were of known socioeconomic status: 1.41M.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L7. Logistic account of the three components of Academic Resources in relation to bachelor's degree attainment for all 1992 12th-graders with complete records for all three components

Variable	Parameter estimate	Adjusted standard error	F	*t*	*p*	Standard-ized estimate	Odds Ratio
Intercept	-5.3515	0.2348	529.46	11.12	0.01		
Curriculum intensity	0.6273	0.0568	122.17	5.39	0.02	0.4672	1.87
Classrank/GPA	0.4700	0.0529	79.05	4.34	0.05	0.3686	1.60
Senior test score	0.3649	0.0561	42.25	3.17	0.10	0.2785	1.44

NOTES: Standard errors adjusted by root design effect=2.05; universe consists of 1992 12th-graders with high school transcript records and senior year test scores. Percent of concordant probabilities predicted: 85.1; G^2=7536.7; *df*=8280; G^2/df=90.9; X^2 (df)=2977.32 (3).

Table L8a. First season of postsecondary attendance of NELS:88/2000 students (a) who participated in the 1992 NELS survey and (b) who were 12th-graders in 1992 and subsequently attended a four-year college

	All students in 1992 survey	12th-graders in 1992 with full high school records who attended a four-year college
First season of attendance		
Summer term	5.8 (0.46)	4.4 (0.49)
Fall term	82.1 (0.83)	91.3 (0.65)
Winter or spring terms	12.1 (0.71)	4.3 (0.37)

Table L8b. Percentage of two groups of NELS:88/2000 postsecondary students who entered in the fall term: (a) All who participated in the 1992 NELS survey and (b) those who were 12th-graders in 1992 and subsequently attended a four-year college, by race/ethnicity and socioeconomic status quintile

	Percent Entering in the Fall Term	
	All students in 1992 survey	12th-graders in 1992 with full high school records who attended a four-year college
By race/ethnicity		
White	84.3 (0.84)	92.3 (0.54)
African-American	73.8 (3.53)	85.7 (4.28)
Latino	73.9 (2.19)	86.1 (3.49)
Asian	83.3 (3.54)	89.9 (3.77)
American Indian	85.1 (5.82)	97.1 (2.87)
By socioeconomic status quintile		
Highest	92.2 (0.73)	93.7 (0.81)
2nd quintile	83.3 (1.85)	90.6 (1.66)
3rd quintile	79.6 (1.68)	90.8 (1.04)
4th quintile	77.4 (1.83)	89.9 (1.32)
Lowest	66.0 (2.96)	82.7 (3.62)

NOTES: Standard errors are in parentheses. Weighted Ns: 1992 survey participants = 2.18M; 1992 12th-graders who attended a four-year college at any time and who presented full high school records = 1.18M.

Table L9. Percentage of 1992 12th-graders earning credits in college-level math courses, both in the first calendar year of attendance and cumulatively, by number of credits earned in college-level mathematics, and type and selectivity of first institution of attendance

Characteristics of first institution	Number of credits in all college-level math courses earned in the first calendar year of attendance: None	1-4	More than 4
Type of first institution			
Four-year	44.2 (1.20)	30.2 (1.02)	25.6 (0.98)
Community college	82.1 (1.22)	12.0 (1.00)	6.0 (0.75)
Other sub-baccalaureate	89.2 (2.72)	9.5 (2.70)	1.3 (0.51)
Selectivity of first institution			
Highly selective	25.1 (5.69)	26.9 (4.24)	48.0 (5.32)
Selective	26.9 (1.98)	32.0 (2.38)	41.1 (2,28)
Nonselective	51.3 (1.26)	30.1 (1.15)	18.6 (0.91)
Open-door	82.4 (1.17)	11.8 (0.96)	5.8 (0.73)
Not ratable	92.4 (2.51)	3.7 (2.09)	3.9 (1.42)

	Number of credits in all college-level math courses earned at any time in the undergraduate careers of students who earned more than 10 undergraduate credits[a]: None	1–4	5–9	More than 9
Type of first institution				
Four-year	23.2 (0.96)	26.3 (0.96)	28.9 (0.92)	21.5 (0.99)
Community college	52.8 (1.82)	21.4 (1.47)	16.1 (1.29)	9.6 (1.01)
Other sub-baccalaureate	79.1 (3.88)	12.4 (3.62)	6.1 (1.70)	2.4 (0.83)
Selectivity of first institution				
Highly selective	18.1 (5.44)	17.8 (3.53)	18.0 (3.34)	46.1 (5.33)
Selective	16.5 (1.74)	21.1 (2.21)	31.9 (2.13)	20.5 (2.16)
Nonselective	25.4 (1.02)	29.1 (1.14)	28.7 (1.09)	16.8 (0.94)
Open-door	54.2 (1.77)	21.2 (1.43)	15.6 (1.24)	9.1 (0.92)
Not ratable	88.0 (3.10)	2.7 (1.14)	7.9 (2.65)	1.4 (0.81)

[a] The "more than 10 undergraduate credits" criterion excludes incidental students.

NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding. Weighted N for all 1992 12th-graders = 2.09M; for those who earned more than ten credits: 1.83M.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L10. Logistic account of factors associated with bachelor's degree completion for 1992 12th-graders who attended a four-year college at any time, using second-year cumulative credits and second-year cumulative GPA

Variable	Parameter estimate	Adjusted standard error	*t*	*p*	Delta-p
Intercept	- 6.2118	.7595	4.63	.001	----
GPA through second year	**0.7585**	**.1826**	**2.37**	**.05**	**0.1672**
Credits through second year	**1.1780**	**.1054**	**6.34**	**.001**	**0.2597**

Academic Resources quintile	**0.3345**	**.0821**	**2.31**	**.05**	**0.0737**
Ever part-time	**-1.3259**	**.1611**	**4.66**	**.001**	**-0.2923**
Summer-term credits	**0.5273**	**.0929**	**3.29**	**.01**	**0.1162**
Race/ethnicity	-0.3327	.2186	0.86	†	†
Gender	-0.1998	.1574	0.72	†	†
Parenthood by age 20	-0.8960	.4535	1.12	†	†
Multiple institutions	-0.5354	.1874	1.62	†	†
Community college transfer	0.6251	.2151	1.65	†	†
First institution was selective	0.4008	.2248	1.01	†	†
College-level math in first year	0.2064	.1692	0.69	†	†
First-year remediation	0.2940	.1929	0.86	†	†

† Variables did not meet threshold criterion for statistical significance.

NOTES: Standard errors adjusted by root design effect = 1.71. Delta-p computed only for statistically significant variables (in bold). Universe consists of all 1992 12th-graders who participated in postsecondary education, whose records indicated positive values for all variables in the model, and whose transcript records were complete. Weighted N = 1.5M. $G^2 = 3477.1$; df=4759; $G^2/df = 0.73$; X^2 (df)= 2272.2 (17); p = 0.0001. Proportion concordant predicted probabilities = 90.4 percent.

SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L11. Institutional attendance patterns of 1982 and 1992 12th-graders who subsequently earned more than 10 postsecondary credits[a]

Attendance characteristics	Class of 1982	Class of 1992
Number of schools attended		
One	46.9 (0.82)	43.5 (1.06)
Two	33.8 (0.75)	35.1 (0.93)
More than two	19.3 (0.63)	21.5 (0.84)
For those who attended more than one school:		
Attended in more than one state	39.5 (1.21)	35.7 (1.36)
Institutional combinations:		
Four-year only	38.9 (1.21)	27.5 (1.17)
Reverse transfer[b]	7.6 (0.60)	8.2 (0.76)
Community college transfer	18.1 (0.90)	22.1 (1.12)
Alternating/simultaneous[c]	10.2 (0.67)	13.8 (1.01)
Four-year student with incidental community college[d]	[e]	12.7 (0.90)
Four-year plus other sub-baccalaureate	4.9 (0.46)	1.8 (0.36)
Community college only	10.2 (0.69)	9.1 (0.71)
Community college and other sub-baccalaureate	5.3 (0.50)	3.0 (0.33)
Sub-baccalaureate trade school only	1.1 (0.22)	0.3 (0.20)
Other combinations	3.6 (0.51)	1.5 (0.31)

[a] The reason for excluding incidental students (those who earned 10 or fewer credits) is that they provide an insufficient history for judging multi-institutional attendance.
[b] Student began in four-year institution, did not earn a degree, and transferred to a community college.
[c] Student moved back and forth between four-year and two-year institutions, or attended two institutions at the same time, or did both.
[d] Student was based in a four-year institution, and earned 10 or fewer credits, principally during summer terms, from community colleges. This measure was not available in the High School & Beyond/Sophomore cohort transcript file.
[e] Category was not available in the High School & Beyond/Sophomore cohort transcript files (NCES 2000-194).
NOTES: Standard errors are in parentheses. Rows may not add to 100.0 percent due to rounding. Weighted N for those who earned more than ten credits: 1.83M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L12. Percentage distribution of final (December 2000) education status of 1988 eighth-graders, by type and timing of high school diploma (if any), and including those who did not earn high school diplomas

Secondary/postsecondary status	Percent
1) Earned standard high school diploma by July 1992 and	
Earned at least a bachelor's degree	29.1 (0.94)
Associate degree was highest earned credential	4.7 (0.28)
Certificate was highest earned credential	2.8 (0.24)
No degree, but still enrolled in 2000	4.6 (0.33)
No degree, not enrolled in 2000	23.6 (0.79)
Never entered postsecondary education	13.1 (1.10)
2) Earned standard high school diploma *after* July 1992 and	
Earned at least a bachelor's degree	0.2 (0.12)
Associate degree was highest earned credential	0.3 (0.14)
Certificate was highest earned credential	0.2 (0.04)
No degree, but still enrolled in 2000	0.4 (0.14)
No degree, not enrolled in 2000	1.9 (0.29)
Never entered postsecondary education	1.6 (0.23)
3) Earned GEDs or certificates of attendance and	
Earned at least a bachelor's degree	0.1 (0.03)
Associate degree was highest earned credential	0.2 (0.05)
Certificate was highest earned credential	0.4 (0.14)
No degree, but still enrolled in 2000	0.8 (0.22)
No degree, not enrolled in 2000	2.8 (0.38)
Never entered postsecondary education	3.9 (0.46)
4) Others	
Did not graduate from high school, but entered postsecondary	1.0 (0.42)
Did not graduate from high school, no postsecondary	6.7 (0.65)
Indeterminable high school graduation status	1.7 (0.37)

NOTES: Standard errors are in parentheses. Percent column may not add to 100.0 due to rounding. Weight used throughout this table is the F4BYWT with a base year (1988) flag. F4BYWT covers NELS:88/2000 students who were in both the base year (1988) sample and the 2000 follow-up survey sample. Weighted N=2.93M.
SOURCE: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement).

Table L13. Mean elapsed time to bachelor's degree[a] for all 1992 12th-graders who earned the degree by December 2000, by demographics, academic background, and attendance pattern characteristics

Student characteristic	Mean elapsed calendar years to degree	Standard deviation	Standard error
All NELS:88/2000 bachelor's	4.58	1.098	0.028
By Academic Resources quintile			
Highest quintile	4.23	0.914	0.042

GLOSSARY

VARIABLES AND THEIR CONSTRUCTION

This glossary serves not only to expand the definition of the variables considered for *The Tool-box Revisited*, but also to provide details on their construction and allied guidance for interpretation that the reader may find helpful. As in Part II of this study, the presentation follows the order of the seven steps of the logistic narrative.

Where the initial definition of the variables in Part II was simple and transparent, e.g., GENDER, no further elaboration is provided here. Nearly all these variables were either taken directly or derived from other variables on NCES 2003-402 and its June 2004 Supplement.

Step 1a: Demographic Background

NNSE (Nonnative speaker of English)—New in this analysis.

The most notable demographic change between postsecondary students from the High School Class of 1982 and those from the High School Class of 1992 was a doubling of those who not only came from households where English was a second language, but who themselves were users of the heritage language. More than half of both Asian and Latino postsecondary students were so classified (Adelman 2004a, table 1.3, p. 9).

IMMIG (Family immigrant status)—New in this analysis.

Allied to second language background is the immigrant status of families. A dichotomous variable, IMMIG, was created to indicate whether the student's parents were immigrants to the United States within the previous 10 years. Among those who attended a four-year college at any time, 27.5 percent (s.e. = 3.33) of Asian students and 8.8 percent (s.e. = 1.61) of Latino students came from recent immigrant families. The dichotomous variable did not meet the minimum *t* criterion for retention in the demographic logistic model. Nonresponse bias undermines this variable: Responses from nearly 15 percent of the NELS:88/2000 families are missing.

BROSIS (Number of siblings)—New in this analysis.

Some research has indicated that students from larger families have more difficulty entering and successfully participating in higher education (Stage and Hossler 1989; Leigh and Gil 2003; Perkhounkova, McLaughlin, and Noble 2004). The dichotomous variable, BROSIS, marks students with three or more siblings versus those with one, two, or none.

FIRSTGEN (First generation postsecondary student)—New in this analysis.

A dichotomous variable under which the criterion for first-generation status is that *neither* parent had attended a postsecondary institution. Parents' education status was reported by parents themselves, not by students. The discrepancy between students' understandings of their parents' education status and parental accounts was demonstrated in the original *Tool Box* (p. 36): For the High School Class of 1982, only 50 percent of the students with at least one parent who had

earned a bachelor's degree (but not a graduate degree) could correctly describe their parents' achievement. Parents' highest level of education is a key component of socioeconomic status, and the original *Tool Box* did not test it separately.

FAMINC (Family income)—New in this analysis.

Family income in 1991 (the year before NELS students were scheduled to be in the 12th grade) was reported by parents, and set in six bands with a fairly even distribution of all respondents across those bands. In 2005 dollars (adjusted for a Gross Domestic Product deflator[66] of 1.288), as shown in figure 4, these bands were:

Figure 4. 1991 family income bands used in the NELS:88/2000 in 2005 dollars

Income band	Income range ($000)
Highest	96.6 and higher
Second	64.4–96.5
Third	45.1–64.3
Fourth	32.2–45.0
Fifth	19.3–32.1
Lowest	Less than 19.3

SOURCES: National Center for Education Statistics: NELS:88/2000 Postsecondary Transcript Files (NCES 2003-402 and Supplement); *Budget of the United States Government: Historical Tables, Fiscal Year 2005*, table 10.1.

For purposes of our analysis, the bands were combined in pairs—highest two, middle two, and lowest two—to produce a trichotomy. This version is used in the Step1a logistic model (demographic characteristics only), along with FIRSTGEN, as one of the proxies for socioeconomic status.

NEWCHILD (Parenthood by age 20)—Carried forward from *Answers in the Tool Box.*

The variable, abbreviated as NEWCHILD, is a dichotomous marking of students (of either sex) who became parents by age 20. It was a powerful, negative, and consistently significant variable through all stages of the logistic story of the HS&B/So. A decade later, the rate of early parenthood had changed. For the entire cohort of the HS&B/So, 11.6 percent (s.e. = 0.43) became parents by age 20, a proportion that rose to 16.4 percent (s.e. = 0.92) for the NELS:88/2000. For those who ever entered a postsecondary institution, these percentages drop in half. Georges (2000) would remind us of the common sense that students who became parents by age 20 were not likely to enter college at all by that time. Indeed, 59.4 percent (s.e. = 2.30) of

[66]For the GDP deflator calculator, go to http://www1.jsc.nasa.gov/bu2/inflateGDP.html

the NELS:88/2000 participants who had children by 1994 did not enter any postsecondary institution by 2000, compared with 20.9 percent (s.e. = 0.89) of those who did not become parents by 1994.[67]

SESQUINT (Socioeconomic status quintile)—Carried forward from the original *Tool Box*.

In NCES longitudinal studies, socioeconomic status (abbreviated SES) is a composite index of family income, parents' highest level of education, prestige of parents' occupations, and the presence of items such as books, regular newspapers, and a computer in the student's household. Parents provide this information, and the 1992 parent interview was the primary source. The NELS:88/2000 files presented this index in centiles, as did the HS& Beyond/So file before it. To match quintile presentations of high school curriculum intensity, high school class rank/Grade Point Average, 12th-grade test score, and the composite variable, Academic Resources (see below), the centile scale was collapsed to quintiles. SES is an anchor of the education attainment literature, with recent studies enlightening our understanding of the complex ways students of different SES backgrounds experience higher education (e.g., Walpole 2003).

Step 1b: High School Background

EDUANTIC (Education anticipations)—Modified from *Answers in the Tool Box*.

In both the original *Tool Box* and *The Toolbox Revisited*, this is a composite variable describing the consistency and level of the student's education expectations, hence, goal commitment (Allen and Nora 1995). It departs considerably from measures of student education "aspirations" that are based on the student's answer to a single question at one moment in time. The variable was built from matched pairs of questions asked in grades 10 and 12. The High School & Beyond/Sophomore cohort surveys included six pairs of questions: highest level of education expected, planned dominant activity in the year following high school graduation, timing of college entry, choice of a two-year or four-year college as entry point, lowest level of education with which the student would be satisfied, and whether the student would be disappointed if he or she did not graduate from college.

The NELS:88/2000 version does not have as strong a base. Only two pairs of questions were asked in grades 10 and 12 that feed into the construction: highest level of education expected and timing of college entry.[68] In grade12 only, the respondent was asked what was the most likely type of postsecondary institution he or she would enter: four-year, two-year, or trade school, and the answer to this question also was used in building the variable. But the lack of parallelism

---

[67]These percentages are based on the entire panel of participants in 1992 who also participated in the 1994 and 2000 follow-up surveys.

[68]Georges (2000) used a similar level-of-expectations by consistency-of-expectations construct for parental visions of their children's future education in the NELS:88/2000 cohort. Parents were interviewed on this issue when students were in the eighth grade and again when students were scheduled to be in the 12th grade.

between the HS&B/So survey and the NELS:88/2000 lead to revisiting the NELS categories and applying stricter algorithmic standards to yield an education anticipations variable closer to the structure of its predecessor, as displayed in figure 5.

Even after this construction, the education anticipations variable required an adjustment. Unlike the quintile variables for curriculum, class rank/GPA, and senior year test score, in which meanings are linear, the five-level anticipations variable is categorical. For purposes of multivariate analysis, the five levels were reduced to three as follows: (1) consistently expected to earn a bachelor's degree; (2) raised expectations to the bachelor's degree between grades 10 and 12; and (3) either lowered expectations from the bachelor's level between grades 10 and 12 or never expected to earn a bachelor's degree. The result is still a categorical variable, but the reference point—expectations for earning a bachelor's degree—is now constant in all three values.

Figure 5. Comparison of the education anticipations composite variable in the High School & Beyond/Sophomore cohort and the NELS:88/2000: Changes in students' expectations between grade 10 and grade 12

HS& B/So	NELS:88/2000
Bachelor's consistent	Bachelor's consistent
Raised to bachelor's	Raised to bachelor's
Lowered from bachelor's to some college; associate consistent	Lowered from bachelor's to some college, inconsistent
Lowered to no degree; associate inconsistent	Raised to some college; consistent "some college"
No degree plans, don't know	Sub-baccalaureate, including high school diploma or less

SOURCES: National Center for Education Statistics: High School & Beyond/Sophomore cohort, NCES 2000-194; NELS:88/2000 Postsecondary Transcript Files, NCES 2003-402.

CLSSRNKQ (Class rank/GPA quintile)—Carried forward from the original *Tool Box*.

This variable is a composite of high school class rank and GPA quintile. In both the HS&B/So and NELS:88/2000 data sets the composite was constructed in roughly the same way. The construction is described in detail in Appendix C, but the key features are worth repeating here.

The construction of this variable began with class rank, expressed as a percentile, for students whose high school graduating classes were larger than 10. Class rank was chosen for the base

reference because it overrides variability in local grading practices,[69] and responds to the divergence between stable scores on standardized tests such as the SAT or ACT and rising GPAs among the college bound (College Board 1998). Not all high schools compute class rank,[70] so for a significant percentage of students, this datum is missing. For these missing cases (as well as for the students from very small high schools), the variable construction turns to high school GPA (where available, and only for students with three or more years of course work). Basing a percentage scale first on class rank, and filling in the missing values with available GPAs from a matched scale using an equipercentile concordance methodology (Houston and Sawyer 1991), weighting the combined scale and cutting it by quintiles solves some of the bias and validity problems that would result from relying on GPA alone.

SRTSQUIN (Senior year test score quintile)—Carried forward from the original *Tool Box*.

SRTSQUIN is the quintile version of a senior year test score. Comparing the HS&B/So to the NELS:88/2000, this variable had the least variation in construction among the precollegiate academic performance variables. In both data sets, composite scores on an "enhanced mini-SAT" given to survey participants in the 12th grade were set out in percentiles. For missing cases, ACT scores were first converted to the SAT scale using ACT's equipercentile concordance methodology (accounting for the 1989 revision of the ACT test battery), and a combined SAT/ACT variable constructed. Scores on this variable were set out in percentiles, and filled in for missing cases of the senior year test score percentile using the equipercentile concordance method. SRTSQUIN reduces the noise in the lumpy distribution with a quintile presentation. Despite these efforts, 14 percent of the students in the NELS:88/2000 database are missing a senior year test measure, compared to 9 percent in the HS&B/So (see Appendix C). It must be acknowledged that the construction of SRTSQUIN combines low-stakes test scores with high-stakes test scores, though it is unclear how that ultimately affects a quintile presentation.

HIGHMATH (Highest level of mathematics reached in high school)—Carried forward from the original *Tool Box*.

In the original construction of this variable in both the HS&B/So and NELS:88/2000 data sets, some editing of the original coding of high school mathematics courses was required in light of postsecondary transcript evidence. For example, if the original coding in 1992 judged the student's highest level of high school mathematics to be "geometry," and the student's postsecondary transcript record of 2000 showed enrollment and completion of "Calculus III" in the first semester of college, then it was obvious that the original coder did not know the

---

[69]Among the divergent policies found by the College Board (1998): (a) 9 percent of high schools do not use A-F or numeric grading systems; (b) 8 percent of high schools do not give credit for grades lower than C-; (c) 19 percent of high schools are in districts where grading systems vary; and (d) 43 percent of high schools exclude some courses when calculating GPA.

[70]In its survey of high school grading practices, the College Board (1998) found that 19 percent of high schools did not calculate class rank.

difference between "geometry" and "analytic geometry," and the student's high school record had to be adjusted accordingly. HIGHMATH is considered a categorical variable (as opposed to a continuous variable) because the distance between its levels cannot be judged as ordinal.

SCIMOM (High school momentum in science and mathematics)—New in this analysis.

This variable has three values: (1) A student who reached a level of math beyond Algebra 2 and who earned three or more Carnegie units in core laboratory science was labeled as having sufficient momentum in STEM (Science, Technology, Engineering, and Mathematics)-oriented fields to enhance that momentum even further in a postsecondary environment (whether or not they chose to do so). (2) Students who reached Algebra 2 but no higher, and accumulated more than 1.5 units of core laboratory science exhibited "modest" science momentum, and (3) those whose high school records fell short of "modest" on either the mathematics or science criteria were labeled "weak-to-minimal" in terms of science momentum. SCIMOM is one of three variables tested together as proxies for the combined measure of the academic intensity of a student's high school curriculum, HSCURRQ.

FLAN (Number of units of foreign language in high school)—New in this analysis.

This variable was developed as part of a configuration of proxies for academic curriculum intensity so that we could test the proxies against the consolidated academic curriculum index, HSCURRQ, described on pages 24–27 and in Appendix F. FLAN indicates the number of Carnegie units earned in high school foreign language study, and has five values: more than 3 units, from 2.01 to 3 units, from 1.01 to 2 units, from 0.1 to 1 unit, and 0 units. FLAN is one of three variables tested as proxies for HSCURRQ.

ADVANCE (Number of Advanced Placement courses)—New in this analysis.

This variable was constructed with three values based simply on the number of AP courses recorded: three or more, one or two, and none. It was tested, along with SCIMOM and FLAN, as a proxy for the consolidated academic curriculum index, HSCURRQ.

The identification of Advanced Placement course work in the NELS:88/2000 was a complex task.The version of the NELS:88/2000 high school transcripts to which researchers have referred in the past understates participation in AP courses, though it was difficult to say precisely by how much. Two proxy measures were employed to create the first version of an AP variable on the data file used in this study:[71] AP test scores recorded on the high school transcripts and AP entries on the postsecondary transcripts (which do not include test scores). These were combined to yield 7 percent of the NELS:88/2000 12th-graders, compared with the College Board's

[71]NCES CD 2003-402.

estimate of approximately 11 percent of 1992 12th-graders having taken AP courses.[72] Not everyone who takes AP courses takes AP examinations, and while that might explain some of the gap in the estimates, it still left an uncomfortable discrepancy between the NELS and College Board accounts of Advanced Placement volume.

In light of this low yield and anomalies in the data, a new approach was taken in the work that produced the 2004 Supplement to the original NCES 2003-402 files. Enough new cases of AP course taking (*not* courses labeled "honors" or just "advanced") were identified to raise the proportion of NELS 12th-graders with AP courses to 9.4 percent.[73]

Step 2: Postsecondary Entry

FIRST4 (First school attended was a four-year college)—Carried forward from *Answers in the Tool Box.*

The dichotomous variable indicating whether the first institution attended by the student was a four-year school was active in the original *Tool Box* account, but did not qualify for entry into the model in this replication. It is not clear why this should be the case. Some 81.9 percent (s.e. = 0.82) of the class of 1982 who attended a four-year college at any time started at a four-year college, versus 78.1 percent (s.e. = 1.04) of the class of 1992. There is no meaningful difference in those numbers.

DOCT (First school attended was a doctoral degree-granting institution)—Carried forward from the original *Tool Box.*

Another dichotomous variable indicating that the first institution attended by the student was not only a four-year college, but a doctoral degree-granting school. In the original *Tool Box*, this variable was admitted to the steps of the logistic model but was never statistically significant. In *The Toolbox Revisited* analysis, this variable did not qualify for entrance in the model, even though roughly similar percentages of students who attended a four-year college at any time started in a doctoral degree-granting institution (33.8 percent; s.e. = 1.06 for the HS&B/So versus 34.1 percent; s.e. = 1.11 for the NELS:88/2000).

---

[72]See indicator #14 in *The Condition of Education, 1999*. Washington, D.C.: National Center for Education Statistics, 1999, p. 56.

[73]This approach began by isolating students who were consistent in their claims to have taken an "advanced placement course," planned to take an AP test, and reported taking at least one AP test between 1990 and 1993. From this group, those for whom AP course work had already been recorded were dropped. The balance were first matched against the HIGHMATH variable. For students who reached calculus or precalculus, responses to another question as to whether they took the course to earn college credit were invoked. If the student responded positively, the record was credited with an AP course. College transcripts were also examined for foreign language study at advanced levels in the first year of attendance (along with more than 2 years of foreign language study in high school), etc. Where matches were found, the student record was credited with an AP course.

The variable indicating the selectivity of the first institution of attendance (SELECT) is, to a large extent, confounded with doctoral degree-granting status (55 percent of the NELS:88/2000 students who started at doctoral degree-granting institutions started at either selective or highly selective schools).

SELECT (Selectivity of first institution attended)—Carried forward from the original *Tool Box.*

A dichotomous variable indicating that the first institution attended by the student was either highly selective or selective.[74] Some 4.1 percent (s.e. 0.49) of the universe for this study started in highly selective institutions (e.g., Princeton, the University of California at Berkeley, and Harvey Mudd). Another 17.8 percent (s.e. = 0.98) began their postsecondary careers in selective institutions (principally flagship state universities such as Michigan-Ann Arbor, North Carolina-Chapel Hill, Wisconsin-Madison, and Texas-Austin). More than half of the universe of students in this study (56.3 percent; s.e. = 1.32) commenced study in nonselective four-year colleges, and 20.7 percent (s.e. = 1.19) in open-door institutions, a category that is just about identical to community colleges. For the previous cohort of students from the High School Class of 1982, selectivity of first institution had a modestly positive and statistically significant association with degree completion until the last step of that analysis, extended postsecondary performance. Readers interested in the distribution of first institutional selectivity by race/ethnicity, gender, and socioeconomic status are referred to Appendix L, table L3.

NODELAY (Direct entry to postsecondary education following high school)—Carried forward from the original *Tool Box.*

This dichotomous variable was built from a simple distinction: Among students for whom we know both the month and year of high school graduation and the month and year of a transcript-documented attendance in a postsecondary institution following high school graduation, is the difference (a) seven months or less, (b) 8–18 months, or (c) more than 18 months? The first of these options is regarded as "direct entry." Dual enrollment courses do not count in this determination. The student who graduates from high school in June has until the following January to enroll and be judged "no delay." To those who might question the seven month allowance and argue for four months, one would point to a small percentage of graduates with April commencement dates who would be judged late entrants in September under a four-month rule.

---

[74] Institutional selectivity in the postsecondary files of all three grade-cohort longitudinal studies conducted by the National Center for Education Statistics has five values: highly selective, selective, nonselective, open-door, and not ratable. The first three of these values were based on the selectivity cells developed by the Cooperative Institutional Research Project (CIRP) at UCLA for its annual survey (since 1966) of entering freshmen. Community colleges and area vocational-technical institutes (AVTIs) were assigned the value of "open-door." Theological seminaries, music conservatories, and sub-baccalaureate vocational schools were considered "not ratable."

ACCELCRD (Credits earned prior to high school graduation and by examination)—New in this analysis.

ACCELCRD sums all college credits earned by course work prior to high school graduation, along with credits earned by examination—including Advanced Placement, College Level Examination Program (CLEP), and institutional challenge exams (the majority of these—in the records of the NELS:88/2000—in foreign languages). Most of these credits were earned either prior to matriculation or during the first term of enrollment, though some were earned at later points in the student's undergraduate career. The ACCELCRD values were set at three levels: more than 4 credits, 1–4, and zero.

Step 3: First-year Performance

LOWCRED (Less than 20 additive credits earned in the first calendar year of attendance)— Carried forward from *Answers in the Tool Box.*

A dichotomous variable built on an analysis of the mean number of additive credits (those that count toward degrees) earned by all postsecondary students in the first calendar year following the date of first enrollment. The threshold at which this broad population began to earn any credentials (including certificates and associate degrees) was 20 credits (in the NELS:88/2000 population, 20.252 credits, to be precise; s.e. = 1.016). LOWCRED is an early momentum indicator with enduring consequences. As table L4 in Appendix L demonstrates, the more additive credits earned in the first year, the more likely a degree will be completed.

FRSHGRAD (Grade point average in the first calendar year of attendance)—Carried forward from the original *Tool Box.*

Grade point averages were determined for the first *full calendar year* of postsecondary attendance, and were then set out in quintiles. FRSHGRAD is a dichotomous variable that divides the highest two quintiles from the other three. For the history of the HS&B/So used in the original *Tool Box* study, the dividing line was 2.70. For that of the NELS:88/2000 used in *The Tool- box Revisited*, the line is drawn at 2.88. The difference reflects the general trend in GPAs of the two cohorts (see Adelman 2004a, table 6.1, p. 78).

FREM (Any remedial course work in the first calendar year of attendance)—New in this analysis.

FREM is a dichotomous variable marking students who took any remedial courses during the first calendar year of attendance. Three variations on first-year remediation were tried out in the process of arriving at this formulation: one that focused only on remedial reading, another on remedial math, and a third on all types of remediation. The dichotomous version of the latter was the only form that could meet the minimal statistical criteria for entrance into the stepwise logistic model and allow us to track any association of early remediation with degree completion.

Step 4: Financial Aid

In general, the NCES grade-cohort longitudinal studies have been weak on financial aid information, where as the event-cohort Beginning Postsecondary Students longitudinal studies have offered a panoply of financing data. For example, if we were to ask about grants or scholarships received in the first year of attendance (1995–96) for the BPS:95/96–2001 by traditional-age students who attended a four-year college at some time, we would find the information indicated in table Glossary-1.

We would know, too, that for those who received grants/scholarships in 1995/96, the amount constituted an average of 69.3 percent (s.e. = 1.0) of all aid received, and covered 33.4 percent (s.e. = 0.7) of the price of attendance for the 1995–96 academic year. We could easily break these averages out by type of institution first attended. And we would know more, as the BPS:95/96–2001 covers PLUS (Parent Loan for Undergraduate Students) loans, Perkins loans, Stafford loans (subsidized and unsubsidized), need-based aid by source, merit-aid by source, Pell grants, SEOG (Supplementary Educational Opportunity Grants) grants, and other types of financial aid. If the grade-cohort longitudinal studies such as the NELS:88/2000 had gathered even a third of this information, a much richer analysis would be possible—though not necessarily an analysis demonstrating a significant association of types, amounts, and ratios of financial aid to degree completion.

Table Glossary-1. Percentage of 1995/96 beginning postsecondary students 20 years old and younger who attended a four-year college at any time, and received grants or scholarships in 1995/96, by source and average amount of award, and bachelor's degree attainment rate by 2001

			Percent earning bachelor's degree by 2001	
Source of grant	Percent receiving grant	Average amount of grant	Received grant or scholarship	Did not receive grant or scholarship
All sources	54.6 (1.3)	$4506.00 (170.7)	59.8 (1.4)	49.1 (1.9)
Federal	23.2 (1.0)	1958.60 (34.0)	47.8 (1.9)	57.1 (1.4)
State	19.1 (1.0)	1757.40 (68.8)	58.6 (2.0)	54.0 (1.4)
Institution	31.9 (1.3)	4312.00 (208.0)	67.5 (1.7)	49.0 (1.5)
Other	16.1 (0.7)	1529.60 (73.5)	71.1 (2.0)	51.9 (1.4)

NOTE: Standard errors are in parentheses.
SOURCE: National Center for Education Statistics: Beginning Postsecondary Students Longitudinal Study, 1995/96–2001, Data Analysis System (NCES 2003-173).

Step 5: Attendance Patterns

FOURTRAN (Transfer from one four-year college to another)—New in this analysis.

The algorithm for classic transfer from a community college to a four-year college was fairly easy to construct. But to distinguish a true four-year-to-four-year college transfer required an indirect route. In the final survey of NELS longitudinal study (2000), respondents who attended any postsecondary institution(s) were asked whether they ever "transferred credits." One cannot equate the yes/no answer to that question with institutional transfer. One group of four-year-to-four-year transfers was easy to identify: those who started in a four-year college and earned a bachelor's degree from a different four-year college. The second group was defined by the following attendance characteristics: They started in a four-year college, attended at least two four-year colleges, earned more than 30 credits from four-year colleges, were *not* reverse transfers, and earned less than 20 credits from community colleges and other sub-baccalaureate institutions. For the most part, these students did not earn bachelor's degrees, but they accumulated an average of 85.6 credits (s.e.=3.57) from four-year colleges. Of those who did not earn a degree, 34.6 percent (s.e. = 4.17) were still enrolled and degree-candidates in 2000.

MULTINS (Student attended more than one postsecondary institution as an undergraduate)—Carried forward from *Answers in the Tool Box.*

MULTINS is a dichotomous variable indicating that the student attended more than one institution. This is a macro-vision of otherwise multidirectional student behavior. One might suspect that when MULTINS, TRANSFER, and FOURTRAN are in the same logistic model, at least one of these variables will evidence an unacceptable degree of collinearity. But within the context of the universe under study in *The Toolbox Revisited*, the correlation between community college transfer (TRANSFER) and MULTINS is 0.3363 and that between four-year-to-four-year transfer (FOURTRAN) and MULTINS is 0.3246. These are modestly positive, but not so high as to indicate collinearity problems. What that may mean is that the three independent variables are making distinctly different statements in the context of the logistic regressions in which they appear.

SUMMER (Number of credits earned during summer terms)—New in this analysis.

Attendance and credit generation during summer terms turned out to be a strong proxy for high-octane persistence among community college students (Adelman 2005a), and was, hence, brought into the model for the population of those who attended a four-year college at any time. The variable was set by three bands of the number of credits earned in this manner: more than 4, 1–4, and 0. Some 54.8 percent (s.e. = 0.92) of all 1992 12th-graders who continued their education earned credits in at least one summer term; 61.1 percent (s.e. = 0.96) of those who earned more than 10 credits did so, as did 63.2 percent (s.e. = 1.10) of the universe on which this essay focuses. Given the magnitude of those percentages, it is not so much the fact of using summer terms, but the volume of credit generation that should count.

PARTTIME (Was the student's enrollment intensity *ever* part-time?)—New in this analysis.

The original *Tool Box* declined to confront part-time status and its effects. If one is using transcripts as evidence, there are a number of problems in determining which students are part-

time and when. This issue deserves extended attention, with support drawn from very different data sources (see, e.g., O'Toole, Stratton, and Wetzel 2003). Even if one standardizes credits on a semester metric across over 3000 institutions in the NELS:88/2000 postsecondary transcript files, it is often difficult to know what is considered "part-time" in term X at institution Y in program Z. With over 60 percent of students earning credits in summer terms, we would be obligated to include such terms in an account of enrollment intensity, and the question, "What is 'full-time' in a summer term?" would have to be answered in each institution. In the last survey of the NELS:88/2000 cohort in 2000, students were asked whether they had ever "attended less than full time." Despite the ambiguity of the phrasing and students' understanding of what "less than full time means," student responses were accepted as the first stage of creating a variable indicating part-time status at some point in their careers. In their 1994 interviews, students were also asked about their enrollment intensity status at the first institution they attended. When they indicated part-time, that fact overrode any denial of part-time status in their 2000 interview. Proximate judgment supercedes retrospection.

The second stage in developing this rough proxy draws on the transcripts and the notion of reducing credit load to part-time status. To identify students who may start with a full-time schedule but reduce it to part-time intensity by withdrawing from courses, we take the average credit load per semester for bachelor's degree recipients—14.2 (average annual load of 30.8 minus the sum of summer-term credits, credits by examination, and dual enrollment credits divided by two)—and ask by what percentage that figure would have to fall to bring the student's credit load below the threshold for full-time status (12 credits). The answer is 16.2 percent. So for the sake of this crude proxy measure, it is assumed that students who withdrew from attempted credits at 16.2 percent rate or higher were—or became—part-time at some time. With that group added to students who indicated part-time status in the course of their 2000 interviews, the proportion of NELS students who were part-time at some time in the undergraduate careers was 47.4 percent—compared with 48.2 percent of traditional-age students in the BPS longitudinal study of 1995/96–2001 (for an account of enrollment intensity in both data sets, see Appendix L, table L5).

Step 6: Extended Postsecondary Performance

REMPROB (Nature and intensity of remedial work)—Carried forward from *Answers in the Tool Box.*

In both the original *Tool Box* and *The Toolbox Revisited*, REMPROB describes the nature and extent of a student's remedial course work without the boundary of the first calendar year of attendance. For that reason, when REMPROB is tried out in the logistic narrative at the stage of extended postsecondary performance, it replaces the freshman year remediation variable (FREM).

REMPROB is created by an if-then-else logic that starts with remedial reading as the most serious of remedial problems,[75] and works its logical steps as follows:

[75]For an elaboration of REMPROB in relation to student demographic backgrounds, high school performance, and degree attainment, see Adelman 2004a, pp. 87–94, and Wirt, et al. (2000), indicator 14, p. 52 and supplemental tables (p. 152).

1. Any remedial reading
2. Two or more remedial courses (not reading, and, if math, more than two)
3. One or two courses of remedial mathematics only
4. One remedial course (not reading, not math, thus leaving writing, language arts, and general basic skills)
5. No remedial course work

For the sake of presentation in the logistic sequence, REMPROB is a dichotomous variable in which remedial reading plus more than one remedial course falls on one side of the border, and all other remediation (including no remediation) on the other side. In the original *Tool Box*, REMPROB was admitted into the model, but did not reach the threshold of statistical significance. In *The Toolbox Revisited*, REMPROB did not meet the minimum statistical standard for entry into the model when it was invoked in Step 6.

TREND (Trend in student's grade point average)—Modified from previous presentation in the original *Tool Box*.

This variable describes the trend in a student's postsecondary grade point average (GPA), and applies only to those students with complete undergraduate transcript records and computable GPAs. In its original *Tool Box* version, two reference points were used: end of the first calendar year GPA, and final undergraduate GPA. From these two markers, one could observe whether GPA was rising, flat, or falling, using a ratio of final GPA to first-year GPA. Ratios in the .95 to 1.05 range were judged to indicate no change, with ratios above 1.05 indicating a rising GPA, and ratios below 0.95 indicating a falling GPA. For a slightly better set of markers, the NELS:88/2000 postsecondary transcript files thus added a variable for GPA two years after entry. With three points of reference, ratios are not invoked, rather relationships (greater, less than, or equal to)—and at three points in time. From the permutations of these relationships one can determine whether the trend was rising, flat/inconsistent, or falling.

CUMMATH (Number of credits earned in college-level mathematics)—New in this analysis.

This variable, setting out cumulative credits earned in college-level mathematics in three bands (more than four, 1–4, and 0) replaces the parallel variable for first-year college-level mathematics credits in the context of an extended postsecondary history account. The motivation for including this curriculum marker is the same: Even if postsecondary students do not concentrate their studies in science, technology, engineering, or mathematics/computer science (STEM), their quantitative background will be called upon (in business and the social sciences, in particular). Student academic momentum, it is hypothesized, will be as much enhanced by quantitative study on the post-matriculation side of education history as it was in secondary school.

CHANMAJ (Change of major)—New in this analysis.

If transcripts are our principal source of evidence, the only moment at which we are sure of a student's major is the moment of degree award. Sometimes, the NELS:88/2000 transcripts with no degree indicated a major, which was verified by hand-and-eye reading by two judges only when the transcript carried a minimum of 15 credits and the major field indicated carried a minimum of 12. But that still leaves a large swath of missing accounts of students' major. It is wholly possible, for example, that a student earning a B.S. in computer science changed majors

twice along the way, and in two different institutions. In the matter of major—and change-of-major—the transcript is not as credible as the student. So the last NELS survey in 2000 asked students whether they had changed majors at any time, but unfortunately did not ask "from what to what."

A dichotomous change-of-major variable was developed and tried out for this study. Basically, it took the universe of students who said they changed majors, and added to that universe community college transfer students who moved from general studies to a discrete major, and cases where the student presented two transcripts with no degrees but different majors. It also took student responses in 1994 to questions about their major at the first institution attended and that at the most recent institution attended. Where the student reported two different disciplinary majors, e.g. electrical engineering at the first institution and biology at the most recent institution, that, too, was marked as a change of major no matter what the student told interviewers in 2000. Unfortunately, all these steps created a collinearity problem with the TRANSFER variable, and CHANMAJ did not qualify for entrance into the logistic narrative. On the other hand, it was admitted and played a notable role in the linear account of time to degree (see Appendix J).

Step 7: Final Model

NOSTOP (Continuous enrollment)—Carried forward from *Answers in the Tool Box.*

Given the extended potential undergraduate periods of 12 years (National Longitudinal Study of the High School Class of 1972), 11 years (High School and Beyond/Sophomores), or 8.5 years (NELS:88/2000), it makes no sense to describe stop-out behavior as one semester or its equivalent. In all three NCES postsecondary transcript-based grade-cohort studies, non-continuous enrollment was defined as *more than* a one semester (or its equivalent, e.g., two quarters) stop-out period. In the dichotomous variable, NOSTOP, the student is considered continuously enrolled even with one semester (or two quarters) off. From the moment of its introduction, NOSTOP was the strongest independent variable in the logistic narrative of the original *Tool Box*.

WRPT Ratio (Ratio of non-penalty withdrawal and no-credit repeat grades to all grades received)—Carried forward from the original *Tool Box.*

In the original *Tool Box*, this variable was called the DWI (drops, withdrawals, and incompletes) index. DWI is not a wholly accurate acronym. What is really described is a ratio in which the number of courses from which the student withdrew without penalty *plus* those the student repeated is the numerator, and the total number of courses in which the student enrolled is the denominator. The ratio counts course attempts, not credits. Withdrawals without penalty are not the same as courses "dropped" within set periods that most colleges and community colleges mark for "drop-and-add." Courses "dropped" are not included in the ratio. Nothing here involves penalty grades. All cases at issue are noncredit grades. The variable WRPT ratio is dichotomous: On one side of the dividing line are students who withdrew from or repeated 20 percent or more of all courses in which they enrolled.

Subject: Probation

Hi John and Robert,

I have spoken to Bobbi Owen and want to summarize what I learned from her. The interpretation of the new eligibility rules that I gave to you, Robert, do not seem to agreee with the intentions of the College.

Bobbi agrees that we need to include some language in the catalog/bulletin that says "good standing" means the ability to register. When you are on probation , you will be able to register and thus it would follow that you are in "good standing."

Bobbi said that they are committed to a "one probation" concept. That means, once dismissed, it would be unusual to be re-admitted on probation. Further, the student who is probated and then reaches a 3.0 for a semester or two, could be dismissed if the student fell below 3.0, even if it had been several semesters since the student was on "probation."

Bobbi is happy to discuss these items. Thanks.\

Alice

Subject: Award Winning Advisors

Dear Colleagues,

Each year, the Academic Advising invites students to nominate candidates for the /Minor-Mickel Shaw Excellence in Advising Award and the Class of 1996 Awards for Advising Excellence/. This year fifty-four advisors campus-wide received nominations. I am delighted to announce the 2006 advising awards winners:

Minor-Mickel Shaw Excellence in Advising Award
Amy Dye, Humanities and Social Sciences (Team 60)
Cheryl Junk, Fine Arts and Humanities (Team 95)
Beth Shuster, Basic and Applied Sciences (Team 70)

__
Class of 1996 Awards for Advising Excellence
Dick Cramer, Senior Team (85)
Gregory Gani, Carolina Environmental Program
Wayne Walden, Academic Support for Student Athletes

A special thank you goes to Jill Fallin for her technical assistance and members of the Awards Selection Committee for their time and deliberations. Members of the selection committee include: Nalin Parikh, Chair and Assistant Dean, Austin Rouse, Peer Advisor, Meredith Soles, Senior Advisor, and Kevin Stewart, Faculty Advisor, Department of Geological Sciences.

I extend my sincere thanks to all advising personnel for making this year a successful one.

Many thanks
Carolyn

Subject: update

I'm sure Doug has emailed everyone that there is not a staff meeting today. However, I do want to take a moment and update everyone on issues that some of us have been working on.

First - Registration Assistance for Committee Case Students:

If you remember, Mary Brunk, Mary Willingham and I wrote a proposal requesting registration assistance for this population of our students. I have had several meetings with Bobbi Owen, Lissa Broome, the Registrars Office and the Faculty Committee on Athletics. All have shared their thoughts and support. This afternoon I present to the Faculty Advising Committee to Admissions (not the sub cmt on athletics). After, they will provide their thoughts and possibly amendments. After, Bobbi and I will meet with the Chair of the Educational Policy Committee, Peter Gordon for direction. If all goes well the proposal will be a pilot for the next registration period (in the fall) and then in full effect in the spring.

Second - New UNC Eligibility Standards - specifically:

Resolution 2006-2. Revising the Standards for Continued Academic Eligibility for Undergraduate Enrollment
Resolution 2006-3. Replacing the System of Academic Warning Notification and Academic Review with a System of Academic Probation
Resolution 2006-4. Revising the Deadline for Undergraduate Course Schedule Changes in the Fall and Spring Semester

Bobbi contacted me about a week and a half ago about these resolutions. Since that time I have had several meetings with Bobbi, Fred, the Registrars Office, Wayne and Cynthia. Lissa Broome, Jack Evans, JGB and I attended last Friday's Faculty Council Meeting to hear and participate in the resolution discussions. Meetings will continue this Friday with Bobbi, Wayne, Cynthia and I.
Please go to http://www.unc.edu/faculty/faccoun/agendas/A06FC03.html
click on the links to read the resolutions.
Bobbi will be the person responsible for writing the new policies and Bobbi has been very open to hearing our questions and issues concerning these eligibility changes.
Also, this afternoon I will meet with the Faculty Committee on Athletics to discuss these changes.
At first reading, these resolutions appear to have a big impact on our population. However, after discussing with Bobbi and others I am reserving judgement. I would like to hear your thoughts and have discussion about this at our next staff meeting (next Tuesday). Waiting till next Tuesday to have staff meeting will allow for another meeting with Bobbi, Cynthia, Wayne and myself. I think we will have a better understanding of it's impact after that meeting.

Third - SI for English 10:

Mary Willingham, Todd and I met and discussed English 10. Out of that meeting, we have decided to pull our resources and work together to include English 10 and 11 in our SI classes. Mary is working with Todd to put this together. This is a great opportunity to work with the Enghlish Dept. in helping all students enrolled in English 10 (and follow them in 11). Mary can share more about this a next weeks staff meeting.

Fourth - Math requirements for students who enter UNC as exceptions:

This has also been an active topic on campus and Wayne and I have been following closely. Both of us will discus at staff meeting.

If you have any questions about anything in this email - please come in and see me. Thank you.

Dear Colleagues--

This is a reminder that training for Day 2 of CTOPS (Registration Lab) is fast approaching. Be sure to attend one of two training dates:

Friday, April 28, 10am-noon, Greenlaw 431
or
Wednesday, May 3, 2:00-4:00, Bingham 103

You do not need to tell us which of the two dates you plan to attend, but please let us know if you have questions or are unable to attend either day.

You are all welcome to also attend Day 1 (Workshop) Training, at which time we will focus on the new curriculum. (Full-time advisors are required to attend.) Part I of Day 1 Training is scheduled for Thursday, May 11, 2:00-4:00, in Bingham 103. If Part II is needed, we have scheduled Bingham 103 for Wednesday, May 24, from 2:00 to 4:00. Although participating in this training is optional for part-time advisors, doing so may serve to ease some of the apprehension you may be feeling about

the new curriculum and thereby enhance your level of comfort in the Registration Lab.

We are looking forward to another great summer of welcoming our new first-year students to Carolina, and we thank you for all of your support and hard work!

Best regards--

Barbara Lucido & Rosemary Howard

Subject: Carolina Football Graduation Rate Honored By AFCA

---

http://tarheelblue.cstv.com/sports/m-footbl/spec-rel/052306aab.html

CAROLINA FOOTBALL GRADUATION RATE HONORED BY AFCA
UNC among nine ACC schools to receive mention.

May 23, 2006

WACO, TEX. -- For the third consecutive year, the University of North Carolina has been recognized for graduating at least 70 percent of its football student-athletes by the America Football Coaches Association. Carolina was one of nine Atlantic Coast Conference institutions to receive the honor. The ACC lead all conferences with nine, followed by the Big East and Big 12 with four.

Carolina has received honorable-mention recognition 13 times since the College Football Association began presenting the award in 1981. The AFCA has presented the award since 1998.

SMU won top honors this year with 100 percent graduation. Twenty-eight other institutions were recognized for graduating 70 percent or more of their football student-athletes. Five of those institutions achieved a rate of 90 percent or better: Boston College, Duke, Northwestern, Notre Dame and Southern Mississippi. Those receiving honorable mention are: Auburn, Baylor, California, Cincinnati, Clemson, Colorado State, Florida State, Iowa, Iowa State, Maryland, Miami (Ohio), Nebraska, North Carolina, Penn State, Rice, Rutgers, Syracuse, Texas Tech, Troy, Virginia, Virginia Tech, Wake Forest and West Virginia.

The overall graduation rate of the 104 schools that responded to the survey was 58 percent, equaling last year's mark. Fifty of the members responding were above the average and 54 were below the average. The median graduation rate was 57 percent, compared to 57 percent last year and 60 percent two years ago.

The study involves the freshman class from the academic year of 2000-2001, including those who entered at that time but who did not receive financial aid until after their initial year, or who transferred from another institution and subsequently received a grant-in-aid.

Conference Breakdown: Atlantic Coast (9), Big East (4), Big 12 (4), Big 10 (3), Conference USA (3), Independents (1), Mid-American (1), Mountain West (1), Pacific 10 (1), Southeastern (1), Sun Belt (1).

Hi there,

Please take a look at the attached information from last year's Student-Athlete Handbook and make any corrections/changes and send back to me by Friday, May 26th

We are changing the look of the handbooks to make them user friendly date books and need to get them to the company much earlier than in the past.

Thanks,
Cricket

University of North Carolina
Department of Athletics

STUDENT-ATHLETE HANDBOOK 2005-2006

STUDENT-ATHLETE SERVICES

STUDENT-ATHLETE SERVICES

The Department of Athletics provides support services to our student-athletes designed to reach each student-athlete based on his or her individual needs focusing on the individual as a whole. These services include the Academic Support Program, Student-Athlete Development, and the Carolina Leadership Academy.

MISSION STATEMENT

The mission of Student-Athletes Services at the University of North Carolina at Chapel Hill is to provide services and develop relationships which foster a climate that supports University of North Carolina student-athletes advancing toward graduation, building character, and developing leadership.

ACADEMICS

The Department of Athletics maintains an Academic Support Program to offer student-athletes the greatest opportunity to excel in academics while at the same time competing in intercollegiate sports.

MISSION STATEMENT

The mission of the Academic Support Program for Student-Athletes at the University of North Carolina at Chapel Hill is to provide programs and services in partnership with the University community to assist and encourage student-athletes in achieving academic success. These programs and services are designed to advance responsibility and enhance leadership potential, while inspiring educational excellence and an appreciation of the academic experience.

ROLE OF THE ACADEMIC COUNSELOR

Each intercollegiate athletic team is permitted to use the support programs conducted in the Academics Center through the guidance of their assigned academic counselor. Academic counselors are available to help student-athletes reach their academic potential and career aspirations. They can assist student-athletes in developing time management skills, successful study skills, an individualized study plan, and other strategies to enhance personal growth.

Academic counselors monitor the degree progress of each student-athlete, as well as monitor their eligibility status according to NCAA and UNC eligibility regulations. In addition, academic counselors in the Academics Center work jointly with the campus advising staff to coordinate the advising and registration processes. Academic counselors also refer student-athletes to appropriate on-campus resources.

RESPONSIBILITIES OF STUDENT-ATHLETES

Students who represent the University of North Carolina in intercollegiate athletic competition are regular, full-time students of the University and, as such, have the same academic responsibilities as students who are not athletes. In addition, student-athletes must devote sizable amounts of time and energy to participating in their sports. Although the Academic Support Program offers a wide range of excellent academic services to student-athletes, the ultimate responsibility for learning and for following a program that leads to a degree lies, of course, with the students themselves.

Student-athletes at the University of North Carolina are expected to meet the following responsibilities:

1. To develop and maintain habits of learning commensurate with education at the university level and to pursue a program of study leading to a degree.
2. To know the provisions of the Code of Student Conduct and to abide by them.
3. To seek academic advice in the Office of Academic Advising and department of the major, or in the appropriate professional school at the regularly prescribed times, and to pre-register every semester during the official pre-registration period. Advising offered by the Academic Support Program complements the regular University advising system. **Student-athletes are not free to bypass ordinary advising procedures.**
4. To attend all class meetings, labs, required discussion sessions, and required conferences with teachers for all courses. The only acceptable reasons for missing course obligations or appointments with teachers are serious illness, family emergency, or official travel to university-sponsored activities. The Academic Support Program provides each student-athlete with a travel letter to present to each of their professors along with their competition/travel schedule. By University policy, students are not to be penalized for absences from class and other academic obligations during those specified times when they are involved in University-sponsored activities. On the other hand, coaches have been advised that in the event of a conflict between practice and a scheduled class or laboratory, make-up session, field trip, or student-teacher conference, students shall be permitted to miss practice without penalty. It is an NCAA violation to miss class for practice.

a) Students should be familiar with the University policy regarding class attendance as printed in the latest edition of The Undergraduate Bulletin, which says, in part "Absences from class for valid reasons are excused only by the instructors. A student should present his or her explanation for any absences to the instructor at the next meeting of class."

b) Students should find out the instructor's attendance and makeup policies for all courses in which they are enrolled.

c) Students are responsible for all material covered in class when they are absent, as well as for all assignments due or assigned on a day when class is missed. Students must take the initiative to talk to their professors about making up work missed because of an absence as a result of athletics travel and competition (e.g., UNC, National Team, etc.).

d) For travel and competition that occurs during the final exam period, students are responsible for notifying their professors of the conflict and obtaining an exam excuse approved by an academic dean. Students should communicate all final exam conflicts to their academic counselor.

5. To fulfill all requirements of all courses being taken, including turning in all papers and assignments on time and taking all quizzes, tests, and final examinations on the scheduled dates.

6. To seek out the advice or help of the instructor about difficulties in a course, preferably during the instructor's regular office hours. If that time is not possible, arrange an appointment with the instructor at another time.

7. To keep their assigned academic counselor in the Academic Support Program and their coach informed of academic progress during the semester.

a) Students should notify their academic counselors of athletic commitments which might interfere with fulfilling their academic responsibilities every semester.

b) Students should speak with their academic counselors right away if they are having difficulty in a course.

c) Students for whom structured study or individual tutoring is deemed appropriate by their academic counselors must abide by the procedures of the Academic Support Program in availing themselves of those services.

d) Students should keep in mind that tutoring is never a substitute for class attendance.

8. To cooperate with and abide by their team's academic policies. For example, some teams require team members with averages below a certain grade point to turn in weekly academic logs.

9. To know and abide by the policies and procedures of the Academic Support Program.

PLAGIARISM AND THE HONOR CODE SYSTEM

All student-athletes should remember that they are to follow the University Honor Code at all times. The definition of the Honor Code is referenced in the Code of Conduct section of this Handbook.

Occasionally, scholastic dishonesty occurs as the result of a lack of information or misinformation. Everyone knows cheating on an exam is dishonest; however, students have, on occasion, turned in papers which they thought were acceptable only to find they were accused of plagiarism.

One area of essay or term paper writing that often causes students confusion is acknowledging sources. **If you use another person's ideas or expressions in your writing without acknowledging the source, you are guilty of plagiarism.** Although most students understand that you are plagiarizing if you use someone else's work more or less verbatim, they do not realize that not giving proper credit for ideas, research conclusions, etc., is also considered plagiarism.

A good rule of thumb is to quote the unique or witty and paraphrase the rest; but, remember, if you are paraphrasing someone else's work, you must acknowledge your source either by direct quotations or by footnotes.

It is often difficult to separate your thoughts from someone else's after reading an article. In general, do not write your thoughts while you are reading someone else's research material.

Many students have the most difficulty when they are asked to prepare a commentary or critique on a particular book. If you consult a critical essay or book review to stimulate your thinking, it is very likely that you will need to acknowledge/cite this material within your paper.

A simple principle helpful when trying to determine if you should acknowledge a source: If you knew it or it was your opinion **before** you did any reading on the subject, it need not be acknowledged/cited.

Remember, whenever specific facts, opinions, judgments, or explanations are obtained from your readings, they must be acknowledged/cited, even if you present the facts entirely in your own words.

PHILOSOPHY OF COACHES REGARDING THE ACADEMIC PERFORMANCE OF STUDENT-ATHLETES

Student-athletes look to their coaches for guidance in their lives. As such, the coach is usually in the best position to stress the importance of academic achievement in preparation for successful careers beyond the undergraduate level. Coaches best serve the interests of the student-athletes when they emphasize the importance of academic achievement. Coaches promote academic achievement by:

1. Understanding the academic expectations that the faculty hold for student-athletes.
2. Creating an atmosphere in which team members strive for stated academic goals.
3. Making class, laboratory, and required study session attendance mandatory.
4. Scheduling practice sessions that minimize conflict with courses and excusing students from practice when these conflicts occur. Again, it is an NCAA violation to miss class for practice.
5. Regulating the amount of practice, competition, and travel time such that each week the students are able to devote a minimum of 2 hours, for each credit hour taken, to academic pursuits; this time is exclusive of time spent in the classroom.
6. Advising students to take advantage of the off season to enhance significantly their academic standing within the University. While conditioning and athletic skill enhancement may occur during this time, the student should have every opportunity to lead a normal student life.
7. Arranging travel time to minimize missed classes, labs, and required study sessions.
8. Structuring study times during extended travel periods.
9. Requiring that each team member contact the Academic Support Program (ASP) staff to discuss academic progress at the time interval determined by the ASP staff. Decisions made by the ASP staff regarding the amount of time each team member should be spending in structured study should be strictly adhered to. Students who are not making satisfactory academic progress, in the view of the ASP staff and/or the coach, should be instructed to substitute supervised structured study time for time normally devoted to athletic activities.
10. Providing special recognition for students who meet or exceed the stated academic goals and for those students who demonstrate improvement over last semester's academic performance.

CLASS REGISTRATION DURING TRAVEL AND COMPETITION

When student-athletes are traveling for athletics competition or competing at home on their specified registration date, a system is in place by which student-athletes may be registered by the Academic Support Program for Student-Athletes staff provided he or she is on the travel roster. All students are expected to see their academic advisors in Steele Building to discuss course selection, receive their PIN #, and remove academic registration holds as soon as the advisement period begins. Appointments to see advisors can be made online. Students must then complete the Pre-registration Form in the Academics Center and return it to their academic counselor no later than 5 pm on the Wednesday before their registration date. This form should include the PIN # and a preferred list of courses totaling at least 12 hours including section number, day and time, and a list of several alternate courses. Student-athletes who have financial holds on their account may not be registered until those holds are removed; thus it is important to review your student account prior to submitting pre-registration materials to the Academics Center. Upon return from competition, it is the responsibility of the student-athlete to review his or her academic record online or meet with their academic counselor to ensure that their class schedule for the upcoming semester is correct.

CHANGING YOUR SCHEDULE

Changes in schedules should be made no later than the first five days of class. If after this time you want to add a course to your schedule, you need to see your University academic advisor.

After the second week of class and before the end of the sixth week of class, you may drop a course with Dean's approval. **Please be sure to consult with your academic counselor BEFORE you make any change to your schedule, as it may affect your eligibility to compete.**

In some cases, the professor may drop you from a course if you do not attend the first and/or second day of class. Though you will be removed from the class roll, you still MUST follow the appropriate steps required for dropping a course. Failure to do so may result in an "F" as a final grade.

Be careful when dropping a course that you do not fall below the NCAA minimum requirements for full-time enrollment of 12 hours per semester or violate the Satisfactory Progress rule. Both requirements are necessary for you to maintain your athletic eligibility. **Keep in mind that Physical Education Activity courses cannot be counted when calculating academic hours of enrollment. At the point when a student drops below 12 hours, he or she becomes ineligible for practice and competition.**

ACADEMIC TEXTBOOK PURCHASING POLICY

- Student-Athletes designated to receive books as part of their scholarship must follow the proper protocol when purchasing academic textbooks.
- Student-Athletes must obtain a textbook purchasing form from the Academics Support Center, complete this form, and obtain signatures from the appropriate Academics Support personnel.
- Only textbooks and course materials that are stated explicitly on the course syllabus as required may be purchased through the book scholarship program.
- Only textbooks and materials that are required by a course for which the student-athlete is officially registered for may be purchased through the book scholarship program.
- Student-Athletes designated to receive books as part of their scholarship are allotted a maximum of $600 per semester to buy books. Exceptions may be approved on a case-by-case basis at the discretion of the appropriate Academics Support personnel.
- Student-athletes are ultimately responsible for the purchase and safeguarding of their books. If books or materials are lost or stolen, it is the student-athlete's responsibility to report the loss to the police. A police report is necessary in order to purchase replacement books and course materials through the book scholarship program.
- Student-athletes have up to one month after the first day of classes to purchase required textbooks and/or course materials and submit a receipt for reimbursement of textbook and course material purchase. Exceptions may be approved on a case-by-case basis at the discretion of the appropriate Academics Support personnel.
- If a student-athlete drops a course, all textbooks and materials must be returned immediately to the appropriate Academics Support personnel.

CHANGING YOUR MAJOR

You are required to officially declare a major before your fifth semester. After the beginning of your junior year, you may not switch from one major to another without the approval of your University academic advisor. Your course of study during your junior and senior years must include the minimum departmental requirements for your major in addition to any other courses selected by you and your University academic advisor. All courses must be applicable towards NCAA degree progress requirements (see NCAA Academic Requirements section).

Before changing your major, notify your academic counselor.

SUMMER SCHOOL

Every effort should be made to maintain satisfactory progress toward a degree. If, despite your best efforts, it becomes necessary for you to attend summer school, please consult with your head coach. **Because of budgetary restraints, it is not always possible to cover summer school expenses for every student-athlete who wishes to attend summer school.** However, it is a departmental goal to have all student-athletes graduate, so as much help as possible is given.

If you need more information on the summer school program, online courses, correspondence courses, or independent study courses at the University, please contact your academic counselor.

If you wish to attend summer school at a university other than the University of North Carolina, you must first obtain written permission from the Office of Undergraduate Admissions to ensure that the hours will transfer.

The Department of Athletics does not pay for courses taken at other universities. Summer school at other universities cannot improve your GPA, as only the credit hours if approved by the Office of Undergraduate Admissions transfer. You must make a "C" or better in order for the hours to transfer.

ONLINE COURSES

Carolina Courses online is becoming increasingly popular. Each course follows the University calendar for the term in which it is offered and is therefore counted within the total hours of enrollment (12 credit hours or more). Students may register for only one online course per semester. There may be athletic scholarship/grant-in-aid implications when registering for an online course**. Students who wish to take an online course must meet with their academic counselor for approval before officially enrolling in the course.** In most cases, the athletic scholarship **WILL NOT** cover the cost of tuition expenses for online courses.

UNC-CH ACADEMIC ELIGIBILITY REQUIREMENTS

To be eligible to remain in the University, a student must meet the following minimum requirements:

To begin the third semester in residence:
1.50 grade point average and 24 academic semester hours (cumulative)
To begin a fifth semester in residence:
1.75 grade point average and 51 academic semester hours (cumulative)
To begin a seventh semester in residence:
1.90 grade point average and 78 academic semester hours (cumulative)
To begin a ninth semester in residence:
2.00 grade point average and 105 academic semester hours (cumulative)

Students are expected to complete their degrees in 9 semesters. If additional time is needed, students must submit an application for a 10th semester to the Dean's office for approval prior to their 9th semester. A plan to seek a 10th semester should be discussed with your academic counselor one year in advance to begin the necessary process with your college or school. Students **do not always** receive University permission for a 10th semester in residence. Each academic counselor will verify with their coaches in July which of their athletes will be in need of a 10th semester. The list of students the counselor receives from the coaches will be given to the Director of the Academic Support Program, who will forward it to the Associate Dean of the Office of Academics Advising.

Required physical education courses (PHYA) do not count as academic semester hours. Students who do not earn at least a 1.00 grade point average and pass 9 academic hours in any semester must appeal to be readmitted by the appeals committee of the schools or colleges in which the students are enrolled.

NCAA ACADEMIC REQUIREMENTS

Those students first entering a collegiate institution full-time prior to August 1, 2003:

To be eligible for athletic competition, students must (1) pass 24 academic hours within the span of one calendar year (fall, spring, and summer semesters), **or** (2) pass an average of 12 academic hours per semester for every semester that a student has been in attendance since initial enrollment at the University. In addition, **75% of these hours** (18 hours) must be earned during the fall and spring semesters. The remaining 25% of these hours (6 hours) may be earned in the summer. Further, a student must earn at least 6 hours during each regular academic term to be eligible to compete the following term.

To be eligible for athletic competition, students must meet the following minimum satisfactory progress requirements:

Entering the fifth semester:

1. The student must have declared a major.
2. The student must have completed 30 hours toward his/her degree program (25% of the required 120 hours for graduation).
3. The student must have a 1.80 cumulative GPA (90% of the 2.0 that is required for graduation).

Entering the seventh semester:

1. The student must have completed 50% of his/her degree program (60 hours).
2. The student must have a 1.90 cumulative GPA.

Entering the ninth semester:

1. The student must have completed 75% of his/her degree program (90 hours).
2. The student must have a 1.90 cumulative GPA.

Those students first entering a collegiate institution full-time on or after August 1, 2003:

To be eligible for athletic competition, students must meet the following minimum satisfactory progress requirements:

Entering EACH semester:

1. The student must have completed a minimum of 6 semester hours of academic credit in the previous full-time regular academic term.
2. The student's GPA must be certified on a term-by-term basis, which means that the GPA listed below must be maintained throughout the year.

Entering the second year (third semester):
1. The student must have completed a minimum of 24 hours of academic credit.
2. At least 18 of these hours must have been earned during the regular academic year (fall and spring semesters). Remaining 6 hours could be earned during the summer.
3. The student must have a 1.8 cumulative GPA (90% of the 2.0 that is required for graduation).

Entering the third year (fifth semester):
1. The student must have declared a major.
2. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
3. The student must have completed 48 hours toward his/her degree program (40%) of the required 120 hours for graduation).
4. The student must have a 1.9 cumulative GPA (95% of the required 2.0).

Entering the fourth year (seventh semester):
1. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
2. The student must have completed 72 hours toward his/her degree program (60% of the required 120 hours for graduation).
3. The student must have a 2.0 cumulative GPA (100% of the required 2.0).

Entering the fifth year (ninth semester):
1. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
2. The student must have completed 96 hours toward his/her degree program (80% of the required 120 hours for graduation).
3. The student must have a 2.0 cumulative GPA (100% of the required 2.0).

FOR ALL STUDENTS

- Hours earned from repeated courses will not count toward eligibility.
- PHYA activity hours do not count toward eligibility.
- Taking level one of your high school foreign language will never count toward graduation. It will only count toward NCAA satisfactory progress if it is taken in your freshmen year of enrollment.
- If you miss a complete term or are unable to complete a term, you must review your eligibility status with your athletics academic counselor and the Director of Eligibility.

FULL-TIME ENROLLMENT
All student-athletes must be enrolled as a full-time student in a minimum of 12 academic hours, not including Physical Education activity courses, in order to be eligible to practice and compete. At the start of each semester, students will have 5 class days to register themselves in a minimum of 12 hours. During these 5 days, student-athletes are permitted to practice but NOT compete. Only seniors in their last semester may apply and take less than 12 hours, or for an underload. These graduating seniors must seek written approval from their college dean for this underload and provide copies of their approval to the Registrar's Office and the academic counselor.

UNC GRADUATION REQUIREMENTS
To qualify for an undergraduate degree, a student must successfully complete at least 120 semester hours, although some programs' requirements are higher than this minimum. In addition to these semester hours, you are required to complete 2 physical education activity courses. Athletes receive credit for 1 physical education course through participation on an intercollegiate team. Please check with your coach to ensure that he or she has submitted your name to the Department of Exercise and Sport Science for this credit to be applied toward your academic record. Also, the student must have a 2.0 cumulative grade point average in all work attempted at the University of North Carolina.

The required 2.0 average must be earned in a total number of hours not to exceed 45 hours beyond the minimum graduation requirements (120 hours) for the degree being sought. A minimum of 45 hours of academic credit must be taken at UNC-CH. 24 of the last 30 hours must be taken on the UNC-CH campus. In the College of Arts and Sciences, at least 18 semester hours of work with grades of "C" or higher are required in the student's major, and at least half the student's major must be completed at this University.

Students who are going to graduate must:
1.File an application for a degree at least one semester before the expected date of graduation with the dean of your college.

2.See their University academic advisor to complete an official degree audit form at least one semester before the expected date of graduation. Students should verify their graduation status with their advisor.
3.Pay all tuition, fees, and other obligations owed to the University before receiving a diploma.

SWIM TEST REQUIREMENT
Every student at UNC-CH must successfully complete the UNC swim test before graduating. Only varsity swimming and diving student-athletes are exempt from this requirement. It is possible to be exempt from the test if the student has current lifeguard certification. Current certification must be presented to the Director of the Activities Program. The UNC Swim Test consists of jumping feet first into the deep end of the pool and swimming at least two pool lengths (any stroke) and then remaining in the pool swimming or treading water without touching the bottom or sides of the pool for a total of five minutes.

The swim test is offered three times during the Fall semester and twice during the Spring semester. Students report to the Bowman Grey Pool next to Woollen Gym on the day of the test and bring their UNC One Card along with a bathing suit.

Counselors send swim test notices to the coaches each semester encouraging student-athletes to take the exam before their senior year. The 2005-06 swim test is offered on the following days:

Fall Semester:	August 29, 2005	9 am-6 pm
	September 2, 2005	9 am-2 pm
	November 18, 2005	9 am-4 pm
Spring Semester:	March 3, 2006	9 am-4 pm
	April 7, 2006	9 am-4 pm

GRADING SYSTEM
A letter grade and plus-minus system for evaluating academic performance is employed for all undergraduates. Each letter grade receives a numeric value (quality points) for the purpose of determining a student's grade point average for a semester's work and for averaging grades for all semesters' work to find a student's cumulative grade point average.

The letter grades, and the quality points represented by each, are as follows:

A = 4.0	B+ = 3.3	C+ = 2.3	D+ = 1.3	IN = 0.0
A- = 3.7	B = 3.0	C = 2.0	D = 1.0	AB = 0.0
B- = 2.7	C- = 1.7	F = 0.0	FA = 0.0	

TEMPORARY GRADES:
Temporary grades of **IN** or **AB** carry the force of an F until replaced by a permanent grade. Courses assigned a grade (or notation) of **PS, NG, NR, or W** are not considered in establishing a grade point average.

PASS/D/FAIL CLASSES:
A student may register for a maximum of four credit hours per semester under the "Pass/D/Fail" grading system. A total of 11 Pass/D/Fail credit hours may be applied to graduation requirements. Course content and requirements are the same for Pass/D/Fail registrants as for regular students. The minimum performance for a **PS** grade is equivalent to the minimum performance of the letter "**C-**". **A student can only sign up for a Pass/D/Fail grade in a class they wish to use for an elective.**

To take a course Pass/D/Fail, a student must complete the Pass/D/Fail course registration form. It is obtained from their academic advisor or dean's office. The period for making Pass/D/Fail declarations begins on the 5th day of classes each semester and concludes at the end of the sixth week of classes. Once a form is submitted, the declaration cannot be changed.

DEAN'S LIST
To be eligible for the Dean's List, you must have:
1. A 3.2 grade-point average with no grade lower than C and be enrolled in15 or more hours of letter grade credit (exclusive of physical education activities courses); or
2. A 3.5 grade-point average and no grade lower than a C and be enrolled in at least 12 hours but fewer than 15 hours of letter grade credit (exclusive of physical education activities courses).

ATLANTIC COAST CONFERENCE HONOR ROLL
To receive recognition on the ACC Honor Roll, students must earn a 3.0 GPA or better for the academic year, which is a combined average from the fall and spring semesters.

SCHOLARSHIPS, AWARDS, AND INTERNSHIPS
Numerous postgraduate scholarships, academic, and leadership awards, along with internship opportunities, are available to all UNC student-athletes through a competitive application process coordinated through the Academic Center. For information about these opportunities, see your athletics academic counselor. A complete description of all scholarships, awards, internships, and their deadlines are available upon request.

CLASS ATTENDANCE
Go to class! It cannot be emphasized enough that there is a direct correlation between classroom attendance and academic success. Be sure to attend your classes each time your classes meet.

Be aware that certain classes, for example English 10, 11 and 12, have very strict attendance rules. If you exceed the specified number of absences, you automatically fail the course, even if your grades were excellent. There is no such thing as an "excused absence." Whether you are hospitalized or on a team trip, it is still counted as an absence. Your class attendance and academic progress is monitored by your academic counselor and reported to your coach. You should inform your professor if illness requires you to miss a class. If a conflict is caused by away games, your professors are usually more than willing to assist you in resolving this conflict when advance notice is given. You will be given a letter from the Director of the Academic Support Program to give to each of your instructors at the beginning of each semester. Your travel schedule will be attached to this letter. The letter will state that you will make up any missed assignments due to team travel and that you will remind your instructor of all approaching travel dates. **Be sure each of your instructors receives this letter!**

MISSING FINAL EXAMS DUE TO TRAVEL AND COMPETITION
The possibility of missing a final exam due to post season competition opportunities may arise. Should this occur, student-athletes must immediately notify their professor and their athletics academic counselor and obtain an exam excuse from a Dean in the Steele Building. Confirmation of the departure and competition dates will be provided to the Dean by the Academic Support Staff.

TUTORING PROGRAM
The Academic Support Program provides quality tutorial instruction to student-athletes. The program employs graduate students who tutor major subjects offered by the University. Students meet regularly with tutors during evening and daytime hours for individual instruction. Assisting students with comprehension of subject matter, test-taking strategies, and study techniques, the tutors continue to form a strong foundation for the success of the Academic Support Program. Additional tutorial assistance can also be obtained through other on-campus services such as the Learning Center, the Writing Center, and the Math Help Center.

SUPPLEMENTAL INSTRUCTION
Supplemental Instruction (SI) is a learning enhancement program and is designed to organize and improve the ways in which students prepare for class outside of the classroom. SI is attached to courses to provide students with a systematic and disciplined approach for processing the course material assigned by the professor. SI leaders are assigned to each of the "perspective" courses selected. Student-athletes will be identified to join a SI group at the beginning of each semester. The meetings will take place during their regular student hall hours. The SI supervisor will attend class and lead the SI sessions.

COMPUTER LAB
The Academics Center houses its own computer lab for student-athletes. The lab holds PC-compatible computers plus 2 laser printers. The computers are equipped with standard applications, such as Microsoft Word, Excel, Power Point, and Publisher. All computers also have internet access as well as access to the University email system. The lab is staffed with a lab manager and lab monitors to help students with computer questions and issues.

STRUCTURED STUDY
The Academic Support staff views structured study the same way your coach views practice. Those student-athletes assigned structured study hours are expected to attend regularly, come on time, and be prepared to study. During structured study periods, you must study in designated areas.

In general, all freshmen on an athletic scholarship, any student-athlete who has less than a 2.0 GPA, and those student-athletes recommended by an academic counselor or a head coach are required to attend structured study. All student-athletes are welcome to use the academic facilities Monday through Friday and Sundays. However, because of the limited amount of space in the evening structured study program, those wishing to attend should talk to their academic counselor. Please contact the Academics Center staff for hours of operation as they may vary throughout the semester.

The following are the only acceptable reasons for missing structured study:

1. You are hospitalized;
2. You are attending a review session held by your professor;
3. You have a scheduled game; or
4. You are on a team trip.

A question frequently asked is, "Can the time I spend in the library be substituted for my structured study hours?" The answer is **NO**. If you are required to attend structured study, you must spend the full time required in the supervised study areas of the Academic Center.

STRUCTURED STUDY RULES

The Academic Center's study programs are designed to maintain a comfortable and conducive academic environment. The following rules apply to all student-athletes using the facility:

1. Arrive promptly.
2. Come prepared to study. That means have the required books, papers, notebooks, etc.
3. Do not disturb other student-athletes who are trying to study.
4. Food or drinks are not allowed.
5. Radios, personal stereos, cell phones, magazines, etc. are not allowed
6. Proper attire must be worn in structured study.
7. Smoking and chewing tobacco are not allowed in the Academic Center.
8. Falsifying forms used by the Academic Support Program is an Honor Code violation.
9. Disrespect of the staff and/or tutors will result in immediate disciplinary action.
10. NCAA rules require that staff phones be off-limits. Copiers are available ONLY By approval of a support Staff member
11. Inappropriate language will not be tolerated.
12. No viewing of inappropriate web-sites is permitted in the computer lab.

STRATEGIES FOR ACADEMIC SUCCESS

For students of all academic achievement levels, there are general rules that will help you perform to your academic potential. They are as follows:

1. **Attend class.** Tests are most often based on the material covered in class. If you are going to be away from campus for a game, alert your instructors ahead of time. Get your assignments in advance, if possible, and determine when the work is due. Let your instructor know when you are ill. Your class attendance may be one criteria used by your professor when assigning final grades.

2. **Go to class prepared.** You should have all reading and written assignments completed on time. If you go to class unprepared, it is often difficult to understand the material presented in class. Also, your instructor may tag you as a student with a poor attitude, which may influence your grade.
3. **Know your instructor.** Introduce yourself to your instructor; if you have any questions relative to the course throughout the semester, meet with your instructor. Your professor is interested in your performance in the classroom and will generally be happy to discuss material related to the course with you.
4. **Make a good impression.** Go to class on time. Entering class late causes a disruption. Do not read newspapers, listen to radios, etc. in class. It is recommended that you sit near the front of the classroom and not within a large group of student-athletes.
5. **Don't let little problems become big problems.** If you feel yourself falling behind in class, contact your academic counselor for help. Also, remember your instructors are there to teach. Don't be afraid to make an appointment and ask a question about material you don't understand. Make sure someone knows you need help before you reach the point where you cannot possibly do well in the course.
6. **Use tutoring help wisely.** Tutors are available in select subjects. They are there to help you understand your assignments, not to do your work for you. If you don't have the notes or haven't read the assignments, tutors will not be able to work with you. If you require a tutor in a special subject that is not normally provided, inform your academic counselor as soon as possible.

Subject: Correspondence Course Concerns

Correspondence Courses Spell Concern

Correspondence Courses Spell Concern

Knightcommission.org

A number of schools are currently under NCAA investigation for allowing student-athletes to use an inordinate amount of correspondence courses (courses by Internet or mail) in their course loads.

According to a special report in <http://www.sltrib.com/ci_3813488> the Salt Lake Tribune, Brigham Young University's independent study program has been employed by coaches and athletes-including football recruits from the University of Kansas, and more than two dozen football and basketball players from Nicholls State University in Louisiana -to improperly gain or maintain athletic eligibility at other schools. The case that tipped off the investigation focused on Ricky Clemons, a basketball player from the University of Missouri.

Wayne Baker, the executive director of the National Junior College Athletic Association, told the Tribune: "For the last two or three years, we have seen a number of transcripts with one hour or two hours or three hours from BYU correspondence courses."

BYU's enormous correspondence program has 28,358 students enrolled in so-called "distance learning" courses in 2005, one of the largest in America.

"There is clearly a rapidly moving coaches' grapevine," said David Price, the NCAA's vice president for enforcement services.

According to the Tribune, it is not clear how widespread the problem is. Price would not reveal to the Tribune how many investigations his office is actively pursuing involving online courses, but admitted there were "a lot more than I thought there would be. The state of technology has made it much more common."

NCAA Bans Transcripts From 15 Prep Schools in Crackdown on Grade Fraud

Stepping up its effort to crack down on preparatory schools that provide fraudulent grades and diplomas to athletes, the National Collegiate Athletic Association has released a preliminary list of 15 nontraditional high schools from which it will no longer accept transcripts.

In April, the NCAA's Division I Board of Directors authorized the association to investigate suspected diploma mills after The New York Times reported that a number of prep schools across the country were giving fraudulent grades to athletes so that they could meet NCAA standards for college competition and scholarships.
One school included on the list is University High School, a now-defunct correspondence school in Miami that reportedly had neither teachers nor classes, but offered diplomas for $399 that enabled 14 athletes to play on Division I college football teams. The school closed in December, and its transcripts will no longer be accepted by NCAA's eligibility clearinghouse.
Also listed as "inactive" are Celestial Prep, in Philadelphia, and Philadelphia Christian School, two schools attended by Omar Williams, a recent graduate of George Washington University who was a key player on its basketball team.
Schools on the preliminary list were identified "based on irregularities in the information reported to the NCAA Initial-Eligibility Clearinghouse," the association said in a written statement. It added that the list is likely to grow before July 1, when the association will complete its list of ineligible schools for the 2006-7 academic year.
Some prep schools that have been under scrutiny for academic fraud were not included on the list. Most notably, Lutheran Christian Academy, in Philadelphia, which, according to a New York Times report in February, did not require students to attend classes and had only one instructor -- the basketball coach -- was not named. The NCAA will be conducting further reviews, including site visits, the statement said, and schools that have been notified of their "inactive" status will have an opportunity to respond.
The schools on the initial list are identified as follows by the NCAA:
American Academy (Miami)
Celestial Prep (Philadelphia)
Einstein Charter School (Morrisville, Pa.)
Goliath Academy (Miami Lakes, Fla.)
Hawaii Electronic School
Martinez Adult Education (Martinez, Calif.)
North Atlantic Regional High (Lewiston, Maine)
Paradise Christian Academy (Paradise, Calif.)
Philadelphia Christian Academy (Philadelphia) Ranch Academy (Canton, Tex.)
Rich Township HS Phoenix Camp (Park Forest, Ill.)
Sagemount School (Miami)
Tazewell City Career and Tech Center (Tazewell, Va.)
University High School (Miami)
Virginia Beach Central Academy (Virginia Beach, Va.)

Tuberville unfazed by academic investigation at AuburnBy Mark Schlabach
ESPN.com
Archive

HOOVER, Ala. -- Auburn coach Tommy Tuberville has survived a coup from within his own administration and coached six seasons in the state where college football seems to matter most.

Nelson Chenault/US Presswire
Tommy Tuberville and Auburn open preseason practice on Tuesday.So perhaps it should come as no surprise that about a month before a season in which the Tigers are a popular choice to win the SEC, Tuberville seems unfazed by his school's investigation into alleged academic irregularities involving his players.

Earlier this month, The New York Times reported that Auburn sociology professor Thomas Petee gave 18 football players from the 2004 team that finished 13-0 and ranked No. 2 in the country high grades in classes that required no attendance or little work. Petee offered the directed-study courses to more than 250 students during the 2004-05 academic year, The Times reported, and a large percentage of them were nonathletes.

James Gundlach, another Auburn professor, alleged that the players received higher grades in Petee's classes -- the 18 players took a combined 97 hours of Petee's courses during their careers, according to The Times -- than they were awarded in other courses. A committee appointed by Provost John Heilman is investigating the matter, and the school's board of trustees is expected to approve academic reform measures at an Aug. 4 meeting.

"It's an academic issue," Tuberville said Friday, during SEC Media Days. "Our president obviously gave me strict orders -- let's complete the investigation before we make any rash judgments. If we're doing something wrong, please look at it and tell us. We're going to do things right. I promise you, we'll change it. I don't foresee anything happening."

Neither does SEC commissioner Michael Slive, who this week defended Auburn by saying that directed-study courses also are offered at Ivy League schools. Historically, the NCAA hasn't delved into academic matters involving individual institutions unless the schools self-report violations.

When former Tennessee professor Linda Bensel-Myers alleged that football players there were being given preferential treatment, school officials investigated the allegations that English tutors wrote and co-wrote papers for athletes. The Tennessee investigation found no evidence of wrongdoing, so the NCAA never took action.

"I really can't say anything about it until we get done," Tuberville said. "Hopefully, it's before the season. I'm pretty sure it will be. Our people have been working very hard trying to catch people -- students that are not on campus, that are home for the summer. We'll just have to see what happens from there."

Tuberville said 98 Auburn football players have graduated during the last three years and 15 received degrees from the sociology department, where Petee was the highest-ranking faculty member.

Former Auburn stars Carnell "Cadillac" Williams, now a starting tailback for the NFL's Tampa Bay Buccaneers, and cornerback Carlos Rogers, who plays for the Washington Redskins, took Petee's classes. According to data Gundlach gave to The Times, football players in Petee's classes had an average grade-point average of 3.31.

The players had a 2.14 GPA in their other courses at Auburn, according to Gundlach's statistics. One player took seven such courses from Petee, and many of the students in his directed-study courses were transfers from junior colleges.

"Obviously, when you come from a junior college, you want to make sure you're successful early," Tuberville said. "But you want to make sure they get a degree in what they want to get one in. We want them to get a degree where they're going to have an opportunity to go back home in their environment -- if they go back home -- to have the opportunity to be successful, to be a positive part of their community. Whether it's sociology or pre-med, you know, it's up to them."

Auburn linebacker Will Herring said the issue hasn't been much of a distraction for the Tigers, who finished 9-3 last season and lost to Wisconsin 24-10 in the Capital One Bowl.

"To be honest, as a team, we really haven't gotten caught up in it," Herring said. "Yet, it kind of hurts me because we're all a family. I've seen some guys' names being dragged into it. It does hurt. But when you're on top and the better you are, the farther people want to see you fall."

Auburn, which opens preseason practice Tuesday and plays its first game at home against Washington State on Sept. 2, was an overwhelming choice by the media to win the SEC championship. The Tigers received 73 of 104 votes.

Auburn returns 13 starters, including quarterback Brandon Cox, tailback Kenny Irons and Herring. But both offensive tackles, two starting receivers, three defensive linemen and two linebackers must be replaced.

The Tigers play four of their toughest opponents -- LSU, Arkansas, Florida and Georgia -- at home and play only four of their 12 games on the road. "I appreciate the target you put on my back," Tuberville told reporters. "Last time you did that, it almost got me fired."

Before the 2003 season, the Tigers were an overwhelming choice to win the SEC and at least one national sports magazine ranked them No. 1 in the country. But Auburn lost its first two games, against Southern California and Georgia Tech, and finished 7-5.

Two nights before the last regular-season game that season, against Alabama, Auburn's former president, athletics director and two trustees secretly met with Louisville coach Bobby Petrino at a Kentucky airport.

They wanted to hire Petrino to replace the disgraced Tuberville. But when the clandestine meeting became public, Auburn fans rallied around their coach, and the president and athletics director later stepped down. The next season, Auburn went undefeated and beat ACC champion Virginia Tech in the Sugar Bowl.

The Tigers were left out of the national championship game because USC and Oklahoma, which were ranked higher during the preseason, finished undefeated, too. So Tuberville knows things could be worse on The Plains.

"Have I checked the airport?" Tuberville joked. "No, I haven't checked the airport."

Subject: faculty resolutions
Attach: Text.htm

At the coaches meeting today I reminded the coaches about the new eligibility resolutions passed in the spring. As a reminder, the resolutions have passed, the procedures of these resolutions are still being discussed. I told the coaches that these resolutions will be discussed in more detail in an upcoming (but yet to be determined) coaches meeting. So -expect some questions from your coaches regarding these resolutions. The resolutions can be read on the Faculty Council web page.
I also asked the coaches not to send walk-on athletes to us for advising (schedule changes) until they are officially on the roster. These students should see their academic advisors in Arts & Sciences.

Larry & John - I am forwarding this to both of you because I know at different times this semester both of you have been involved in our computer issues. From Brent's email the frustration from our students' and staff is clear. The tangible issues of the electronics not working combined with the personality conflicts of the tech support staff has created a "perfect storm" scenario. So...looking only at the wireless issue...do either of you know who is Kent and Christy's supervisor so we can chase down this problem? Is it Ken Yow?

Subject: Wireless Issue Continues
Attach: Text.htm

We had more trouble last night, so after speaking with Doug, I believe something needs to be communicated to Kent, Mr. Gallo and ITS. I tempered the frustration, but left some in b/c they need to know what results come from their seemingly arbitrary decisions. If it is our ignorance, then that is addressed too... B

Kent/Christy,
I want a clear explanation for why we are experiencing so many problems with our wireless settings and why the students suddenly have to reconfigure their machines. My understanding is that Tarheel-1 is a connection for visitors, not a group that we have in the facility on many occasions. For visiting media (a group I heard may be involved in this situation), it is a rarity in the scheme of 365 days/year. Our students are our priority, and I want to repeat that in case you missed it - our students are our priority, and they should not experience any of these problems or have to reconfigure if it is all based on something for visitors. We as a staff do not have the time to constantly help students reconfigure their machines if that is the solution proposed. In an email trail that I read yesterday, it seemed that there was a response that solved the problem. Actually, I thought it was already solved because our students experienced no problems for the better portion of a week until last night when Tarheel-1 re-entered the picture.

Clearly, there is ignorance somewhere. If it is on this side of things, then clear us up and solve this problem, because we are in an incredibly busy time for our students, and these problems tie them up much longer than necessary. Printing from personal laptops and accessing UNC's Blackboard, which is critical for students, have become problems or impossible because of this situation. Since our lab is not large, we cannot accommodate all of the traffic in the lab that results. AND, since several of our lab machines cannot be used (more on that in a moment), the problem is compounded. We simply want to know the score over here. Several of us received new machines recently, and they were not set up properly. We also bought two new printers, but now four of our lab machines cannot be used because they are having drive problems in the printing process. These are problems that you guys are supposed to take care of but have not, so you can understand our frustration and cynicism in the case of the wireless problem. I understand Christy has been out this week, but business goes on and needs still must be met.

Again, please clear things up - both in our minds and for the students so they can come into our facility and receive the level of service they deserve and have received for some time before these problem arose.

Thank you,
Brent

November 4, 2006Athletes Get New College Pitch: Check Out Our Tutoring Center
By PETE THAMEL (http://topics.nytimes.com/top/reference/timestopics/people/t/pete_thamel/index.html?inline=nyt-per)
LOS ANGELES Chris McFoy, a wide receiver at the University of Southern California
(http://topics.nytimes.com/top/reference/timestopics/organizations/u/university_of_southern_california/index.html?inline=nyt-org), answers to about half a dozen coaches. Off the field, his coaching staff has been much larger.
Like many U.S.C. athletes, Mr. McFoy has had a lot of help during his five years as a student. During his freshman season, he met weekly with four tutors, one for each of his classes. He also met with a learning specialist who composed action plans to organize his schedule and help him plan for tests and papers. U.S.C. and most other N.C.A.A.
(http://topics.nytimes.com/top/reference/timestopics/organizations/n/national_collegiate_athletic_assn/index.html?inline=nyt-org) Division I-A universities also use student class checkers who traverse campus to make sure athletes are where they are supposed to be.
There s no way that you should do bad, said Mr. McFoy, a 23-year-old senior. You have to really not care about your grades, or your life in general, to mess up.
Bigger stadiums and better training facilities are no longer enough to attract some of the most talented football prospects. The competition to create a top athletic program now extends to efforts that help ensure that players survive in class.
LouisianaState University, a perennial championship contender, spent $15 million to build an academic center for athletes. The University of Georgia
(http://topics.nytimes.com/top/reference/timestopics/organizations/u/university_of_georgia/index.html?inline=nyt-org), another top-10 football program, built a new facility for $7 million.
At Temple University (http://topics.nytimes.com/top/reference/timestopics/organizations/t/temple_university/index.html?inline=nyt-org), long home to one of the nation s worst football programs, officials increased the academic support budget for athletes by 34 percent in the aftermath of poor academic performance that led to scholarship losses.
All of the nation s more than 100 major college athletic departments employ some type of academic support program. So do some Ivy League
(http://topics.nytimes.com/top/reference/timestopics/organizations/i/ivy_league/index.html?inline=nyt-org) colleges and other smaller institutions. The National Collegiate Athletic Association said Division I athletic departments spend at least $150 million annually on such programs.
Few in college athletics doubt the importance of helping student athletes succeed. But while college officials say these programs are necessary because athletes must devote so much time to their sports, few other students whose time is consumed by jobs or activities receive as much assistance. Another issue is oversight: The educational support centers often report to the athletic director, who has an interest in keeping athletes eligible to compete, instead of to the academic leadership.
I think that the people who work in it should be working for the provost, said Jim Delany, the commissioner of the Big Ten Conference.
Investing in Support
U.S.C. spends $1.5 million annually on tutors and other academic support for its student athletes, more than most programs. The university has 14 staff positions in its Student Athlete Academic Services Department, having added four positions in the past six years, to serve its 550 student athletes.
We re looking for every opportunity to get ahead, said Pete Carroll, the football coach.
LouisianaState s academic center for athletes opened in 2002 and has a corporate sponsor, Cox Communications. A review in Architectural Record called the ornate design by Victor Trahan III sleek, inspiring and almost monastic in character.
Georgia s $1.3 million budget for academic tutoring for its roughly 600 athletes is the same amount that the university spends on its centralized campus tutorial program for its 25,000 undergraduate students. Dell Dunn, the university s vice president for instruction, said the budget for all of Georgia s tutoring services outside athletics rose by $200,000 when programs in individual departments were included.
Georgia s center for athletes, which was built in 2002, features rows of computers, plush furniture and an electronic check-in system to make sure athletes put in their minimum study hours. The center has 17 full-time staff members and more than 60 tutors.
It s getting competitive that s one of the reasons why we have this center, said Becky Galvin, an academic counselor and tutorial coordinator at Georgia. The coaches started hearing from kids that so-and-so had a nicer academic center. We had a good academic program, but we didn t have all the bells and whistles.
New N.C.A.A. rules can reduce the number of scholarships for colleges whose student athletes do not meet minimum academic standards, a change that has fueled the building boom and budget increases for academic centers. The money usually comes from the athletic department, from ticket sales and television deals, and from the N.C.A.A.
On some campuses, tutoring programs have run into trouble recently. At the University of South Carolina
(http://topics.nytimes.com/top/reference/timestopics/organizations/u/university_of_south_carolina/index.html?inline=nyt-org), the senior associate athletic director for academic support arranged for tutors for junior college players not yet enrolled at the university.
At the University of Tennessee (http://topics.nytimes.com/top/reference/timestopics/organizations/u/university_of_tennessee/index.html?inline=nyt-org) in the late 1990s, a tenured English professor, Linda Bensel-Meyers, found that athletic tutors were doing too much of the work themselves and that the athletic department had the influence to change grades. Bensel-Meyers was ostracized for bringing her findings public, and she later left for the University of Denver.
Based on my experiences, I would have to say that athletic academic assistance centers serve more as academic evasion centers, Ms. Bensel-Meyers said.
Many universities have developed training and monitoring programs for tutors, and rules govern how much assistance they can provide. For example, tutors at Tennessee cannot type papers for athletes. Most universities make the tutors sign an integrity contract saying they will not perform work for athletes.
Teaching Independence
At Southern California, Mr. McFoy is a success story. He graduated after four years with a degree in economics and, in his fifth year on campus, is pursuing a double major in political science as he plays football as a redshirt senior.
Magdi el-Shahawy, U.S.C. s director for student athlete academic services, said Mr. McFoy s experience was ideal. He did well enough eventually to be excused from mandatory team study halls, and he no longer required tutors for all of his classes.
Our goal in this profession is to create independent, self-regulated learners and teach them what they need to survive, Mr. Shahawy said.
Mr. Shahawy s program includes about 50 tutors, all of whom are students, in addition to the 14 staff positions. He reports to both the provost and the athletic director.
Mr. McFoy said his academic career had not been without incident. Once or twice, he said, he was fined $10, which was taken from his athletic stipend, for missing an appointment with a tutor.
Even though his grade-point average was high enough that tutors became unnecessary, he sometimes continued with them anyway. I knew that they would help motivate me, Mr. McFoy said. Why not? It s free.
Mr. Carroll tries to make academics competitive, like football. U.S.C. has instituted a points system in which athletes can get in trouble with their coaches if they are not attending class or handing in assignments.
Taking Action at Temple
Colleges without the money to pay for such programs can find it harder to recruit and to compete. The struggles at Temple, a public university in Philadelphia, illustrate what can happen. Last year, the university s football program lost nine scholarships because of its athletes academic shortcomings, the most of any Division I-A program. In what Temple s athletic director, Bill Bradshaw, called crisis management, he said all five Temple academic counselors either resigned or were not rehired for their positions. That led to an overhaul that included luring a counselor from Notre Dame (http://topics.nytimes.com/top/reference/timestopics/organizations/u/university_of_notre_dame/index.html?inline=nyt-org) and the 34 percent budget increase for academic support.
How does Wendy s succeed when it doesn t have McDonald s budget? said Temple s coach, Al Golden. We have to be creative.
Formal academic support for college athletes traces back to 1964, and as with just about every major development in college sports, money was a factor.
The president of Notre Dame at the time, the Rev. Theodore M. Hesburgh, asked the fencing coach and engineering professor, Mike DeCicco, to start a program to tutor student athletes. Television money had become important in college football, and Father Hesburgh worried that universities might sacrifice academic integrity to keep players eligible so they would have strong teams to cash in on television payouts.
To keep that from happening at Notre Dame, Mr. DeCicco began tracking the progress of athletes in class through contact with their professors. If players missed classes, Mr. DeCicco would threaten them with the fencing saber hanging over his desk.
A few years later, Sports Illustrated described Mr. DeCicco s program in an article on Notre Dame s high graduation rate. Calls and visitors came from places like Arizona State, Kentucky and Michigan.
It was like someone had opened the faucet, Mr. DeCicco said.
The career of one Temple linebacker, Leyon Azubuike, a redshirt sophomore, shows the difference the right people can make. In less than a year, Mr. Azubuike has gone from a struggling

student with a 1.8 grade-point average, on the brink of becoming ineligible, to a confident student with a 2.2 average.
When Mr. Golden was hired last December, he made his entire staff build two and a half hours into their daily schedules to help the players personally, with a special focus on academics.
Mr. Golden took the pool table out of the players lounge and replaced it with more computers.
He posted a list of players not attending class or handing in assignments on the door of the Temple football facility for everyone to see. He takes one shift a week himself to check players classes personally.
He made his players get to know their professors, sit in the front row, and not wear hats to class. If you re not going to class, you re going to be suspended, Mr. Golden said.
Templeincreased its academic support staff to nine from six. Peter D Alonzo, the lead coordinator and a learning specialist at Temple, installed the same program he used at Notre Dame.
Freshmen are now mentored by students in Temple s law school. Students below a 2.4 average are given mandatory study hours and intensive tutoring; Mr. D Alonzo compared it to doing homework in front of Mom and Dad at the kitchen table.
Mr. Golden said incredible doesn t do justice to the academic turnaround. The team had a grade-point average of more than 3.0 during one session of summer school, and Mr. Bradshaw said the university expected to increase its Academic Progress Rate, the measure the N.C.A.A. uses to gauge progress of student athletes.
But Mr. D Alonzo is pushing for the tutorial staff to report only to the provost. Noting that the athletic department has an interest in keeping athletes eligible to compete, he said, It s entrapment.
Mr. Azubuike had failed the most basic math course, Math 45, offered by Temple. He credited the new football staff with giving him the confidence and guidance to get a B in the course the second time. He said he was on pace for a B in Math 55, something I never could have imagined before.
He is looking forward to raising his average even more by retaking a few classes this summer.
The biggest difference to me was their love for the student athlete transcended football, he said. I ve been in few situations where the coach cares as much for you personally and academically as they do athletically.

EnlargeBy Steve Nesius, AP
Iowa coach Kirk Ferentz has a base salary of $1.4 million this year and is guaranteed another $1.4 million in supplemental compensation for media and other obligations.

WHERE THE MONEY COMES FROM

IOWA'S FERENTZ A $4M MAN

Iowa coach Kirk Ferentz earns one of college football's highest annual salaries and, with extras, is in the middle of a particularly lucrative 13-month period:

Guaranteed compensation June 1, 2006-June 30, 2007:

Base salary: $1.44 million (includes shoe and apparel endorsements, compensation for working at a summer football camp, participating in radio and TV shows).

Recurring supplemental payments: $1.4 million (four payments of $350,000 annually, Sept. 2006-June 2007).

Longevity bonus: $400,000 (paid for remaining Iowa's coach as of June 1, 2006).

One-time payment: $1.4 million (paid on or before June 1, 2006 under contract amendment dated May 15, 2006).

Total: $4.64 million

Annual incentive bonuses that he could still achieve, based on Iowa's 6-5 record with one regular-season game remaining:

Participating in bowl game that pays $1 million or more to each school: $75,000.

Participating in bowl game that pays less than $1 million to each school: $25,000.

Participating in any bowl game also will result in a $180,000 increase in base salary on July 1, 2007 under a provision triggered if the team plays in a bowl game and has a federally computed graduation rate of 55% or higher; its rate this year is 56%.

This is the third and final year in which Ferentz can earn the guaranteed annual salary increase for himself (he added $100,000 after the 2004 season and $140,000 after 2005). But his contract, which runs through June 2012, provides an average salary increase of 8% for his nine assistant coaches, head strength coach and top assistant strength coach when Iowa hits the bowl-grad rate combination.

MORE ON COACHES' SALARIES

(http://www.usatoday.com/sports/graphics/coaches_contracts/flash.htm)Database: Compensation for NCAA Division I-A head football coaches (http://www.usatoday.com/sports/graphics/coaches_contracts/flash.htm)
Provisions: Coaches' contracts contain some unusual clauses (http://www.usatoday.com/sports/college/football/2006-11-16-contract-provisions_x.htm)
Coming Friday: How are athletic departments finding the money to pay coaches? New, and increasingly rich, department-wide marketing and media rights deals help.
Contracts for college coaches cover more than salaries
By Jodi Upton and Steve Wieberg, USA TODAY
Pick any numbers you like to define college football's premier teams points scored, yards allowed.

Or the big money earned by their coaches.
The sport's dizzying salaries spiral has come to this, a USA TODAY study finds: The million-dollar coach, once a rarity, is now the norm. Head coaches at the NCAA's top-level schools are making an average of $950,000 this year, not counting benefits, incentives, subsidized housing or any of the perks they routinely receive. At least 42 of the 119 Division I-A coaches are earning $1 million or more this year, up from five in 1999.
Jim Tressel, coach of No. 1-ranked Ohio State, and Mack Brown, who steered Texas to the national championship a year ago, are among the nine coaches making more than $2 million. Iowa's Kirk Ferentz will pocket a guaranteed $4.6 million in an atypical 13-month period ending next June, including $1.8 million in one-time payments. With the incentive bonuses he still can earn, he could push his take to more than $4.7 million. That's the most among the 107 coaches for whom USA TODAY could obtain a contract or other official document showing compensation. Oklahoma's Bob Stoops is the only coach in that group who has cleared the $3 million-a-year bar in guaranteed pay, although Ferentz likely will join him in 2007.
Coaches' contracts these days offer far more than just the basic salary. In scrutinizing contracts, USA TODAY found all kinds of perks: personal use of private jets, low-interest home loans, land deals, million-dollar annuities, pricey luxury suites at schools' stadiums, use of vacation homes and family travel accounts.
Texas' Brown received a $1.6 million "special payment" for his 53rd birthday in 2004, before his contract was renegotiated.
The perks vary from coach to coach, but at least one car, country club memberships and tickets for varsity sports events are de rigueur.
About 10% of coaches get a cut of ticket revenue; Oregon's Mike Bellotti got $631,000 last season under such a provision.
Incentive bonuses, raises and automatic contract extensions are promised for winning specific games or specific numbers of games, helping guide players to graduation, keeping players out of trouble and completing individual years of contracts.
USA TODAY could not obtain figures for 11 coaches, including Notre Dame's Charlie Weis, who is likely among the higher earners. Notre Dame is a private school that declined the newspaper's request for salary information, and his salary does not appear on the school's most recently available tax records.
Access to compensation information for the coaches in Pennsylvania, including Penn State's Joe Paterno, is being decided as part of a lawsuit that has reached the state's supreme court.
"Is (Ferentz's compensation) fair?" says Gary Barta, who took over as Iowa's athletics director in August, inheriting the high-end contract accorded Ferentz, a two-time Big Ten Conference coach of the year with a 6-5 record this season. "I'm not going to judge that. Is it the reality across the country? Yes. We want to keep Kirk here. The marketplace drives what we pay ... and right now the marketplace is aggressive."
Competition for proven coaches is keen, not only among colleges but increasingly from the National Football League. Its teams have hired four college head coaches in the past five-plus years Nick Saban from Louisiana State, Dennis Erickson from Oregon State, Steve Spurrier from Florida and Butch Davis from Miami (Fla.) giving them contracts averaging $2.5 million to $5 million per year. NFL teams also have flirted with Stoops, Brown and Ferentz, among others.
"Just like the high-end housing market can pull up the mid-range housing market," NFL coaching salaries can affect college coaching salaries, says Gary O'Hagan, manager of the sports marketing and representation firm IMG's coaches' division, which represents NFL and college coaches.
The coaching market isn't always so logical, says Peter Likins, the recently retired president of the University of Arizona and head of an NCAA panel on fiscal responsibility. Even presidents and trustees can fall prey to the impulse to overpay for the promised glitter of a winning season.
"These are emotional decisions," Likins says of the hiring process.
Multimedia is driving force
Feeding the salary spiral, insiders and critics say, is a tidal wave of money from schools' lucrative television and apparel contracts and from the latest skyrocketing revenue sources, multimedia and marketing rights deals for entire athletic programs or entire campuses.
For example, Auburn in April signed a nine-year, $51.3 million multimedia and marketing rights deal with ISP Sports; starting in 2008, Auburn's guaranteed annual rights fee will rise 138% to $5.7 million. While the deal covers all Auburn sports teams, its value is connected largely to fan and advertiser interest in football, says athletics director Jay Jacobs.
Football coach Tommy Tuberville is being paid an average of $1.5 million a year under provisions related to Auburn's deal with ISP Sports for TV, radio and related personal appearance work during his seven-year contract, which began in 2005.
"The fact is, today, the majority of (a football head coach's) salary comes from the multimedia rights," Jacobs says.

Above all, schools are driven to maintain or shore up a sport that's the revenue-generating backbone of most overall athletics programs.
At Texas, for example, the return on the sizable investment in Brown is a pre-eminent football program that last season won the school's first football national championship in 35 years and accounted for 62% of all the Longhorns' athletics revenues, turning a $42 million profit. Football essentially underwrote 17 other sports at the school that don't make money all but men's basketball and baseball.
Not all athletic departments are self-supporting. Between 80% and 95% of Division I-A athletic departments still rely on either the university's general fund or student fees to balance the budget, according to NCAA financial reports obtained by USA TODAY and other academic studies.
When football coaches are the face of the athletic program, however, they are more and more often claiming marquee salaries. Increasingly, they are turning to sports agents to exact what they consider a fair share.
Conflicting messages?
As their take grows, so do critics' concerns about the distortion of sports' importance in its higher-education setting. The chancellor of Texas' university system, Mark Yudof, earned $693,677 last year, according to The Chronicle of Higher Education. Brown makes about four times as much.
Louisville paid its full-time professors an average of $95,024 a year ago, according to the state's Council on Postsecondary Education. That's less than half what coach Bobby Petrino would receive as a bonus for getting the Cardinals to a Bowl Championship Series game; Petrino is guaranteed a little more than $1.6 million annually, not including sweeteners like a gasoline allowance of $10,000 a year.
"What kind of message does that send?" says Smith College sports economist Andrew Zimbalist. "What does that say about the value system? What does that say to students?"
Even the man who so richly rewarded Ferentz at Iowa is conflicted. "When you have a football coach or a basketball coach who makes multiples of three to six times what the university president makes," says Bob Bowlsby, who left Iowa in July to become the athletics director at Stanford, "I think there's probably something a little out of whack."
Iowa's president made $390,250 last year, according to The Chronicle.
The rise in salaries caught the eye of the House Ways and Means Committee, which in October asked the NCAA to justify why such a revenue-generating enterprise deserves tax-exempt status.
Chairman Bill Thomas, R-Calif., in a letter to association President Myles Brand, contended "excessive compensation ... makes less revenue available for other sports, causes many athletic departments to operate at a net loss, and may call into question the priorities of educational institutions."
Thomas went on to ask: "What actions has the NCAA taken to encourage its member institutions to curb excessive compensation for college coaches?"
Brand has urged schools not to spend beyond their means, on facilities as well as on coaches. But the NCAA can't set financial parameters for individual schools without violating antitrust laws.
Brand's answer to Congress, in part: Much of the big money paid to coaches is underwritten by media, apparel and other outside entities, and isn't coming out of university coffers, and those coaches hardly differ from schools' faculty stars, who also have tenure.
Incentives run gamut
The Division I-A Athletic Directors Association conducts its own salaries survey, including the 1999 tally that found five million-dollar coaches, and executive director Dutch Baughman says there's one area where schools are trying to hold the line: incentives.
Because of faculty complaints about "additional compensation for (coaches) doing things they should be doing anyway," Baughman says, both the number and value of incentives are being reduced. Still, USA TODAY's study found they're common:
At 83 schools, more than $23 million in on-field performance bonuses are at stake as coaches and their teams approach the 2006 postseason. Florida's Urban Meyer will pocket $37,500 for getting the Gators to next month's Southeastern Conference title game; he will effectively get another $137,500 if the Gators win it and qualify for a Bowl Championship Series game, $50,000 more if they get to the BCS national title game and an additional $100,000 more if they win that.
Maryland's Ralph Friedgen receives $50,000 in any year in which he, his players or coaches essentially behave themselves if there are no violations of university student conduct or academic rules that result in action by the school's office of judicial programs; no arrests, indictments or convictions for "any criminal or suspected criminal conduct"; and "no neglect or willful conduct" that the athletics director deems a violation of NCAA rules.
Texas' Brown gets $20,000 if the football team's graduation rate is at least 50%-54% (the Division I-A average is 66%) and rises to $100,000 at 75%.
Top conferences, top salaries
Overall salary packages are the biggest in college football's six biggest, richest conferences the Atlantic Coast Conference, Big East, Big Ten, Big 12, Pacific-10 and SEC. There, excluding bonuses, USA TODAY found the average coach's salary is $1.4 million. That's more than three times the average of $419,000 in Conference USA, the Mountain West, Western Athletic, Mid-American and Sun Belt.
"I don't think people are going to pay the salaries if they don't have the money," says Texas athletics director DeLoss Dodds. "If you've got the revenue, you're going to stay in the marketplace. If you don't, you can't."
That's the rationale at Iowa, where Ferentz, in his eighth season as the Hawkeyes coach, has won 44 games and two Big Ten championships in the past five seasons. The financial aspects of his original eight-year contract were to "not be renegotiated within three years" of its October 2004 signing, but nonetheless were this May.
The school is counting on revenues from private suites, outdoor club seats and other amenities geared to wealthier fans to cover the cost of an $87 million stadium renovation. Sustaining football's success is key to keeping those patrons happy, and the 51-year-old Ferentz is seen as the instrument of that success.
"And so," Bowlsby says, "negotiation with a coach who had brought great stability to the program seemed to make good sense. Now, I never in my wildest dreams thought that I would be negotiating a contract with a coach with a $2.8 million base. But that's where we've gotten to."
A former NFL offensive line coach, Ferentz has seen his value spike in the wake of approaches in recent years by rival colleges and pro teams. He interviewed with the Jacksonville Jaguars after the 2002 season. Ferentz withdrew from consideration. He received a $72,800 raise, according to The Des Moines Register.
Ferentz's compensation was re-worked again in May. His base salary is $1.4 million this year, and he's guaranteed another $1.4 million in supplemental compensation for radio and TV and other obligations. He also got a $400,000 longevity bonus for still being at Iowa last June 1 and a $1.4 million "one-time lump sum payment" when the school reworked his deal.
Ferentz can get $75,000 for getting his team to a bowl game that pays at least $1 million to each team.
He has made a point of giving back, donating $100,000 with his wife, Mary, to Iowa's College of Liberal Arts and Sciences several years ago, and last week announcing gifts of $150,000 to the college and $250,000 to the University of Iowa Children's Hospital.
Ferentz was a 10th-grader in Pennsylvania when he decided he wanted to coach for a living. He's still doing it for love, not the money, he says, though "I've learned it's silly to leave money on the table. ... I've learned, too, that they fire you besides hire you. It's the reality of what we do."
Are players overlooked?
The schools have their own realities. Those straining budgets to pay their marquee coaches top dollar have been forced to tighten their belts elsewhere. And to seek out additional revenue.
Transylvania (Ky.) University accounting professor Dan Fulks, who conducts the NCAA's biennial study of athletics finances, says the use and amount of student fees as a supplement are trending up, especially at schools without big football stadiums or significant ticket sales.
The more coaches are paid, meanwhile, the louder the argument that the sport's most essential personnel players allowed little more than scholarships covering room, board, books and tuition are under-compensated and exploited. "They're saving tens of millions by not paying their players," Zimbalist says. "So they spend it on coaches."
Individual institutions could take a stand. Says Baughman: "I'm waiting to see one of those schools step up and say, 'At the next time of a coaching change, we will not be in this marketplace.' "
Fulks expects football revenues to level off, and that could force schools to apply the brakes. But not shift into reverse.
"I don't think you can unring the bell. I don't think we're going to one day decide these coaches aren't worth the money and start paying them $800,000 a year again," Bowlsby says. "How does that happen? I think the answer is it doesn't."

Sorry if you received a blank email earlier. Below is a message from
Dean Stenross.

Dear Advisors,

The last weekly Appeals Committee meetings for fall 2006 are as follows:
* GC: Tuesday, Dec. 5
* AS: Monday, Dec. 4

Deadlines to have the petitions heard are the prior Friday at noon (AS)
and that Monday at noon (GC).
Counseling and Wellness Services (CWS) will offer as many academic
intervention appointments as possible for current semester course drop
requests up through Thursday, Nov. 30, at 5. If a student's paperwork
(petition form, typed statement, and CWS evaluation) are not received
by the Appeals Committee deadline, the petition will be rolled over to
be heard at a GC or AS Administrative Appeals Committee meeting. If the
student is ineligible, the petition will be heard at the January
meetings before classes start; if not, at the next semester meeting
Unless they have a dean's excuse, students should take their final exams.

Please note that Dr. Martin is no longer the only person seeing students
for Academic Intervention appointments. If students are working with
other counselors at CWS, those counselors may be completing the CWS
evaluation and then sending students down here to get the petition form
and to turn in their typed statements. We must have all of the pieces
(student statement, instructor assessment of grade and performance, and
CWS evaluation) before a petition can be heard.

For the purpose of Administrative Appeals (retroactive course drops and

semester withdrawals), CWS will be open for academic intervention appointments until Dec. 15. They will then be closed until they open for students on January 2 (except for January 3, staff retreat).
Please let me know if you have any questions.

Barb

PS: Please destroy all old petition forms in your office. If you are not sure whether you the newest forms, check with Melissa or Sandra.

Re: 2006 Fall Olympic Sports All-ACC Academic Teams

Date: January 5, 2007

Attached are the nomination forms for the 2006 Fall Olympic Sports All-Atlantic Coast Conference Academic Teams. The All-ACC Academic Teams are based on a combination of the student-athlete's academic achievement and athletic performance.

Nominate any player who achieved a minimum 3.00 grade-point average for his/her last semester/quarter and has at least a cumulative 3.00 GPA for his/her career.

The ACC Office has produced a new form this year allowing you to submit your form electronically. If you wish to submit your form electronically, please be sure to save the document before sending it via email to ensure that the information you entered is not lost. You may also print the completed form out and submit your nominations via fax (336-854-8797). Once nominations are received the All-ACC Academic Teams will be selected by a committee appointed by the Commissioner.

Please return the completed forms to the appropriate person covering that sport by Friday, January 26, 2007

Academic Eligibility

The University expects all students to study and perform to the best of their abilities. The eligibility standards listed below do not suggest acceptable academic performance, but rather minimum levels. Students failing to meet these standards are not making good use of their educational opportunities.

First-year students entering the University on or after May 14, 2007 are required to meet the requirements listed below. These standards will apply to sophomore transfer students beginning Fall 2008 and to junior transfer students beginning Fall 2009.

Eligibility standards

Good Standing entitles a student to enroll in a fall or spring term. The requirements for ordinary **Good Standing** are as follows.

> A 2.0 cumulative grade-point average **and** the following number of credit hours passed:
>
> 9 hours to enter a second semester
> 24 hours to enter a third semester
> 36 hours to enter a fourth semester
> 51 hours to enter a fifth semester
> 63 hours to enter a sixth semester
> 78 hours to enter a seventh semester
> 93 hours to enter an eighth semester
> Special permission of the Dean to enter a ninth semester

A student who falls short of these standards will be considered in "**good standing–on probation**" for one semester provided he or she passed at least nine credit hours of graded coursework in the preceding semester and was not already on probation. Probation is considered good standing.

Academic Ineligibility

Students who do not qualify for automatic probation or who do not meet cumulative eligibility standards after a probationary term are **academically ineligible** and may not enroll in a spring or fall term.

Registration Priority and Classification

Academic eligibility, registration priority, and classification are separate considerations.

Classification (class standing)

Comment [bo1]: Effective date?

- Semesters 1 and 2: First-year student
- Third or later semester
  At least 30 hours but fewer than 60 hours: Sophomore
  At least 60 hours but fewer than 90 hours: Junior
  90 or more hours: Senior

Registration Priority

- Based on the number of semesters completed (1, 2, 3, 4, 5, 6, 7, 8, 9). Those with more semesters completed are granted higher priority
- Office of Undergraduate Registrar will determine priority among students with the same number of semesters completed
- A group will look at registration priority for select populations

External Semesters

The following formula will define the number of semesters regarded as completed based on the number of credit hours transferred from other colleges or from enrollment in Part-time Classroom Studies:

0 – 14.9 = 0 semesters
15.0 – 29.9 = 1 semester
30.0 – 44.9 = 2 semesters
45.0 – 59.9 = 3 semesters
60.0 – 74.9 = 4 semesters
75.0 – 89.9 = 5 semesters
90.0 – 104.9 = 6 semesters
105.0 or more = 7 semesters

Commentary: All Not Well At Clemson Despite Another Strong Class
by Dan Scott (mailto:dan.scott@tigernet.com)
(http://www.thetigernet.com/feeds/news/rss.xml)| Printer Friendly (http://www.tigernet2.com/print/story.do?id=6475) | E-mail Article (http://www.tigernet2.com/view/story.do?id=6475#email)

Correspondent

Signing Day is supposed to be a day of joy and anticipation for fans of big time college football programs - a Christmas in Feb., if you will.
The two, sometimes three years of hard work by a coaching staff recruiting a player - building a relationship with the kid and his family - is supposed to pay off with an early-morning fax to the football office, returning to the school a signed Letter of Intent.
Often times the faxes are delayed by press conferences scheduled at the player's high school. Sometimes there are hi jinx or shenanigans which delay the process, like the switching of hats or a round of musical jerseys. All have become commonplace in recent years.
But by and large when a coaching staff arrives at its office that first Wednesday in Feb., it has a pretty good idea of who's coming and who isn't. Sure, there are always a surprise or three around the corner (Bobby Bowden swore a year ago he went to bed not knowing for sure where as many as 12 players would sign), but then what fun would Signing Day be without a little mystery?
At Clemson, however, a number of faxes failed to arrive on Wednesday for markedly different reasons. And a fan base, which should be celebrating what is still a very good recruiting class pulled in by Tommy Bowden and staff, instead is asking a very direct question today:
What the devil is going on at Clemson University?
The questions - and subsequent firestorm - began early Wednesday morning when WCCP radio personality Mickey Plyler reported that at least two players, and maybe as many as four or more, were declared off limits to the Clemson coaches by some sort of special academic advisory board at the university.
Apparently the way it works is as follows:
Every player Clemson recruits has already submitted high school grade transcripts and any ACT or SAT testing scores to the school.
The advisory board reviews each player's high school academic profile, then apparently determines whether or not - in their opinion - the recruit could ever obtain a degree from Clemson University.
When the board decides a player wouldn't be able to make it through Clemson and graduate, apparently the coaching staff is notified that they can no longer pursue the athlete and can't put a scholarship offer in front of him.
It is an academic standard which goes above and beyond the NCAA requirements for admission and eligibility to a school like Clemson.
That fact alone is enough to ruffle some feathers, though there are a number of high profile colleges and universities out there who set their entrance and eligibility standards significantly higher than those of the NCAA.
But if Plyler is correct - and he repeated the facts as he knows them to be true on my show this morning, as well - the issue isn't just that the coaching staff was prohibited from offering a scholarship to these players by an academic board.
It's when they were informed.
By all reports, at least one of the most highly sought after wide receivers in the country told Clemson coaches as late as this past Sunday night that all was well and the school could expect his LOI to be faxed in Wednesday morning with no problem.
But - again according Plyler's story today - the academic board told Clemson's coaches Tuesday that they couldn't offer a scholarship to the wide receiver and some number of other recruits.
If that's the case, if the coaches were blind-sided by such restrictions this late in the process, then it's no wonder they - and fans alike - are upset today. The academic board, it would seem, has forced the Clemson coaching staff to compete on a playing field that's anything but level.
Earlier Wednesday on my talk show (Cruise Control, 9 a.m.-Noon on 104.9 FM, The Drive), I asked Clemson wide receivers coach Dabo Swinney if there was anything to the story.
Swinney's response was, and I'm paraphrasing, that he couldn't address the issue. Any comment, he said, would have to come from his higher-ups.
Anybody see a denial there?
Later, in his post-Signing Day press conference, Bowden was asked about the issue as well. He, too, refused comment on the issue.

Again, no denial.
Makes one pause and think, doesn't it?
The bottom line here, then, simply is this:
There is a rift between the academic world and the athletic world - especially the football program - at Clemson University. How large is the rift? How wide the divide?
No one knows. Or at least no one will say publicly.
But when a wide receiver Clemson can't even offer turns around and signs a scholarship with the University of North Carolina, it speaks volumes about the relationship between the two sides here.
Beneath the beauty of this campus nestled around Lake Hartwell, there could be an ugly battle beginning to brew.
Meanwhile, though he walks without a limp, Wednesday's events only seem to further highlight the speculation that Bowden is, indeed, a lame-duck coach.

The Truth (http://www.tigernet2.com/blogs/page/plyler?entry=the_truth)

The Truth
Nine years ago I had a conversation with a high ranking Clemson athletic department official who told me that the University is going in a new direction with new goals from an academic standpoint. He was very clear when he told me that this would hurt the athletic department.
I was there on April 7, 2000 when Jim Barker was named the 14th president of Clemson University. I consider him a friend but in my opinion his "Top 20"
initiative was another step towards the decline of the Clemson athletic department.

('http://coy.tigernet.com/adclick.php?n=a2a58df3' target='_blank')

Barker's 10-year goals included two Final Fours in men's basketball, a national title in football and two national titles in Olympic sports. I think it is unfair to place public goals on employees and not give them the resources to be able to reach those goals.
Five years ago I told three members of the Clemson board of trustees that the "Gaffney gate" deal was a sensationalized version of the truth and that was the tip of the iceberg as to how the playing field was not level for this football staff.
And on February 7, 2007 the next step towards football mediocrity was taken by Clemson University.
After consulting with more than 10 sources inside the athletic department and the university administration, I am fully confident that you will find the following to be true:
*Clemson has an academic review board that prospects' transcripts must go through in order to continue to be recruited by the football staff.
*This board is made up of six or seven individuals including Becky Bowman (director of Vickery Hall), Larry LaForge (management professor and NCAA faculty rep) and Gail DiSabatino (vice-president of student affairs).
Provost Dorrie Helms is not on the review board but is involved. The president is also aware of the results.
*This board turned down the following players among others:
JoJo Cox-unsigned
Dwight Jones-North Carolina
Tydreke Powell-North Carolina
Ryan Houston-North Carolina
Brandon Paul-Florida State
Weslye Saunders-South Carolina
Olufemi Ajiboye-South Carolina
Jarius Wynn-Georgia
*Wynn and Ajiboye have cleared the NCAA clearinghouse and are currently enrolled in their respective schools.
*The board also turned down Markish Jones and six prospects that did eventually sign with Clemson. However, Bowden demanded that they review the cases again. Markish Jones was given a clearance the second time because he was an in-state prospect. The board gave second reviews to the seven players and the coaches were allowed to send LOIs to each prospect after Bowden's battle.
*Dwight Jones committed to Clemson but the day before signing day, Clemson assistants had to call his mother and high school to explain that he could not sign with Clemson. Jones' mother was in tears after hearing the news.
Jones has a 2.25 core GPA and a 670 SAT. He is currently taking three core classes. If he made Bs on each core credit he would have to raise his SAT to an 800. Jones signed with North Carolina, a top 10 public institution, on Wednesday.
*Clemson originally turned down Kourtnei Brown who has a 2.4 core GPA. He has a 21 ACT which is equivalent to about a 970 SAT. That GPA and core are passable scores according to the NCAA Clearinghouse. The reason Brown was originally turned down was because he had two semester Ds in English but made Bs during the other semester in each of those years. The other reason Brown was turned down was because he was in the lower half of his class in terms of class rank. Brown's high school is a small, Christian school that 93% of the students at the school went on to college last year. It is among the most competitive high schools in the state.
*Because the other five that Bowden fought for were signed by the Tigers, I will omit their names. However, I will reveal that all five were on defense. I could not imagine this class with the five plus Brown not being a part of the program. I could not imagine what the future of the defense would have looked like.
*The morale among the coaching staff is extremely low. The staff recruited numerous prospects for countless hours and drove and flew countless miles in the past year only to have over 15 players turned down by this board.

*In the past, the board has claimed that no player they have ever turned down ever made it to a Division I-A school. This is false on two fronts.
First, some went to a D-I school after being placed in a prep school or junior college. Also, Wynn and Ajiboye are currently enrolled at SEC schools.
*What this board has prevented is the signing of a prospect that has a chance to qualify but does not and is placed in a prep school or JUCO.
Under this scenario, some of Clemson's all-time leading players would have never entered Clemson University. Gaines Adams is the all-time sack leader at the school and is a recent Clemson graduate. Adams was signed by the Tigers but did not qualify out of high school. He re-signed with Clemson after a year at prep school. There are many examples of great Clemson players who went on the become Clemson graduates who had to go the JUCO or prep school route. There are members of the academic review board who feel it is not appropriate to sign these type of prospects.
*The Clemson staff essentially wasted hundreds of hours on players like Dwight Jones. One Clemson assistant saw Jones at every legal opportunity.
On Saturday Tommy Bowden and two assistants went to Burlington to try to convince Jones one last time to sign with the Tigers. The attempt was successful. However, Tuesday the academic review board gave the staff the news and the staff had to deliver the news to Jones.
*Clemson assistants had to write letters of recommendations for players to the academic review board. They had to personally go in front of the board and plead each case. I could not imagine how degrading that would be. What happened to trusting your coaches?
*Six of the top 20 public universities finished in the top 10 in the rivals.com recruiting rankings.
*Clemson has an Athletic Council that meets periodically. They also have a Sportsmanship Committee. Former NCAA faculty rep Cecil Huey sits on both of those committees and according to several members of the committee made the statement that, 'The Clemson-USC fight in 2004 was the single most embarrassing moment in Clemson history." Huey also spearheaded a committee meeting that was attempting to eliminate booing the opponent or officials at home sporting events. I mention these two examples for two reasons. First, Huey has been an extremely influential member of the academic movement at Clemson. Second, they both represent how far removed from the real world Huey and his academia cronies have become.
*The University has turned down proposed majors and eliminated other majors that were considered not in line with the Top 20 goal.
*The administration had compliance director, Stephanie Ellison, sit in on Bowden□s press conference Wednesday. Bowden joked and asked her what she was doing there and if he had already committed some minor violations that she would send to the president□s office. Bowden has a way of lightening the mood and was clearly joking with her but what does it say that they placed Ellison in the room for the press conference? What are they afraid the coach would say? I have been to countless press conferences and have never seen a member of compliance. How degrading was that move? How paranoid was that move?
*It is the feeling among several staff members that Clemson will have a hard time in recruiting in the future with this academic review board in place.
*Several members of the athletic administration feel it will be difficult to retain coaches in the future with the academic review board in place.
*Here are some quotes from athletic department officials and university administrators that have been said to me in the last six days:
"I don't know what Danny Ford did to you guys years ago but it must have been unbelievable because this place is still paranoid."
"The administration has no idea what it takes to be successful in football.
They are scared to be great. This place could be great but they are scared to be great. They want to 8-4 so everyone gives their money to IPTAY and buys the season tickets. If they went 4-8 they would have to fire people and they don't want to do that. If they went 12-0 they would be scared to death that someone would think badly of them... that Danny Ford is coming back or something."
"As a staff they are hand cuffed. The public has no idea the hoops they have to jump through here that other schools don't. Other coaches laugh at us when they find out what they have to go through."
"These people have no idea what goes on in this industry. Think this kind of thing would happen at Georgia, Florida, Tennessee or LSU? Alabama is spending over $30 million on Saben alone. Think this academic review board would go over there? Who do you think will be better in football in the next few years Alabama or Clemson?"
"We signed a great class but imagine what it could have been if they would not have been in the way."
"Things won't change around here until we have some expensive funerals."
"The perplexing aspect is that Bowden has graduated players at a high rate and academics are good here. But he gets no credit for that. They handcuff him instead."
"One Clemson runs one way. It is a one-way street that flows from Jervey to Sikes."
These are quotes that I believe tell the story. Please understand that they asked me to please not use their names in fear of losing their jobs. After I spoke in Charleston, Columbia, and Greenville and on the radio after the Gaffney Gate situation, a major ordeal occurred at the university and athletic department. Instead of righting what was wrong, the university called meetings and went on a mission to find out who leaked information to me. They were more worried about the perception as opposed to solving the problem.
I am confident that the next step here will be another attempt from the university to out my sources. I am sure that not many of the university officials want to be seen in public talking to me in the next few months.
However, they need to fix what is broken. Clemson football is not doomed to mediocrity but is headed there. Signing a kid and him not qualifying is not the end of the world. It is not embarrassing to the university.
I realize this blog entry will be met with skepticism by some. I have confirmed it with multiple sources and have full confidence that I am stating the facts in this case. I also realize that it may hurt the university on the short term but I think the facts coming out will help in the long run. Personally, I do not want to hurt the football program. I only want to be part of the solution not the problem.
Abolish the academic review board before it kills the Golden Goose--Clemson football.
I will conclude with a statement I told the chairman of the board of trustees at Clemson five years ago. "Cecil Huey, Becky Bowman and several others want Clemson to be Duke Monday through Friday but that will never happen because of perception. However, if

you don't fix it, Clemson will become Duke on Saturdays in the fall."

Oh, what a statewide classroom debate: Should Clemson, the most academically challenging public university from Fort Sumter to Sassafras Mountain, err on the studious side of admissions policy even if leaning away from its traditional role as a land grant institution theoretically founded to roughly mirror the brainpower profile of the Palmetto State?
Clemson football coach Tommy Bowden and staff, along with thousands of Tigers fans, probably don't think so. They have privately blamed the school's rising admissions standards for some big losses on the recruiting trail.
Some of these outraged folks - most of whom probably didn't actually graduate from Clemson - are stunned that school president James F. Barker (Clemson, '70) has the audacious goal of placing Clemson among the nation's top 20 public universities. The anger was enough to get Barker to issue a statement Tuesday calling for a "healthy discussion" and for athletic director Terry Don Phillips to issue his own statement insisting, "There is no university conspiracy to devalue the football program in favor of an academic ranking."
Calm down. Before you go marching through the streets of Berkeley ... uh, Clemson ... burning either a calculus book or a Music City Bowl jersey consider that this conflict hardly is new.
South Carolinians with teens are well aware of rising admission standards at our state schools, led by Clemson.
Clemson was named Time magazine's "Public College of the Year."
That was six football seasons ago. Since then, academics and athletics have meshed well enough at Clemson to produce bowl team after bowl team, one of the very best college baseball programs in the world and a basketball program apparently headed in the right direction.
Danny Ford, a former Clemson head football coach and All-Southeastern Conference Academic Team selection, clashed with Clemson officials who wanted to build an academic learning center on campus against Ford's wishes.
That was so long ago that babies born that summer of 1989 are now sending out college apps.
But a football national title?
No, probably not.
The real rub
Obviously, state schools such as California, UCLA, Michigan and Ohio State have proven high-profile success is possible on and off the football field. Those schools, however, are located in California, Michigan and Ohio, not in a state whose high school students annually have combined for one of the worst collective SAT averages in the nation.
Of course, lots of wonderful things are going on in South Carolina public schools, which are full of great teachers and staff. Just in the last week, students at Wando High School convinced over-cautious administrators that "To Kill a Mockingbird" would not stir racial discord as a school play but instead help unite people in the sensitive spirit of the book and movie.
But it doesn't take a Clemson math whiz to tell you that when entrance
standards at a given college rise in a given state where low high school test scores remain relatively stagnant, a lower percentage of students in the given state will qualify for admission.
Ay, there's the rub.
That tailgatin' Clemson family in which mom or dad (or both) are alums who have always told their daughter or son (or both) that a dorm room within walking distance to Death Valley is just a few good report cards away is in for a shock: Admission denied.
It started happening a few years ago at Clemson and the College of Charleston. Students smart enough to qualify for South Carolina's Life Scholarship (meeting two of three criteria including a 3.0 grade-point average, an 1,100 SAT score and top 30 percent class rank) were turned away from places where the average entering SAT score shot above 1,200 (Clemson's is now 1,217, and rising).
At this rate, Clemson may have to change its athletic nickname to the Geeksters.
More likely, more and more kids of Clemson alums and fans will be denied access to their (and their parents') dream school. Junior's spot in the freshman class will be taken by some better-prepared teen from California, Michigan or Ohio.
And there will be a bitter backlash costing Clemson at the football, basketball and baseball turnstiles.
Clemson probably will get a little worse in football. Last semester, the program's average grade point average was 2.17, last among Clemson sports teams. Hello, Boise bowl trips.
SAT numbers
Funny. But Clemson's high sports profile, surely including the coolness of the Tiger paw logo, has partly driven the popularity of the school, and enough competition for admission eventually makes it more difficult for coaches to recruit.
Bowden knows this isn't new, that standards didn't shoot up out of Lake Hartwell last month. Even while building a generally successful and classy program usually sprinkled with more graduate students than the average bowl-bound team, Bowden clashed with admissions people almost from the get-go.
The same conflict is playing out at the College of Charleston. John Kresse's remarkable basketball success brought the school millions of dollars in national publicity, and more applicants.
With admission standards now so much higher than Kresse ever had to deal with, the basketball program is significantly less likely to produce NCAA Tournament-caliber teams.
The same thing may play out at South Carolina. The average entering SAT score is up to 1,172.
Last spring, Life Scholarship qualifiers were turned away in Columbia, too. I have had a kid rejected by Clemson. And South Carolina. I feel your pain.
But in a state too long known for weak and lagging public education the answer is yes, err on the side of quality.
And if it takes the real or perceived decline of Clemson and South Carolina football prowess to inspire improved high school academics, the whole state will score a touchdown.

Big 10 commish responds to Big 10/ SEC recruiting commentary [1]

Big Ten needs to find new talent pool -- fast
RECRUITING

February 9, 2007
BY TAYLOR BELL
There was a time when the Big Ten was the most feared and most respected college football conference in the country.
The conference of Grange, Butkus, Brady and Griffin dominated the Rose Bowl, won national championships and produced more NFL players than the SEC, Pac-10 or any other league.

So what happened?

It got slower.

The Big Ten fell behind because it stayed north of the Mason-Dixon Line and failed to bring in the athletes who were coming out of the Deep South, especially Florida.

And they were reluctant to challenge the traditional powers in Texas and California, the mother lodes of high school football talent.

For the first time in memory, the Big Ten failed to sign at least one of the top 10 recruiting classes in the nation. When the No. 1 prospect in Michigan invited five coaches to visit, Michigan's Lloyd Carr wasn't one of them. He chose USC. And the No. 1 player in Ohio went to Tennessee.

"The Southeastern Conference is much faster on defense than the Big Ten," said CSTV recruiting analyst Tom Lemming, who has been evaluating players from coast to coast since 1978.

"In the Midwest, people are thinkers. In the SEC, they rely on athleticism and aggressiveness on defense. They pride themselves on rushing the quarterback. They appear to be much more aggressive than the Big Ten."

If the Big Ten hopes to catch up to the SEC, Lemming suggests the conference must lower its academic standards.

"Then they can get anyone into school that they want," Lemming said. "It seems to me that no matter who the kid is, he finds a way to get into school. A lot of times it is an SEC school, after the kid spends only four months at a prep school.

"People have turned poor students into very good ones and make them eligible to play in the SEC. Few of them wind up in the Big Ten. But many of them are difference-makers and game-breakers. If the Big Ten can't get those kind of players, it will keep falling behind."

Bob Chmiel, a former recruiter at Michigan and Northwestern, cites two other reasons the Big Ten has fallen behind. Except for Michigan and Ohio State, other schools were slow to become national recruiters. And assistant coaches in the SEC and Pac-10 are paid more than those in the Big Ten.

"Some say recruiting rankings don't make a difference," Chmiel said. "But look at the past. It is a direct reflection on their success. You can't miss a year without bringing in a top 10 class.

"Contrary to when I was coaching, competition for great assistant coaching talent has turned into a bidding war. There is a lot more movement among assistant coaches than 10 to 20 years ago. The salaries of assistant coaches at the elite teams in the SEC and Pac-10

are by far the highest in the country."

Chmiel said the best recruiters combine the ability to sell their programs with the ability to evaluate and project talent. He says the great Miami teams were laden with high school fullbacks who ended up as defensive linemen, linebackers and strong safeties -- big guys who could run.

"LSU's defensive linemen -- those are the kind of guys you have to get, big guys who are athletic and can run, who are relentless in their pursuit," Chmiel said. "You have to go where they are and they are all over the country, not just in California, Florida and Texas."

Big Ten Commissioner Jim Delany's response...

To Fans of the Big Ten and College Football
Feb. 9, 2007

Greetings from the Big Ten Conference,

With the conclusion of another tremendous college football season and the recent national signing day, there has been a lot written and said about the Big Ten's recruiting efforts across the country, including a recent article in the Chicago Sun-Times entitled "Big Ten needs to find new talent pool - fast" (see full article here). In response to these commentaries, it seems premature for us to lower our admission standards or give up on the tremendous talent pool in the Midwest. No doubt national programs must recruit nationally wherever the talented students and athletes live. Hats off to Florida and the SEC -- they had a great year. We believe that both the Big Ten and the SEC have been and remain two of the greatest college football conferences in the country. But you may want to keep in mind the following as you review the various recruiting services, listen to talking heads and reflect the blogosphere out there as they compare these two fine conferences. I think most people would agree that head-to-head competition is an effective method to compare relative strengths between competitive entities:

The Big Ten was 2-1 vs. the SEC in this past season's bowl games.
The Big Ten is 8-6 vs. the SEC in bowl games over the last five years
The Big Ten is 13-13 vs. the SEC in bowl games over the last decade.
Over the last nine years of Bowl Championship Series games, the Big Ten leads all conferences with 15 berths while ranking second with eight victories. The SEC tops all leagues with nine wins and ranks second to the Big Ten with 13 appearances.
In the last 10 years the Big Ten has produced two national champions compared to three for the SEC.
In the last 15 years the Big Ten has produced five Heisman Trophy winners, more than any other conference. Over that same time span, the SEC has claimed one Heisman.
While the SEC ranked first among various recruiting rankings, the Big Ten ranked second or third nationally with four to five programs rated among the top 25 recruiting classes.
The Big Ten has a history of developing players - the most recent Heisman Trophy winner, Troy Smith, was one of the last players to receive a scholarship from Ohio State.
The Big Ten has slightly less than 300 players in the NFL while the SEC has slightly more than 300; Sixteen former Big Ten players earned Super Bowl rings with the Indianapolis Colts earlier this month.

I love speed and the SEC has great speed, especially on the defensive line, but there are appropriate balances when mixing academics and athletics. Each school, as well as each conference, simply must do what fits their mission regardless of what a recruiting service recommends. I wish we had six teams among the top 10 recruiting classes every year, but winning our way requires some discipline and restraint with the recruitment process. Not every athlete fits athletically, academically or socially at every university. Fortunately, we have been able to balance our athletic and academic mission so that we can compete successfully and keep faith with our academic standards.

Let's see if the five- and 10-year trend lines hold or whether the recruiting services and talking heads are seeing a new day. We are quite proud of our history and tradition and remain optimistic about the future of Big Ten football.

Thanks.
Jim Delany

Due to new procedures with time sensitive deadlines mandated by the federal government in the pay-rolling of new employees, ALL new temporary AND student employees must come to our office to complete their paperwork. PLEASE NOTE: this must be done on the employee's FIRST work day--with no exception. Paperwork may no longer be processed in advance, as mandated by federal regulations governing certain processes that all state agencies must now adhere to. HOWEVER, before a non-student temporary employee can start work, they must complete the criminal background investigation form, which you may completed in your area and sent to our office. Once the Office of Public Safety notifies us of the results, we will contact the hiring supervisor to notify you know that the employee can begin work (the crim check does not apply to student employees).
Please contact Tracy Harris (2-7852) or myself (2-7850) to arrange a time for the new employee to come to our office on their first day of work.
A FEW OTHER REMINDERS:
1. PLEASE contact Joyce PRIOR to entering into an agreement to pay someone for services rendered to be sure that we can in fact employee the individual.
2. Timesheet deadline reminder: timesheets are due to Tracy Harris by 10:00 on the Monday following payday. Several areas are turning timesheets in much later than this deadline, and this is creating a delay in the delivery of timesheets to payroll services.
3. Please share this information with those who may need to be made aware of these changes and updates but may not be on the recipient list or have access to email.
Please let me know if you have any questions, and thank you in advance for your prompt attention to these matters.
Joyce & Tracy

NCAA Division I 2005 - 2006 Academic Progress Rate

Public Report

Institution: University of North Carolina, Chapel Hill Date of Report: 04/30/2007

This report is based on academic progress rate (APR) information submitted by member institutions for the 2003-04, 2004-05, and 2005 - 2006 academic years.

[Note: All information contained in this report is for three academic years only, unless otherwise noted. This may lead to very small sample sizes within certain groups. The NCAA anticipates reporting data only on the basis of a four-year rolling rate for all sports when four years of data are available.]

*In accordance with FERPA's interpretation of federal privacy regulations, data cells containing three or fewer student-athletes have been suppressed and are indicated by an * symbol.*

The following chart represents by sport APR averages for noted subgroups.

Sport (N)	Multiyear APR	Percentile Rank within Sport	Percentile Rank within All Sports	All Divison I	Public Institutions	Private Institutions	Football Bowl Subdivision	Football Championship Subdivision	Division I
By Sport - Men's									
Baseball (292)	988	90th-100th	70th-80th	934	923	957	936	933	931
Basketball (333)	993	90th-100th	80th-90th	927	917	947	922	930	932
Cross Country (304)	947	20th-30th	20th-30th	961	952	978	962	960	962
Football (239)	948	70th-80th	20th-30th	931	922	955	934	927	NA
Fencing (20)	1000	80th-90th	90th-100th	974	950	987	969	987	961
Golf (292)	950	30th-40th	30th-40th	962	956	974	967	957	962
Gymnastics (16)	NA	NA	NA	970	968	1000	969	1000	958

* Denotes data representing three or fewer student-athletes - In accordance with FERPA's interpretation of federal privacy regulations, these data are not available.
N/A = No APR
N = Number of teams reporting
Percentile Rank: 0 to 100; 0 = low, 100 = high
^ Denotes APR that does not subject the team to a contemporaneous penalty because the team is performing better than the institution's general student body or based on institutional, athletics and student resources.
+ Denotes APR that does not subject the team to contemporaneous penalties due to the squad-size adjustment. The "upper confidence boundary" of a team's APR must be below 925 for that team to be subject to contemporaneous penalties. Squad-size adjustments will be eliminated when the fourth year of APR data is collected, provided the team's multiyear cohort includes 30 or more student-athletes.
@ Denotes APR that does not subject the team to historical penalties due to the team's demonstrated academic improvement and favorable comparison based on other academic or institutional factors.
~ Denotes APR that does not subject the team to historical penalties due to the squad-size adjustment. The "upper confidence boundary" of a team's APR must be below 900 for that team to be subject to historical penalties. Squad-size adjustments will be eliminated when the fourth year of APR data is collected, provided the team's multiyear cohort includes 30 or more student-athletes.
% Denotes APR based on a one year cohort, not subject to a historical and/or contemporaneous penalty.
! Denotes APR based on a two year cohort, not subject to a historical penalty.

ACC ACADEMIC & COMPLIANCE MEETING

MAY 7-8 2007
CONFERENCE OFFICE
GREENSBORO, NC

AGENDA

- WELCOME & INTRODUCTIONS
- REVIEW ITINERARY & AGENDA
- APPROVE MINUTES FROM 5/01/06
- BENCHMARKING
- INSTITUTIONAL POLICIES (ADMISSIONS PROCESSES, TRAVEL&MISSED CLASS, SUMMER SCHOOL)
- CONTINUING ELIGIBILITY
- COMMUNICATION WITH PROSPECTS
- NCAA LEGISLATION UPDATE
- BEST PRACTICES (J.S.STUDYHALL,PROGRAMMING)
- APR (RECOVERY PLANS, COLLABORATION)
- STUDENT-ATHLETE PROGRAMS (FUTURE INTERNS, POSTGRADUATE SCHOLARSHIPS LUNCHEON)
- OTHER BUSINESS
- FUTURE MEETING/CONFERENCE CALL
- ADJOURNMENT

INSTITUTIONAL POLICIES & PROCEDURES

ADMISSIONS PROCESSES

TRAVEL/MISSED CLASSES

SUMMER SCHOOL

THE STUDENT-ATHLETE ADMISSIONS PROCESS

UNC-CHAPEL HILL

STEP 1

- COACHES MUST PROVIDE A PROSPECT LIST TO THE ADMISSIONS OFFICE AND THE COMPLIANCE OFFICE BY NOVEMBER 1ST

STEP 2

- COACHES SEND UNOFFICIAL TRANSCRIPTS TO THE COMPLIANCE OFFICE FOR INITIAL REVIEW
- COMPLIANCE OFFICE REVIEWS TRANSCRIPTS FOR PRELIMINARY NCAA ELIGIBILITY

STEP 3

- UNOFFICIAL TRANSCRIPTS AND COMPLIANCE WORKSHEETS FORWARDED TO THE ADMISSIONS OFFICE
- ADMISSIONS OFFICE REVIEWS TRANSCRIPTS AND WORKSHEETS TO DETERMINE STUDENT STATUS
- POSSIBLE STATUS: ATHLETIC SLOT, FACULTY COMMITTEE CASE, EXCEPTION (MINIMUM CORE REQUIREMENTS-MCR)
- THERE ARE 140 SLOTS PLUS AN ADDITIONAL 20 ACADEMIC INCENTIVE SLOTS

DEFINITIONS

- SLOT – ANY SA WHO DOES NOT MEET UNC ADMISSION CRITERIA BUT IS ABOVE THE FACULTY COMMITTEE ON ATHLETIC ADMISSIONS CRITERIA
- ACADEMIC INCENTIVE SLOT – ANY SA WHO DOES NOT MEET UNC ADMISSION CRITERIA BUT IS ACADEMICALLY COMPETATIVE AT PEER INSTITUTIONS
- EXCEPTION – MINIMUM CORE REQUIREMENT DEFICIENT (MCR)
- FACULTY COMMITTEE CASE –
  - SAT CRITICAL READING BELOW 420
  - SAT MATH BELOW 400
  - SAT COMBINED CRITICAL READING AND MATH BELOW 900
  - ACT COMPOSITE BELOW 19 (SUBTOTAL 76)
  - RANK IN CLASS BELOW THE MIDDLE OF THE CLASS
  - NCAA CORE GPA OF LESS THAN 2.5

MCR-4 units English, 4 units Math, 2 units language (same), 3 units science (1bio,1physical, 1lab), 2 units Soc. Sci. (1USHistory).

STEP 4

- ADMISSIONS OFFICE FORWARDS REVIEW TO SR. ASSOCIATE ATHLETIC DIRECTOR
- SR ASSOCIATE AD MEETS WITH COACH TO SHARE ADMISSIONS REVIEW AND DETERMINE INTEREST LEVEL
- SR ASSOCIATE AD & COACH DETERMINE SLOT USE OR COMMITTEE VIABILITY – SR ASSOCIATE AD ULTIMATELY DETERMINES HOW MANY SLOTS EACH TEAM REVIEVES BASED ON SQUAD SIZE & TEAM ACADEMIC PERFORMANCE

STEP 5

- SLOTS (INCLUDING ACADEMIC INCENTIVES) ARE SENT BACK TO ADMISSIONS OFFICE FOR APPROVAL
- COMMITTEE CASE SLOTS & EXCEPTIONS ARE SENT BACK TO THE ADMISSIONS OFFICE FOR FACULTY SUB COMMITTEE REVIEW
- ADMISSIONS OFFICE SCHEDULES THE FACULTY SUB COMMITTEE MEETINGS

STEP 6

- FACULTY COMMITTEE CONSIST OF 7 FACLUTY, 1 ATHLETIC OFFICIAL, DIRECTOR OF ACADEMIC SUPPORT, DIRECTOR OF ADMISSIONS, SR. ASSOCIATE DIRECTOR OF ADMISSION – FACULTY COMMITTEE ACTS ONLY AS AN ADVISORY COMMITTEE TO THE DIRECTOR OF ADMISSIONS
- ATHLETIC OFFICIAL & DIRECTOR OF ACADEMIC SUPPORT ARE NON VOTING MEMBERS
- COACHES PRESENT EACH SA TO THE FACULTY COMMITTEE – COACHES ARE QUESTIONED ON ACADEMIC, CHARACTER & ATHLETIC VIABILITY OF SA (FULL DISCLOSURE IS EXPECTED)
- DIRECTOR OF ACADEMIC SUPPORT PRESENTS TEAM ACADEMIC INFORMATION AND PAST COMMITTEE CASE SUCCESS
- FACULTY COMMITTEE DETERMINES STATUS OF STUDENT-ATHLETE: APPROVED (ADMIT IF QUALIFIES), DENIED, DEFERRED (REQ. LETTERS FROM TEACHERS), EXCEPTION
- RECOMMENDATION GIVEN TO THE DIRECTOR OF ADMISSIONS

Faculty sub committee members are elected by the faculty council for a 3 year term and may serve a limit of 2 terms.

ATHLELTIC TRAVEL & MISSED CLASS TIME

- UNC ATHLETIC DEPARTMENT POLICY –
- The maximum number of classes student-athletes can miss, due to athletic related activities is seven (7) per semester.
- Exam Travel Statement – No student-athlete will be excused from, or reschedule, a final exam to accommodate an in-season athletic contest. Therefore, an athletic contest, or travel, may not commence prior to the participating student-athlete completing final exams as scheduled by The University of North Carolina.

SUMMER SCHOOL

- OPEN TO THE FLOOR…

Subject: 2006-65-A - Core Courses

Attach: TEXT.htm

Hi Everyone -

The NCAA just released the ed column below this morning regarding the application of adopted NCAA Proposal 2006-65-A, which specifies that a prospect must complete his/her core courses no later than the graduation date of his/her class (determined as being 8 semesters after enrollment in high school). If the prospect graduates within the 8 semesters one additional core course may be used to meet initial eligibility standards during the summer following graduation or the following academic year.

During our recent meeting with the men's basketball coaches there were several concerns expressed over the adoption of this legislation and how it would affect the recruiting process. The main concern being that if a prospect needed to repeat a year of high school and therefore was unable

to graduate within the 8 semesters. I have highlighted in red the section below that addresses this issue.

The staff has not yet responded to our additional question regarding waivers for these individuals who do not graduate within the 8 semesters. The men's basketball coaches' main concern was that these waivers could not be filed until after the prospect graduates high school, which is basically too late in the recruiting process. As soon as we get a response on that matter I'll forward it to you.

Please feel free to contact Shane or me if you have any additional questions or concerns regarding this matter.

Thanks,

Lindsey

Educational Column -- Eligibility -- Freshman Academic Requirements -- Core Curriculum Time Limitation (I)

_____

Date Issued: May 23, 2007
Type: Ed. Column
Item Ref: 1

Interpretation:

The NCAA Division I Board of Directors adopted NCAA Proposal No. 2006-65-A during its April 2007 meeting. This proposal amends NCAA Bylaw 14.3.1.2.1, by adding Bylaw 14.3.1.2.1.1. The amended bylaw specifies that a prospective student-athlete must complete his or her core-curriculum requirements not later than the high school graduation date of the prospective student athlete's class [as determined by the first year of enrollment in high school (ninth grade) or the international equivalent as specified in the NCAA Guide to International Academic Standards for Athletics Eligibility].

If the prospective student-athlete graduates from high school within the described time-frame, he or she may use one core course completed in the year after graduation (summer or academic year), but not later than the end of the academic year immediately after the high school graduation

date of the prospective student athlete's class.

Below are some commonly asked questions along with some example scenarios that may assist in the application of this legislation.

Question: What is the effective date of proposal No. 2006-65-A?

Answer: August 1, 2007, for all prospective student-athletes first entering a collegiate institution on or after August 1, 2007.

Question: How does this Proposal affect prospective student-athletes whose expected date of graduation was prior to or during 2006?

Answer: The NCAA Initial-Eligibility Clearinghouse* will conduct "business as usual" for prospective student-athletes whose expected date of graduation was prior to or during 2006. That is, the clearinghouse will accept post-eighth semester coursework for these individuals, subject to review if inconsistencies or irregularities are discovered. Institutions will not be required to request a waiver for these courses to be considered in a prospective student athlete's final certification. However, if a prospective student-athlete still does not meet initial-eligibility standards after consideration of the post-eighth semester coursework, institutions will be able to seek relief through the initial-eligibility waiver process.

Beginning with the 2008-09 academic year, the new legislation will apply to all prospective student-athletes regardless of their year of expected graduation.

*NOTE: As of October 29, 2007, the NCAA Eligibility Center will conduct all initial-eligibility certifications for prospective student-athletes.

Question: Will the amended legislation affect prospective student-athletes whose expected date of graduation is in 2007?

Answer: Yes. Prospective student-athletes whose expected date of graduation is with the 2007 class, but failed to meet graduation requirements, will not be able to use coursework completed after the 2006-07 academic year.

Question: How will this legislation affect prospective student-athletes with disabilities?

Answer: The legislation does not impact prospective student-athletes with a diagnosed disability that is approved by NCAA Disability Services. These prospective student-athletes may use coursework completed prior to initial full-time enrollment at a collegiate institution.

Question: What if a prospective student-athlete repeats a grade during his or her high school career?

Answer: This legislation is designed to encourage prospective student-students to take academic courses each year of high school to ensure timely graduation, and to discourage prospective student-athlete's from intentionally delaying high school graduation solely to meet NCAA eligibility requirements while not preparing for the academic rigors of college. Thus, if a prospective student-athlete repeats a grade during his or her high school career, the application of this legislation will impact his or her ability to use core courses. In other words, the prospective student-athlete will still be required to complete core-curriculum requirements prior to the graduation date of their class at the time they entered ninth grade.

The NCAA recognizes there will be legitimate instances where student-athletes repeat a grade or do not graduate in a four-year period. The initial-eligibility waiver process will continue to address these situations.

Question: May an initial-eligibility waiver be filed for a student-athlete who does not meet the requirements?

Answer: Yes. The initial-eligibility waiver process is available for situations in which a prospective student-athlete is required to repeat a grade which results in an inability to meet the

requirements. These waivers will be considered by the eligibility center and governance committees.

The NCAA will also continue to monitor these instances to ensure that no unintended consequences result from the adopted rules.

Question: If an individual completes a core course after his or her expected date of graduation, may it be considered in the initial-eligibility certification process?

Answer: Only those individuals who graduate within the appropriate timeframe (eight semesters) may take advantage of the additional core course considered in the initial-eligibility certification process.

Prospective student-athletes who do not graduate in eight semesters with their class may not use any courses taken after eight semesters, unless they have a documented and approved disability.

Question: Does the one additional course have to be completed at the same high school from which the prospective student-athlete graduated?

Answer: No. The course may be taken at any high school, through any nontraditional program or at any post-secondary institution. However, the course must meet the legislated definition of a core course.

Question: What if the high school's graduation date is June 1, but the prospective student-athlete does not graduate until July 1? May a summer school course be used?

Answer: No. A prospective student-athlete must graduate on time with his or her class in order for the additional core course to be considered in the initial-eligibility certification process.

Question: What if a prospective student-athlete meets requirements for graduation, but proof of graduation does not appear on the high school transcript?

Answer: The prospective student-athlete must graduate on time with his or her class and have proof of graduation on the high school transcript in order for the additional core course to be considered in the initial-eligibility certification process. (See the above question regarding potential waiver opportunities.)

Question: May a prospective student-athlete using the additional core course take two half-unit courses?

Answer: Yes. A prospective student-athlete using this opportunity may complete the equivalent of one Carnegie unit. For example, the prospective student-athlete could complete two one-half unit courses.

Question: May a prospective student-athlete who graduates and meets the core curriculum requirement after eight semesters of high school use the additional core course to improve his or her core-course grade-point average?

Answer: Yes. A prospective student-athlete who completes the core-curriculum requirements within the specified timeframe may use the additional core course to improve his or her core-course grade-point average for consideration in the initial-eligibility process.

Examples:

No. 1 2003-04: Grade 9

2004-05: Grade 10

2005-06: Grade 11

2006-07: Grade 12 (did not graduate)

Summer 2007: takes three classes through online program

RESULT: The prospective student-athlete did not graduate with his class; therefore, only courses taken in the first eight semesters will be considered in the initial-eligibility certification process. The summer school online courses may not be used.

No. 2 2003-04: Grade 9

2004-05: Grade 10

2005-06: Grade 11

2006-07: Grade 12 (graduated)

Summer 2007: takes three classes through online program

RESULT: One of the three courses taken through the online program may be used, since the prospective student-athlete graduated at the end of eight semesters. The eligibility center will use the one class that most benefits the prospective student-athlete in the review of his or her initial eligibility.

No. 3 2003-04: Grade 9

2004-05: Grade 10

2005-06: Grade 11

2006-07: Grade 12 (did not graduate)

2007-08: The prospective student-athlete plans to enroll at a prepatory school for a fifth year.

RESULT: The prospective student-athlete may attend the prepatory school, but none of the courses may be used for initial eligibility certification. The prospective student-athlete may still improve his or her standardized test score during the prepatory school year.

No. 4 2003-04: Grade 9

2004-05: Repeat grade 9 due to injury or illness

2005-06: Grade 10

2006-07: Grade 11

2007-08: Grade 12

RESULT: Under the new legislation, none of the courses from 2007-08 can be used for initial-eligibility purposes unless the prospective student-athlete graduated at the conclusion of the 2006-07 year. However, there is a waiver process available for prospective student-athletes who fail to meet the core-curriculum time limitations.

No. 5 2002-03: Grade 9

2003-04: Repeat Grade 9

2004-05: Grade 10. Prospective student-athlete diagnosed with learning disability.

2005-06: Grade 11

2006-07: Grade 12

RESULT: Provided the prospective student-athlete is approved through NCAA Disability Services, he or she will be able to use coursework from all five years.

FYI ...

FOUR TAR HEELS EARN ACADEMIC ALL-DISTRICT HONORS

CHAPEL HILL, N.C. – Four North Carolina student-athletes have earned ESPN The Magazine Academic All-District honors, as announced Thursday by the College Sports Information Directors of America (CoSIDA). Sara Anundsen (tennis) and Heather Kendell (field hockey) were named to the District 3 University Division women's at-large second team and Barden Berry (golf) and Benjamin Carlotti (tennis) were named to the District 3 University Division men's at-large second team.

The at-large teams include student-athletes from the sports of women's bowling, women's crew, men's and women's fencing, field hockey, men's and women's golf, men's and women's gymnastics, men's and women's ice hockey, men's and women's lacrosse, men's and women's rifle, men's and women's skiing, men's and women's swimming, men's and women's tennis, men's volleyball, men's and women's water polo and wrestling. To be a candidate for the honor, a student-athlete must be a starter or key reserve and must carry a grade point average of 3.2 or better. First and second teams in University and College divisions were announced Thursday for eight districts across the U.S.

Anundsen, a senior from Littleton, Colo., is a two-time All-America selection and part of the nation's second-ranked doubles team. She is 20-13 in singles and 31-6 in doubles this season. In addition to serving as a team captain, she is the squad's Academic Team Captain and recipient of the Athletic Director's Scholar-Athlete Award. She is a member of the Student-Athlete Advisory Council (SAAC), as well as a participant in the Carolina Leadership Academy and Carolina Outreach. An ACC Academic Honor roll member, Anundsen is majoring in management and society and carries a 3.3 GPA.

Kendell, a junior from Chapel Hill, is a three-year starter for the Tar Heel field hockey team. She is a two-time All-Atlantic Coast Conference Academic Team selection and a four-time member of the NFHCA National Academic Squad. The team's second-leading scorer as a sophomore, she is the field hockey Academic Team Captain and SAAC representative, and the squad's recipient of the Athletic Director's Scholar-Athlete Award. She also is a member of the National Society of Collegiate Scholars and volunteers for Habitat for Humanity and Adopt-a-Highway as well as participating in the Carolina Leadership Academy. Named to the ACC Academic Honor Roll and the Dean's List, Kendell is majoring in exercise and sport science with a minor in chemistry and carries a 3.8 GPA.

Berry, a junior from Kinston, has been a starter for the golf team in all 12 tournaments this year and has six top-25 finishes. A member of the 2006 All-ACC Academic Team, he is the squad representative to SAAC and recipient of the Athletic Director's Scholar-Athlete Award. He has volunteered at UNC Hospitals and with the Get Kids in Action program, is a Carolina Leadership Academy participant and has been named to the ACC

Academic Honor Roll and the Dean's List. A psychology major with a 3.9 grade point average, Berry is part of the UNC honors program and has earned a perfect 4.0 GPA in each of the last two semesters.

Carlotti, a junior from Paris, France, played No. 1 singles for the Tar Heels in 2006-07. He finished the season ranked No. 75 nationally and was ranked as high as No. 33 during the year, when he went 22-17 in singles and beat eight nationally-ranked opponents. An All-ACC selection in 2007, he has more than 20 singles wins in each of the last three years. Carlotti is a two-time ACC Academic Honor Roll selection and spent part of last summer interning with the Red Cross in France. A business major, he carries a 3.2 GPA.

Women's District 3 Winners
University Division
FIRST TEAM
Kristi Miller (Georgia Tech, Jr.); Amanda Blumenherst (Duke, So.); Audra Cohen (Miami, Jr.); Lindsay Pieper (Virginia Tech, Sr.); Amy Stopford (Duke, Sr.); Heather Reynolds (Georgia Southern, Grad.); Courtney Kupets (Georgia, So.); Savannah Evans (Florida, Sr.); Leah Wigger (Virginia, Sr.); Jessica Botzum (Virginia Tech, Jr.)
SECOND TEAM
Romy Altmann (Florida State, Sr.); Caroline Westrup (Florida State, So.); Kristen Waagbo (Duke, Sr.); Heather Kendell (UNC, Jr.); Sara Anundsen (UNC, Sr.); Cassandra Price (Radford, Jr.); Claire Maust (Georgia, Sr.); Klaudyna Kasztelaniec (William & Mary, So.); Emily Klein (UNC Wilmington, Jr.); Lene Krog (East Carolina, So.)

Men's District 3 Winners
University Division
FIRST TEAM
Roberto Castro (Georgia Tech, Sr.); Kevin Nead (Florida, Jr.); Thomas Cunningham (Virginia Military Institute, Jr.); Luca De Matteis (Florida, Sr.); Ofer Finkler (Georgia Tech, Sr.); Geoff Handsfield (East Carolina, Jr.); Ed Douglas (Duke, Grad.); Richard Redding (Coastal Carolina, Sr.); Henrique Cancado (Old Dominion, Sr.); Ben Rubeor (Virginia, Jr.)
SECOND TEAM
Barden Berry (UNC, Jr.); Neil Savage (Virginia Tech, Sr.); Andrew An (Mercer, Jr.); Phillip Compeau (Davidson, Jr.); Jonas Enander Hedin (Charlotte, Jr.); Brendon Todd (Georgia, Sr.); Alex Kennon (Florida State, Sr.); Peter Borchelt (Virginia Military Institute, Jr.); Jonas Blixt (Florida State, Jr.); Ray Sheedy (Charlotte, Sr.); Benjamin Carlotti (UNC, Jr.); Pat Mellors (Virginia, Jr.); Dimitar Dimitrov (Appalachian State, Sr.)

Nearly 2 dozen FSU athletes accused of cheating

The Associated Press
Published on: 09/26/07
Tallahassee, Fla. □ Two athletic department academic assistance employees have resigned and 23 Florida State University athletes were implicated in cheating on tests given over the Internet, school officials said Wednesday.

The athletes represent nine sports and 17 of the students are or have been on scholarship. Officials could not identify the students and could not say which sports are involved because of federal confidentiality restrictions.

University President T.K. Wetherell reported the findings in a letter to the NCAA. He indicated inquires are continuing although an internal investigation failed to find conclusive evidence of a more widespread pattern of cheating.

The students could face punishment from the university and NCAA including loss of eligibility. The NCAA also could sanction the university, but spokesman Erik Christianson said it would be speculative and declined comment.

"I think the school took appropriate action," said Jim Smith, chairman of the university's board of trustees and a former Florida attorney general. "It's unfortunate something like this could happen."

Wetherell ordered an investigation by the university's Office of Audit Services in May after receiving information an athletics department learning specialist had directed one athlete to take an online quiz for another and then provided the answers.

The student who took the test was not enrolled in the class and reported what happened to his athletics academic advisor.

Neither he nor the other athlete, who had been unaware someone else took the test for him, were disciplined, the report said.

The investigation then found the learning specialist also typed papers for five students who apparently didn't qualify for that service and a tutorovided answers or other unethical assistance to 23 students for online tests. The testing involved a single course, which was not identified.

"Some students from the 2007 semester indicated that it was common knowledge among the student athletes that the tutor would help with the exams in the class," the report said.

The learning specialist and tutor resigned. They are not named in the report.

The tutor confirmed in an interview with the school's auditors that he had been assisting students with answers for the online exams since the fall of 2006, according to the report.

"Student testimony as well as the students' grades indicated the amount of assistance the tutor provided escalated from fall 2006 through his resignation during the summer semester 2007," the report stated.

The auditors also found the learning specialist had failed to direct athletes with disabilities to Florida State's Student Disability Resource Center where they could have received legitimate assistance.

The NCAA is also awaiting more details.

"We are aware of the situation and we will work with the institution when more information is submitted to our office," Christianson said.

Academic Fraud in Collegiate Athletics

Academic fraud cases have long been a staple of the National Collegiate Athletic Association's infractions list. The descriptions are pleasure reading for critics of big-time college sports who question the influence that determined athletics officials, administrators and faculty can have on keeping athletes eligible at all costs.

Of late, there's been no shortage of material:

* At Florida State University, a "learning specialist" and a tutor "perpetrated academic dishonesty" in a scandal involving 23 athletes, an internal investigation found. In some cases, the employees — both of whom resigned, according to the university — gave students answers to online exams and typed material for them.
* A former Purdue University women's basketball assistant coach, fired last year, was found to have partially researched and composed a sociology paper <http://www.insidehighered.com/news/2007/08/23/purdue> for a player and then lied about it to university officials who were looking into the allegations. The coach left an e-mail trail behind that proved to be the smoking gun.
* The University of Kansas received three years' probation last fall for a series of violations <http://www.insidehighered.com/news/2006/10/13/ncaa>, including a former graduate assistant football coach who gave two prospective athletes answers to test questions for correspondence courses they were taking at the university.
* Add to the list concerns over correspondence courses <http://www.insidehighered.com/news/2005/12/01/ncaa> that allow athletes to gain eligibility and the issue of "clustering <http://www.insidehighered.com/news/2006/07/20/sports>" — illustrated in the Auburn University case involving a sociology professor who is accused of offering specialized classes to athletes that required little work.

Whether or not cases of academic fraud have become more rampant or even more serious in recent years is up for debate; statistics on their occurrence (increased or otherwise) are hard to come by. But many agree that the climate has changed in college athletics in ways that may make such misbehavior more likely. And it has happened since the NCAA unveiled its latest set of academic policies <http://insidehighered.com/news/2005/03/01/athletes3_1>that raised the stakes on colleges to show that their athletes perform well in the classroom while simultaneously lowering the requirements freshman athletes must meet to become eligible initially.

Largely as a response to sagging graduation rates for football and basketball players, the NCAA put into place several years ago new academic rules that require colleges to report each term whether their athletes are on progress toward a degree — with penalties awaiting those whose students aren't progressing and aren't performing.

At the same time, the NCAA reversed its previous approach of continually raising initial entrance requirements and began allowing students with SAT scores as low as 400 (or a corresponding ACT score) to enroll so long as their high school grades were high enough. That move appeased critics of the standardized test score requirement who said it adversely affected minority students.

In the years since the changes, many have expressed concern that the combination of heightened academic expectations and lowered entrance regulations would put the campus employees responsible for providing academic support to athletes in a tough spot, asked to help a growing number of marginal students — potentially at all costs.

That fear is so real to James F. Barker, president of Clemson University, that he meets each semester with everyone who gives tutorial help or guidance to athletes and "reads them the Riot Act."

"I tell them, 'I'm responsible for 20,000 people and a half-a-million-dollar budget — those two things could keep me awake at night, but they don't. What does is academic fraud. No student-athlete is worth crossing that line for,' " says Barker, who also heads the NCAA's Division I Board of Directors, the panel of college presidents that governs the NCAA's highest-profile competitive level.

David Goldfield, a professor of history at the University of North Carolina at Charlotte who served on the academic eligibility and compliance cabinet of the NCAA, which helped craft the new policy, said he supports the new progress standards but still opposes lowering entrance requirements — which he said strains the entire system of academic support.

"When there's pressure applied you're going to get a reaction, and the reaction we're seeing is academic fraud cases," Goldfield said. "From a coach's perspective, the major task is to win, but now with the new requirements, the second and often equally pressing task is to maintain the eligibility of players."

Goldfield fears that academic fraud cases are far more widespread than just the ones reported to the NCAA. Compliance officers can have a difficult time tracking down such cases, he said, because they can involve wrongdoing by people in all parts of an institution, and often rely on self-reporting by athletics officials.

The NCAA did not have a comment for this article. Kevin Lennon, the association's vice president for membership services, said in a

statement
<http://www2.ncaa.org/portal/media_and_events/press_room/2007/september/20070928_fsu_statementb_rls.html>
about the Florida State case that "the NCAA and its member institutions take seriously any allegation of academic misconduct" and that "these types of violations are among the most serious that can be committed."

Lennon added that the NCAA is committed to its academic reform measures. The association has defended its eligibility changes by arguing that the focus should be primarily on what students can achieve in college and not just on their high school academic performance.

But some say that stance ignores the reality that unprepared students often can't cut it in college.

"Just because you're technically eligible to compete doesn't mean you are ready to compete in the classroom," said Tim Metcalf, director of compliance at East Carolina University.

Terry Holland, a longtime men's basketball coach at the University of Virginia who is now athletics director at East Carolina, said coaches and college officials are under increasing pressure to accept any student who qualifies under the NCAA's rules. In his meetings with other athletics directors, Holland said he hasn't encountered one yet who says athletes are better prepared now than they were five years ago.

"For many programs, the recruiting pitch is, 'We have a great academic support system and everyone graduates,' " Holland said. "Maybe what the athletes are hearing is, 'You're going to do the work for me. It may not be fraud, but I won't have to do as much.' "

Colleges have largely responded by devoting more resources to academic support services. They are hiring more tutors, building new academic centers and beefing up compliance offices.

If more academic fraud cases have surfaced in recent years, it's most likely a product of better reporting and more collaboration among those monitoring the athletics departments, said Phil Hughes, associate director of athletics for student services at Kansas State University and president of the National Association of Academic Advisors for Athletes.

Hughes said he understands the increasing demands on athletics and academic support employees, who are spending more time tracking real-time data for the Academic Progress Rate
<http://www2.ncaa.org/portal/academics_and_athletes/education_and_research/academic_reform/defining_academic_reform.html>

(the NCAA's primary new way of measuring athletes' and teams' classroom progress) and helping struggling students, which can take time away from helping other students, athlete or non.

Barker, the Clemson president, said he typically doesn't meet with the academic support staff who provides tutoring and other services to the general study body (as opposed to athletes) because he doesn't see the pressures of committing academic misconduct there to be as great.

At Clemson, both academic support offices report to the university's provost. Some have called for more colleges to remove the perceived wall between athletics and the rest of the academy by moving tutors assigned to athletes into academic affairs, or at least providing students and athletes with the same degree of academic support.

Hughes sees reason for optimism in the academic support landscape: Advisers who once felt like they worked directly for the football coach are increasingly reporting that they feel insulated from that pressure,

he said.

Holland, the East Carolina athletics director, said that simply adding more tutors doesn't get at the problem. Colleges still face the risk of having lower-level employees (often graduate students) making important judgment calls about what the proper boundaries are in helping a student stay eligible. The NCAA, he added, is also complicit in adding stress to academic support system by scheduling events during busy test periods instead of moving more contests to the weekend.

But Tomas Jimenez, executive director of the LSU Academic Center for Student Athletes, said he isn't convinced that entering students are any less prepared than before, or that the NCAA's new academic rules are leading to more cases of academic misconduct.

"It's always easy to point the finger at the NCAA, but it takes institutions to step up for academic support," he said.

Goldfield, the Charlotte professor, said he doesn't entirely blame athletics departments for misconduct, either. Faculty are often guilty of grade manufacturing or taking part in schemes in which athletes are funneled to their class and largely given a pass.

And what about the role of students in such scandals? Kerry Kenny, vice-chair of the Division I Student-Athlete Advisory Committee, which represents the interests of athletes in the NCAA's top competitive level, said that while it's unfair to judge all athletes by the actions of a few, the group as a whole needs to make better decisions about how they use help from academic support employees.

In the end, most agree it comes down to trust.

"We have to rely on the integrity of the people involved," Goldfield said.

— Elia Powers <mailto:elia.powers@insidehighered.com>

Comments

Until three months ago I was the faculty athletic rep. from Tulane and a member of the NCAA's AEC Cabinet, so I was involved with the creation of the new APR system that raises the stakes of not keeping athletes on track to graduate. When that system was being considered, everyone who thought about it knew that increasing academic standards would put put great pressure on coaches to improve their athletes' academic performance and thus would inevitably produce two effects: (1) some coaches would change behavior in desirable ways by recruiting better academically qualified student-athletes and by increasing the emphasis on good academic performance, and (2) some coaches would change behavior in undesirable ways by committing academic fraud and by creating bogus watered-down academic courses and majors. The hope was that there would be far more of the desirable behavior changes than the undesirable. But there was no doubt that there would be some of both. That we are seeing more instances of academic fraud is not only no surprise, it was virtually certain to happen. The question is by how much. I suspect we will never know exactly the answer to that question.

Gary Roberts, dean & professor of law at Indiana Univ. School of Law — Indianapolis, at 8:55 am EDT on October 2, 2007

End the pretense

If colleges are to offer athletic scholarships (an oxymoron: you start with an ox and end with a moron) they should not require the recipients to use them during their playing years but allow them to use them later when they are no longer eligible to play. That way, during the player's playing years he or she could concentrates on athletics without the pretense of being a college student. The college should pay the athlete a salary commensurate with his ability. Once his or her eligibility ends, he or she could use the scholarship to go to college if that suits his or her career plan. If the ex-player chooses not to pursue a college degree, or cannot qualify academically, then he or she should be allowed to surrender the scholarship for cash. The few (about 1%) whose talent qualifies them to join the professional leagues should be free to do so at any time, since playing careers are usually short and they need to make full use of their talent while they're young.

Why should the colleges subsidize the National Football League and the NBA by serving as their minor leagues? The pretense of semi-pro athletes playing in guise of college students interferes with the colleges' academic mission, as this article illustrates. If the colleges must have football and basketball teams to satisfy the alumni, let them sponsor teams but not require the players to pretend to be college students. Then the colleges could avoid scandals like the above.

Priority Registration Task Force (and others who are following this process):
The modified Priority Registration Proposal was approved by unanimous vote of the Faculty Athletics Committee yesterday and by a unanimous vote of the EPC today. The EPC requested one word-smithing modification: The eligibility condition for students with a disability is now "a diability for which priority registration is an approved accommodation."
Next step: Faculty Council this Friday has agenda item "Introduction of the Priority Registration Proposal" scheduled for 3:35. I will briefly describe the context, process, and specific proposal, and take "point of information" questions. Based on the level of interest, a decision will be made as to whether to schedule an information session for later in November and an extended discussion and vote on the matter at Faculty Council on Dec 7.

Thanks,
Steve

Letter of Transmittal to Accompany the Proposal for Priority Registration

A complex system of priority registration that is based on assorted traditions, permissions, and precedents has evolved at the University of North Carolina at Chapel Hill. There is a long history of efforts to establish a formal priority registration policy on our campus, and the goal of the Proposal for Priority Registration that is attached here is to provide a transparent, systematic mechanism for administering priority registration under appropriate scrutiny.

Informal conversations in fall 2006 led the Faculty Committee on Athletics to establish a task force to explore the possibility of proposing a priority registration system that would assist varsity athletes and other students who have notably difficult scheduling issues due to their university obligations. I was asked to Chair this task force. The initial members of the task force were Lissa Broome, Jack Evans, George Lensing (all from the Faculty Committee on Athletics), John Blanchard (Department of Athletics), and Robert Mercer (Academic Support Center for Student-Athletes).

To launch this endeavor, I consulted with various individuals regarding the groups of students who should be candidates to be covered by priority registration and the steps that would lead to a registration priority proposal being implemented. Conversations with Senior Associate Dean Bobbi Owen, Provost Bernadette Gray-Little, and Associate Dean of Academic Services Carolyn Cannon indicated that education majors, students with disabilities, and allied health majors were obvious candidates. Also, a plan emerged whereby if the Faculty Committee on Athletics endorsed the task force's proposal, the proposal would then be forwarded to the Registrar, and she would seek advice from the Educational Policy Committee regarding the proposal's merits pursuant to the charge of that committee to act "as a council of advice for the university registrar in administering faculty regulations concerning . . . registration."

To expand the task force's expertise, I consulted with Dean Tom James of the School of Education and on his advice, invited Jane Smith, Licensure Officer and Coordinator of Teacher Recruitment and Retention to join the task force. Subsequently, I also asked Anne Bryan, Director of Student Affairs of the School of Education to join. Beverly Foster, Chair of the Educational Policy Committee and Director of Undergraduate Studies in the School of Nursing; and Harold Woodard, Associate Dean of Student Academic Counseling, also agreed to join the task force.

After an initial meeting in December, the task force met four times and corresponded via e-mail. Our deliberations were focused on preparing the attached Proposal for Priority Registration. This

proposal addresses the general issue of priority registration and does not address enrollment priorities for select groups of students in particular courses (e.g., honor student enrollment in honor's classes, or eligibility for courses with supplemental instruction). Another issue that this proposal does not address is the problem facing a student who is off campus due to a university sanctioned event on the specific day when that student is expected to register for classes. These issues are adequately covered by current policies. It is our understanding that UNC currently allows students with learning disabilities to register before their classmates in order to reduce barriers to their academic success. The present proposal would formalize this policy and extend it to a broader group of students who are deemed eligible.

We consulted with the University Registrar Alice Poehls and Applications Analyst Megan Keefe regarding the feasibility of the plan. The Registrar also helped us compile the registration priority policies at other ACC schools and at universities that we consider to be our "comparables" by updating a report prepared by the previous Registrar, David Lanier, in 2002 (Survey of Registration Priorities for Athletes 2007 – attached). She also gathered new data regarding priority registration policies at our peer institutions (Registration Priority for Athletes and Others at Selected Universities – attached). We also examined information gathered by Robert Mercer concerning registration policies for athletes at schools in the ACC and some of our comparables (SA Registration Procedures at Comparable Universities – attached). On the basis of these data, we are confident that our proposal is feasible and well within the boundaries that have been adopted by comparable institutions.

One important aspect of our deliberations was to determine how many student athletes would be eligible to be considered for priority registration. Under the guidelines of our proposal, the Athletics Department could nominate a student-athlete for priority registration during a semester in which the student's practice obligation is at the NCAA maximum of 20 hours per week. John Blanchard prepared a table (attached) showing the number of weeks per semester in which varsity athletes are practicing at the NCAA maximum of 20 hours per week. One sport (cross country) has no official practices in the spring semester, so under the guidelines of our proposal, athletes who only participate in cross country (and are not members of the track & field team) would not be eligible for priority registration for that semester. Several sports practice at the 20 hour limit for only a few weeks a semester (e.g., baseball and softball in the fall semester). These students could be nominated for priority registration, but the Priority Registration Advisory Committee might advise against it on a sport-by-sport or student-by-student basis.

The Faculty Committee on Athletics reviewed the Proposal on May 1, 2007, endorsed it, and forwarded it to the Educational Policy Committee. Subsequently, Lissa Broome and Jack Evans raised the issue of priority registration with the Executive Committee of the Faculty Council. During the summer of 2007, I met with Student Body President Eve Carson to review the proposal, and I provided documentation to be posted on the Student Government website. I also met with Melissa Exum, Theresa Maitland, Jim Kessler, and Fred Clark to review the implications of this policy for students with special needs.

The Educational Policy Committee reviewed the Priority Registration Proposal on October 10 and October 17, and voted to return the Proposal to the task force with the request that clarifications be made regarding the scope of students who would be covered, the focus on groups of students rather than individual students, the expectations regarding annual reports, and the explicit inclusion of a four-year sunset provision that would require reauthorization of the Proposal after a thorough review by the Educational Policy Committee in collaboration with Faculty Council. A straw poll suggested that Educational Policy Committee members would vote in favor of the proposal if it incorporated the recommended changes.

I consulted with Lissa Broome and reconvened the task force with some change of membership. Specifically, Jane Smith was no longer available, but Anne Bryan continued to represent the School of Education. I also asked Theresa Maitland, Jim Kessler, and Fred Clark to join the task force. Modifications were made in the Proposal to incorporate the suggestions from the Educational Policy Committee. The Faculty Athletics Committee reviewed the revised policy on November 6, 2007 and approved it unanimously. The Educational Policy Committee reviewed the revised policy on November 7, 2007, made one minor modification, and approved it unanimously.

To summarize, we have made a diligent effort to formulate a priority registration system that solves obvious problems and has appropriate limitations and oversight to avoid misuse. The modifications suggested by the Educational Policy Committee are improvements. We look forward to a broad discussion of the proposal, and hopefully, its eventual implementation.

Sincerely,

J. Steven Reznick, Ph.D.
Professor and Director, Program in Child Development

Proposal for Priority Registration – November 7, 2007

Rationale

Some groups of undergraduate students encounter unusual challenges in our registration system that inhibit their academic progress and threaten their timely graduation. For example, students with physical or learning disabilities may require reasonable accommodations in order to reduce barriers to their academic success. Education majors in teaching programs spend the second semester of their senior year off campus as student teachers, and during their junior and senior year must complete specific courses required for certification in their areas of specialization. Nursing students must spend significant amounts of time in clinical rotations in order to meet licensure requirements. Varsity athletes must fit their class schedules with their practice/competition schedules so that they can make progress toward their degrees as required by the University and the NCAA. This proposal suggests a process for priority registration that provides a flexible but transparent approach to these issues.

Mechanism

A process for determining how students qualify for priority registration is described in subsequent paragraphs. Those students who qualify for priority registration will be allowed to register ahead of their cohort. UNC has adopted a new registration ordering plan in which the order in which students register is based on the number of semesters completed. Students who qualify for priority registration would receive the earliest assignment times for their semester cohort. In other words, a sophomore who receives priority registration would register before other sophomores but not before any juniors or seniors.

The Registrar will convene a Priority Registration Advisory Committee (the PRAC) that will meet each semester to review the student groups who have been recommended for priority registration. Members of the PRAC will be appointed by the Registrar and will include faculty, students, and administrators representing a range of interests and expertise. We recommend that the PRAC include some individuals who have had experience in educational policy, academic advising, and disability services.

Each semester, prior to the start of registration, an official who has responsibility for students who are potentially eligible for priority registration (e.g., a Dean, Director, or Department Chair) will send the Registrar a list of students who are recommended for priority registration and a rationale for the need for priority registration given the demands of the students' activities. The Registrar will forward these rationale statements to the PRAC along with a tally of the number of students being proposed (i.e., the Registrar will not give PRAC an actual list of names). In the interest of transparency and accountability, the PRAC's meetings will be open to the public, and all rationale statements and tallies as well as the PRAC's decisions will be publicly available. Having received advice from the PRAC, the Registrar will adjust assignment times for those students who are selected for priority registration.

The PRAC will review summary data regarding the operation of priority registration (e.g., the specific courses that are selected during priority registration) and suggest modifications to the Priority Registration Policy as needed. The Registrar will consult with the PRAC and seek advice from the Educational Policy Committee

regarding any amendments to the Priority Registration Policy. The Registrar will present an annual report to the Educational Policy Committee indicating the number of students who were granted or denied priority registration, and evaluating whether course selection during priority registration appears to be serving its intended purpose.

The Priority Registration Policy proposed here will be in effect for a trial period of four years. After four years, the Registrar will request that the Educational Policy Committee in collaboration with Faculty Council review how well the policy is working and make a formal recommendation regarding whether the policy should be continued as is, modified, or allowed to lapse.

Limitations

As a general rule, we recommend that no more than 25% of the seats in each section be available for priority registration. The Registrar and the PRAC will monitor the distribution of priority registration students across sections to determine whether any sections are being selected disproportionately. If significant over-enrollment occurs in selected courses, the Registrar will work with the department involved so that seat availability in selected courses is capped at 25% during the next priority registration.

Eligibility for Priority Registration

Priority registration will be extended to undergraduate students who encounter unusual challenges in our registration system that inhibit their academic progress and threaten their timely graduation. It is difficult to establish an a priori definition of "unusual", but the Priority Registration Task Force has identified three groups that would be exemplars of these unusual registration challenges. Thus, these student groups are eligible to be considered for priority registration if the students in the group meet any of the following conditions:

- The student engages in an activity that formally represents the University and by virtue of that representation is required to attend practices and events during hours in which classes are offered (e.g., varsity athletes during a semester in which the student's practice obligation is at the NCAA maximum of 20 hours per week);

- The student is enrolled in a degree program requiring that at least one semester be spent off campus (e.g., student teaching), that specific courses in Arts and Sciences be successfully completed in order to obtain licensure (e.g., Education majors), or that requires significant time be devoted to clinical practice (e.g., nursing, allied health, etc); or

- The student has a disability for which priority registration is an approved accommodation.

Other groups that may have comparable registration challenges may be proposed for priority registration by an official who has responsibility for their program (e.g., a Dean, Director, or Department Chair), and these groups will be reviewed by the PRAC. Individual students may not apply directly to the Registrar for priority registration.

Bcc: Brent Blanton <blanton@uncaa.unc.edu>
Subject: Priority Registration Update

Priority Registration Task Force (and others who are following this process): Balancing my optimism with realism, I am confident that the presentation at Faculty Council on Friday went well. The questions were reasonable and not notably hostile. Joe Templeton asked FC if an additional informational meeting would be needed. The response was a unamimous "no", but Anne Whisnant hopes to set up some form of on-line discussion. Student reaction in the DTH has been reasonable. In my opinion, the informational pieces on the 9th and the 12th were accurate and fair-minded, and the editorial on the 13th was reasonable albeit unrealistic: an open-application process for priority registration would be great, but it would require an office and staff dedicated to that task. Someday, maybe.
So, next step: FC will discuss the priority registration proposal on Dec 7 and vote on it. If the proposal is endorsed by FC, Alice will assemble the PRAC in December, and the new system will be in operation before registration begins for Fall 2008.

ACLU wants Bowden to stop team church trips
University denies players' rights violated

The American Civil Liberties Union has accused Clemson head football coach Tommy Bowden of abusing his authority by imposing his religious beliefs on his players, and it has asked the university to discontinue the coach's practice of strongly recommending that players participate in an annual team visit to a local church.
The university on Wednesday denied the ACLU's claim that Bowden, who is a state employee in a supervisory position, has violated the players' constitutional rights of separation of church and state.
The coach used publicly owned team buses to transport the team to the church this past August but will no longer be allowed to do so, school spokeswoman Cathy Sams said. "From our standpoint, this has been resolved for several months."
Neil Caesar, vice president of the South Carolina chapter of the ACLU, said the organization plans to press the issue. "The ball's in our court," Caesar said. "We just need to figure out what our response is going to be."

Advertisement

Frank Page, pastor of Taylors First Baptist Church and president of the national Southern Baptist Convention, called the ACLU's allegations "absolutely inane," and said the group is fighting "anything that is Christian."
"If the coach had taken his team to another religion, I doubt we would ever have heard from the ACLU," he said, adding, "He is doing what he thinks is best for the group, and absolutely no harm would come from that."
Page said using the university bus is appropriate.
"They take them to all kinds of places that are certainly less positive than that," Page said. "I just think the ACLU needs to find something better to do with its time."
University president James Barker was out of town Wednesday and wasn't available for comment, Sams said. Bowden was out of town and unavailable for comment, Clemson sports information director Tim Bourret said.
The ACLU filed a complaint with the university on Aug. 31. The complaint refers to comments Bowden made in The Greenville News in May in which the coach describes how he annually holds a "church day" for everyone on the roster and how one player's mother asked her son to be excused from the trip.
Bowden, who frequently refers to his Christian faith publicly, said in The News that the player's absence was "OK" and that "there's no intent to make anyone feel uncomfortable or awkward."
Caesar said that Bowden "has abused his authority as Clemson University's head football coach by imposing his strong personal religious beliefs upon student-athletes under his charge" and that the coach has created a situation wherein a player must "opt out" of something that is being billed as voluntary, bringing undue attention to that player's "apostasy."
Caesar questioned whether it would be acceptable if a Jewish or Muslim coach created an annual visit to a temple or mosque that players had to request to be excused from.
In a July letter to players' parents, Bowden expresses his Christian faith and his belief that "a young man's spiritual growth should be addressed, but done so in a very personal and private way."
The coach explains in the letter that "having said this, I strongly recommend attendance at a local church once per year as a team." In the letter, he instructs parents to call him if "this creates a concern for either you or your son."
In Clemson's Sept. 21 response to the ACLU's request to discontinue the church visit, university general counsel Clayton Steadman said "we decline to take this action and do not believe it is warranted."
The response cites Bowden's letter to parents and states that "the voluntary nature of the event is made very clear to students and their parents." The university's response points out that players have declined to participate in the past and none have been penalized.

The university didn't receive any complaints it was aware of from players or parents, Sams said on Wednesday.
Steve Lowe, president of the ACLU's Piedmont chapter, said on Wednesday that the ACLU didn't receive any complaints from players or parents but looked into the issue after ACLU board members raised concerns.
Caesar said on Wednesday that while the university "does seem to be taking this seriously," the ACLU still believes that Bowden is violating players' rights.
"A person who doesn't want to do it has to actively take steps to opt out of it," Caesar said. "It's not voluntary. It's something you have to get out of."
He said that "coach Bowden or anybody is allowed to be religious or express their religious preferences. How and when it might be done with student-athletes is an area that is kind of subtle and kind of nuanced and needs to be approached from that perspective."

Attach: TEXT.htm

All,

While you are working on your survey for Maryland, please review this minute from our November ACC Compliance Director's meeting here in Greensboro, NC. It appears as though Shane and Lindsey on our staff are discovering in their compliance reviews that many of your institutions may be misapplying this NCAA rule. Let me know if you have questions or concerns.

1. Hours Countable Toward Degree. Ms. Lindsey Babcock reminded the group that while counting hours toward degree for certification of continuing eligibility, NCAA rules require those hours to be included within a specific major, once a major has been declared and after the beginning of their third year. Some institutions may have been misapplying this rule when institutions accept all hours toward GRADUATION, however, these hours may not fit into the actual MAJOR requirements or electives. The following scenario was used as an example:

A student-athlete declares a major that requires 120 hours to graduate. Within those 120 hours 80 of those hours are specific requirements and the remaining 40 hours are electives. Students in that major are permitted to take additional electives; however, those additional classes must be considered above the 120 hours and therefore cannot be used for NCAA certification purposes. This student-athlete decides to take 43 hours of electives in his major. Now he will graduate with 123 hours but those 3 additional hours will not be countable toward degree by NCAA rules.

Attach: Textbook Purchasing Procedures - Loopholes.doc

Hey Mercer,
Good meeting this morning.

I typed up a summary of our discussion yesterday regarding the loopholes to the textbook purchasing process. Before I formalize this document, please take a look at it in detail and let me know your thoughts. Let me know if I am missing anything.

Thanks.
Susan

Susan Maloy

Plan of Action to Patch the Loopholes in the Academic Textbook Purchasing Procedures

What to do with books from courses that have been dropped?

If a student-athlete drops a course at anytime during the semester, he/she must return the books to their academic counselor promptly. When books are returned, the counselor will mark each book with the student-athlete's name, PID# and name of the course. The return date will then be recorded on the original requisition form maintained in the master alphabetical binder by the counselor or a staff designee. By recording this information on the original form, counselors will know right away that all required books and supplies for the dropped course have been returned. The Bookstore will provide a full refund to the Athletic Department when the books are returned by a staff member. Books that the academic counselors do not wish to keep as reference materials, will be returned to the Bookstore every week or two. Books that have been returned to the academic counselor must be kept under lock and key to prevent any possible theft.

To prevent the counselor from having to chase a student down for their books, one of two things should happen. 1.) Counselor will not sign an additional book requisition form until all books from the dropped class are returned; or 2.) Counselor will not sign a Drop/Add Form until the books are returned.

It may be helpful to provide a handout with brief instructions as to what to do with books from a course that the student has dropped.

If a student-athlete takes the books back to the Bookstore on their own, the Bookstore staff will need to check to see if they are an athlete. The Bookstore staff will inform the athlete that they may not accept their returned books and that they must return their books to their academic counselor in athletics.

How do we prevent a student from purchasing the same book twice?

If a book that appears on their original requisition form is not yet available at the Bookstore, the student-athlete does not need to complete a second form. The Bookstore will maintain the original requisition form at the service desk. The counselor must instruct the student-athlete to go to the service desk at the Bookstore in order to purchase the book.

If a student-athlete comes back a 2nd and 3rd time to purchase books, the counselor must refer to the master binder to review any previous requisition forms for that student to be sure that the book has not already been purchased.

Hi, Robert.

Attached is an eligibility report of all First-Year athletes.

There are currently 12 on Probation. All but 1 of these students have received all of their grades (see the last column).

6 Students are currently Ineligible. Only 2 of these 6 have all of their grades in.

I have contacted all students that are currently Ineligible and informed them about the process to appeal/request a semester of probation (see attached letter that was emailed today).

I will be out of town until the 26th. On the 27th, I will provide updated information and will begin contacting students on Probation.

Have a happy and healthy holiday!

Best,
Cynthia

Good afternoon.

Several people have been asking, so here are some general updates as of January 7, 2008. Please let me know if you have any questions and keep in mind these are still flexible/rough numbers.

Thank you,
Cynthia

There are currently 159 students on PR.

Out of the initial 1st First Year cohart of 3893 students: 15 withdrew before the end of the semester; 159 are PR and 11 are Ineligible.

Of the 159 students on PR, 107 have already completed the Self-Assessment (the first step in the Academic Enhancement Plan). All 107 Self-Assessments have been forwarded to academic advisors and student support services. All students who have not completed the assessment have been contacted by email and asked to do so.

Of the 159 students on probation: 19 are Athletes; 27 are Carloina Covenant; 4 are Summer Bridge; 51 are 1st Generation (neither parent holds a 4 year degree); 81 are minority.

Hi All,

It's that time again . . . Student-Athlete Handbook time . . . Attached you will find "your part" of the handbook. Please edit and track changes. I need to have your edited text emailed to me by May 18th to guarantee on time delivery.

Please contact me if you have any questions.

Thanks,
Cricket

STUDENT-ATHLETE SERVICES

STU

T-ATHLETE SERVICES

The Department of Athletics provides support services to our student-athletes designed to reach each student-athlete, based on his or her individual needs focusing on the individual as a whole. These services include the Academic Support Program, Student-Athlete Development, and the Carolina Leadership Academy.

MISSION STATEMENT

The mission of Student-Athletes Services at the University of North Carolina at Chapel Hill is to provide services and develop relationships which foster a climate that supports University of North Carolina student-athletes advancing toward graduation, building character, and developing leadership.

ACADEMICS

The Department of Athletics maintains an Academic Support Program to offer student-athletes the greatest opportunity to excel in academics while at the same time competing in intercollegiate sports.

MISSION STATEMENT

The mission of the Academic Support Program for Student-Athletes at the University of North Carolina at Chapel Hill is to provide programs and services in partnership with the University community to assist and encourage student-athletes in achieving academic success. These programs and services are designed to advance responsibility and enhance leadership potential, while inspiring educational excellence and an appreciation of the academic experience.

ROLE OF THE ACADEMIC COUNSELOR

Each intercollegiate athletic team is permitted to use the support programs conducted in the Academics Center through the guidance of their assigned Academic Counselor. Academic Counselors are available to help student-athletes reach their academic potential and career aspirations. They can assist student-athletes in developing time management skills, successful study skills, an individualized study plan, and other strategies to enhance personal growth.

Academic Counselors monitor the degree progress of each student-athlete, as well as monitor their eligibility status according to NCAA and UNC eligibility regulations. In addition, Academic Counselors in the Academics Center work jointly with the campus advising staff to coordinate the advising and registration processes. Academic Counselors also refer student-athletes to appropriate on-campus resources.

RESPONSIBILITIES OF STUDENT-ATHLETES

Students who represent the University of North Carolina in intercollegiate athletic competition are regular, full-time students of the University and, as such, have the same academic responsibilities as students who are not athletes. In addition, student-athletes must devote sizable amounts of time and energy to participating in their sports. Although the Academic Support Program offers a wide range of excellent academic services to student-athletes, the ultimate responsibility for learning and for following a program that leads to a degree lies, of course, with the students themselves.

Student-athletes at the University of North Carolina are expected to meet the following responsibilities:

1. To develop and maintain habits of learning commensurate with education at the University level and to pursue a program of study leading to a degree.
2. To know the provisions of the Code of Student Conduct and to abide by them.
3. To seek academic advice in the Office of Academic Advising and department of their major, or in the appropriate professional school, at the regularly prescribed times, and to pre-register every semester during the official pre-registration period. Advising offered by the Academic Support Program complements the regular University advising system. **Student-athletes are not free to bypass ordinary advising procedures.**
4. To attend all class meetings, labs, required discussion sessions, and required conferences with teachers for all courses. The only acceptable reasons for missing course obligations or appointments with teachers are serious illness, family emergency, or official travel to University-sponsored activities. The Academic Support Program provides each student-athlete with a travel letter to present to each of their professors along with their competition/travel schedule. By University policy, students are not to be penalized for absences from class and other academic obligations during those specified times when they are involved in University-sponsored activities. On the other hand, coaches have been advised that in the event of a conflict between practice

and a scheduled class or laboratory, make-up session, field trip, or student-teacher conference, students shall be permitted to miss practice without penalty. **It is an NCAA violation to miss class for practice.**

a) Students should be familiar with the University policy regarding class attendance as printed in the latest edition of The Undergraduate Bulletin, which states, in part, "Absences from class for valid reasons are excused only by the instructors. A student should present his or her explanation for any absences to the instructor at the next meeting of class."

b) Students should find out the instructor's attendance and makeup policies for all courses in which they are enrolled.

c) Students are responsible for all material covered in class when they are absent, as well as for all assignments due or assigned on a day when class is missed. Students must take the initiative to talk to their professors about making up work missed because of an absence as a result of athletics travel and competition (e.g., UNC, National Team, etc.).

d) For travel and competition that occurs during the final exam period, students are responsible for notifying their professors of the conflict and obtaining an exam excuse approved by an Academic Dean. Students should communicate all final exam conflicts to their Academic Counselor.

5. To fulfill all requirements of all courses being taken, including turning in all papers and assignments on time and taking all quizzes, tests, and final examinations on the scheduled dates.
6. To seek out the advice or help of the instructor about difficulties in a course, preferably during the instructor's regular office hours. If that time is not possible, arrange an appointment with the instructor at another time.
7. To keep their assigned Academic Counselor in the Academic Support Program and their coach informed of academic progress during the semester.

a) Students should notify their Academic Counselors of athletic commitments which might interfere with fulfilling their academic responsibilities every semester.

b) Students should speak with their Academic Counselors right away if they are having difficulty in a course.

c) Students for whom structured study or individual tutoring is deemed appropriate by their Academic Counselors must abide by the procedures of the Academic Support Program in availing themselves of those services.

d) Students should keep in mind that tutoring is never a substitute for class attendance.

8. To cooperate with and abide by their team's academic policies. For example, some teams require team members with averages below a certain grade point to turn in weekly academic logs.
9. To know and abide by the policies and procedures of the Academic Support Program.

PLAGIARISM AND THE HONOR CODE SYSTEM

All student-athletes should remember that they are to follow the University Honor Code at all times. The definition of the Honor Code is referenced in the Code of Conduct section of this Handbook.

Occasionally, scholastic dishonesty occurs as the result of a lack of information or misinformation. Everyone knows cheating on an exam is dishonest; however, students have, on occasion, turned in papers which they thought were acceptable only to find they were accused of plagiarism.

One area of essay or term paper writing that often causes students confusion is citing sources. **If you use another person's ideas or expressions in your writing without acknowledging the source, you are guilty of plagiarism.** Although most students understand that you are plagiarizing if you use someone else's work more or less verbatim, they do not realize that not giving proper credit for ideas, research conclusions, etc., is also considered plagiarism.

A good rule of thumb is to quote the unique or witty and paraphrase the rest; but, remember, if you are paraphrasing someone else's work, you must acknowledge your source either by direct quotations or by footnotes/endnotes.

It is often difficult to separate your thoughts from someone else's after reading an article. In general, do not write your thoughts while you are reading someone else's research material.

Many students have the most difficulty when they are asked to prepare a commentary or critique on a particular book. If you consult a critical essay or book review to stimulate your thinking, it is very likely that you will need to acknowledge/cite this material within your paper.

A simple principle helpful when trying to determine if you should acknowledge a source: If you knew it or it was your opinion **before** you did any reading on the subject, it need not be acknowledged/cited.

Remember, whenever specific facts, opinions, judgments, or explanations are obtained from your readings, they must be acknowledged/cited, even if you present the facts entirely in your own words.

PHILOSOPHY OF COACHES REGARDING THE ACADEMIC PERFORMANCE OF STUDENT-ATHLETES

Student-athletes look to their coaches for guidance in their lives. As such, the coach is usually in the best position to stress the importance of academic achievement in preparation for successful careers beyond the undergraduate level. Coaches best serve the interests of the student-athletes when they emphasize the importance of academic achievement. Coaches promote academic achievement by:

1. Understanding the academic expectations that the faculty hold for student-athletes.
2. Creating an atmosphere in which team members strive for stated academic goals.
3. Making class, laboratory, and required study session attendance mandatory and enforcing this policy.
4. Scheduling practice sessions that minimize conflict with courses and excusing students from practice when these conflicts occur. Again, it is an NCAA violation to miss class for practice.
5. Regulating the amount of practice, competition, and travel time such that each week the students are able to devote a minimum of 2 hours, for each credit hour taken, to academic pursuits; this time is exclusive of time spent in the classroom.
6. Advising students to take advantage of the off season to enhance significantly their academic standing within the University. While conditioning and athletic skill enhancement may occur during this time, the student should have every opportunity to lead a "normal" student life.
7. Arranging travel time to minimize missed classes, labs, and required study sessions.
8. Structuring study times during extended travel periods.
9. Requiring that each team member contact the Academic Support Program (ASP) staff to discuss academic progress at the time interval determined by the ASP staff. Decisions made by the ASP staff regarding the amount of time each team member should be spending in structured study should be strictly adhered to. Students who are not making satisfactory academic progress, in the view of the ASP staff and/or the coach, should be instructed to substitute supervised structured study time for time normally devoted to athletic activities.
10. Providing special recognition for students who meet or exceed the stated academic goals and for those students who demonstrate improvement over last semester's academic performance.

CLASS REGISTRATION DURING TRAVEL AND COMPETITION

When student-athletes are traveling for athletics competition or competing at home on their specified registration date, a system is in place through which student-athletes may be registered by the Academic Support Program for Student-Athletes staff provided he or she is on the travel roster. All students *with advising flags* are expected to see their Academic Advisors in Steele Building to discuss course selection, receive their PIN #, and remove academic registration holds as soon as the advisement period begins. Appointments to see advisors should be made online. Students must then complete the Pre-registration Form in the Academics Center and return it to their Academic Counselor no later than 5 pm on the Wednesday before their registration date. This form should include a preferred list of courses totaling at least 12 hours including section number, day and time, and a list of several alternate courses. Student-athletes who have financial holds on their account will not be registered until those holds are removed; thus it is important to review your student account prior to submitting pre-registration materials to the Academics Center. Upon return from competition, it is the responsibility of the student-athlete to review his or her academic record online or meet with his/her Academic Counselor to ensure that the class schedule for the upcoming semester is correct.

DROP/ADD APPROVAL FOR STUDENT-ATHLETES

Each semester (fall, spring, and summer) after the last day to drop a course using the web registration system, student-athletes must obtain written approval from their athletics academic counselor, in addition to their Arts & Sciences academic advisor, in order to add or drop a course. PLEASE NOTE that student-athletes must continue to attend class in the course(s) that they wish to drop until the written approvals from both their advisor and counselor have been granted.

In some cases, the professor may drop you from a course if you do not attend the first and/or second day of class. Though you will be removed from the class roll, you still MUST follow the appropriate steps required for dropping a course. Failure to do so may result in an "F" as a final grade.

ACADEMIC TEXTBOOK PURCHASING POLICY

- Student-Athletes designated to receive books as part of their scholarship must follow the proper protocol when purchasing academic textbooks.
- Student-Athletes must obtain a textbook purchasing form from the Academics Support Center, complete this form, and obtain signatures from the appropriate Academics Support personnel.

- Only textbooks and course materials that are stated explicitly on the course syllabus as **required** may be purchased through the book scholarship program.
- Only textbooks and materials that are required by a course for which the student-athlete is officially registered for may be purchased through the book scholarship program.
- Student-Athletes designated to receive books as part of their scholarship are allotted a maximum of $600 per semester to buy books. Exceptions may be approved on a case-by-case basis at the discretion of the appropriate Academics Support personnel.
- Student-athletes are ultimately responsible for the purchase and safeguarding of their books. If books or materials are lost or stolen, it is the student-athlete's responsibility to report the loss to the police. A police report is necessary in order to purchase replacement books and course materials through the book scholarship program.
- Student-athletes have up to one month after the first day of classes to purchase required textbooks and/or course materials and submit a receipt for reimbursement of textbook and course material purchase. Exceptions may be approved on a case-by-case basis at the discretion of the appropriate Academics Support personnel.
- If a student-athlete drops a course, all textbooks and materials must be returned immediately to the appropriate Academics Support personnel.

CHANGING YOUR MAJOR

You are required to officially declare a major before your fifth semester. After the beginning of your junior year, you may not switch from one major to another without the approval of your University academic advisor. Your course of study during your junior and senior years must include the minimum departmental requirements for your major in addition to any other courses selected by you and your University Academic Advisor. All courses must be applicable towards NCAA degree progress requirements (see NCAA Academic Requirements section).

Before changing your major, notify your Academic Counselor.

SUMMER SCHOOL

Every effort should be made to maintain satisfactory progress toward a degree. If, despite your best efforts, it becomes necessary for you to attend summer school, please consult with your head coach. **Because of budgetary restraints, it is not always possible to cover summer school expenses for every student-athlete who wishes to attend summer school.** However, it is a departmental goal to have all student-athletes graduate, so as much help as possible is given.

If you need more information on the summer school program, online courses, correspondence courses, or independent study courses at the University, please contact your Academic Counselor.

If you wish to attend summer school at a university other than the University of North Carolina, you must first obtain written permission from the Office of Undergraduate Admissions to ensure that the hours will transfer.

The Department of Athletics does not pay for courses taken at other universities. Summer school at other universities cannot improve your GPA, as only the credit hours, if approved by the Office of Undergraduate Admissions, will transfer. You must make a "C" or better in order for the hours to transfer.

ONLINE COURSES

Carolina Courses Online is becoming increasingly popular. Each course follows the University calendar for the term in which it is offered and is therefore counted within the total hours of enrollment (12 credit hours or more). Students may register for only one online course per semester. There may be athletic scholarship/grant-in-aid implications when registering for an online course. **Students who wish to take an online course must meet with their Academic Counselor for approval before officially enrolling in the course.** *See Policy for Funding Online Courses in Financial Aid section for information on payment of online courses.*

UNC-CH ACADEMIC ELIGIBILITY REQUIREMENTS

To be eligible to remain in the University, a student **who entered UNC prior to the fall of 2007** must meet the following minimum requirements:

To begin the third semester in residence:
1.50 grade point average and 24 academic semester hours (cumulative)
To begin a fifth semester in residence:
1.75 grade point average and 51 academic semester hours (cumulative)

To begin a seventh semester in residence:
1.90 grade point average and 78 academic semester hours (cumulative)
To begin a ninth semester in residence:
2.00 grade point average and 105 academic semester hours (cumulative)

Students are expected to complete their degree in no more than 9 semesters. If additional time is needed, students must submit an application for a 10th semester to the Dean's office for approval prior to their 9th semester. A plan to seek a 10th semester should be discussed with your Academic Counselor one year in advance to begin the necessary process with your college or school. Students **do not always** receive University permission for a 10th semester in residence. Each Academic Counselor will verify with their coaches in July which of their athletes will be in need of a 10th semester. The list of students the counselor receives from the coaches will be given to the Director of the Academic Support Program, who will forward it to the Associate Dean of the Office of Academics Advising.

First-year students entering the University on or after May 14, 2007 are required to meet the requirements listed below. These standards will apply to sophomore transfer students beginning Fall 2008 and to junior transfer students beginning Fall 2009.

Eligibility Standards
Good standing entitles a student to enroll in a fall or spring term. The requirements for ordinary ***Good Standing*** *are as follows:*
A 2.0 cumulative grade-point ***and*** *the following number of credit hours passed:*
9 hours to enter a second semester
24 hours to enter a third semester
36 hours to enter a fourth semester
51 hours to enter a fifth semester
63 hours to enter a sixth semester
78 hours to enter a seventh semester
93 hours to enter an eighth semester
Special permission of the Dean to enter a ninth semester

A student who falls short of these standards will be considered in ***"good standing-on probation"*** *for one semester provided he or she passed at least nine credit hours of graded coursework in the preceding semester and was not already on probation. Probation is considered good standing.*

Academic Ineligibility
Students who do not qualify for automatic probation or who do not meet cumulative eligibility standards after a probationary term are ***academically ineligible*** *and may not enroll in a spring or fall term.*

NCAA ACADEMIC REQUIREMENTS
Those students first entering a collegiate institution full-time prior to August 1, 2003:
To be eligible for athletic competition, students must (1) pass 24 academic hours within the span of one calendar year (fall, spring, and summer semesters), **or** (2) pass an average of 12 academic hours per semester for every semester that a student has been in attendance since initial enrollment at the University. In addition, **75% of these hours** (18 hours) must be earned during the fall and spring semesters. The remaining 25% of these hours (6 hours) may be earned in the summer. Further, a student must earn at least 6 degree applicable hours during each regular academic term to be eligible to compete the following term.

To be eligible for athletic competition, students must meet the following minimum satisfactory progress requirements:

Entering the fifth semester:
1. The student must have declared a major.
2. The student must have completed 30 hours toward his/her degree program (25% of the required 120 hours for graduation).
3. The student must have a 1.80 cumulative GPA (90% of the 2.0 that is required for graduation).

Entering the seventh semester:
1. The student must have completed 50% of his/her degree program (60 hours).
2. The student must have a 1.90 cumulative GPA.

Entering the ninth semester:
1. The student must have completed 75% of his/her degree program (90 hours).
2. The student must have a 1.90 cumulative GPA.

Those students first entering a collegiate institution full-time on or after August 1, 2003:
To be eligible for athletic competition, students must meet the following minimum satisfactory progress requirements:

Entering EACH semester:
1. The student must have completed a minimum of 6 semester hours of *degree applicable* academic credit in the previous full-time regular academic term.
2. The student's GPA must be certified on a term-by-term basis, which means that the GPA listed below must be maintained throughout the year.

Entering the second year (third semester):
1. The student must have completed a minimum of 24 hours of academic credit.
2. At least 18 of these hours must have been earned during the regular academic year (fall and spring semesters). The remaining 6 hours could be earned during the summer.
3. The student must have a 1.8 cumulative GPA (90% of the 2.0 that is required for graduation).

Entering the third year (fifth semester):
1. The student must have declared a major.
2. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
3. The student must have completed 48 hours toward his/her degree program (40% of the required 120 hours for graduation).
4. The student must have a 1.9 cumulative GPA (95% of the required 2.0).

Entering the fourth year (seventh semester):
1. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
2. The student must have completed 72 hours toward his/her degree program (60% of the required 120 hours for graduation).
3. The student must have a 2.0 cumulative GPA (100% of the required 2.0).

Entering the fifth year (ninth semester):
1. The student must have completed a minimum of 18 hours during the institution's preceding regular two semesters.
2. The student must have completed 96 hours toward his/her degree program (80% of the required 120 hours for graduation).
3. The student must have a 2.0 cumulative GPA (100% of the required 2.0).

FOR ALL STUDENTS
- Hours earned from repeated courses will not count toward eligibility.
- PHYA activity hours do not count toward eligibility, with the exception of Lifetime Fitness courses
- Taking level one of your high school foreign language will never count toward graduation. It will only count toward NCAA progress toward degree if it is taken in your freshman year of enrollment.
- If you miss a complete term or are unable to complete a term, you must review your eligibility status with your athletics Academic Counselor and the Assistant Athletic Director for Certification and Eligibility.

ELIGIBILITY FOR POST-SEASON COMPETITION BETWEEN TERMS
In order for any student-athlete to be eligible to compete in post-season competition (e.g. conference tournament, bowl game, NCAA Championships, etc.) that occurs between regular terms (including summer), he/she must pass six degree-applicable hours during the preceding regular academic term of full-time enrollment. For example, if football is participating in a bowl game in December or January, all student-athletes must have passed a minimum of 6 hours toward their degree that Fall semester in order to participate in the bowl game. Additionally, student-athletes who are in their final season of competition and are enrolled in an approved underload of less than 12 hours must pass a minimum of 6 hours the preceding regular academic term. If the student-athlete is enrolled in an approved underload of less than six hours, he/she must pass the number of semester hours in which he/she is enrolled during the preceding regular academic term.

FULL-TIME ENROLLMENT
All student-athletes must be enrolled as a full-time student in a minimum of 12 academic hours, not including Physical Education activity courses, in order to be eligible to practice and compete. At the start of each semester, students will have 5 class days to register themselves in a minimum of 12 hours. During these 5 days, student-athletes are permitted to practice but NOT compete.

Only seniors in their last semester may apply and take less than 12 hours, i.e., an underload. These graduating seniors must seek written approval from their college dean for this underload and provide copies of their approval to the Registrar's Office and the Academic Counselor.

UNC GRADUATION REQUIREMENTS

To qualify for an undergraduate degree, a student must successfully complete at least 120 semester hours, although some programs' requirements are higher than this minimum. In addition to these semester hours, you are required to complete 2 physical education activity courses. Athletes receive credit for 1 physical education course through participation on an intercollegiate team. Please check with your coach to ensure that he or she has submitted your name to the Department of Exercise and Sport Science for this credit to be applied toward your academic record. Also, the student must have a 2.0 cumulative grade point average in all work attempted at the University of North Carolina.

The required 2.0 average must be earned in a total number of hours not to exceed 45 hours beyond the minimum graduation requirements (120 hours) for the degree being sought. A minimum of 45 hours of academic credit must be taken at UNC-CH. 24 of the last 30 hours must be taken on the UNC-CH campus. In the College of Arts and Sciences, generally at least 18 semester hours of work with grades of "C" or higher are required in the student's major, and at least half the student's major must be completed at this University.

Students who are going to graduate must:

1. File an application for a degree at least one semester before the expected date of graduation with the Dean of your college.
2. See their University Academic Advisor to complete an official degree audit form at least one semester before the expected date of graduation. Students should verify their graduation status with their advisor.
3. Pay all tuition, fees, and other obligations owed to the University before receiving a diploma.

GRADING SYSTEM

A letter grade and plus-minus system for evaluating academic performance is employed for all undergraduates. Each letter grade receives a numeric value (quality points) for the purpose of determining a student's grade point average for a semester's work and for averaging grades for all semesters' work to find a student's cumulative grade point average.

The letter grades, and the quality points represented by each, are as follows (all numeric values are per hour):

A = 4.0	A- = 3.7	B+ = 3.3	B = 3.0	B- = 2.7
C+ = 2.3	C = 2.0	C- = 1.7	D+ = 1.3	D = 1.0
F = 0.0	FA = 0.0	AB = 0.0	IN = 0.0	

TEMPORARY GRADES:

Temporary grades of **IN** or **AB** carry the force of an F until replaced by a permanent grade. Courses assigned a grade (or notation) of **PS, NG, NR, or W** are not considered in establishing a grade point average.

PASS/D/FAIL CLASSES:

A student may register for a maximum of four credit hours per semester under the "Pass/D/Fail" grading system. A total of 11 Pass/D/Fail credit hours may be applied to graduation requirements. Course content and requirements are the same for Pass/D/Fail registrants as for regular students. The minimum performance for a **PS** grade is equivalent to the minimum performance of the letter "**C-**". **A student can only sign up for a Pass/D/Fail grade in a class they wish to use for an elective.**

To take a course Pass/D/Fail, a student must complete the Pass/D/Fail course registration form. It is obtained from their Academic Advisor or Dean's office. The period for making Pass/D/Fail declarations begins on the 5th day of classes each semester and concludes at the end of the **eighth** week of classes. Once a form is submitted, the declaration cannot be changed.

DEAN'S LIST

To be eligible for the Dean's List, you must have:

1. A 3.2 grade-point average with no grade lower than C and be enrolled in 15 or more hours of letter grade credit (exclusive of physical education activities courses); or
2. A 3.5 grade-point average and no grade lower than a C and be enrolled in at least 12 hours but fewer than 15 hours of letter grade credit (exclusive of physical education activities courses).

ATLANTIC COAST CONFERENCE ACADMEIC HONOR ROLL
To receive recognition on the ACC Honor Roll, students must earn a 3.0 GPA or better for the academic year, which is a combined average from the fall and spring semesters.

SCHOLARSHIPS, AWARDS, AND INTERNSHIPS
Numerous postgraduate scholarships, academic and leadership awards, along with internship opportunities, are available to all UNC student-athletes through a competitive application process coordinated through the Academic Center. For information about these opportunities, see your athletics Academic Counselor. A complete description of all scholarships, awards, internships, and their deadlines are available upon request.

CLASS ATTENDANCE
Go to class! It cannot be emphasized enough that there is a direct correlation between classroom attendance and academic success. Be sure to attend your classes each time your classes meet.

Be aware that certain classes, for example English 100, 101 and 102, have very strict attendance rules. If you exceed the specified number of absences allotted, you automatically fail the course, even if your grades are excellent. There is no such thing as an "excused absence." Whether you are hospitalized or on a team trip, it is still counted as an absence. Your class attendance and academic progress is monitored by your Academic Counselor and reported to your coach. You should inform your professor if illness requires you to miss a class. If a conflict is caused by away games, your professors are usually more than willing to assist you in resolving this conflict when advance notice is given. You will be given a letter from the Director of the Academic Support Program to give to each of your instructors at the beginning of each semester. Your travel schedule will be attached to this letter. The letter will state that you will make up any missed assignments due to team travel and that you will remind your instructor of all approaching travel dates. **Be sure each of your instructors receives this letter!**

MISSING FINAL EXAMS DUE TO TRAVEL AND COMPETITION
The possibility of missing a final exam due to post season competition opportunities may arise. Should this occur, student-athletes must immediately notify their professor and their athletics Academic Counselor and obtain an exam excuse from a Dean in the Steele Building. Confirmation of the departure and competition dates will be provided to the Dean by the Academic Support Staff.

TUTORING PROGRAM
The Academic Support Program provides quality tutorial instruction to student-athletes. The program employs qualified personnel who tutor major subjects offered by the University. Students meet regularly with tutors during evening and daytime hours for individual instruction. Assisting students with comprehension of subject matter, test-taking strategies, and study techniques, the tutors continue to form a strong foundation for the success of the Academic Support Program. Additional tutorial assistance can also be obtained through other on-campus services such as the Learning Center, the Writing Center, and the Math Help Center.

SUPPLEMENTAL INSTRUCTION
Supplemental Instruction (SI) is a learning enhancement program designed to organize and improve the ways in which students prepare for class outside of the classroom. SI is attached to courses to provide students with a systematic and disciplined approach for processing the course material assigned by the professor. SI leaders are assigned to each of the "perspective" courses selected. Student-athletes will be identified to join a SI group at the beginning of each semester. The meetings will take place during their regular study hall hours. The SI supervisor will attend class and lead the SI sessions.

COMPUTER LAB
The Academics Center houses its own computer lab for student-athletes. The lab holds PC-compatible computers plus 2 laser printers. The computers are equipped with standard applications, such as Microsoft Word, Excel, Power Point, and Publisher. All computers also have internet access as well as access to the University email system. The lab is staffed with a lab manager and lab monitors to help students with computer questions and issues.

STRUCTURED STUDY
The Academic Support staff views structured study the same way your coach views practice. Those student-athletes assigned structured study hours are expected to attend regularly, come on time, and be prepared to study. During structured study periods, you must study in designated areas.

In general, all freshmen on an athletic scholarship, any student-athlete who has less than a 2.0 GPA, and those student-athletes recommended by an Academic Counselor or a head coach are required to attend structured study. All student-athletes are welcome to use the academic facilities Sunday through Friday; however, because of the limited amount of space in the evening structured study program, those wishing to attend should talk to their Academic Counselor. Please contact the Academics Center staff for hours of operation as they may vary throughout the semester.

The following are the only acceptable reasons for missing structured study:

1. You are hospitalized;
2. You are attending a review session held by your professor;
3. You have a scheduled game; or
4. You are on a team trip.

A question frequently asked is, "Can the time I spend in the library be substituted for my structured study hours?" The answer is **NO**. If you are required to attend structured study, you must spend the full time required in the supervised study areas of the Academic Center.

STRUCTURED STUDY RULES

The Academic Center's study programs are designed to maintain a comfortable and conducive academic environment. The following rules apply to all student-athletes using the facility:

1. Arrive promptly.
2. Come prepared to Study: have the required books, papers, notebooks, etc.
3. Do not disturb other student-athletes who are trying to study.
4. Food or drinks are not allowed.
5. Radios, personal stereos, cell phones, magazines, etc. are not allowed.
6. Proper attire must be worn in structured study.
7. Smoking and chewing tobacco are not allowed in the Academic Center.
8. Falsifying forms used by the Academic Support Program is an Honor Code violation.
9. Disrespect of the staff and/or tutors/monitors will result in immediate disciplinary action.
10. NCAA rules require that staff phones be off-limits. Copiers are available ONLY by approval of a support staff member.
11. Inappropriate language will not be tolerated.
12. No viewing of inappropriate web-sites is permitted in the computer lab or on laptops in Study Hall.

STRATEGIES FOR ACADEMIC SUCCESS

For students of all academic achievement levels, there are general rules that will help you perform to your academic potential. They are as follows:

1. Attend class. Tests are most often based on the material covered in class. If you are going to be away from campus for a game, alert your instructors ahead of time. Get your assignments in advance, if possible, and determine when the work is due. Let your instructor know when you are ill. Your class attendance may be one criteria used by your professor when assigning final grades.

2. Go to class prepared. You should have all reading and written assignments completed on time. If you go to class unprepared, it is often difficult to understand the material presented in class. Also, your instructor may tag you as a student with a poor attitude, which may influence your grade.

3. Know your instructor. Introduce yourself to your instructor; if you have any questions relative to the course throughout the semester, meet with your instructor. Your professor is interested in your performance in the classroom and will generally be happy to discuss material related to the course with you.

4. Make a good impression. Go to class on time. Entering class late causes a disruption. Do not read newspapers, listen to radios, etc. in class. It is recommended that you sit near the front of the classroom and not within a large group of student-athletes.

5. Don't let little problems become big problems. If you feel yourself falling behind in class, contact your Academic Counselor for help. Also, remember your instructors are there to teach. Don't be afraid to make an appointment and ask a question about material you don't understand. Make sure someone knows you need help before you reach the point where you cannot possibly do well in the course.

6. **Use tutoring help wisely.** Tutors are available in select subjects. They are there to help you understand your assignments, not to do your work for you. If you don't have the notes or haven't read the assignments, tutors will not be able to work with you. If you require a tutor in a special subject that is not normally provided, inform your Academic Counselor as soon as possible.

Feature
Walking a thin line
The rewards of academic advisement are great, but so are the pressures
By Michelle Brutlag Hosick

When academic-support staff members in athletics departments talk about their jobs, they use words such as □passion,□ □fulfilling□ and □rewarding.□

But lately, they also are using words such as □grind,□ □burnout□ and □pressure.□

It□s always been like walking a tightrope. Some who work in academic advising lose their footing and drop out of the profession; others find the right balance between the upside and the downside of the job.

After five years of academic reform in the NCAA, the lofty goals of that high-wire act □ keeping student-athletes playing games while steadily working toward and ultimately earning degrees □ seem more within reach in Division I than ever before. But the downside hasn□t disappeared, and more and more advisors are warning that recent reforms are shaking the rope a bit.

In many ways, the extra attention that observers □ ranging from institutional presidents to journalists □ are paying to student-athletes□ academic success has been positive for academic-support staff. Their work is more valued. They get more recognition for a job well done. The pay is sometimes better.

But expectations are higher, stress levels have increased and downtime has become almost nonexistent.

□You□ve got to monitor everything□

As academic standards have increased, so have the requirements for documentation, monitoring and paperwork. Some institutions have hired staff specifically to collect and analyze academic-performance data generated by student-athletes.

That□s the case at Minnesota, where Mark Nelson is director of the McNamara Academic Center. Minnesota hired an analyst to work full time with the registrar□s office and compliance office, searching data to reveal trends indicating who is successful and who is not □ and why. Nelson spends much of his time examining graduation rates and Academic Progress Rates.

But the challenge goes well beyond tending to marginal students. Before academic reform, □good students□ mostly were left alone after initial discussions about classes and schedules, unless they asked for help. Not so anymore, said Steve McDonnell, associate athletics director for academic services at Texas A&M.

□You□ve got to monitor everything,□ he said. □We have to make sure all students know what the rules are and what they need to keep us informed about. While that□s not a bad thing, it is more demanding of your time.□

Jim Rost, director of the student-athlete enhancement center at Middle Tennessee, cited increased monitoring of student-athletes as the most significant change in his job since academic reform began, and he believes it is creating a dilemma.

Academic-support units must pay attention to all student-athletes, but they also must allocate resources appropriately and effectively. It□s getting tougher to focus on individual needs, and even to know what those needs are, as academic advisors find themselves dealing with more student-athletes.

□If you don□t know what□s happening, how can you possibly know how to intervene?□ Rost said. □You can□t use your resources effectively if you don□t know the student-athletes and what their needs are.□

That problem cuts right to the bone for academic advisors. Most, such as Kim Durand, associate athletics director for student development at Washington, entered the profession precisely because they want to help student-athletes succeed outside the arena.

□I□ve always been challenged, impressed with collegiate student-athletes at every level,□ Durand said. □There□s not a day that goes by that I don□t get up in the morning and I□m excited to go to work.□

But she admitted that excitement is tempered when she runs into some of the unintended consequences of academic reform.

Sometimes, advisors will tell you that they struggle a little with what is good, solid academic advice and what they need to do to make a student-athlete aware that these choices might impact their eligibility, she said. Examples include stiffer progress-toward-degree requirements and a rule requiring student-athletes at schools on the quarter system to pass six hours of coursework per academic term.

Academic advisors are trained to consider what s best for a student, but those who work in athletics oftentimes find themselves toeing a fine line.

They might encourage student-athletes to stretch their limits by taking challenging courses. But they also must consider that student-athletes need to meet specific grade standards and show progress toward a degree in order to compete and to retain a scholarship. The resulting advice always is tempered by the need to keep a student-athlete eligible for competition.

In your heart, you might believe that part of the college experience is having some academic freedom to fully explore what a university has to offer, Durand said. But sometimes, that advice could be at a detriment to the student s progress.

Tom s Jimenez of LSU described the conundrum this way: Academic advisors are kind of caught between two worlds the powerful enterprise of college athletics and the pure education of students.

Upside/downside

Balancing the requirements of those worlds can be tough, but the effort can yield rewards.

Many academic advisors believe that recent reforms have created a positive environment for student-athletes, encouraging them to always be aware of eligibility standards and their own academic standing. More student-athletes are thinking for themselves about such things than in years past, said Donald Reed, associate athletics director for academic services at Buffalo.

They do feel a sense of urgency more now than before, he said. I look at it as stimulating life lessons. When we go into our professions, there always is some level of urgency as far as completing tasks or meeting standards to be successful. This is helping our student-athletes understand the academic commitments and that there are standards that must be met.

Another benefit: Not only has the advisors relationship with the student-athletes shifted, but they also are seeing a change in other relationships opportunities to build more partnerships outside the walls of the athletics department.

Whether they call it north campus, upper campus or something else, academic staffers are spending more time with people who work there: admissions personnel, registrars, financial aid officers, deans and others. They have meetings, they review paperwork and they make sure student-athletes are on the path to graduation.

And some say that relationships with coaches are stronger than before. Many coaches respected the work of the academic professional even before academic reform, and now that respect has grown.

They see us more as professionals, Texas A&M s McDonnell said. When you talk to coaches, they tell you we have the toughest job, that they wouldn t have my job for anything. In general, they have a genuine respect for what we do in our profession.

As penalties for classroom failures have become a Division I reality, coaches who rarely dabbled in the academic side are beginning to realize the true value of the academic-support staff. They ve become more knowledgeable about academic issues, which makes for a strong partnership. After all, coaches can provide the carrot, or wield the stick, of playing time in urging student-athletes toward better academic performance.

Meanwhile, others who have desired, and perhaps even demanded, academic success from student-athletes university administrators, faculty and staff also are becoming more directly engaged in achieving the goal. It s more of a partnership, Middle Tennessee s Rost said. Our president is tremendously involved. It really starts at the top and moves on down.

The academic/eligibility vise

But even with such help, academic advisors still bear the basic responsibility for achieving results. In fact, one type of help in the form of increased financial resources for academic support seems to be heightening the pressure by increasing that accountability.

As the media report APRs and Graduation Success Rates of football and basketball teams at championship selection time, academic personnel get more public scrutiny. When schools pour money into academic programming but results still are slow in coming, the glare of the spotlight can be harsh.

Universities have put in a lot more resources to these units, staffing and money for programming, Rost said. That puts a little bit more emphasis on our department to have a succinct, clearly defined mission in place to make sure we are using all the resources we

have for the student-athletes. There□s more accountability when things are missed. Universities are saying you have all these resources available, you should have known about this.□

Academic staff may be responsible for advising errors, but some suggest it□s unfair to hold advisors responsible in cases in which student-athletes simply are ill-equipped or unmotivated to perform in the classroom.

□I don□t believe it□s uniquely our responsibility to make sure student-athletes succeed,□ Rost said. □It□s up to the student-athletes to be intrinsically motivated, to value their education and do what they□re supposed to do. There is a fine line between babysitting and actually teaching them.

□It□s the student-athletes□ responsibility to go to class, to take the tests, to write the papers. It□s our responsibility to provide the best environment for them to be as successful as possible.□

Jimenez said academic support may not be enough to help student-athletes who enroll unprepared for college studies. In such cases, he said, it□s not the academic staff□s job to provide remedial education.

□We certainly can□t perform miracles,□ he said. □It□s a societal issue. We□re talking about education and the educational attainment of our young people. When we work with young people, we provide support services. We try to supplement their education using different resources, different programs. But we can□t recapture what they didn□t learn in grades K through 12. We can□t re-teach them everything they didn□t learn.□

The price of caring

Such pressures are creating personal issues for academic advisors.

As more and more sports become □year-round,□ more and more student-athletes stay at school for summer sessions and freshmen arrive early for the □summer bridge□ programs on many campuses, there is no real break □ no □downtime□ □ in advisors□ work.

The summers don□t look much different than the academic year for many academic-support programs. They still conduct orientation programs, offer tutoring sessions, operate the study center, do advising and run study halls. The pressure for student-athletes to get ahead and stay ahead means that more of them stay at school year-round than they did 10 years ago. Sometimes, academic support is even more crucial in the summer, when student-athletes take classes in a compressed time frame.

Reed acknowledged that it□s tough but said that academic-support staffs are simply mirroring what is going on in athletics programs overall, especially in football and men□s basketball.

□Summer is just a continuation of the spring in a lot of peoples□ minds,□ he said. □We, as academicians, had to come up with a way to assist these students just as we would in the fall or spring, The only way we know it□s summer as opposed to spring is there□s a few less students and it□s a lot hotter.□

Add certifications and quarter-school schedules into the mix, and the squeeze gets tighter. Not only has summer downtime disappeared, Durand said, but breaks between terms are nonexistent.

□It□s frustrating and concerning to me because the workload of our advisors has quadrupled,□ she said. □We ask our advisors to not take vacation (at certain times of year). We have had to add staff. The costs associated with doing business have gone up. It seems like every couple of weeks you□re reviewing work or projecting their next quarter classes. There□s not a time when our advisors are not focused on eligibility.□

Student-athletes may be paying a price, too. Instead of spending summers working in jobs, pursuing internships or tackling other interests, they are on campus □ full time.

□It□s a grind for the kids, the coaches, for us,□ Rost said. □But with the (competitive) culture the way it is, it□s tough to do anything else.□

As the spotlight on academics grows brighter and the pressure on those charged with assisting student-athletes to succeed in the classroom builds, more and more program directors are seeing burnout among their staffs.

Like many in athletics, those who coordinate the academic lives of student-athletes care deeply about the success of those in their charge, and some have difficulty finding a balance between work and life outside of the athletics department.

Sometimes, academic personnel approach the work with expectations that are different from the reality of the job. Sometimes, they simply think it will be □cool□ to work in big-time college athletics. But the hours are long and the pressures are real. Advisors and tutors often don□t know when to let the phone ring or to go ahead and take a vacation.

□It is such a high burnout rate,□ Jimenez said. □The hours they work, the stressful situations they are placed in, it□s hard to

eliminate stress. There□s always something to do. There□s always a student who needs you. There□s always an issue that needs to be resolved.□

Most agree that the pace is different for advisors who work with student-athletes compared to those who work with the general student body. More factors must be considered □ athletics commitments and academic activities must be balanced, and every decision must be carefully considered with future eligibility in mind. In fact, Jim Pignataro at Michigan State said that academic personnel working with student-athletes can really no longer be called □advisors.□ Instead, he said, they serve as academic coordinators, helping to manage and synchronize every aspect of a student-athlete□s academic career.

But despite all the pressure and the danger of burning out, many advisors wouldn□t consider doing anything else. A new father, Jimenez compared his feelings about his job to his feelings on fatherhood: He wants to see student-athletes succeed, just as he loves to see his toddler mature and grow.

□It□s the moments that you capture when a student graduates, or a student succeeds, or a situation that didn□t seem like it could work itself out works itself out, or you see a staff member achieve a positive result,□ he said. □That□s what it□s all about. You□re going to be successful if you□re in it because you really want students to succeed academically and in their lives.□

It is a labor of love, even if the safety net seems a little skimpy.

□By and large, people are very passionate about what they□re doing, and they really care for the welfare of the kids,□ Rost said. □It□s a really rewarding field, but it takes a lot out of you, too. When the day is over, you need to let it go. Sometimes, it can be an emotional roller coaster □ you want them to do well. But I will do nothing else. I really love it.□

Hi, Robert.

Attached please find a report of the Eligibility Status of all 1st Year Student Athletes. Most students have received all grades (see last column). I have contacted all students on Academic Probation and with Ineligibility Pending. Please let me know if you have any questions.

Thank you,
Cynthia

Good morning, Robert.

I am taking a look at all of our Non-Good 1st Year Students: students that at EOT Spring 2008 are on PR, Ineligibility Pending, Eligible but did not enroll and Withdrawals. Attached is a report of the Non-Good 1st Year Student-Athletes. My goal is to encourage as many of these students as possible to register for summer school. The athletes look excellent the vast majority is registered. There are only a few students (highlighted in red) that I am concerned about. Do you have any info on these students?

Thank you!
-Cynthia

Amateurism Age-Related Rules—Division I

Prior to initial full-time collegiate enrollment, prospective student-athletes wishing to compete at an NCAA Division I institution may be subject to age-related rules that are certified as part of the Eligibility Center's amateurism certification process.

Participation After 21st Birthday

In Division I sports other than tennis and swimming and diving, a student-athlete will use a season of eligibility for each year the student-athlete competes as an individual or member of a team in that sport.

Participation After 20th Birthday – Tennis

A student-athlete who participates in tennis after his or her 20th birthday will use a season of eligibility for each year and will be subject to academic year in residence.

* Please note that NCAA Division II has different pre-enrollment amateurism rules than Division I. Additionally, the amateurism certification process does not certify the amateur status of prospective student-athletes enrolling at NCAA Division III institutions. For more information regarding amateurism rules, please visit our Web site at www.ncaa.org or contact an NCAA Eligibility Center representative at 317/223-0700.

The NCAA amateurism certification team is available to answer questions about the amateurism certification process. Also, if you have information about the amateurism status of a prospective student-athlete, please contact a team member. The staff can be reached at 317/223-0700 or by e-mail at: ec-amateurism@ncaa.org.

Amateurism Certification Newsletter

June 2008

Amateurism Certification Newsletter

NCAA Eligibility Center

June 2008

- All prospective student-athletes (high school, two-year, four-year, domestic and foreign) enrolling at a NCAA Division I or II institution for the first time on or after August 1, 2007 must register with the NCAA Eligibility Center and have their amateur status certified in order to be eligible to participate in NCAA intercollegiate athletics.
- A prospective student-athlete may register online at www.ncaaclearinghouse.net.
- Prospective student-athletes enrolling in **fall 2008** who have completed their amateurism questionnaire need to request a final certification of their amateur status at www.ncaaclearinghouse.net.
- Prospective student-athletes enrolling in **winter/spring (January) 2009** should register with the Eligibility Center and complete the amateurism questionnaire now at www.ncaaclearinghouse.net.
- To learn more about the amateurism certification process, and to read past issues of the Amateurism Certification Newsletter visit our Web site at http://www1.ncaa.org/membership/ach/index.html.
- To learn more about the NCAA, visit www.ncaa.org.

How to Request a Final Amateurism Certification

To receive an amateurism certification decision, follow the steps below:

· Login to www.ncaaclearinghouse.net by entering your SSN or Eligibility Center ID and your PIN number.

· Choose **ENTER/UPDATE AMATEUR QUESTIONNAIRE** from the tabs on left side of page.

· Choose **FINAL AUTHORIZATION SIGNATURE** at the bottom of the WELCOME PAGE.

· READ the NCAA 10.1 Ethical Conduct Statement page.

· Check the **"I AGREE"** box and type your full name in the space provided.

· Click **SUBMIT**.

Amateurism Certification Staff

The NCAA amateurism certification team is available to answer questions about the amateurism certification process. Also, if you have information about the amateurism status of a prospective student-athlete, please contact a team member. The staff can be reached at **317/223-0700** or by e-mail at: ec-amateurism@ncaa.org.

Subject: EC PSA Review and IEW information

Lindsey:

Attached you will find two PowerPoints with some information on the PSA Review and Initial-Eligibility Waiver processes. We hope that these can be helpful resources for people in your conference as they prepare for a PSA review case or prepare to file an IEW. Please e-mail these to the compliance officers in the conference and encourage them to review the information. If anyone has any questions, they can call me, or we can schedule a conference call with a larger group later in the month if necessary.

Best Regards,

Greg

Division I Initial-Eligibility Waiver Update – June 2008

Overview

- Initial-Eligibility Waiver: What Now?
- Best Practices
- 72-Hour Memo Reminders

More Details from the Eligibility Center

- This is where the Eligibility Center starts with the initial-eligibility waiver process:
  - Common follow-up questions are listed here.
  - Prospective student-athlete specific questions will be added to each case based on the prospective student-athlete's individual academic history.
- Answering these questions and gathering the supporting documentation for those answers is the first step toward a smooth and efficient waiver process.

NCAA Division I Reclassification

As per the NCAA Division I Academics/Eligibility/Compliance Cabinet directive, waivers involving grade reclassification that shall be favorably considered include:

- Clear and strong nexus between post-eighth semester enrollment and a prospective student-athlete's unique circumstance in the areas of:
  - Family.
  - Health.
  - Financial.
  - Circumstances outside the prospective student-athlete's control.

NCAA Division I Reclassification

- Examples of unique circumstances outlined in the directive:
  - Illness or injury to the prospective student-athlete or immediate family member.
  - Significant geographical movement.
  - Natural disaster.
- What if a prospective student-athlete's reclassification does not fit in the Cabinet's directive?
  - Proceed cautiously.

International Initial-Eligibility Waiver

- Has the secondary school provided course descriptions?
- Has the secondary school provided the specific school program with curriculum and other supporting documentation?
- Has the secondary school provided an explanation of the circumstances?
  - Obtain a copy of the secondary school policy.
  - Obtain the secondary school educational program.
- The extraordinary circumstances may entail additional information.

Core-Course Grade-Point Average Initial-Eligibility Waiver

- Has the high school provided information to support circumstances?
- Has your institution done a preliminary evaluation?
- Has the high school changed its grading scale?
- The extraordinary circumstances may entail additional information.

Test Score Initial-Eligibility Waiver

- Have all official test scores been sent to the Eligibility Center?
  - Code 9999 sends scores from the testing agency to the Eligibility Center.
- Has the prospective student-athlete received any correspondence from the testing agency?
  - Test score letter indicating the score is under review.
  - The testing agency will only communicate with the student while the score is under review. Score recipients are notified only if the score is cancelled.
- Gather all information related to score review, affirmation of validity or cancellation.

Transcript Change Initial-Eligibility Waiver

- Request the high school's or district's policy for transcript changes.
- Determine whether the policy was followed.
  - Who is permitted to make changes?
  - Is approval by principal or superintendent required?
  - Is there a time limitation for retroactive transcript changes?
- The extraordinary circumstances may entail additional information.

Proof of Graduation Initial-Eligibility Waiver

- Did the prospective student-athlete meet high school graduation requirements?
- Did the prospective student-athlete meet the state's graduation requirements (i.e., state exit/proficiency exam)?
- What is the high school's policy for meeting graduation requirements?
- What is the high school's district policy on graduation requirements?
- The extraordinary circumstances may entail additional information.

What Drives Initial-Eligibility Waiver Results?

Building your case with supporting documentation is key to make your best case and to ensure the process is efficient/expedient.

How do you do that?

Consult with:

- Prospective student-athlete in gathering all facts and any supporting documentation the prospective student-athlete has or can provide.
- Coach in the background of the prospective student-athlete and any additional information they have.
- Parents/guardians/family members/high school personnel that can provide information of the circumstances.
- Others possibly include faculty athletics representative, athletics director, senior woman administrator, institution's coaches for the merits of the initial-eligibility waiver.

Supporting Documentation

Supporting documentation drives waiver results.

- Specific circumstances that connect the mitigation to the deficiency, including documentation and/or statements to support circumstances and/or institution's assertions.
- A statement from the prospective student-athlete that specifically identifies why he or she did not meet the initial-eligibility requirements.
- If a waiver indicates misadvisement, the institution will need to have supporting documentation that not only indicates misadvisement but documentation that supports the mitigation.

Minimum Threshold

Be mindful of minimum threshold standards.

- If a prospective student-athlete's academic credentials are beyond minimum threshold, significant or extraordinary mitigation must exist and be documented
  for staff to even consider a review of the waiver.

Increase from 14 to 16 required core courses in fall 2008.

- Core-course deficiencies due to this change will automatically result in a significant increase in waiver applications to the Eligibility Center.

- There is more need now than ever for each institution to submit only initial-eligibility waiver applications that provide mitigation and meet the standards set forth in the initial-eligibility waiver application outline of what is or is not a good waiver.

Timely Initial-Eligibility Waiver Submissions

File as soon as the prospective student-athlete is deemed a nonqualifier.

- If, after completing your own internal review, you determine that the prospective student-athlete will need an initial-eligibility waiver, gather the needed information during the recruiting process before a final “No” is certified by the Eligibility Center.
- If you collect information along the way, this will enable your institution to submit a complete waiver as soon as possible.
- Filing as soon as possible after the final nonqualifier declaration will help ensure the waiver is reviewed and decided in advance of key deadlines, including admission, financial aid and/or competition.

Best Practices

Submitting a complete waiver application can be a difference maker.

- Ensure your institution stands behind the merits of the waiver.
  - Institutions should not file waivers they do not believe merit relief of the initial-eligibility requirements.
  - Institutions should not file waivers for which they cannot provide documentation that supports the merits of the waiver.

- Before submitting the waiver, have another person review it with a fresh set of eyes to ensure the application is completely filled out and assertions and supporting documentation collectively “make sense.”

72-Hour Memo

What is it?

- Notification to the institution that the initial-eligibility waiver application has been received by the Eligibility Center is provided within three business days.

72-Hour Memo Reminders

72-Hour Memo Practice:

- 72-hour memo will not release a prospective student-athlete for practice purposes until ALL documentation supporting the institution's assertions has been received.
- This aids the Eligibility Center in prioritization of cases while working to meet institutional deadlines (e.g., practice, financial aid, admissions, competition).
- Best Practice: Review the initial-eligibility waiver application to make sure all assertions (prospective student-athlete statement, parent statement, etc.) are documented and supported.

72-Hour Memo Reminders

The text of the 72-Hour memo will differ depending on whether or not the initial-eligibility waiver application was complete when submitted.

Complete Initial-Eligibility Waiver:	Incomplete Initial-Eligibility Waiver:
• Confirms the receipt of initial-eligibility waiver. • Informs the institution the initial-eligibility waiver is complete. • Informs the institution that the prospective student-athlete is permitted to practice during the initial-eligibility waiver process.	• Confirms the receipt of initial-eligibility waiver. • Informs the institution the initial-eligibility waiver is not complete. • Informs the institution that the prospective student-athlete is not permitted to practice until all necessary information is provided. • Information needed will be specifically outlined.

Thank you!

Prospective Student-Athlete Review Update – June 2008

Overview

- Reminders.
- Prospective Student-Athlete Review: What Now?

General Reminders

Prospective student-athlete review is part of the certification process.

- All information must be received for a prospective student-athlete's certification.
  - Official high school transcript with graduation date.
  - Official test score(s).
  - Payment received.
  - Amateurism questionnaire and final amateurism certification requested.

- Certification process begins and is completed unless irregularities are discovered.
- Once irregularities are discovered, prospective student-athlete review will begin on prospective student-athlete's academic record.
  - N03 code placed on Web status report indicating record is under review.

Member Institution Collaboration

NCAA Eligibility Center staff will work directly with the member institution.

- Eligibility Center staff will send a list of required documents to the member institution in order to gather the necessary information.
- Institutions will work with outside sources to gather the information requested by the Eligibility Center:
  - PSA statement (signed).
  - Parent/guardian statement.
  - High school, testing agency, etc.

List of Required Documents

Attempt to provide all information requested in the list of required documents to Eligibility Center staff for review.

- Institution should review all documentation and ensure that all questions have been addressed before forwarding to the Eligibility Center.
- Indicate possible delays in gathering certain or specific information and when that information may be provided.
- Provide statement signed by the prospective student-athlete. Provide statements with detailed explanation from parents/guardians or others involved in any aspect of the prospective student-athlete's high school or prep-school enrollment.
- Please provide any other details that explain the prospective student-athlete's enrollment choices for secondary school.
- If the requested documentation is not available, provide other supporting and contemporaneous documentation (e.g., letters from teachers/tutors, progress reports and grade books in the absence of coursework).

More Details from the Eligibility Center

- This is where the Eligibility Center starts with the prospective student-athlete review process:
  - Common follow-up questions are listed here.
  - Prospective student-athlete specific questions will be added to each case based on the prospective student-athlete's individual academic history.
- Answering these questions and gathering the supporting documentation for those answers is the first step toward a smooth and efficient review.

Sample Questions ~ Matriculation Pattern

Suggestions of helpful documents:

- School policy as outlined in handbook.
- Curriculum program design as outlined in handbook.
- Guidance counselor advice / what is typical for students in general.

Prospective student-athlete graduated from a high school where no coursework was taken:

- What is the graduating high school's policy on this issue?
- Why did the prospective student-athlete attend another educational program/school and not graduate?
- Provide the graduation requirements and high school courses the graduating high school accepted for graduation.

Sample Questions ~ Matriculation Pattern

In their senior year, the prospective student-athlete transferred to a new high school or attended multiple high schools:

- Why did the prospective student-athlete transfer to a new high school in senior year?
- Who was involved in the decision-making process?
- Was the prospective student-athlete on track to graduate from the old high school from which the prospective student-athlete transferred?
- Will the prospective student-athlete graduate at the end of eight semesters (i.e., with his or her class)?

Prospective student-athlete left late in the senior year without graduating and subsequently enrolled in a different high school:

- Why did the prospective student-athlete leave during the senior year without graduating?
- Who assisted the prospective student-athlete in making the decision?
- Was the prospective student-athlete on track to graduate from the original high school attended?
- Will the prospective student-athlete graduate in eight semesters (i.e., with his/her class)?

Sample Questions ~ Matriculation Pattern

Attendance at a high school not cleared by the Eligibility Center:

- If the prospective student-athlete was enrolled at a high school before a decision was made on a school as "not cleared," the courses will be reviewed on a case-by-case analysis.
- If the prospective student-athlete enrolled at a high school considered "not cleared" after that decision was rendered, coursework from that school will not be used in the final certification.
- Provide enrollment history of prospective student-athlete including entry and withdrawal dates (to include month, day and year).
- Who advised the PSA to attend the school?

Attendance at a high school under review by the Eligibility Center:

- The courses will be reviewed on a case by case analysis.
- Provide enrollment history of PSA including entry and withdrawal dates (to include month, day and year).
- Gather and provide syllabi, class schedules, copies of coursework completed.
- Who advised the PSA to attend the school?

Sample Questions ~ Course Acquisition

Prospective student-athlete was enrolled in sequential courses in a single academic year or term:

- Who advised the prospective student-athlete to register in the specific courses taken?
- Provide school policy that explains enrollment in concurrent / sequential coursework.
- What is the high school's class schedule used for all students (e.g., semester, block)?
- What was the prospective student-athlete's daily schedule (class time, travel, practice, job, home responsibilities, etc.)?

Courses taken out of sequence:

- Who advised the prospective student-athlete to register in the specific courses taken?
- Provide coursework and grade books.

Sample Questions ~ Course Acquisition

Number of core courses taken in grade 12 is disproportionate to what was taken before grade 12:

- Who advised the prospective student-athlete to register in the specific courses taken?
- Explain the increase in the number of courses taken during grades nine, 10 and 11 relative to the number of courses taken in grade 12.

Prospective student-athlete completes course(s) in a short timeframe:

- What type of educational program was the prospective student-athlete enrolled?
- What is the program's recommended policy for the completion of courses?
- Explain the abbreviated timeframe for course completion.
- Explain how coursework was completed.

Sample Questions ~ Course Acquisition

Repeat Courses:

- Provide high school's written policy on repeating courses.
- Did the prospective student-athlete attend another educational program/school to complete the repeat courses?
- Did the repeat course(s) count toward high school graduation?
- Did the prospective student-athlete repeat the entire curriculum or specific portions (e.g., failed exams, senior paper)?
- Provide course curriculum and materials for original and repeated course(s).
- Who advised the prospective student-athlete to repeat courses? Does that person's job responsibility entail advising students regarding course selection?

Sample Questions ~ Course Acquisition

Nontraditional coursework (online, correspondence, independent study):

- What is the graduating high school's policy on nontraditional coursework?
- Why did the prospective student-athlete attend another educational program/school to complete the course(s)?
- Who advised the prospective student-athlete to complete a nontraditional course? Does that person's job responsibility entail advising students to meet graduation or NCAA initial-eligibility requirements?
- Is the nontraditional program connected to the high school or school district? If so, how?
- What are the quality control measurements in place for the nontraditional course?

Sample Questions ~ Test Score Increase

Significant increase in test score:

- Did your admissions office review the test scores and have concerns?
- Has the prospective student-athlete received any correspondence from the testing agency?
- Are prospective student-athletes required to report such communication to athletics department personnel?
- Does your institution or conference have a policy regarding test-score irregularities? If so, provide copy of policy.
- Contact the testing agency directly for questions regarding review.

Sample Questions ~ Grade-Point Average Increase

Significant increase in grade-point average (GPA) from preliminary evaluation to final evaluation:

- When did the GPA increase occur (e.g., after transferring schools, after completing nontraditional courses)?
- Did the prospective student-athlete receive tutoring or other academic assistance?
- Explain the increase in the GPA relative to the GPA at previous schools/during previous semesters.
- Explain how the coursework was completed for the courses associated with the increased GPA.
- Explain how learning outcomes were assessed and provide examples of assessment.
- Obtain letters from teachers, tutors or other individuals personally familiar with the prospective student-athlete's academic performance during the relevant time periods.

Thank you!

Hello,

As Summer Session 2 draws to a close, I thought you might find the following information helpful.

Below, please find the email I sent to today to all 1st Year Students/rising Sophomores that were Ineligibility Pending during Summer Session 2. If these students do not return to Good by the beginning of next week, they may apply for Probation or Continued Probation.

In the case that you may work with some of these students, I thought it would be helpful for you to read the email the students will be receiving about how to apply for Probation or Continued Probation. Attached is a document with the names and PIDs of each of these students. Please do not hesitate to contact me should you have any questions.

Thank you,
Cynthia

Dear ,

Your academic standing during the 2008 2nd Summer Session was Ineligibility Pending.
Please check your current academic standing through Student Central.

If you are not in Good Academic Standing by the beginning of next week, you may want to consider applying for a semester of Academic Probation.

If you were on probation during the Spring 2008 semester, you will have to request a semester of Continued Probation.

If your academic standing is Ineligible at the start of the fall semester, you will not be allowed to take courses on campus during the fall term.

Please note: all requests for probation are due by 9 a.m. on August 1st.

I have cut and pasted information below on Probation and Continued Probation from www.studentsuccess.unc.edu
(http://www.studentsuccess.unc.edu/). Please read it carefully.

Best,

Cynthia Demetriou
Retention Coordinator

If you did not qualify for a semester of probation but you would like to request a semester of probation you must put your request in writing. The request must contain a compelling explanation for your poor academic performance in the preceding semester as well as an explanation of why you believe you should be granted a probationary semester. This request may be accompanied by supporting

documentation if appropriate (such as a doctor□s note, official and/or financial records). It should also identify your plan of action for the upcoming semester in the case you are granted a semester of probation. To request a semester of probation the student must send a letter and supporting documents to:
The Academic Advising Programs
Appeals Committee of the Administrative Board
The University of North Carolina at Chapel Hill
CB# 3110, Steele Building
Chapel Hill, NC 27599-3110
by 9 a.m. on August 1st. The Appeals Committee of the Administrative Board will approve or deny requests. Their action is final.
A student whose request for probation has been approved is granted probation for one semester only. The probationary status is valid only in the specific semester for which it is granted. If a student withdraws from or does not enroll in that semester and wishes at a later time to be granted probation for a subsequent semester, the student will have to re-petition the appeals committee.
Continued Probation
In the rarest of cases, a student who has already completed a semester on probation but did not return to Good Academic Standing, may be granted one semester of Continued Probation by the Appeals Committee of the Administrative Board. This will occur only when a student successfully presents a compelling explanation of medical, psychological, financial or personal difficulties that prevented him/her from returning to good academic standing.

This request may be accompanied by supporting documentation if appropriate (such as a supporting recommendation from the University's Campus Health Services, Counseling and Wellness Services, or private physician or therapist).
Students requesting Continued Probation should have done everything requested of students on Probation during their probationary semester:
completing the self-assessment,
completing the online Student Success Seminar,
completing the Probation Contract,
completing the End of Semester Assessment,
meeting with their academic advisors
and
utilizing university resources such as the Learning Center.
Whether or not a student completed these steps and/or took additional measures to resolve their probationary status such as participating in Bounce Back, will be taken into consideration when determining whether or not to grant Continued Probation.
Students will not be granted Continued Probation if they cannot return to good academic standing in one semester or if the student□s academic performance is getting worse rather than better.
To request a semester of Continued Probation the student must send a letter and supporting documents to:
The Academic Advising Programs
Appeals Committee of the Administrative Board
The University of North Carolina at Chapel Hill
CB# 3110, Steele Building
Chapel Hill, NC 27599-3110
by 9 a.m. on August 1st. The Appeals Committee of the Administrative Board will approve or deny requests. Their action is final.
All students on Continued Probation will be required to meet with the Retention Coordinator and complete an individualized performance contract.□

Hi, Robert.

The attached file contains all First-Year and Sophomore student-athletes.

You will find that 28 are on Academic Probation and 8 are Ineligible as of today, December 19th.

Please do not hesitate to contact me should you have any questions.

Happy Holidays!

Best,
Cynthia

ACC Directors of Academic Support,

I hope you are having a great week. Attached you will find the following;

- Memo sent to you February 19, 2009 regarding our meeting Monday & Tuesday April 6-7, 2009
- An updated itinerary adding Mr. Steve McDonnell as our F.L.A.G presenter, as well as the option to watch the NCAA National Championship Game on the Big Screen at the ACC office
- Directions to the ACC Office if you will be arriving just in time for the meeting-DO NOT USE YOUR NAVIGATION UNITS OR MAPQUEST YOU WILL GET LOST!
- Directions to the Grandover Resort if you wish to check-in prior to the meeting
- April 2009 Meeting Agenda
- Minutes from the October 2008 conference call for your review
- UPDATED NCAA Webinar Academic Updates Presentation Material for Monday
- UPDATED NCAA FLAG Presentation For Tuesday Morning Please make plans to stay for Day 2
- NCAA FLAG One page Summary
- Supplement 6 Article on Academic Majors of Upperclassman Football Players in the ACC. All other meeting materials will be provided in an ACC folder so you do not have to print

PLEASE DON T FORGET TO MAKE YOUR HOTEL ROOM RESERVATIONS ASAP(SEE MEMO).

I m looking forward to seeing everyone and to having another productive meeting. Ms. Teresa Evans-Hunter, Executive Director for N4A, will be joining us for day 2 of the meeting. My office number is 336-854-8787 ext. 233 and my work cell is 336-207-6409 if you have any questions. Have a great weekend!

FACILITATING LEARNING AND ACHIEVING GRADUATION (FLAG)

FLAG is a system that assesses and recommends support for each student-athlete, regardless of his or her level of risk. This program will facilitate the success of all student-athletes, and has been designed to help institutions optimize their respective campus environments to leverage opportunities for graduation success. In so doing, FLAG will provide tools for institutions to increase the efficiency of their current services--including academic support and life-skills programs--and to make informed decisions regarding recruiting, admissions and program resources (e.g., staffing and budget).

DEFINING "RISK"

"Risk" includes all the factors that can reduce a student-athlete's chances of graduating from the institution, not just academic-risk factors. For purposes of this system, every student is assumed to have some degree of risk of not graduating until the time that he or she actually completes all requirements for a degree. As a result, throughout their collegiate careers student-athletes are on a risk continuum determined by factors that often fall into three main categories:

a. Factors inherent to the student-athlete when he or she enters a member institution (e.g., academic preparation, two- or four-year transfer status, academic motivation and effort, socioeconomic status, first-generation college student);

b. Factors presented by the student-athlete's institution, program or sports team (e.g., sport time demands, level of academic support programming); and

c. Factors that arise during a student-athlete's collegiate career (e.g., academic ineligibility, personal issues, actual or perceived opportunities to pursue a professional sports career, coaching change, exhaustion of athletics eligibility).

Consistent with this approach, a student-athlete's individual risk level may fluctuate from low risk to high risk due to the development or resolution of various risk factors. The working group acknowledges the paradigm shift presented within its work, as "at risk" often is used to categorize a group of students who are academically underprepared at the point of entry into the collegiate environment. However, research regarding student-athlete graduation success indicates that other nonacademic factors, some of which develop after the student-athlete has enrolled in college, present significant threats to a student-athlete's likelihood of persistence to graduation.

Academic Risk for Student-Athletes at Entry

Category	Weight	Variable(s)/Criteria
Academic	+2	(HS student) HS core GPA < 2.6 ***or*** ACT/SAT < 820 ***or*** Core units < 16 ***or*** Academic nonqualifier ***or*** Number of HS > 2 ***or*** Educational disability diagnosed ***or*** Other locally identified criteria. (Transfer) Transfer GPA < 2.6 (for 2-4 or 4-4 transfers)
Role of Academics	+1	Identifies strongly as an athlete, not as a student.
	+2	Academic effort lacking (historical or contemporary).
Transfer	+1	Transferred into current institution (2-4 or 4-4).
Personal History	+1	First-generation college student ***or*** Student has low financial resources ***or*** Student is homesick ***or*** Other locally identified criteria.
	+1	Personal, health, injury, family, mental health or substance abuse issue(s).
Sport	+1	Student-athlete in high-profile sport at the institution ***or*** High-profile (e.g., Olympic caliber) student-athlete.
	+1	Team environment does not prioritize academics ***or*** Coach in first year.
Total		0-1 = low risk; 2-3 = moderate risk; 4+ = high risk

Academic Risk for Student-Athletes Post-Entry

Category	Weight	Variable(s)/Criteria
Academic	+4 or +2	(+4) Current cumulative GPA < 2.0 ***or*** Current term GPA < 2.0 ***or*** Academically ineligible within the past year (+2) Current cumulative GPA < 2.6 ***or*** Current term GPA < 2.6 ***or*** Education disability diagnosed ***or*** Other locally identifiable academic criteria.
Role of Academics	+1	Identifies strongly as an athlete, not as a student ***or*** Professional sports opportunity presents.
	+2	Academic effort lacking (historical or contemporary).
	+1	Negative attitude toward major.
Transfer	+1	Transferred into current institution (2-4 or 4-4).
Personal History	+1	First-generation college student ***or*** Student has low financial resources ***or*** Student is homesick ***or*** Other locally identified criteria.
	+1	Personal, health, injury, personal, family, mental health or substance abuse issue(s).
Sport	+1	Student-athlete in high-profile sport at the institution ***or*** High-profile (e.g., Olympic caliber) student-athlete.
	+2	No athletic eligibility remaining.
	+1	Team environment does not prioritize academics ***or***

The National Collegiate Athletic Association
March 30, 2009 JLC:alg

		Coaching change occurred ***or*** Student-athlete dissatisfied with athletics experience.
Total		0-2 = low risk; 3-4 = moderate risk; 5+ = high risk

Academic Majors of Upperclassmen Football Players in the Atlantic Coast Conference: An Analysis of Academic Clustering Comparing White and Minority Players

Jeffrey J. Fountain
Nova Southeastern University

Peter S. Finley
Nova Southeastern University

Studies on graduation rates of college athletes have typically utilized subdivisions based on race, gender, and sport to allow for more transparent scrutiny of potential problem areas. However, subdivision by race has not been utilized when examining clustering of football players into academic majors. Clustering occurs when 25% or more of an athletic team shares a single academic major (Case, Greer, & Brown, 1987). Football media guides from Atlantic Coast Conference (ACC) schools were utilized to determine the academic majors of upperclassmen to explore whether race could be a factor in academic clustering. The results showed that Minority players were clustered into specific academic programs at greater rates than their White counterparts. While academic clustering occurred for both White and Minority players, the clustering of Minority players involved greater numbers of players enrolled in clustered majors, as well as the existence of a second clustered major at several schools. At six of the schools in the study, 75% or more of the Minority players were enrolled into just two academic majors.

The academic performance of college athletes, most notably in revenue-generating sports, continues to receive considerable attention from both the academic community and the media. The research focus of the academic community has included comparisons between athletes and the general student body in regard to graduation rates, academic performance, academic support services, academic entrance requirements, and academic motivation (Carodine, Almond, & Gratto, 2002; Gaston-Gayles, 2004; Maloney & McCormick, 1993; Purdy, Eitzen, & Hufnagel, 1982). The primary focus of the media has revolved around the reporting of unusual and/or unethical behavior by coaches, players, alumni, athletic department employees, university administrators and faculty members as it pertains to the academic performance of athletes (Finley, Finley, & Fountain, 2008; Lederman, 2003; Suggs, 2003).

Academic Reform

The NCAA also created the Graduation Success Rate (GSR) to better reflect the percent of athletes who do earn a college degree. This measure increases the overall Division I athlete graduation rate up to 77% (from the 63% based on traditional means of measurement) for the 1999-2000 freshman class, once athletes who transfer schools are accounted for (NCAA, 2007b). However, the GSR for Division I-A (Football Bowl Subdivision) showed a marked gap between White and African-American players (64% GSR and 50% GSR, respectively) (The Institute for Diversity and Ethics in Sport, 2007). Unfortunately there is no GSR score for the general student body to compare against the GSR for athletes.

In April of 2004 the NCAA Division I Board of Directors adopted the Academic Reform Package. The goals of the reform package, according to Myles Brand, were to "...improve the academic progress, retention, and graduation rates of student-athletes..." (NCAA, 2004, p. 1). The Academic Progress Rate (APR) was created to measure the academic progress of each athletic team. Teams that fall below the NCAA acceptable APR (925 out of 1000 possible points) risk losing scholarships (NCAA, 2007c). The metric encompasses maintaining eligibility and staying enrolled in the short run, as well as graduating players over time.

Basketball coaches' opinions of the new academic reform revealed some of the top coaches in the country did not immediately embrace the APR (Prisbell, 2005). Roy Williams of the University of North Carolina said, "I am not going to care about the APR at all. The fact of a guy leaving early for the NBA, that may be what I think about, but the APR is not what I will be thinking about" (p. E1). Syracuse University's coach Jim Boeheim said, "The better players you recruit, the lower your APR is going to be" and "the scholarship reduction might be worth it if you end up winning the national championship" (p. E1). Boeheim also said, "I can have a 1000 APR every year, I can graduate every guy. I won't be coaching here very long. You're not going to win" (p. E1). Bob Huggins was concerned about disciplinary action because throwing a player off the team for violating rules would lower a team's APR score.

While the goal of the APR, to increase graduation rates of athlete, is admirable, the means utilized by schools to avoid loss of scholarship could prove to be dubious. Pressure on coaches, and subsequently on academic advisors and professors, to find new and creative ways for players to stay eligible and ultimately to graduate is not a new issue (Renick, 1974), but, among academicians, there is concern that the APR will drive such practices to new extremes (Capriccioso, 2006; Finley & Fountain, 2007). Given that coaches certainly do not want to face scholarship reductions due to a low APR, they will be faced with several options for maintaining, or increasing graduation rates. First, they can recruit athletes who are truly and completely prepared for the academic rigors of the university. Second, they can increase expectations of players and provide academic services for the players of marginal academic pedigree. Third, they can recruit athletes of marginal academic ability and seek easier majors, courses, and professors to ensure a reasonable graduation rate. Exercising the third option could lead to an increase in academic clustering of athletes. Academic clustering (loading athletes into a few majors which might be "athlete friendly") is not a new phenomenon but is one that might become more prevalent in the face of the APR and the threat of lost scholarships. Indiana Professor Murray Sperber, a former chair of *The Drake Group*, believes "you will see a kind of movement toward more Mickey Mouse courses" when addressing the issue of eligibility of athletes (Prisbell, 2005, p. E1). Sperber is not alone in this belief. Richard Southall, director of the *College Sport*

one academic major. The authors examined media guides from 130 randomly selected NCAA Division I basketball teams (77 men's teams, 53 women's teams). Results showed men's teams clustered players more often than women's teams. In addition, African-American players comprised over half the team roster on 71% of the teams exhibiting clustering.

While athletes in football and men's basketball are often steered into academic programs (Knobler, 2007), this is apparently seen as little more than the cost of doing business by the NCAA. In response to a survey that found nearly one-third of football and basketball players at the Division I level were prevented from pursuing the major they really wanted, NCAA President Myles Brand responded, "You have to be somewhat directed. Everyone doesn't get in this world to do everything they want to" (Knobler, 2007, 1A). While journalistic attention has been paid to the issue of academic clustering among football players, it has treated the players as one group. To date, no attempt was found that determined whether academic clustering is more prevalent among football players when divided into White and Minority subgroups.

The overarching purpose of this investigation was to examine academic clustering and race and to determine whether it merits entrée into discussions that traditionally centered on graduation rates, academic fraud, and academic support. The following researcher questions were considered: 1) Does academic clustering occur among ACC football players? 2) Is there a difference in prevalence of clustering when considering White and Minority subgroups? 3) Are there multiple majors at these schools that exceed the threshold to be considered clustered?

Method

Participants

The ACC was utilized as the population for this study. Following the 2006 season, it was decided to analyze a Bowl Championship Series (BCS) conference that had an average football performance, and preferred to examine a twelve-team conference to increase the size of the population under examination. The ACC was considered to best represent an average BCS conference, in terms of football performance in 2006. The ACC was ranked fourth of the six BCS conferences, according to Sagarin rankings (Sagarin, 2007) and was the in the middle of the three conferences with 12 teams (The Southeastern Conference was the highest rated conference and the Big Twelve was sixth). Data from 11 of the 12 ACC schools was available.

The data set contained 394 football players from 11 of the 12 ACC schools. The sample had 41.4% of players identified as White and 58.6% identified as Minority. The percentages of Whites and Minorities was nearly identical to published percentages of White and Minority football players at the Division I level (the 1999-2000 freshman class had 42% White players and 58% Minorities) (NCAA, 2007a). The number of upperclassmen per team with published majors at a particular university ranged from 28 to 44 players, with a mean of 35.8.

Procedure

As in prior research (Case et al., 1987), a survey study was conducted via analysis of media guides from the 2006 season to determine the published academic major of athletes. The operational definition of clustering as proposed by Case et al. was utilized: Clustering occurs when 25% of a team was identified as having the same major.

Table 1-*Highest Concentration of Upperclassmen Majors*

School	N	(n) and %	Major
University 1	33	(24) 73%*	Business Management
University 2	28	(13) 46%*	Social Science
University 3	38	(17) 45%*	Liberal Arts
University 4	44	(17) 39%*	Apparel, Housing and Resource Mgt.
University 5	31	(11) 36%*	Sport Management
University 6	36	(12) 33%*	Sociology
University 7	43	(13) 30%*	Communications
University 8	41	(12) 29%*	Arts & Science
University 9	36	(10) 28%*	Criminology
University 10	36	(10) 28%*	Sociology
University 11	28	(7) 25%*	Sport Administration

* Meets or exceeds the 25% cutoff for academic clustering as defined by Case et al. (1987). N = total number of football players with a listed major in the media guide. (n) = the number of players in that specific major, followed by the percent of the total players.

Research Question 2: Is there a difference in prevalence of clustering when considering White and Minority subgroups?

Nearly every school in the study had Minority football players clustering into a single major at a higher percentage than their White counterparts (See Table 2). The pattern of Minorities clustering more densely into a single program held true at nine of the schools. Four teams had 62% or more of its Minority upperclassmen clustered into a single major. Only in one case was the percentage of White players in one major as high (69%).

One common explanation for academic clustering has been the players gravitate to majors that allow flexibility in scheduling, allowing more electives, and offering a wide variety of class times (Capriccioso, 2006; Finley & Fountain, 2007). However, if flexibility of scheduling were the driving force behind academic clustering, a large percent of players, both White and minorities would select the same majors as opposed to the significant divisions between White and Minority players. In only three universities in this study was the clustered program the same for White and Minority players. It should be noted that at one university, where Business Management is the major of preference for a tremendous number of both White and Minority players in this study, there was an alarming disparity in the GSR between White (81%) and African-American (34%) players according to The Institute for Diversity and Ethics in Sport (2007).

The NCAA over the years has attempted to address academic issues by adopting certain academic criteria like Proposition 16 and requiring academic reports to track academic progress and graduation using the GSR and the Academic Progress Rate (APR). Nevertheless, the NCAA may be oblivious to the larger issues of academic integrity and fairness as it pertains to the treatment of student-athletes and especially Minority student-athletes in revenue generating sports. Factoring in the significant financial resources schools allocate for academic support for athletes as well as the presence of clustering the athletes into a few majors (including into General Studies majors) the graduation rates of football players, especially African-American players at some schools is appalling and should be viewed as the greatest academic crises facing college football. It is not surprising that some view college football as little more than a "neo-plantation" that creates high-paying jobs for coaches and athletic directors, while players are sometimes treated like raw materials, used up and discarded, with no better than a coin-flip's chance of earning a degree. One must also determine if a degree in "General Studies" has value.

The NCAA needs to exert more control over academic integrity and fairness. Future NCAA legislation should focus on legitimacy of academic programs at each institution, especially if clustering is present. Having a system in place that only analyzes the most basic academic information (graduation rate, academic standing during current and previous terms, and progressing toward any degree) does not allow for any analysis of the quality of education received. For example, a system that allows a Division I football program to graduate only 49% (the average) of its Minority players but does not review what majors the degrees were in or the quality of the degree is creating a path of least resistance and nobody should feign surprise when the institutions exploit that very path.

This study did not seek to determine how players selected majors, which has been attributed to cultural or sociological interest, scheduling, advising, and pressure from coaches (Capriccioso, 2006; Finley & Fountain, 2007; Finley et al., 2008). Further research should be performed to make definitive statements about how players come to be enrolled in a major. Other athletic conferences and other sports may be analyzed to determine if clustering in other conferences and sports occurs. A longitudinal study also needs to be conducted to determine if new APR rules and punishments increase the likelihood of clustering at schools over time. Finally, this research should be replicated on a broader scale to determine whether the clustering that is evident at the ACC schools is also present among the Bowl Championship Series schools in general, particularly as the pressures regarding the potential loss of scholarships due to the APR become more pronounced.

ATLANTIC COAST CONFERENCE

OFFICE OF THE COMMISSIONER

MEMORANDUM

TO: ACC Directors of Academic Support

FROM: Eric A. Wood, Director of Student-Athlete Programs & Compliance

DATE: February 19, 2009

SUBJECT: 2009 ACC Directors of Academic Support In-Person Meeting

The spring meeting of the ACC Directors of Academic Support will be held April 6-7, 2009 in the Conference Office Board Room in Greensboro, NC. A boxed lunch of your choice will be served at noon and the meeting will begin promptly at 1:00 p.m. on Monday, concluding no later than 11:30 am on Tuesday. A group dinner has been arranged for Monday evening as well as breakfast in the hotel restaurant Tuesday morning.

As in the past the ACC will provide expenses (transportation, lodging and meals) for one academic advisor to attend the meeting; however, we are requesting that all attendees pay their own expenses (including hotel) up front and the ACC will reimburse the appropriate staff person upon receipt of your expense form. One other full-time academic staff member may attend the meeting at the institutions expense. This year, some of the hot topics will include a discussion on the Facilitating Learning and Achieving Graduation (F.L.A.G) presentation by The Working Group to Examine Issues Related to Academic Risk, as well as a progress report on the Football Academic Working group and an update on the Basketball Academic Enhancement Group. I am working on setting up a video conference with an NCAA staff member in Academic Affairs to facilitate our F.L.A.G discussion. A block of rooms has been reserved at the Grandover Resort and reservations may be made by contacting the hotel at 1-800-472-6301. Be sure to mention that you are with the "ACC Directors of Academic Support Block" for the corporate rate of $149.

Please make your flight reservations at least 21 days in advance and submit your travel itinerary to Tracey Haith in order for us to set up your shuttle service from the airport to the hotel. The other option is to use the PTI Express taxi service for $30 per person and they can be reached at 1-877-796-5466. The conference will reimburse for shuttle and taxi service but will not reimburse for a rental car.

Please use the enclosed form to submit agenda items for the meeting and to identify those planning to attend from your institution by **Friday, March 6, 2009.** The final agenda will be forwarded to you prior to the meeting. If you have any questions or concerns please feel free to contact Eric Wood or Tracey Haith, Administrative Assistant for Compliance/Student-Athlete Welfare.

DIRECTORS OF ACADEMIC SUPPORT MEETING
CONFERENCE OFFICE BOARD ROOM

Greensboro, NC
April 6-7, 2009

ITINERARY

Monday, April 6, 2009

12:00 - 1:00 p.m.	Box Lunch Available (Conference Board Room)
1:00 – 5:00 p.m.	Academic Meeting (Conference Board Room)
6:00 p.m.	Meet in Grandover Resort Lobby
6:30 pm	Dinner (Smokey Bones Restaurant)
8:45 pm	National Championship Game Viewing (ACC Office-Projection Screen)

Tuesday, April 7, 2009

6:00 – 8:30 a.m.	Breakfast (DiValletta Restaurant – Grandover First Floor) (Vouchers Provided by ACC)
9:00 a.m. – 9:30 a.m.	Academic Meeting (Conference Board Room)
9:30 – 11:30 a.m.	F.L.A.G. Discussion (Mr. Steve McDonnell)
11:30 a.m.	Adjourn

Directions to the Atlantic Coast Conference Office
4512 Weybridge Lane, Greensboro, NC 27407 ~ Phone: (336) 854-8787

From PTI Airport (approx. 16 miles):
Turn **right** onto East Bryan Blvd. Take the Winston Salem Exit off of Bryan Blvd. Continue on I-40 East to Exit 218 (Greensboro/Charlotte/High Point). Merge **right** to Groometown Road/Grandover Parkway Exit. Turn **right** onto Groometown Road at the traffic light. Turn **left** at the next stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

Directions to PTI Airport from ACC Office:
*Turn **left** onto Grandover Parkway. At the stoplight, turn **right** onto Groometown Road. Cross over bridge and turn **left** at the stoplight. Bear **right** at the first exit (before getting onto I-85). Exit **left** to I-40 W/73 N to Winston-Salem. Take Exit 212A (Bryan Blvd/PTI Airport Exit). Take Exit 3 (Bryan Blvd/PTI Airport). Take **left** off of Bryan Blvd into Airport.*

From Charlotte area and points South on I-85:
Follow I-85 North towards Greensboro. Take Exit 119 and turn **left** onto Groometown Road. Turn **left** at the second stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

From Raleigh/Durham/Chapel Hill and points East:
Traveling I-40 W/I-85 S, follow I-85 South (towards Charlotte). Take Exit 122A to Groometown Road. Turn **right** onto Groometown Road at the traffic light. Turn **left** at the next stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

Alternate route from Raleigh/Durham/Chapel Hill and points East:
If you enter Greensboro from Business I-85 instead of the new interstate, continue traveling south on Business I-85. Take the Groometown Road Exit. Turn **right** onto Groometown Road at the traffic light. Turn **left** at the next stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

From Winston-Salem/High Point and points West:
Follow I-40 E into Greensboro. There will be two signs for I-85 (one 85 South, one 85 North). Take the **first** exit which is I-85 South. The road will then split. Bear **right** to take Groometown Road Exit. Turn **right** onto Groometown Road at the traffic light. Turn **left** at the next stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

From Charlottesville area and points North on Highway 29:
Follow Hwy 29 South into Greensboro. Merge onto I-40/85 Business. Continue on I-85 South towards Charlotte. Take the Groometown Road Exit. Turn **right** onto Groometown Road at the traffic light. Turn **left** at the next stoplight onto Grandover Parkway. Go approximately 0.5 miles and turn **right** onto ACC Lane. The ACC building will be on the left.

For those traveling south on I-85:

Directions to the Atlantic Coast Conference Office
4512 Weybridge Lane, Greensboro, NC 27407 ~ Phone: (336) 854-8787

If you miss the Groometown Road Exit from I-85, take Business I-85 South towards High Point (Exit 118). Take the Vickery Chapel Road Exit to the ***right****. Turn* ***right*** *onto Vickery Chapel Road. At the next stoplight, turn* ***right*** *onto Grandover Parkway. Continue past Grandover Resort & Conference Center which will be on your left. Turn* ***left*** *onto ACC Lane. The ACC building will be on the left*

DIRECTIONS TO GRANDOVER RESORT & CONFERENCE CENTER

From Raleigh/Durham/Chapel Hill and points East:

Traveling I-40 W/I-85 S, follow sign for I-85 South (new bypass) (Charlotte/High Point) to Exit 122A (Groometown Road). Turn right onto Groometown Road. Turn left onto Grandover Parkway; go half mile and you will see the Grandover Resort & Conference Center on the right.

> ***Alternate route from Raleigh/Durham/Chapel Hill and points East****: If you continue on the old I-85 (now Business I-85 entering Greensboro), continue traveling south on I-85. Take the Groometown Road to Grandover Parkway Exit. Turn right onto Groometown Road. Turn left onto Grandover Parkway; go half mile and you will see the Grandover Resort & Conference Center on the right.*

From Greensboro/High Point/Winston-Salem Airport and points West:

Follow signs from airport to I-40 E. Take I-40 to I-85 South (Exit 218, then Exit 79) . Take the Groometown Road to Grandover Parkway Exit). Turn right onto Groometown Road. Turn left onto Grandover Parkway; go half mile and you will see the Grandover Resort & Conference Center on the right.

From Charlotte area:

From I-85, take Exit 119 (Groometown Road to Grandover Parkway). Turn left onto Groometown Road. Turn left onto Grandover Parkway; go half mile and you will see the Grandover Resort & Conference Center on the right.

From Charlottesville area and points north on Highway 29:

Enter Greensboro from the north by way of Hwy 29. Take I-85 South to Groometown Road Exit. Turn right onto Groometown Road. Turn left onto Grandover Parkway; go half mile and you will see the Grandover Resort & Conference Center on the right.

> ***For those travelling south on I-85:***
>
> *If you miss the Groometown Road to Grandover Parkway Exit, take Business I-85 South towards High Point. Take the Vickery Chapel Road Exit. Turn right onto Vickery Chapel Road (going past the gas station which will be on the right). At the stoplight, turn right onto Grandover Parkway. Grandover Resort & Conference Center will be on your left.*

ATLANTIC COAST CONFERENCE
ACADEMIC ADVISORS MEETING
April 6-7, 2009
Conference Office Board Room
Greensboro, NC

AGENDA

1. Welcome & Introductions (*Eric Wood/Jane Caldwell, Chair*)

2. Review Itinerary & Agenda (*Caldwell)*

3. Approve Minutes from October 8, 2008 Call (*Caldwell*) **Supplement No. 1**

4. NCAA Academic Updates-Webinar (*Matt Burgemeister*) **Supplement No. 2**
   a. Men's Basketball Academic Enhancement Group
   b. Football Academic Working Group
   c. Division I Academic Cabinet
   d. Division I Committee on Academic Performance

5. NCAA Legislative Update (*Lindsey Babcock*) **Supplement No. 3**

6. **Best Practices**-Academic Support During Challenging Economy
   a. Roundtable Discussion

7. Attendance Policy for Orientation (*Caldwell*)

8. Student-Athlete Opportunity Fund Executive Summary (*Wood*) **Supplement No. 4**

9. ACC All-Academic Teams (*Carrie Leger*) **Supplement No. 5**

10. Article on Student-Athletes Choosing Majors (*Ferna Phillips*) **Supplement No. 6**

11. NCAA Self Study Of Academic Units (*Phillips*) **Supplement No.** 7

12. APR/GSR Conference Comparison (*Wood*) **Supplement No. 8**

13. Student-Athlete Programs (*Wood)*

14. Future Meeting/Conference Call(s) (*Caldwell*)

15. Adjournment

ATLANTIC COAST CONFERENCE
MINUTES OF THE
DIRECTORS OF ACADEMIC SUPPORT SERVICES COMMITTEE

October 8, 2008

Those on the call:

Ferna Phillips, Boston College
Becky Bowman, Clemson University
Heather Ryan, Duke University
Bill Shults, Florida State University
Phyllis LaBaw, Georgia Tech
Anton Goff, University of Maryland
Robert Mercer, University of North Carolina
Carrie Leger, North Carolina State University
Phillip Moses, North Carolina State University
Jim Booz, University of Virginia
Colin Howlett, Virginia Tech
Jane Caldwell, Wake Forest University, *Chair*
Atlantic Coast Conference – Eric Wood, *ex-officio*

Those unable to join the call: David Wyman, University of Miami

[Note: While certain items in the agenda may have been acted on at various times throughout the call, all final actions within a given topic are combined in these minutes and listed in order of the agenda for convenience of reference. These minutes reflect only actions (formal votes or "sense of meeting") that occurred.]

1. Welcome/Introduction. Jane Caldwell welcomed everyone and shared the purpose of the call. During our spring 2008 in-person meeting it was the request of the group to have a conference call in October in order for the committee to provide input on 2008 NCAA legislative proposals related to academic issues.

2. NCAA 2008 Legislative Proposals. Eric Wood reviewed 12 proposals selected by the Conference Office for the committee to review, discuss and provide feedback. There was a request to add proposal 2008-46 to the voting chart. Institutional positions are due back Friday October 17, 2008. Since that meeting the deadline was extended to Monday October 20, 2008. The results will be shared with the group and included in the mailings sent to the FAR's, AD's and SWA's for consideration prior to taking official institutional positions.

3. APR Issues. The group received an e-mail from the NCAA prior to the call regarding the Academic Performance Program (APP)-clarifying the documentation needed for student-athletes who transfer. Jane Caldwell solicited the group for questions/concerns but there was no further discussion.

4. Benchmarking Survey. Jane Caldwell asked the group to review the benchmarking survey because it was evident that many people responded differently based on how they interpreted the questions. Please pay close attention to the operating budget question and be more specific about how many staff members are working with each sport, excluding names. It would also be helpful to update the priority registration question explaining what exactly it allows student-athletes to do. We will also add a column for the salary range of interns. Please notify Eric Wood with your updates and he will provide the revised survey during the spring meeting.

5. Meeting/Conference Calls. The group decided we did not need another conference call this academic year. Jane asked if everyone would check their calendars for April 6 & 7, 2009 or April 13 & 14, 2009 and let Eric know your preferred meeting dates as you submit your voting charts.

6. Other Business. Eric Wood learned that The Compliance Group added an academic services consulting unit with Mr. Steve McDonnell, formerly of Texas A&M, and wanted to know if the group would like to extend an invitation to him for the spring meeting. The group was not in favor of inviting Mr. McDonnell in as a speaker at this time because of the potential conflict with what N4A already provides. Jane Caldwell thanked the group for their work on the Men's Basketball Academic Enhancement Group recommendations. Anton Goff reported that the comments/suggestions were forwarded to Dr. Debbie Yow as our ACC representative and were well received.

Division I Academic Updates

Atlantic Coast Conference
April 6, 2009

Matt Burgemeister
NCAA Academic and Membership Affairs

Agenda

- NCAA Division I Men's Basketball Academic Enhancement Group (BAEG).
- Football Academic Working Group (FAWG).
- NCAA Division I Academic Cabinet.
- NCAA Division I Committee on Academic Performance.

MEN'S BASKETBALL ACADEMIC ENHANCEMENT GROUP

BAEG Overview

- Chair: Dan Guerrero, Director of Athletics, UCLA.
- August 2007: Working group established.
- September 2008: Progress report circulated for comment.
- December 2008: In-person meeting.
- Subcommittee work throughout.

Areas to Address

- Identified areas for the potential development of recommendations to improve the academic performance of basketball student-athletes:
  - Transfers – incoming and outgoing.
  - "0/2" phenomenon.
  - Academic preparation and support.
  - Coach/player relationship.
  - Playing and practice season.

Preliminary Concepts

- Mandatory summer school.
- Playing and practice seasons.
- NCAA Division I Academic Progress Rate (APR) policies.
- Academic preparedness.

Mandatory Summer School

- Summer attendance for incoming freshmen and returning student-athletes.
  - Not mandatory; based on academic profile and academic performance of individuals and teams.
  - Three credit hours and study skills/life skills before initial enrollment.
  - Six credit hours for continuing student-athletes.

Mandatory Summer School (continued)

- Summer athletics activities; limited opportunity for practice/skill development.
- Group continues to support "access," but is concerned about appearance of rewarding low academic achievement.

Playing and Practice Seasons

- Staggered start to on-court practice.
- Maintain 15-week season.
- Reduce maximum number of contests by one.

Playing and Practice Seasons (continued)

- In-season best practices (conference offices should monitor and require documentation).
  - Average no more than two contests per week when classes in session.
  - No contests during week of final exams.
  - No more than one away-from-home game Monday through Friday of a given week.

APR Policies

- Not recommending any changes in the APR calculation at this time.
  - Withdrew recommendation to consider academic engagement to point of departure.
- Narrowed recommendation regarding waiver flexibility after a head coaching change - advocate consideration to all penalties, not just historical.
  - Full group will review at April meeting.

Academic Preparedness

- Examining academic preparedness and "year of readiness."
  - Entering prospective student-athletes.
  - Two-year transfers.
- Greater interaction with 2-4 transfers *prior* to transfer (e.g., academic advising).

Academic Preparedness
(continued)

- Limit use of physical education activity courses for two-year transfers.
- Academic Cabinet continue to review transfers and nontraditional courses.

April 2009 Meeting

- Finalize summer school recommendation.
  - Institutional opt-out.
  - "At-risk" students.
  - Athletics access.
- 2-4 Transfers.
  - Residence requirement.
  - Remediation period.
- Status of APR recommendations.
- Playing and practice seasons – 48-hour rule.

Next Steps

- April 6, 2009: Next meeting.
- Recommendations forwarded to NCAA Division I Board of Directors at August or October 2009 meeting.
- Legislative items forwarded to 2009-10 legislative cycle.
  - Recommendations will be considered by Division I governance structure.

FOOTBALL ACADEMIC WORKING GROUP

FAWG Overview

- Chair: Joe Castiglione,
  Director of Athletics, University of Oklahoma.
- April 2008: Working group established.
- January 2009: Preliminary report to Board of Directors.
- Three subcommittees (separated by FBS/FCS).
  - Eligibility.
  - Retention.
  - Finances.

Preliminary Findings

- APR problems seem to be more related to eligibility rather than retention.
  - Retention rates higher than baseball and basketball, but eligibility rates lower.
- Incoming freshman in football have lower high school academic profiles than any Division group except basketball.
  - First year academic performances is worse than basketball.

Preliminary Findings

- High rate of student-athletes who lose the "E" for the fall term.
  - First term of enrollment:

	Credits Earned	GPA
Earn "E"	12.2	2.560
Lose "E"	6.4	1.130

- "0/2s" most likely to occur after exhausting eligibility.
- Retention loss occur most after exhausted eligibility.

Preliminary Findings

- Two-year college transfers most likely to be "0/2s."
  - More than 18 percent of two-year transfers become "0/2" after exhausting eligibility.
- About one-quarter of all two-year transfers lose an E-point in first term of enrollment.
- Two-year transfers more likely to depart without graduating.

Preliminary Findings

- Football student-athletes report higher time demands than other sports, but less missed class and time away from campus.
- Summer school usage much higher in FBS (81 percent) than FCS (36 percent).
- High school SAT scores and percentage of 2-4 transfers more correlated to APR than resources.

March 2009 Meeting

- First-year student-athlete required to earn "E" in fall semester or lose some contests the following season.
  - Possibility to earn back through remainder of year.
- Eliminate APR contemporaneous penalty exemption for student-athletes who exhaust eligibility.
- Best practices (retention).

Next Steps

- Consult various constituent groups (AFCA, CCA, SAAC, N4A, etc.).
- April 2009: Status report due to Board of Directors.
- Recommendations will be considered by Division I governance structure.
  - Additional feedback to structure: 2-4 transfers, initial-eligibility standards and APR coaches rate.

NCAA DIVISION I ACADEMIC CABINET

Academic Cabinet

- Chair: Carolyn Callahan, Faculty Athletics Representative, University of Virginia.
- Jurisdiction includes:
  - Overseeing academic research and policies;
  - Establishing, managing and monitoring eligibility standards; and
  - Serving as the appellate body for academic waivers.

Academic Cabinet Priorities

- Academic success of transfers, particularly two-year college transfers.
- Nontraditional courses.
- Impact of academic reform on academic support personnel.
- Student-athlete time demands.
- Degree program selection.

Transfer Student-Athletes

- Reviewed final report of Transfer Issues Ad Hoc Group.
- Reviewed academic performance of 2-4 transfers.
  - About five percent of all student-athletes; downward trend.
  - Baseball and men's basketball over 17 percent; women's sports other than basketball about 2.5 percent.
  - Tend to have lower high school academic performance than nontransfers and four-year transfers.
  - Transfer status increases likelihood to be "0/2."

Transfer Student-Athletes

- More data collection needed for 2-4 transfers.
  - High school academic record.
  - Performance at two-year college.
- Possible concepts for consideration:
  - Residence requirement/year in readiness.
  - Summer coursework at four-year institution.
  - Delay of five-year clock or percentage of degree requirements.

Nontraditional Courses

- Support proposals regarding use of nontraditional courses for full-time enrollment and progress-toward-degree requirements.
  - Topic remains a priority despite defeat of NCAA Proposal Nos. 2008-32-A, 2008-35-A and 2008-35-B.

Nontraditional Courses (continued)

- Reviewed document produced by N4A to assist institutions in monitoring nontraditional course enrollment by student-athletes.
- Will review nontraditional courses used for initial-eligibility purposes at June 2009 meeting.

Academic Support Personnel

- Hosted representatives from N4A: president and president-elect.
  - Reviewed results of 2006 survey on the impact of academic reform and workload of academic support personnel.
  - Agreed to repeat survey to update findings.
- Working with representatives from N4A and NACADA on a comprehensive study of academic support services.

Time Demands

- Reviewed findings of GOALS and SCORE studies.
  - Student-athletes report 30-40 hours per week on athletic activities.
  - FBS football players report the most hours and the highest athletics plus academics time commitment.
  - Baseball and basketball report the least time on class and study.
  - Five sports report more time on athletics than academics: baseball, men's basketball, football, men's golf and men's ice hockey.

Time Demands

- Competition during final-exam period.
  - Many teams continue to compete during final exams.
  - Teams from low-resource institutions more likely to compete and travel greater distances during finals.
  - More nuanced data needed.

Time Demands

- In-season versus out-of-season academic performance.
  - Student-athletes consistently earn fewer credits and achieve lower GPA during season, especially in sports with high time demands and students who entered less academically prepared.

Degree Program Selection

- Will review current requirements regarding degree designation, double majors, dual degrees, minors, etc. during June 2009 meeting.
- Will also review progress-toward-degree waivers related to major selection.

Academic Cabinet Guiding Principles

- Eligibility requirements shall assure proper emphasis on educational objectives, promote competitive equity and prevent exploitation.
- Intercollegiate athletics shall be a vital component of the educational program, and student-athletes shall be an integral part of the student-body.

Academic Cabinet Guiding Principles

- Support graduation as the primary measure of student-athlete success; preserve the "seamless" academic eligibility model and promote graduation within five years.
- Emphasize research and data-driven decision making in the development of legislative and policy recommendations.

Academic Cabinet Guiding Principles

- Increase student-athletes' responsibility for academic success.
- Increase institutional responsibility to facilitate the academic success.
- Commit to student-athlete well-being issues, including minimizing missed class time and balancing self-identification as students with identity as athletes.

Academic Cabinet Guiding Principles

- Promote student-athletes' options to select from a wide range of degree programs and to integrate fully into the university and student-body.
- Minimize disparate impact on low-income and minority student-athletes and PSAs.

Academic Cabinet Guiding Principles

- Remain cognizant of the impact of proposals on institutional resources, academic support professionals and other institutional staff members.
- Ensure legislation is written in a simple, clear and direct manner.
- Consider the amount of time legislation has been in effect before supporting a legislative change.

Academic Cabinet Guiding Principles

- As appropriate, ensure feedback has been solicited from external groups.
- Consider whether or not sport-specific legislation is warranted or whether a proposed legislation can/should be expanded to other sports.
- Examine potential unintended consequences when reviewing legislation.

Data Collection

- Initiative for 2009-10:
  - Collect information on academic performance of two-year college transfers while at the two-year institution.
- Proposals currently under consideration:
  - Collect high school academic information (courses, grades, test scores) for two-year college transfers.
  - Collect final high school transcripts for early academic qualifiers.

NCAA DIVISION I COMMITTEE ON ACADEMIC PERFORMANCE

February 2009 Meeting

- Head Coaches' APR Portfolio.
- Two-year transfer data collection.
- Occasion-Three Historical Penalty Hearings.
- Public data release: May 2009.

Summary

- Basketball Academic Enhancement Group.
- Football Academic Working Group.
- Academic Cabinet.
- Committee on Academic Performance.

Facilitating Learning and Achieving Graduation

A Report from the Working Group Examining Issues related to Academic Risk

Brief History and Process Overview

- The Presidential Task Force on the Future of Division I Intercollegiate Athletics noted the need to focus on support for "at-risk" student-athletes.
- In response, a working group was formed to examine issues pertaining to the academic risk of student-athletes.
- The working group's report has been approved by the NCAA Division I Board of Directors and the NCAA Division I Academic Cabinet.

Working Group Charge

- Identify factors and characteristics that may cause a student-athlete to be at risk of not graduating from his or her institution.
- Establish a data-based definition of “at risk” that allows for local differences among the diverse NCAA Division I membership.
- Develop a tool for campuses to use to examine special admissions of scholarship student-athletes and to measure whether campus systems can adequately support the number of student-athletes admitted via special admissions review each year.

Working Group Charge

- Identify model practices in academic and life-skills programs to support at-risk student-athletes in their academic endeavors.
- Develop mechanisms to assist institutions in evaluating the level of academic and life-skills support provided to at-risk student-athletes and in determining if enhancements or changes are necessary.

Defining "At Risk"

- Determined to be at risk of not graduating from a four-year institution.
- The working group was mindful of negative connotations of the at-risk label, as well as traditional view of at-risk students as those who are academically underprepared as they enter college.
- At the urging of the Board of Directors and the Oversight and Monitoring Group, a new paradigm was developed.

Nature of "Risk"

- Any student-athlete can be at risk of not graduating.
- Risk can take a variety of forms, including nonacademic factors (e.g., first-generation status, financial hardship, time demands of sport).
- Risk factors can be specific to the student-athlete or can be presented by team culture or campus environment.

Nature of "Risk"

- A student-athlete's level of risk may fluctuate throughout the course of his or her collegiate enrollment.
- As a result, risk assessments should not be limited to the point of student-athlete entry. Rather, they should continue throughout a student-athlete's career.
- In order to best support student-athlete success, institutions need a management system to identify and mitigate each student-athlete's risk of not graduating.

FLAG Program

Facilitating Learning and Achieving Graduation

- Program's purposes:
  - To optimize each campus environment to leverage opportunities for graduation success.
  - To increase the efficiency of current services, including academic support and life-skills programs.
  - To inform decision making regarding recruiting, admissions and program resources (e.g., staffing and budget).

FLAG Program

Facilitating Learning and Achieving Graduation

- Primary components will…
  - Determine an individual student-athlete's hurdles to graduation.
  - Match support services for an individual student-athlete to mitigate hurdles.
  - Evaluate the level and effectiveness of services provided.

FLAG Modules
GRO
FLAG
Support Services
Evaluation

FLAG Modules

Graduation Risk Overview (GRO)
Scoring model by which each student-athlete can be evaluated, based on data-driven risk factors.

FLAG Modules

Support Services
Activities designed to counter the risk factors presented by each student-athlete.

FLAG Modules

Evaluation of Support Services and Programs
Determines the effectiveness of campus units in mitigating risk factors presented collectively by student-athletes.

FLAG Structure

Facilitating Learning and Achieving Graduation

- A current NCAA Web-based program (i.e., NCAA Division I Academic Performance Program) will be expanded to include FLAG.
- The FLAG system will be programmed to:
  - Compute a GRO score for each student-athlete.
  - Match suggested services to factors identified for each student-athlete.
  - Provide summary reports regarding the effectiveness of programs and services and the potential impact of recruiting and admissions decisions on service provision.

GRO – First Year

Category	Weight	Variable(s)/Criteria
Academic	+2	(HS student) HS core GPA < 2.6 ***or*** ACT/SAT < 820 ***or*** Core units < 16 ***or*** Academic nonqualifier ***or*** Number of HS > 2 ***or*** Educational disability diagnosed ***or*** Other locally identified criteria. (Transfer) Transfer GPA < 2.6 (for 2-4 or 4-4 transfers).
Role of Academics	+1	Identifies strongly as an athlete, not as a student.
	+2	Academic effort lacking (historical or contemporary).
Transfer	+1	Transferred into current institution (2-4 or 4-4).
Personal History	+1	First-generation college student ***or*** Student has low financial resources ***or*** Student is homesick ***or*** Other locally identified criteria.
	+1	Personal, health, injury, family, mental health or substance abuse issue(s).
Sport	+1	Student-athlete in high-profile sport at the institution ***or*** High-profile (e.g., Olympic caliber) student-athlete.
	+1	Team environment does not prioritize academics ***or*** Coach in first year.
Total		0-1 = low risk; 2-3 = moderate risk; 4+ = high risk

GRO – Second Year and Beyond

Category	Weight	Variable(s)/Criteria
Academic	+4 or +2	(+4) Current cumulative GPA < 2.0 ***or*** Current term GPA < 2.0 ***or*** Academically ineligible within the past year (+2) Current cumulative GPA < 2.6 ***or*** Current term GPA < 2.6 ***or*** Education disability diagnosed ***or*** Other locally identifiable academic criteria.
Role of Academics	+1	Identifies strongly as an athlete, not as a student ***or*** Professional sports opportunity presents.
	+2	Academic effort lacking (historical or contemporary).
	+1	Negative attitude toward major.
Transfer	+1	Transferred into current institution (2-4 or 4-4).
Personal History	+1	First-generation college student ***or*** Student has low financial resources ***or*** Student is homesick ***or*** Other locally identified criteria.
	+1	Personal, health, injury, personal, family, mental health or substance abuse issue(s).
Sport	+1	Student-athlete in high profile sport at the institution ***or*** High-profile (e.g., Olympic caliber) student-athlete.
	+2	No athletic eligibility remaining.
	+1	Team environment does not prioritize academics ***or*** Coaching change occurred ***or*** Student-athlete dissatisfied with athletics experience.
Total		0-2 = low risk; 3-4 = moderate risk; 5+ = high risk

Next Steps

- FLAG development is underway at the NCAA national office.
  - Advisory and pilot groups are being formed to complete module designs and to test new program.
    - If you would like to participate, please contact Matt Burgemeister at the NCAA National Office (mburgemeister@ncaa.org)
  - Targeted Project Time Line:
    - GRO module available to the membership Fall 2009.
    - Support Services module available Spring 2010.
    - Evaluation module available in 2010.

Final Thoughts…

- Student-athletes fall along a continuum of risk that is based on multiple factors - not all of which are academic.
- Institutional units must collaborate to identify student-athlete support needs and to provide quality services and programs to foster student-athlete graduation success.
- Informed decision making is essential to optimizing campus resources to mitigate student-athlete hurdles to graduation.
- To this end, FLAG is designed to support institutional endeavors to ensure graduation for every student-athlete.

Attached is a copy of the Faculty Review of the Academic Support Program for Student-Athletes as required by the NCAA for the institution's 10 year certification, completed by Patrick Akos. Thank you folks for cooperating with Patrick. RJM

Faculty Review of the Academic Support Program for Student Athletes

2008-2009

During the spring semester 2009, the Faculty Advisory Committee to the Academic Support Program for Student Athletes conducted a review of the Academic Support Program. The review focused on the eleven areas listed in the Institutional Self-Study Instrument Report under the Academic Integrity Report subhead. The Faculty Advisory Committee is composed of five faculty members including Dr. Patrick Akos (chair), Dr. Sherry Salyer, Prof. Lissa Broome, Dr. Helen Tauchen (also representative of the Faculty Athletic Committee), and Dr. Glynis Cowell (another representative of the Faculty Athletic Committee); and four Ex Officio members including Dr. Shade Little, Dr. Fred Clark, John Blanchard, and Robert Mercer.

The chair of the Faculty Advisory Committee, Dr. Patrick Akos, conducted a review of the program materials provided by Robert Mercer, and conducted several interviews with academic support staff (including tutors and mentors).

Based on these interviews and the information and data provided by the Academic Support Program, the committee was overwhelmed by the attention to integrity and found the Academic Support Program thoughtful in its program planning and responsive to the needs of student athletes. The effectiveness of each and every service remains a challenging and elusive question to answer, but the leadership is mounting additional efforts to determine effectiveness (and related cost-effectiveness). A general recommendation is for additional and continuous analysis of utilization of campus- based along with the academic support program-based services. Ideally, student-athletes take advantage of campus based academic support services (e.g., writing center) as often as possible, and this program monitors redundancy and how services are additive to campus-based services. Another glaring need is the addition or renovation of space to serve the large number of student-athletes and growing needs (e.g., level of academic preparedness, post-graduate opportunities). Below are additional comments about each of the services listed in program documentation along with selected recommendations for future consideration.

Academic advising – Advising is accomplished similar to that of all UNC-CH undergraduate students, and is supplemented by Academic Support staff. UNC-CH students are assigned an advisor upon entering the University. The Academic Support Program assigns their staff to student-athletes according to each sport. The Academic Support staff provides complementary advising on course selection, class scheduling, and degree program assistance. They further assist student-athletes with registration when travel and competition schedules warrant assistance. The Priortiy Registration Committee remains an important part of optimizing student-athlete course scheduling, and it seems those freshman student-athletes most academically at-risk (really any UNC-CH student academically at-risk) would even benefit from additional consideration in registration. Further, continued communication and work with faculty

around travel and exams seems warranted to provide student-athletes equal opportunity when traveling. There is some obvious utility in assigning advisors by sport, which includes consolidated schedules and communication with coaches. Even so, we suggest exploration and discussion around equitable distribution of those student-athletes that are least academically prepared upon entering the university (as they are most demanding for advising and support services). Because the distribution of academic preparedness may be skewed by sport, some advisors may be overloaded with students with more needs.

Tutoring – Tutoring is available to all student-athletes on a walk-in basis during the Academic Support Program tutoring hours. Student –athletes also utilize tutoring on campus that is offered to all students, however availability of tutoring requires the academic support program to supplement those services extensively. For example, tutoring is also organized through the team academic counselor and review sessions are offered on demand. Coordination of the academic tutoring program is a laborious task (e.g., scheduling, contact, monitoring and oversight with tutors) and the lack of consistency from year to year (as the task is moved around to different staff) seems problematic. Academic tutors are hired based on content knowledge and undergo screening and training, follow a tutor handbook, and agree to NCAA compliance forms both at the start and end of each semester (often campus personnel from the honor court and/or writing center are used in training). Integrity of the academic tutoring program is also monitored by tutor review forms where tutors both log in and out of session that includes a summary of what occurred during tutoring sessions (e.g., how many students were served, what was the focus of the session). Student-athletes also provide feedback on tutor effectiveness, although tutor turnover occurs frequently as tutors are graduate students. Tutors that were interviewed commented "the integrity of the academic support program is solid and consistent" and "effectiveness is difficult to assess…however…the vast majority have been able to get back on track and finish their course(s) successfully (through tutoring)". Further, one UNC-CH undergraduate who serves as a tutor noted an emphasis on integrity with "it was not until I began working at the academic center that I really began to understand the honor code." Future enhancement of the tutoring program may include use of studyhalltracker.com – a web-based system that can automate some of the monitoring process. Additional suggestions include making the tutoring program a shared coordination task among the staff and/or the use of graduate assistants to help with the labor intensive administrative tasks. Finally, it was noted the tutoring programs on campus often hire UNC-CH students as tutors doing a service-learning requirement. It may be useful to investigate the use of service-learning programs on campus to enhance or supplement the tutoring efforts in the academic support program.

Success skills – Study skills programs include note and test taking strategies, writing skills, and time management, among other topics. These topics are addressed through workshops throughout the year, and provided by learning specialists and academic counselors individually. Priority and proactive attention is given to freshmen/transfer students, and those who are deemed academically at-risk. Additional programs include the Academic PASS (**P**romoting **A**cademic **S**uccess for **S**tudent-Athletes) Book (time management) and Summer College Opportunity for Realizing Educational Success (SCORE; overall college success skills).

Freshman/transfer student orientation – Orientation activities are mandatory for all UNC-CH students. This includes meeting with academic advisors on campus. Academic Support Program staff also attends orientation sessions to assist student-athletes as needed. Additionally, Academic Support staff invites all student athletes to meet with them and to learn more about the programs offered through the Academic Support Center.

Academic progress monitoring and reporting – Monitoring and reporting is done by each of the assigned staff persons by sport in the Academic Support Program. Even though a comprehensive academic monitoring database is in place, it is utilized only by some advisors as each staff person seems to monitor in ways they feel work best. With the database system, sometimes daily and weekly reports are created based on self and faculty reports of student-athlete academic progress. While not all faculty provide data – the reports generated address grades, attendance, and related issues. Monitoring is especially intense for freshmen, transfer, and at-risk student-athletes, and data is shared with the appropriate coaches. Recommendations include more regular and consistent use of the academic monitoring system among all program staff – in particular for the targeted student groups and those least academically prepared. There also seems to be utility in cultivating strong relationships with head or appointed assistant coaches where academic progress information can be shared, and then reinforcing structures that are in place from both the academic support staff and athletic coaches to implement and monitor compliance with support services.

Study hall – Study hall is mandatory for freshmen, transfer, and at-risk student athletes. It is open to all student-athletes and coordinated with the assigned Academic Support staff member. Trained tutors and supplemental instruction is offered 7-9pm Sunday through Thursday.

Assistance for special academic needs – UNC-CH students can access special assistance for learning needs through the Academic Success Program for Students with LD/ADHD (or the Learning Center which oversees that program). The Academic Support Program employs learning specialists that work in collaboration with the UNC-CH office and provide additional screening and academic skills development as needed.

Learning assessments – The program provides coordination for screening, appointments, and accommodations for special needs (e.g., LD, ADHD) of any student athletes.

Mentoring (Academic) – The academic support center has also initiated the use of academic mentors to supplement the tutoring program. Academic mentors go through a rigorous hiring process including review of resume and transcripts, an interview, orientation and training, use of a handbook, and agreement with NCAA integrity statement. The program is primarily utilized in the fall to get at-risk student athletes off to a good start, but some student-athletes choose to continue in spring. Academic mentors include predominantly juniors and seniors, and several preservice teachers from the School of Education. Mentoring relationships evolve individually – but predominantly center on academic strategies (e.g., bringing and organizing notes/books, how to take notes, strategies for reading a textbook) and skills. Academic program staff meets with mentors weekly or every two weeks, and both mentors and student-athletes evaluate the program every semester. It seems that football student-

athletes primarily use mentors. Recommendations include the use of mentors in other sports based on academic preparedness and continual evaluation of mentor effectiveness and checks for redundancy with tutoring.

Assistance for at-risk students – Structured study, individualized counseling/advising, tutoring, supplemental instruction, learning skills workshops, learning disability screening, and the opportunity to work with a learning specialist are all available and promoted for helping at-risk students. The program also now offers a "bounce back" program coordinated through the University Counseling and Wellness Services to assist students on academic probation. One example, Supplemental Instruction (SI) is designed to focus on classes student-athletes have struggled with the most (often large freshman courses). A SI leader is selected (again provided orientation, training, manual, and compliance forms) and paid to attend class. This is done only after written permission is given by the course instructor (some UNC-CH faculty have declined participation). The SI leader then leads group discussion of class material, readings, and test preparation outside of class. For papers, the SI leaders often discuss major prompts or key components. These sessions are open to any undergraduate student at UNC-CH. The program coordinator noted decades of research and anecdotal evidence and suggests that those students that attend seem to have a 99% pass rate for the class.

Post-eligibility programs – Programs include information and assistance with scholarships, awards, and internships. These come in the form of workshops, monthly newsletters, and email blasts.

Academic Results -- The academic data (progress and GPA results) have been impressive and perhaps indicative of the strong support offered through the programs mentioned above and staff in the Academic Support Program. We suspect that outcome data (e.g., GPA, degree progress, retention) for student-athletes would well exceed a similar matched population of students attending UNC-CH.

Kent - can you tell me who on my staff will be getting new computers this summer? Also, are we eligible for new printers in the computer lab? If so, we would like to get double sided printers. If we would have to purchase the printers, could you get us any deals on double sided printers? Thanks! RJM

>>> Kent Pennington 5/5/2009 8:03 PM >>>

June 5th, 2009

Please note above date. This is the last day that I will place any computer related orders should you have any remaining funds this fiscal year. This includes computers, laptops, monitors, printers and software. This date is in no way related to the Business Office's end of fiscal year deadlines for 2008-09.

So please be sure to do any computer related ordering by June 5, 2009.

Thanks for your attention.

Kent

---

let's talk about this tomorrow...

>>> "Babcock, Lindsey" <lbabcock@theacc.org> 8/18/2009 9:08 AM >>>

Hi Everyone attached is an electronic copy of the Academic Support Services Evaluation Guide completed by the N4A in partnership with the DI Committee on Athletics Certification. The evaluation guide includes an example academic support review for the either required areas only. However any academic evaluation should include those eight required areas and any other areas in which support services are provided to student-athletes.

This information was shared with the CCACA last week. Since Eric is currently out of the office I thought I would share it with you in hopes that you find the information useful. Let me know if you have any questions.

Thanks,
Lindsey

Academic Support Services

Evaluation Guide

ACADEMIC SUPPORT SERVICES EVALUATION GUIDE

Background.

Based on feedback from the membership, the NCAA Division I Committee on Athletics Certification partnered with the National Association of Academic Advisors for Athletics (N4A) to develop sample materials to provide institutions as a resource for the required academic support services evaluation and report. These materials include example lists of potential interviewees, potential documents to review prior to and during the visit and suggested questions to ask during interviews. The committee agreed these materials will provide guidance to individuals conducting these evaluations to demonstrate the nature and scope expected by the committee in this evaluation.

This document is intended to provide guidance for institutions in the conduct of the academic support services evaluation, along with a sample format for the written report. This document should be used only as a guide to assist the institution in examining and improving its academic support services for student-athletes. It is important to note that institutions are **not** required to use these specific materials in order to conduct a satisfactory evaluation; nor, does the use of these materials alone ensure completion of an acceptable evaluation. The committee will continue to accept reports of any format, provided institutions demonstrate that the evaluation conducted was comprehensive in nature and meets the requirements set forth by the committee.

Please note: Institutions must involve on-campus academic authorities who do not have day-to-day responsibilities in the academic support services area as participants in the evaluation of academic support services (e.g., academic board, undergraduate education office, provost office) and are not permitted to solely rely on outside entities or individuals (e.g., conference office, peer colleagues) to conduct this evaluation. An outside entity or individual (e.g., conference office, peer colleague) may assist in the coordination or facilitation of the evaluation, provided they do not serve as the lead authority. For example, the outside entity or individual (e.g., conference office, peer colleague) could provide materials for the institution's academic authorities to use during the conduct of the review, observe interviews or suggest questions to ask during the interviews. However, in no way should the balance of responsibility for the academic support services evaluation shift from on-campus academic authorities to outside entities or individuals (e.g., conference office, peer colleague).

SAMPLE EVALUATION AND REPORT

PLEASE NOTE: The following report is only a sample format. The observations, recommendations and individuals interviewed are only an example of how an evaluation could be conducted and reported.

Purpose of Evaluation.

The purpose of this evaluation is to provide recommendations that can improve the overall effectiveness of the institution's academic support services for student-athletes. The evaluation is not intended to be an investigation or an audit. As required by the NCAA Division I Committee on Athletics Certification, this evaluation includes a review of the eight required areas only.

The following areas were evaluated:

1. Academic counseling and/or advising resources and services;
2. Tutoring;
3. Academic progress monitoring and reporting;
4. Assistance for student-athletes with special academic needs;
5. Assistance for at-risk student-athletes;
6. Academic support services facilities;
7. Academic evaluation of prospective student-athletes; and
8. Student-athlete degree selection.

An evaluation committee of faculty and staff external to the athletics department were selected by the president to conduct this evaluation and to provide a written summary of their recommendations to the director of athletics, faculty athletics representative and the athletics council.

Format for Evaluation.

The evaluation committee of faculty and staff selected to conduct the evaluation include representatives from the athletics council, faculty senate, provost office and office of student affairs.

The evaluation committee included:

- <Evaluation Committee Names and Titles>

The evaluation committee examined the following documents prior to conducting the evaluation:

1. Mission statement and goals for academic support services;
2. Most recent NCAA athletics certification self-study report;
3. Most recent academic support services evaluation report;
4. Student-athlete handbook;
5. Athletics departmental policies regarding student-athlete well-being issues (e.g., class absences, competition and practice scheduling, etc.);
6. NCAA Division I Academic Progress Rate (APR) improvement plans;
7. Academic support services budget;
8. Academic profile data of entering students (e.g., first-year students, transfers);
9. Special or alternate admissions policies and procedures;
10. Special or alternate admissions data (e.g., high school grade point average, SAT/ACT test score, first year grade point average, credit hours earned);
11. APR report;
12. Graduation success rate report;
13. Sampling of student-athlete eligibility files;
14. Tutorial handbook;
15. Academic support services organizational chart, including reporting lines; and

16. List of academic support services personnel, titles and responsibilities.

The evaluation committee conducted interviews with key constituents to examine the existing policies and procedures of academic support services for student-athletes. [Please note: the following is a list of groups included but should not be considered comprehensive. Each campus is unique and, therefore, it is imperative to understand the "lay of the land" and to involve all key personnel in the evaluation.]

Example Constituent Groups and Individuals to Interview during the Evaluation.

Listed below are the names and titles of individuals interviewed:

1. Athletics administration;
2. Academic support services staff;
3. Coaches;
4. Student-athletes;
5. Faculty athletics representative;
6. Provost office;
7. Office of academic affairs;
8. Athletics council members;
9. Compliance staff;
10. Institution administrators;
11. Representatives from the faculty senate;
12. Office of admissions and records; and
13. Other groups recommended by the institution.

Areas Reviewed in the Evaluation.

Academic Counseling and/or Advising Resources and Services.

Individuals interviewed: athletics administration, academic support services staff, compliance staff, faculty athletics representative, student-athletes and coaches.

Interview Questions:

1. What support services are provided for student-athletes?

2. What are the policies or requirements for using these services?

3. Are the services available to all student-athletes?

4. How are student-athletes made aware of these services?

5. How are progress-toward-degree requirements monitored?

6. What are the responsibilities of the academic support services staff and campus academic advisors?

7. What methods are used each term to ensure student-athletes are taking courses that fulfill progress-toward-degree requirements?

8. Is there regularly scheduled communication each term between academic support services staff and campus academic advisors? If yes, describe the frequency and type of communication.

9. How regularly do coaches meet with academic support services staff?

10. Describe the orientation program presented by academic support services staff for all student-athletes.

11. How many full-time staff members are in academic support services?

12. What are the titles and job responsibilities of full-time staff?

13. What are the reporting lines of the staff in academic support services?

14. What is the ratio of full-time athletics academic advisors to student-athletes?

15. What part-time staff does academic support services use? Describe their roles and job responsibilities.

16. Are development opportunities provided for academic support services staff? If yes, please describe.

17. Describe involvement with institutional academic support services external to athletics where collaboration is significant (e.g., honors program, learning disabilities, minority student support, university orientation).

Observations:

1. The academic support services staff participates in monthly meetings with campus academic advisors. These meetings discuss advising issues, curriculum changes, adjustments and/or changes in degree audit and general everyday academic advising information. Relationships are established and maintained through this venue. Clear communication is encouraged through networking when concerns arise regarding degree audits.

2. The registration process for student-athletes is clear and concise. All student-athletes are required to have their registration forms signed by their campus academic advisor after their advising session. Quite often, pre-advising meetings are established to gauge the student-athlete's responsibility and accountability with these sessions.

Recommendations:

1. Currently, the academic support services staff reports exclusively to the director of athletics. The committee suggests that the institution examine the reporting lines to consider reporting external to athletics.

2. Some academic support services staff members meet regularly with coaches; however, the committee suggests that regular meetings occur with coaches from all sports.

Tutoring.

Individuals interviewed: academic support services staff, coaches, student-athletes, athletics administration and tutors.

Interview Questions:

1. What support services regarding tutoring are provided for the student-athletes?

2. What are the policies or requirements for using these services?

3. Are the services available to all student-athletes?

4. How are student-athletes made aware of these services?

5. How are tutors recruited, selected, trained and evaluated?

6. Is there a tutorial handbook? If yes, please describe how often it is reviewed and updated. Also, identify who is responsible.

7. What training occurs to ensure that tutors are knowledgeable of applicable NCAA, conference and/or institutional compliance rules and regulations?

8. What methods are in place to ensure that tutors adhere to NCAA rules and regulations?

9. What programs are in place to provide ongoing training for tutors?

10. Is the tutorial program certified? If yes, by what association?

11. What are the methods by which a student-athlete is assigned a tutor?

12. What strategies are used to ensure that you have enough tutors to meet the academic needs of student-athletes?

13. What type of collaboration, if any, exists between academic support services and tutoring services on campus?

Observations:

1. The tutorial program is an extremely important component of academic support services. The tutorial coordinator is a full time, benefited institutional employee. It is the tutorial coordinator's responsibility to ensure recruitment, orienting, training, supervision and oversight of the tutors is handled professionally and ethically. The tutorial coordinator has created a tutoring handbook (attached is table of contents from the manual).

2. A critical component of the orientation program for tutors is to ensure academic integrity. The staffs of both the office of student conduct and the compliance office within athletics are involved in the orientation training. During this time, the staff shares real case studies and consequences regarding the ramifications of inappropriate behavior. The tutorial program is certified through the College Reading and Learning Association at the third level. The continued commitment to certification remains a point of focus for the program.

3. The tutorial coordinator consistently seeks feedback from other members of the academic support services staff regarding best measures regarding assignment of tutors. An emphasis is not to allow tutors to become tutors exclusively for certain teams. The tutorial program offers student-athletes three methods of receiving tutorial services. The three methods are individual (one-on-one) requests, drop-in tutoring and team study halls. All assignments are approved by the coordinator and all tutorial sessions occur in one of three highly supervised support study areas.

Recommendations:

1. Recruitment and retention of tutors remains a top priority for the program. The evaluation committee recommends the tutorial coordinator develop a recruitment plan for meeting immediate needs but, eventually, to meet with all departments, student associations and other contacts as identified.

2. It is the evaluation committee's recommendation that the tutorial coordinator meet on a regular basis (at least once a semester) with campus tutorial program leaders. We believe this collaboration is critical to the relationship with other campus groups and helps to facilitate new ideas for training and recruitment.

3. It is recommended that specific training be included in the tutorial manual and the training sessions in regards to working with student-athletes enrolled in online courses, including the proctoring of online tests.

Academic Progress Monitoring and Reporting.

Individuals interviewed: academic support services staff, office of admissions and records and compliance staff.

Interview Questions:

1. What is the role of academic support services staff in monitoring the academic progress of student-athletes?

2. How does the academic support services staff interact with staff from the office of admissions and records and campus academic advisors to monitor academic progress?

3. May coaches communicate directly with faculty or campus academic advisors regarding student-athlete academic performance?

4. What is the procedure for informing coaches, administrators and student-athletes about the academic progress of student-athletes?

5. How is faculty involved in monitoring the academic progress of student-athletes?

6. How does the academic support services staff monitor the number of class absences due to athletics competition?

Observations:

1. Academic support services advisors have specific team responsibilities and are responsible for monitoring all academic areas involved with the team, including monitoring academic progress. The academic progress of student-athletes is primarily monitored through electronic communication with the instructors and individual meetings with student-athletes. The staff has developed a process of gathering the academic updates and compiling reports. The report is shared with the director of academic support services and with coaches on a weekly basis. Only academic support services staff communicate directly with campus instructors. Coaches may not contact instructors without permission from the director of academic support services.

2. The eligibility coordinator and one academic support services staff member have continuous contact with the office of admissions and records. These individuals are the liaisons to the office of admissions and records if there are concerns regarding degree audits. All academic support services staff members are encouraged to foster relationships and ties campus wide. Academic support services has established liaisons for each college to funnel and control communications.

Recommendation:

- It is suggested that academic support services purchase a software program to assist in monitoring the continuing eligibility of all student-athletes.

Assistance for Special Academic Needs.

Individuals interviewed: academic support services staff, coaches, student-athletes, athletics administration and office of disability services.

Interview Questions:

1. How are student-athletes with special academic needs identified?

2. What diagnostic testing is provided generally for students with special needs?

3. What diagnostic testing is provided for student-athletes with special needs?

4. Is comprehensive learning disability testing provided for student-athletes? Who performs the testing? Does this differ from the general student body? If not, how are learning disability testing services provided to student-athletes?

5. What accommodations are available for the general student body if diagnosed with a learning disability?

6. What specific services or accommodations do you provide to meet the needs of student-athletes with special academic needs? Does this differ from those provided to the general student body? If so, how?

7. Does your institution have a learning specialist? If yes, what are his or her qualifications and duties?

8. What type of communication occurs between academic support services staff and the office of disability services?

Observations:

1. Academic support services has a full-time learning specialist located in academic support services but has a direct relationship with the office of disability services. This relationship is critical to the success of the student-athletes with diagnosed disabilities. Accommodations typically available for these student-athletes are note takers, extended time and distraction-free testing environments. The personnel in the office of disability services are responsible for sending notices to instructors regarding these accommodations. Academic support services emphasizes that all student-athletes with documented disabilities must register with their office.

2. All official diagnostic testing is done external to the institution. The learning specialist does the initial screening (documents approved by the licensed psychiatrist/psychologist). The academic support services learning specialist does informal testing using the Scholastic Abilities Test for Adults. The areas tested are nonverbal reasoning, reading comprehension, math calculations, writing mechanics and reading/vocabulary.

3. The major qualification established for the learning specialist is for the individual to have earned, at minimum, a masters degree in an educational discipline (preferably in special education) and have three to five years experience working with college-age students. The learning specialist does oversee a small staff (three graduate assistants) to work with approximately 35-40 student-athletes on learning strategies.

Recommendation:

- There seems to be a very effective working relationship between the academic support services staff and the office of disability services. However, there is a need to coordinate more effectively with coaches and student-athletes to ensure that the student-athletes are using all of the accommodations for which they are qualified.

Assistance for At-Risk Students.

Individuals interviewed: athletics administration, academic support services staff, coaches and student-athletes.

Interview Questions:

1. How are at-risk student-athletes identified?

2. What support services are provided for student-athletes determined to be at-risk?

3. What are the policies or requirements for using these support services?

4. Are the support services available to all student-athletes?

5. How are student-athletes made aware of these support services?

6. What diagnostic testing is provided for at-risk student-athletes? Who performs these tests? Does this differ from the general student body? If so, how?

7. Describe the support services provided to at-risk student-athletes to assist them in developing study skills.

8. Does your institution offer a basic study-skills class? If yes, please provide a copy of the syllabus.

9. Are learning assistants and mentors provided or available to work with at-risk student-athletes? If yes, please describe their qualifications and duties.

10. What is the staffing ratio of learning assistants and mentors to student-athletes?

11. Are at-risk student-athletes required to log a specific amount of time in the learning center (e.g., study hall, tutors) each week? If yes, what are the requirements?

12. How do the academic profiles of at-risk student-athletes compare to student-athletes, at-risk students and the general student body at your institution?

13. What are the policies regarding academic probation?

14. Does your institution provide a summer bridge (or comparable) program for new student-athletes? If yes, are at-risk student-athletes encouraged and/or required to attend? What are the components of the program?

Observations:

1. A complete listing of the support services offered was provided, including the institution's definition of "at-risk" and the policies and procedures regarding at-risk student-athletes.

2. Every new student-athlete is required to participate in the institution's new student orientation sessions. During these sessions, the staff has an opportunity to meet with student-athletes and their parents to discuss the services. Additional opportunities to share orientation information are the freshmen orientation courses and team meetings.

3. Initial screening for at-risk student-athletes is performed during the first week of classes. If the results dictate, full-diagnostic testing is scheduled at a later date at an external facility. The results of this testing and noted observations dictate the type of academic plan that is designed for each at-risk student-athlete. It is required that all at-risk student-athletes have an academic plan on file. It is the responsibility of the academic advisor and/or coordinator to make sure the plan is implemented and followed.

4. The learning specialist works with student-athletes based on their specific academic needs. The sessions with the learning specialist and his or her staffs are designed toward the implementation of strategies. These sessions are not tutorial sessions. Each staff member is assigned a maximum of 10 at-risk student-athletes.

Recommendations:

1. Currently, there is a very limited summer bridge program for new student-athletes. The committee recommends academic support services work in conjunction with the office of student affairs and the academic colleges on campus to expand this program for more new student-athletes.

2. The majority of coaches have been very cooperative when working with the learning specialist and academic support services staff to address the needs of at-risk student-athletes. However, it is recommended that the athletics department stress the importance of this to all coaching staffs to ensure that the needs of at-risk student-athletes are being met.

Academic Support Facilities.

Individuals interviewed: athletics administration, academic support services staff, coaches, student-athletes and faculty athletics representative.

Interview Questions:

1. Is a learning center (or other designated space or facility) available exclusively for student-athletes? If yes, please describe the facility.

2. How many tutorial rooms, offices, classrooms or other facilities are available?

3. Is there a computer lab? If yes, how many computers are available? Does the computer lab have the software equivalent to other labs on campus?

4. Does your institution have computers available to be checked out for team travel? If yes, how many are available? What is the pattern of use? Are there policies related to use?

5. Is the facility accessible to student-athletes during the day and evening hours? What are the hours of operation?

Observations:

1. The floor plan for the academic support services facility was provided. There is a desktop computer lab that accommodates 25 student-athletes and a laptop lab that can handle the overflow up to 20 more computer stations. Academic support services also has a classroom that accommodates 30 student-athletes.

2. The offices for the academic advisors are located on the top floor with the main level hosting the tutorial rooms. There are eight large and 10 small tutorial rooms.

3. For monitoring and safety reasons, all rooms have windows that allow for clear vision into the rooms.

4. The hours for the study center are Monday through Thursday 7:30 a.m. to 11 p.m; Friday 7:30 a.m. to 5 p.m.; and Sunday 4 p.m. to 11 p.m. The hours are adjusted as finals approach.

Recommendations:

1. The facilities seem to adequately meet the needs of student-athletes. It is recommended that academic support services provide additional tutoring opportunities during the daytime hours to better address the needs of many of the student-athletes.

2. It is also recommended that academic support services purchase a software program to monitor the student-athlete participation in the learning center. Currently, this process is done by hand with periodic reports going to coaches and staff.

Academic Evaluation of Prospective Student-Athletes.

Individuals interviewed: academic support services staff, office of admissions and records, faculty athletics representative and office of academic affairs.

Interview Questions:

1. Are evaluations of unofficial or official high school, two-year and four-year college transcripts prepared? If yes, what are the procedures?

2. How do you evaluate transcripts of prospective transfer student-athletes?

3. How do you determine if prospective transfer student-athletes will meet progress-toward-degree requirements when they arrive on campus?

4. How do predictors of academic success of student-athletes at your institution compare to the general student body?

5. Does your institution have special or alternative admission policies for prospective student-athletes? If yes, what are the policies?

6. Do faculty members participate in the review of specially admitted prospective student-athletes? If yes, describe.

7. What are the procedures for admitting prospective student-athletes who do not meet the regular admission standard of the institution? Does this differ from the general student body? If so, how?

8. Describe the involvement of academic support services staff in the recruiting process (e.g., unofficial, official visits).

Observations:

1. The official visit process incorporates an evaluation of the prospective student-athlete's high school or college transcripts. The review is to identify prospective student-athletes who are significantly deficient in meeting the institution's admissions standards or NCAA eligibility standards. This information is forwarded to sport administrators and coaches

immediately. This review also would identify a prospective student-athlete that would need additional review through the special-admission process.

2. The special-admission process is a faculty-based review. The institution has established five criteria that must be met to avoid the need for special admissions. If a prospective student-athlete falls short in two or more of the five areas, he or she is reviewed as a special admission. The criteria are: (1) 2.5 cumulative high school grade-point average; (2) top half of his or her class; (3) 900 combined SAT score; (4) 420 score in critical reading; and (5) 420 score on the math component of the SAT. The special admission committee meets to review prospective student-athletes to access if their academic history indicates they have the academic ability to be successful on campus.

3. Regarding transfer student-athletes, the office of admissions uses an unofficial transcript and does the first review for transferability of courses. If a course does not match with the database, the course may be sent to the dean's office of the department for review. After all courses have been reviewed, a comparison is done to determine satisfaction with the percentage-of-degree requirements. Academic support services has assigned one person, the eligibility coordinator, to be responsible for the review of each transfer's academic history. The director of academic support services signs off on each of the evaluations.

Recommendation:

- The committee recommends that the director of academic support services sign off on a document that verifies the eligibility status of all prospective student-athletes prior to a National Letter of Intent being issued to the prospective student-athlete. This document would also be signed by the athletics director.

Student-Athlete Degree Selection.

Individuals interviewed: academic support services staff, student-athletes, office of admissions and records and faculty athletics representative.

Interview Questions:

1. What is the process for student-athletes to select a major at your institution? Do student-athletes receive any education for choosing a major?

2. Is there a selection of majors that do not have restricted admission?

3. Are student-athletes satisfied with the selection of majors available to them on your campus? How is this monitored or evaluated?

4. How does your institution monitor degree-selection trends or patterns for student-athletes? Are there trends and/or patterns?

Observations:

1. Approximately 40 percent of the student-athletes initially enroll at the institution with an undeclared major. The other 60 percent move directly into their degree major and are advised by departmental advisors.

2. The undeclared student-athletes take an additional one-hour course which allows them to gather information regarding the institution's curriculums in an effort to make educated decisions concerning their matriculation. This process has served this population well. Students' satisfaction with their choice of major is quite often higher than other matriculated students.

3. The change of major process for student-athletes is the same process for all students on campus. The student-athlete first must be accepted into another major before he or she is allowed to move out of the current area. One of the recent trends on campus is that most majors, as a part of their degree requirements, have increased the transfer grade-point-average minimums and have added additional course requirements with recommended grades in specific courses.

Recommendations:

1. Academic support services has not conducted a formal review of whether student-athletes are clustering in specific majors. The committee recommends that a formal review be completed this academic year with the results and recommendations submitted to the athletics council.

2. The academic support services currently does not have a procedure to monitor student-athlete degree and/or major changes. The institution should formally collect and evaluate this information. Further, this information should be shared with the athletics council.

Summary.

Based on its evaluation of these areas, the evaluation committee believes that the institution has a sound academic support services program. The committee believes certain academic support services can be more effective with the implementation of the recommendations from this report.

The observations and the recommendations listed are not intended to be inclusive. They reflect the continuing issues and themes that were raised as a result of this evaluative process. The committee would welcome any questions or concerns regarding these recommendations. The committee appreciates the cooperation provided by all participants in this evaluation. Everyone who was interviewed was very cooperative and forthcoming with information and documents requested.

The institution's academic support services for student-athletes should be evaluated on a continuing basis. It is important to note that the academic support services evaluation was intended to assist the institution in examining and improving its academic support services for student-athletes. It should not be viewed as a comprehensive "audit" or "seal of approval" relative to the institution's academic support services efforts for student-athletes.

Subject: Fwd: Junior Transfer Seminar
Attach: TEXT.htm

>>> cyndem <cyndem@email.unc.edu> 6/4/2010 11:30 AM >>>

Dear Colleagues:

Please encourage all new junior transfers to register for the Junior Transfer Seminar this fall.

Junior transfer students are among the least likely to persist and graduate from Carolina. The Junior Transfer Seminar was designed to help junior transfers make a successful transition to the University. This small seminar, consisting of only junior transfer students, gives students the opportunity work closely with a faculty member in a small class environment and to meet with other transfer students. The seminar was modeled on the First Year Seminar program. It is an academic three-credit course emphasizing class discussion as well as learning in creative ways. The seminar is also designed to help students refine their communications skills, ability to speak clearly, and to write persuasively. Most importantly, students will have fun in this seminar because they are able to participate in the excitement of intellectual discovery and creative accomplishment.

Participating in this seminar may help transfers build a network of peers with the common experience of transferring. This support system can help smooth their transition to the University. Additionally, the seminar may fulfill a supplemental general education requirement.

For the fall 2010 semester, the Junior Transfer Seminar will be:
DRAM 290-003 - Special Studies
MWF - 11:00-11:50, CDA #105
Prof. Kimball King

To register for the Junior Transfer Seminar, please invite students to send an email to cyndem@email.unc.edu as soon as possible.
There are limited seats available for this opportunity so please encourage students to register as soon as possible.
The student email must include the following:Full name PID (Personal Identification Number) A statement requesting enrollment in Drama 290 for the fall 2010 semester.

Please do not hesitate to contact me should you have any questions. The Junior Transfer Seminar was offered for the first time last year and it was a great success. 100% of students who participated last fall were retained and are currently in good academic standing. I hope you encourage transfers to take advantage of this opportunity to make a strong start to their academic career at Carolina.

Best,
Cynthia

Subject:	FORMAL NOTICE: Update from Chancellor Thorp

Dear Carolina Trustees, Faculty and Staff,

This has been a year of great accomplishments and, at the same time, significant challenges.

This weekend, we will welcome nearly 4,000 outstanding first-year students whom we accepted from a record 29,000 applicants, up 24 percent over last year. Our faculty brought in an estimated $767 million in research funding despite a challenging federal budget picture. Alumni and friends stepped up their private giving for our second best year ever. With the state budget stabilized, the General Assembly provided for modest faculty and staff raises for the first time in four years. And we have launched a campus-wide initiative to develop our 21st-Century Vision of the Public University.

Against this backdrop of achievement, we disclosed in May serious breaches of academic integrity that had occurred in our Department of African and Afro-American Studies. We forced the retirement of Professor Julius Nyang'oro, who had earlier stepped down as department chair. A former departmental manager had long ago retired from the University. They were the only people implicated in the investigation. Throughout, we have kept our Board of Trustees, UNC President Ross and the leadership of the Board of Governors informed. We have been and are continuing to conduct our review in a deliberate and careful manner. Our focus every day remains on fixing the problems and ensuring they never happen again.

We also had four extensive reviews that examined what went wrong and recommended improvements and new safeguards. We are implementing every recommendation made in these reports:

* Review of Courses in the Department of African and Afro-American Studies: a departmental review that found 54 irregularly taught courses among 616 offered between summer 2007 and summer 2011; see the report at http://www.unc.edu/news/12/1.pdf.

* Report on Academic Support Program for Student-Athletes: an examination of ways to better serve the academic needs of student-athletes following the relocation of the Academic Support Program for Student-Athletes to the Loudermilk Center for Excellence; see the report at http://www.unc.edu/news/12/3.pdf.

* Independent Study Task Force Report: an assessment of independent study practices throughout the College of Arts and Sciences that produced recommendations for consistent policies college-wide to be implemented beginning this semester; see the report at http://www.unc.edu/news/12/2.pdf.

* Faculty Executive Committee Report: a faculty-led examination of the University's reviews of courses in the African and Afro-American Studies department and independent studies, with a focus on identifying issues that contributed to the academic problems and recommendations for next steps; see the report at http://www.unc.edu/news/12/4.pdf.

In addition, a panel of the UNC Board of Governors began its own review last month to assess our investigative work and to determine whether the steps we have taken and proposed are reasonable and adequate to protect the University's academic integrity and help prevent a similar situation from occurring again. We are cooperating fully in that effort.

As we start the new school year, I want to share what we have done so far and the additional steps we are taking to ensure integrity.

Former Governor James G. Martin agrees to lead continuing review of courses:

As part of our ongoing review of academic irregularities disclosed in May in our review of courses in African and Afro-American Studies, we have been reviewing the extent to which irregularities may have occurred prior to 2007. In consultation with our Board of Trustees and UNC President Tom Ross, we have asked James G. Martin, former N.C. governor and a former professor at Davidson College, to lead an independent review of any additional academic irregularities that may have occurred. Governor Martin's expanded review will be assisted by Virchow, Krause & Company, LLP, a national management consulting firm with extensive experience in academic performance audit procedures and controls. Members of the Board of Trustees, President Ross and I all believe that this is an important step in rebuilding the confidence that you deserve to have in our academic integrity. This review will begin immediately.

Governor Martin and Virchow, Krause & Company will provide their findings to the UNC Board of Governors panel that is now assessing the University's previous investigation. We will then ask Virchow, Krause & Company to review the new academic performance policies, procedures and controls that we have already implemented to ensure that they represent best practices and, if not, to make specific recommendations for improvement. We are determined to make sure that our internal controls are such that irregularities of the past will not recur.

Appointment of Hunter Rawlings to examine the role of athletics in the life of the University:

In its report, the Faculty Executive Committee acknowledged the complicated relationship between academics and athletics and recommended that I appoint outside experts to provide an independent, comprehensive analysis of that relationship. I agree that finding the right balance is essential, and we have the opportunity now to determine where we want to be in the future.

I have asked Hunter Rawlings, president of the Association of American Universities (AAU), to help us examine the appropriate future relationship between academics and athletics at the University. The AAU is the association of 61 preeminent public and private research universities. Hunter's credentials are impressive. He is a member of the American Academy of Arts and Sciences. He was president of the University of Iowa and Cornell University. His degrees are in classics - from Haverford and a Ph.D. from Princeton. He also brings personal experience as a student-athlete. While he was in college, he was the star of the men's basketball team, and he pitched for the baseball team.

We will launch this effort after Governor Martin and Virchow, Krause & Company complete their independent review and after the Board of Governors' panel wraps up its work. Our goal is to engage the entire campus community in a meaningful discussion and analysis of the role of athletics in the life of the University.

Changes in the Academic Support Program for Student Athletes:

College of Arts and Sciences Dean Karen Gil, Athletic Director Bubba Cunningham, the Board of Trustees and I have been examining ways to strengthen the intersection of academics and athletics. Our plans reflect excellent ideas from members of our faculty and are entirely consistent with the report issued by the 2011 Task Force on Athletics and Academics commissioned by President Ross. That report recommended that academic affairs be "fully in control" of academic support services related to athletics.

We are implementing plans now to:

Reorganize the Academic Support Program for Student-Athletes and Hire a New Leader:
The College has, for several months, been engaged in the process of reorganizing the Academic Support Program for Student-Athletes, and has launched a national search for a new director. Steve Matson, dean of the Graduate School, is chairing the search. The new director will report solely to the College of Arts and Sciences and will have the authority to manage the program's budget. Harold Woodard, associate dean and director of the Center for Student Success and Academic Counseling, will serve as interim director of the Academic Support Program for Student Athletes. Collectively, these changes provide the opportunity to move forward with a fresh perspective.

Expand Academic Advising:
Like all students at Carolina, each student-athlete is assigned a primary academic advisor through the College's Academic Advising Program. The College will strengthen the role of the advisors by adding two new positions to monitor and oversee academic advising for student-athletes.

Coordinate and Clarify the Relationship between Academic Advising and the Academic Support Program for Student-Athletes:
We are making it unequivocally clear that the College of Arts and Sciences is in charge of Academic Advising and the Academic Support Program for Student-Athletes. The College will enhance its training and supervision of academic advisors and academic counselors to strengthen their distinct, but complementary, roles and responsibilities.

Expand the Summer Bridge Program:
The College is expanding its successful summer residential academic support program to incorporate student-athletes who may need help with their personal and academic transition from high school to the University.

Strengthen Faculty Involvement in Athletics:
We are strengthening relationships among the Faculty Advisory Committee of the Academic Support Program, the Faculty Athletics Committee and the faculty representative to the ACC/NCAA. Professor Joy Renner, the new

chair of the Faculty Athletics Committee, spent the summer meeting with members of her committee, the administration and Athletics Department to discuss how the committee can better ensure academic integrity and full integration of student-athletes into the life of the University. To meet the complex challenges associated with balancing academic and athletic excellence, it's essential that faculty be visibly engaged in relevant policies and practices.

Changes in the Department of Athletics:

Athletic Director Bubba Cunningham is the right person to help us move forward. He wants our student-athletes to get a world-class education, with high academic standards. To that end, he and College Dean Karen Gil are working collaboratively to strengthen the connections between academics and athletics.

Bubba recently completed a comprehensive analysis of the department and has reorganized to strengthen the department. He has hired two new staff members.

Senior Associate Athletic Director Vince Ille comes from the University of Illinois, where he was first an assistant athletic director for compliance and then a senior athletic director. He will be the liaison with academic advising and counseling for student-athletes. Bubba has made clear that these functions remain independent of athletics and are part of the College of Arts and Sciences. Vince will coordinate with the College. He will also supervise the compliance program and work with staff to minimize the risk of NCAA infractions.

Associate Director Paul Pogge was associate athletic director for strategic planning and partnerships at the University of Denver. He will assist in coordinating student-athlete eligibility, the NCAA's Academic Progress Rankings, risk assessment and summer camps.

A wide range of improvements in the department, the College and the University:

The Department of African and Afro-American Studies, all of the departments in the College of Arts and Sciences, and the Summer School all have new policies and procedures in place to prevent irregularities going forward:

* The department has entirely new leadership and governance structure, and new policies and procedures for independent studies.

* The new chair, Professor Eunice Sahle, has a vision for the department that will further strengthen the excellent teaching, research and service being done by its current faculty.

* Stronger and more consistent policies for exams, grading and course syllabi are now in place.

* The College is implementing consistent best practices for independent study in all of its academic departments.

* The College now follows an annual process for reviewing all teaching assignments and enrollments in every academic department and curriculum.

* The Summer School has implemented new policies and monitoring tools.

* ConnectCarolina, the University's new centralized database, now enables stronger management of monitoring and tracking student records and grade forms.

Summary

I am a graduate of this great University, I have served on its faculty, and I am proud now to be the chancellor. The academic issues that we have confronted are unacceptable for our University, and we are intent on resolving them. Nothing is more important than restoring integrity to this University that we all love.

The great things we have accomplished would not be possible without your hard work and dedication to this University. So thank you for all that you do for the University of North Carolina at Chapel Hill.

Sincerely,

Holden Thorp

Subject: Following Up

Dear Beth and Bradley:

Thank you again for meeting with Barbara and me on December 7.

I've done some homework in response to the advice you gave us and would welcome the chance to talk with you about it.

If you'd have 30 minutes free during any of the times listed below, I'd be glad to come to your building. If none of these will work, I hope you'll feel free to suggest others during the next few weeks.

Thank you again and Happy New Year to both of you.

Steve

Subject: Tutorial Items - Spring 2013

Hey Everyone,
I hope you all had a great holiday break!
I have a couple of things regarding tutoring and structured study that I wanted to run by everyone.
1. Tutor Training is scheduled for Wednesday, January 9th 6-8pm. Dr. Steve Knotek from the School of Education will be our guest speaker for the evening. Please plan to attend if you can.
2. If you are confident that your students' schedules for certain courses will not change, go ahead and begin loading your tutor requests in the database. If a drop-in is sufficient, no need to add this as a tutor request. At this point, tutor requests should be one-on-one requests or small group requests. Please be sure to indicate LEEP students and identify priorities in the comments. If there are specific drop-ins that you would like to see on the weekly schedule, just email me or stop by my office to let me know.
3. Below is what we are considering for start dates to structured study and tutoring. Please review and let me know any thoughts you may have. I need to have this officially added to the Policy Sheet for team meetings ASAP. If I do not hear from you, I will assume everyone is comfortable with this schedule.
Thanks so much,
Susan

STRUCTURED STUDY PROGRAMS

First-year students participating in our structured study program will be required to complete designated team hours of structured study per week. Upperclassmen who are below a certain GPA may also be required to attend according to his/her academic counselor's guidelines. Structured Study starts on **Sunday, January 13th.** All structured study hours must be completed **during the building's hours of operation**, **Sunday through Thursday.** Students MUST present their ONE Card in order to log study hours at night. There will be a sign-in sheet for hours logged during the day.

EVENING TUTORING

Contact your academic support counselor if you need a tutor. **Drop-in tutoring for English, Math, and Foreign Language will begin on Monday, January 14th with all other tutoring scheduled to begin on Tuesday, January 22nd and will run from 6:00pm -10:00pm, Sunday-Thursday evenings.** See staff on duty for nightly tutor schedule. This schedule may change during the term, so be sure to check in with the staff on duty each night. In order for the tutoring session to be useful and productive, please arrive on time with proper books, notes, materials, **and your computer**. YOU MUST HAVE A GOAL FOR YOUR TUTOR SESSION!

Sexual Assault Investigator
Persons interested in applying should EMAIL their resumes to: jobs@durhamcrisisresponse.org. No calls, please!
GENERAL DESCRIPTION AND PURPOSE:
The position of Sexual Assault Investigator is a critical component of the "Strengthening Sexual Assault Advocacy and Investigations in Durham" (SSAI) Grant through the Governor's Crime Commission. This grant is designed to improve coordination and services throughout the victim's experience, including law enforcement and the courts. Durham Crisis Response Center (DCRC) is the implementing agency for this grant. DCRC will work collaboratively with law enforcement and the District Attorney's office to improve service delivery and critical responses to victims of sexual violence.
The SA Investigator is an employee of DCRC, assigned exclusively to the District Attorney's Office. The DA's office will provide daily supervision of this employee. The Investigator will perform investigations and other tasks as assigned by the District Attorney or his designee in keeping with the terms of this grant.
Minimum Qualifications for Position:

1. At least two years of study at a college or university or an Associate degree from an accredited institution or at least two years of experience as a law enforcement officer or a related field of employment.
2. Ability to understand complex legal issues and develop investigation techniques to provide District Attorney's Office with information needed in the prosecution of criminal cases involving violence against women, in particular, sexual assaults cases.
3. Ability to develop relationships with witnesses and victims of crimes for the purpose of extracting relevant information.
4. Possess a thorough knowledge of the court system and the various law enforcement personnel involved in criminal prosecution.
5. Ability to work long hours and weekends as needed to contact witnesses and victims and develop information required for each case.
6. Ability to work collaborative with a multidisciplinary team to address the systemic needs for the successful investigation and prosecution of sexual assault cases.
7. Examine records in order to locate links in chains of evidence or information. 8. Knowledge of relevant

equipment, policies, procedures, and strategies to promote effective local, state, or national security operations for the protection of people, data, property, and institutions. 9. Knowledge of laws, legal codes, court procedures, precedents, government regulations, executive orders, agency rules, and the democratic political process.

Skills/Abilities:

- Strong oral and written communication skills
- Strong organizational skills
- Demonstrates ability to effectively work on a multidisciplinary team
- Demonstrates skills of self-direction

This job description is meant to serve as information to the applicant as to what may be required for appointment to this position. It is in no way to be exhaustive of the education and experience required. The final decision as to whether the applicant possesses the qualifications for appointment to this position will rest with the Executive Director of DCRC and the District Attorney.

LICENSES/CREDENTIALS:

Preference is given to a duly sworn officer with investigative experience

SUPERVISED BY:

Daily supervision by the Durham District Attorney and the Executive Director of DCRC

1. Accountabilities of the Sexual Assault Investigator:
   - To abide by the policies and procedures of Durham Crisis Response Center's personnel manual
   - Maintain the high standards and work ethic of the Office of the District Attorney
   - Mandatory attendance of and participation in the Sexual Assault Response Team, ensuring the success of the collaborative approach to sexual assault cases
2. Provide referral information and support to clients
   - Possess a sense of social perceptiveness, being aware of victims' reactions and understanding why they react as they do.
   - Refer clients to DCRC for assistance and support
   - Work collaboratively with all community partners
3. Program Evaluation and Program Statistics
   - Produce a monthly program statistical report to DCRC, documenting cases referred and disposition of cases
   - Number of clients referred to DCRC for support and support
4. Provides outreach to the community
   - Provide community education as need and time permits
   - Attends appropriate activities within the community, representing the needs of DCRC clients

Other duties as determined by the Executive Director in conjunction with the District Attorney

The Sexual Assault Investigator will receive DCRC's Employee Manual and participate in DCRC meetings and programs.

Compass Center for Women and Families

Court Advocacy and Community Response Director
Position Description

Overview:
The Court Advocacy and Community Response Director oversees the domestic violence court advocacy program, trains and supervises volunteers to support this program and manages a multi-agency coordinated community response of service providers. This position provides direct services to victims of domestic violence in English and Spanish. The Court Advocacy and Community Response Director is supervised by the Client Services and Programs Director.

Primary Duties:
- Coordinate domestic violence court advocacy program.
- Accompany victims to civil and criminal domestic violence court.
- Assist victims in securing Domestic Violence Protective Orders.
- Recruit, screen, train and supervise court advocacy volunteers.
- Provide direct assistance to Spanish-speaking and English-speaking victims of domestic violence receiving services through the 24-hour hotline and in person.
- Provide leadership in building and managing the coordinated community response system of Orange County domestic violence victim service providers.
- Serve as a liaison between victims and victim services providers related to court advocacy such as those in the District Attorney's office, law enforcement, Legal Aid NC, and local attorneys.
- Develop and present trainings for justice system and law enforcement personnel as requested.
- Remain informed about domestic violence legislation.
- Maintain statistical records and proper documentation on clients served.
- Assist in training of hotline advocates.
- Other activities as assigned by the Client Services and Programs Director or Executive Director.

Qualifications:
- Bachelor's Degree required.
- Fluency in Spanish and English required.
- Minimum of two years experience providing services to victims of crime or working with an underserved population or an equivalent combination of education and work experience.
- Demonstrated interest or experience in the justice system.
- Ability to perform job duties with a high degree of initiative and professionalism; demonstrated sound judgment, and outstanding communication skills.
- Must possess and maintain a valid driver's license, automobile insurance, and reliable vehicle.

Hours: Full-time; exempt from FLSA. Will participate in hotline rotation as primary and/or back-up staff, including weekend and overnight shifts. Other evening and weekend hours may be required.

To apply, please send a cover letter and resume as a Word or PDF attachment to employment@fvpcoc.org. State the job title in the subject line of the email. No phone calls please. Position will be open until filled.

From:	nobody@notify.unc.edu on behalf of chancellor@unc.edu
Sent:	Thursday, January 3, 2013 8:48 PM
To:	Bridger, Beth <bridgerb@email.unc.edu>
Subject:	FORMAL NOTICE: Message from the Chancellor: Provost Search Update

Dear Students, Faculty and Staff:

I'm pleased to announce the appointment of a reconstituted 21-member committee searching for the University's next executive vice chancellor and provost. I will charge the committee at its first meeting later this month, and we expect this work to proceed productively in the coming weeks under the leadership of Kristen Swanson, dean of the School of Nursing and Alumni Distinguished Professor, as chair.

With the search for the University's next chancellor well under way, it was important to take action now to time the provost search so my successor will have an opportunity to provide input and be involved in the interview process and final selection. (We plan to use the same strategy with the search for the vice chancellor for development.)

The University faced a similar situation with vacant provost and vice chancellor for finance and administration positions in 2000 before James Moeser became chancellor. I consulted with Chancellor Moeser, and he confirmed my thinking that taking this approach would help accelerate the transition process within the administration and put my successor in the best position to hit the ground running when he or she is expected to take office next July.

I am grateful for Dr. Bruce Carney's continued service as executive vice chancellor and provost until this search is complete. He previously announced plans to return to his teaching and research career. Dr. Carney has done an exceptional job in serving as our chief academic officer. The provost oversees all academic operations including our schools and the College of Arts and Sciences, the University Library, a variety of centers and several cultural and educational units. This position also involves working closely with our vice chancellor for finance and administration to manage the University's budget process.

Dean Swanson is communicating with Wade Hargrove, chair of the chancellor search committee and our Board of Trustees, to assure a well-coordinated process with both searches. Joining Dean Swanson on the committee are distinguished faculty colleagues representing the College of Arts and Sciences, our professional schools and the Office of Faculty Governance. They are:

* Howard Aldrich, Kenan Professor and chair, Department of Sociology;

* Bill Andrews, E. Maynard Adams Professor of English, Department of English and Comparative Literature;

* Tim Carey, professor of medicine and social medicine, School of Medicine, and director of the Cecil G. Sheps Center for Health Services Research;

* Jennifer Conrad, senior associate dean for academic affairs and Dalton McMichael Distinguished Professor of Finance, Kenan-Flagler Business School;

* Jo Anne Earp, professor and former chair, Department of Health Behavior, Gillings School of Global Public Health;

* Joe Ferrell, Secretary of the Faculty and Albert Coates Professor of Public Law and Government, School of Government;

* Thomas Hazen, Cary C. Boshamer Distinguished Professor of Law, School of Law;

* William Kier, professor and chair, Department of Biology;

* Barbara Moran, Louis Round Wilson Distinguished Professor and former dean, School of Information and Library Science;

* Mike Smith, dean and professor of public law and government, School of Government;

* Dulcie Straughan, James and Hallie Parker Distinguished Professor and former interim dean, School of Journalism and Mass Communication;

* and Kim Strom-Gottfried, Smith Theimann Distinguished Professor for Ethics and Professional Practice and former interim dean, School of Social Work.

Also serving on the committee are:

* Alston Gardner, a member of our Board of Trustees and a lecturer of strategy and entrepreneurship, Kenan-Flagler Business School;

* Taffye Clayton, vice provost for diversity and multicultural affairs;

* Stephen Farmer, vice provost for enrollment and undergraduate admissions;

* Karol Kain Gray, vice chancellor for finance and administration;

* Bettina Shuford, associate vice chancellor for student affairs;

* Tammy Cox, treasurer of the Employee Forum;

* Rachel Myrick, student body vice president;

* and Kiran Bhardwaj, vice president of external affairs for the Graduate and Professional Student Federation.

Sincerely,

Holden Thorp

THE COMPLIANCE NEWSLETTER

UNC Department of Athletics

JANUARY 4, 2013 ***VOLUME XVIV, NUMBER 6***

JANUARY ENROLLEES

Any new student-athlete enrolling at UNC in January must complete eligibility paperwork and be cleared by Sports Medicine PRIOR to participating in any countable activities. Contact Lance (3-7259) to complete eligibility paperwork.

ELIGIBLE TO COMPETE

As a new semester quickly approaches, please remember that all student-athletes must be certified and released by the Compliance department before they can compete. Prior to the first competition, all coaches will receive an email from Lance Markos with a list of those S-As that are eligible. Do NOT let any S-A compete before receiving that eligible to compete memo.

CAMP BROCHURES

All camp and clinic brochures must be approved by the Compliance Office before they are printed and distributed. Brochures should be submitted to Lance for review.

BOOKS

The process for S-As on a book scholarship will be the same in the Spring as it was for Fall 2012. Samantha Kirby will be in Loudermilk Tuesday, January 8 through Friday, January 11, from 10am-2pm to collect book forms. Those book forms will be processed within 48 hours and S-As can then pick up books on the first floor of Student Stores. If a S-A preordered books then those will be available for pick up on the first floor of Student Stores starting Saturday January 5th. Please feel free to call Samantha or Tom Timmermans with any questions related to the textbook process.

NATIONAL LETTER OF INTENT (NLI) SIGNING PERIOD

Please note the upcoming NLI signing dates:

FOOTBALL: 2/6/2013 to 4/1/2013

FIELD HOCKEY, SOCCER, TRACK/CROSS COUNTRY: 2/6/2013 to 8/1/2013

FIELD HOCKEY, SOCCER, TRACK/CROSS COUNTRY: Coaching staff members may make unlimited telephone calls to a prospect from February 6th through February 8th.

FOOTBALL: Coaching staff members may make unlimited telephone calls to prospects from February 4th at 7:00 am until February 8that 7:00 am.

Please note: Sports associated with this NLI signing period are in a dead period from Monday, February 4th through Thursday, February 7th. During a dead period, it is not permissible to make in-person recruiting contacts or evaluations on or off the UNC campus. This also prohibits official or unofficial visits to UNC's campus, as well as the provision of complimentary admissions to prospects for campus athletics contests. See Bylaw 13.02.5.5 for more details.

Coaches, please remember that Tom will be preparing all NLI/ASA packets. In order to have a packet prepared, you must complete the NLI/ASA Information Form (found on the J: drive, Compliance, Financial Aid, NLI/ASA Information) and submit it to Tom. Please do so as soon as you know of individuals to whom you wish to send an NLI packet.

Cc: Bobby Hundley <bhundley@uncaa.unc.edu>; Matt Bowers <mbowers@uncaa.unc.edu>
Subject: Academic All-America nominees

Beth and Jenn,
When you get a chance, could you please let me know whether we have any potential nominees for Academic All-America honors from mbb or wbb? Full criteria below, but basically it's soph or above with a 3.3 or better cumulative GPA.
Thanks,
Dana

REMINDERS:
The nominee must be a starter or important reserve with legitimate athletic credentials.

Nominees must have a cumulative grade point average of at least 3.30 (on a 4.0 scale) in BOTH undergrad and graduate work. This MAY NOT be rounded up to 3.30 -- thus, a student-athlete with a 3.299 GPA is not eligible. Nominees in graduate school must have a cumulative GPA of 3.30 or better both as an undergrad AND in graduate school. For example, a student-athlete with GPAs of 3.0 in undergraduate work and 3.9 in graduate school would not be eligible, even if the average of the two combined was above 3.30.

Nominees must have reached sophomore athletic and academic standing at your institution (true freshmen, red-shirt freshmen and ineligible athletic transfers are not eligible) and must have completed at least one academic year at your institution.

Nominees must have participated in at least 50 percent of the team's games. The basketball programs are not selected by position, so please remember to include the nominee's position in the field for academic and athletic accomplishments.

Subject: FORMAL NOTICE: DDD -- State Mileage Allowance Change

---

To: Deans, Directors, and Department Chairs

From: Martha J. Pendergrass, Director, Procurement Services

Effective January 1, 2013, the Internal Revenue Service (IRS) has increased the business standard mileage rate from 55.5 cents per mile to 56.5 cents per mile to better reflect the recent increases in gas prices. Pursuant to state statute, the Office of State Budget and Management changed the allowable rate of reimbursement for travel on official business by state employees to be equal to the IRS rate.

In processing travel reimbursement forms for trips that begin on or after January 1, 2013, the allowable rate is 56.5 cents. For trips that began before January 1, 2013, the rate is 55.5 cents.

University travelers are obligated to use a State vehicle (if available) when the round trip exceeds 100 miles. The reimbursement rate is 30 cents per mile when an individual uses a personal car when a state car is available.

If you have any questions regarding the new rate or the processing of travel forms, please contact Fahir Zulfikar at 843-5098 or zulfikar@email.unc.edu. Thank you.

This memo is also being sent to University Business Managers.

ACADEMIC SUPPORT PROGRAM FOR STUDENT-ATHLETES
POLICIES AND PROCEDURES: Spring Semester 2013

AN IMPORTANT MESSAGE…
The University of North Carolina expects students to act with the highest regard for integrity and ethical conduct when it comes to the UNC Honor Code and NCAA rules. These standards are to be taken seriously with your academic decision making as you not only represent yourself, but also your family, your team, and the University of North Carolina.

STRUCTURED STUDY PROGRAMS
First-year students participating in our structured study program will be required to complete designated team hours of structured study per week. Upperclassmen who are below a certain GPA may also be required to attend according to his/her academic counselor's guidelines. Structured Study starts on **Sunday, January 13th**. All structured study hours must be completed **during the building's hours of operation**, **Sunday through Thursday.** Students MUST present their ONE Card in order to log study hours at night. There will be a sign-in sheet for hours logged during the day.

EVENING TUTORING
Contact your academic support counselor if you need a tutor. **Drop-in tutoring for English, Math, and Foreign Language will begin on Monday, January 14th with all other tutoring scheduled to begin on Tuesday, January 22nd and will run from 6:00pm -10:00pm, Sunday-Thursday evenings.** See staff on duty for nightly tutor schedule. This schedule may change during the term, so be sure to check in with the staff on duty each night. In order for the tutoring session to be useful and productive, please arrive on time with proper books, notes, materials, **and your computer**. YOU MUST HAVE A GOAL FOR YOUR TUTOR SESSION!

UNC/NCAA TUTOR POLICIES
The Academic Support Program for Student-Athletes provides a variety of resources to promote academic success. These resources are to be used with the utmost respect and regard for academic integrity.
The following are **NOT ALLOWED** when utilizing tutors and other academic staff/resources:

- Working with a tutor who is not currently employed by the University without paying the standard rate for such service.
- Contacting tutors, via telephone, text messaging, social networking sites, etc.--you must contact tutors through your academic counselor
- Having tutors write papers for you or do any of your class assignments for you
- Having tutors write their own thoughts, circle misspellings, and write edits on your papers
- Meeting with ASPSA tutors for academic sessions outside of the Academic Center
- Socializing with tutors outside of academic sessions (ie dating or contact on social networking sites such as Facebook, MySpace, or Twitter)
- Providing tickets to tutors or putting tutors on pass lists
- Accepting cash, gifts, and other extra benefits from tutors
- ***IF YOU WISH TO HIRE A PRIVATE TUTOR YOU MUST MEET WITH TUTOR COORDINATOR, SUSAN MALOY!***

YOU ARE RESPONSIBLE FOR ALL OF YOUR OWN ACADEMIC WORK

GENERAL FACILITY RULES
Any violation of the following rules may result in removal from the facility and possible loss of tutor privileges

- Behave in a manner that does not disrupt others
- Must be respectful of all staff (part-time staff and tutors included)
- Discard all trash in appropriate receptacles
- Accessing non-academic websites during academic sessions is prohibited
- Cell phones and other similar electronic devices are prohibited during academic sessions
- Music use is at the discretion of your academic counselor
- Please do not put your feet on the furniture, also, if you move the furniture please put it back in its original location

---

IMPORTANT ACADEMIC INFORMATION & EVENTS

YOU MUST BE ENROLLED IN 12 HOURS TO BE CONSIDERED A FULL TIME STUDENT AND ABLE TO PRACTICE AND COMPETE

CLASS ATTENDANCE
Class attendance is mandatory and necessary. Attend and be on-time to all classes. **Please note that English 100 and 105 have a very strict attendance policy.** Make sure that you inform your professor of your competition schedule in advance!

DROP/ADD PROCEDURES
You MUST MEET with your academic counselor in order to add or drop a course. Your eligibility may depend on it! After the on-line drop/add period ends, you must see your academic advisor on campus to obtain a drop/add form. You must then obtain your academic counselor's signature. Should you go to the Registrar's Office without that signature, you will be turned away. REMEMBER, ONCE YOU RECEIVE THE DEAN'S APPROVAL, YOU WILL HAVE UNTIL THE END OF THAT DAY TO MAKE YOUR SCHEDULE CHANGE. DO NOT FORGET TO GET YOUR ACADEMIC SUPPORT COUNSELOR'S SIGNATURE/APPROVAL BEFORE SEEING THE REGISTRAR!

DECLARING/CHANGING YOUR MAJOR
You MUST MEET with your academic counselor in order to declare or change your major. Paperwork must be filled out and signed BEFORE you MEET with your academic advisor at the Steele Building. If you do not have the proper paperwork, you will not be able to declare/change your major with your campus advisor.

TRAVEL LETTERS
All students in their competition season need to contact their professors **during the first week of school** and make them aware of their travel schedule by handing them a copy of the travel letter with the conflict dates highlighted. Students need to make arrangements for these conflicts **as soon as possible.** Remind professors each week of pending competitions! After the second week of classes, letters will no longer be available at the Academic Center – they will *ONLY* be available at your coach's office. **NEW POLICY: You must obtain each professor's signature and return it to your academic counselor as verification that you have met with your professor.**

TEXTBOOK PURCHASE/PICK-UP POLICY ***(only for student-athletes designated to receive books as part of their scholarship)***

- Where (Book Forms): Loudermilk Center for Excellence, Pope Academic Center Room 2417 (by computer lab)
- When (Book Forms): 10:00am-2:00pm, Monday August 20 thru Friday August 24 and 6:00pm-8:00pm Tuesday August 21
- Where (Pre-Packaged Books): Student Stores/South Road Entrance/1st floor on the left
- When (Pre-Packaged Books): 7:30am-9:00pm during Student Stores hours of operation
- Last day to purchase books: October 17th
- Save receipts for ALL purchases and returns
- All books from dropped courses must be returned to either Student Stores (with proof of receipt of return) or your academic counselor—You will not be approved to drop a class unless you either return the books or show a receipt.
- Only textbooks and course materials that are listed in the official University Book list as "required" may be purchased.

ALL STUDENT-ATHLETES

- **YOU MUST MEET WITH YOUR MAJOR ADVISOR ON CAMPUS EACH SEMESTER IN ORDER TO REGISTER FOR CLASSES**
- **YOU MUST MEET WITH YOUR ACADEMIC SUPPORT COUNSELOR FOR AN INDIVIDUAL MEETING TO REVIEW YOUR ELIGIBILITY STATEMENT EACH SEMESTER**

GRADUATING SENIORS

- At least 120 hours/2.0 cum, 1 LFIT needed
- See major advisor on campus and complete an official degree audit during your senior year
- Resume on file with University Career Services, Career Guide
- Application for 9th or 10th semester (if necessary)
- Last day to file for Fall 2012 graduation – Friday, October 12th
- UNDERLOAD APPROVALS MUST BE COMPLETED BY THE END OF THE FIRST WEEK OF CLASSES—FRIDAY, AUGUST 24th

JUNIORS

- See major advisor on campus for academic worksheet update

SOPHOMORES

- You must declare a major with your major advisor on campus before your junior year, specifically during the second semester of your sophomore year before Fall registration!

FRESHMEN

- You must meet with your advisor in the College of Arts & Sciences for initial advising appointment before registration during the Spring semester.

ACADEMIC ELIGIBILITY REQUIREMENTS

***UNC* REQUIREMENTS FOR STUDENT-ATHLETES**

To enter…	All students must have…
1st semester	2.0 cum gpa and 9 hours
3rd semester	2.0 cum gpa and 24 hours
4th semester	2.0 cum gpa and 36 hours
5th semester	2.0 cum gpa and 51 hours
6th semester	2.0 cum gpa and 63 hours
7th semester	2.0 cum gpa and 78 hours
8th semester	2.0 cum gpa and 93 hours
9th semester	2.0 cum gpa and 105 hours and prior approval by a dean is required
10th semester	Prior approval by a dean is required

You must pass 9 hours with a 2.0 *each* semester in order to return to UNC.
The student-athlete is responsible for the appeals process. The Academic Support Program exists to counsel and assist.

***NCAA* REQUIREMENTS FOR CONTINUING ELIGIBILITY** (GPA & HOURS FOR AID, PRACTICE, AND COMPETITION)

To be eligible for…	All students must have…
3rd Semester	1.8 gpa and 24 total hours
4th Semester	1.8 gpa
5th Semester	1.9 gpa and 48 DA hours + declare major
6th Semester	1.9 gpa
7th Semester	2.0 gpa and 72 DA hours
8th Semester	2.0 gpa
9th Semester	2.0 gpa and 96 DA hours
10th Semester	2.0 gpa

DA = Degree Applicable

FOR SATISFACTORY PROGRESS

IMPORTANT!!! 6 degree hours each semester (fall and spring) and 18 degree hours (fall + spring) are needed to meet satisfactory progress.
Hours must be earned during the regular academic year. PHYA courses **DO NOT** count as academic hours or towards NCAA eligibility and therefore are not counted toward full-time enrollment. Only 1 **(one)** Lifetime Fitness course counts for graduation.

HOURS OF OPERATION

Monday-Thursday – 8:00 a.m. to 11:00 p.m, **Friday** – 8:00 a.m. to 5:00 p.m, **Sunday** – 6:00 p.m. to 11:00 p.m.

ACADEMIC SUPPORT PROGRAM FOR STUDENT-ATHLETES
POLICIES AND PROCEDURES: Spring Semester 2013

AN IMPORTANT MESSAGE…
The University of North Carolina expects students to act with the highest regard for integrity and ethical conduct when it comes to the UNC Honor Code and NCAA rules. These standards are to be taken seriously with your academic decision making as you not only represent yourself, but also your family, your team, and the University of North Carolina.

STRUCTURED STUDY PROGRAMS
First-year students participating in our structured study program will be required to complete designated team hours of structured study per week. Upperclassmen who are below a certain GPA may also be required to attend according to his/her academic counselor's guidelines. Structured Study starts on **Tuesday, August 28th.** All structured study hours must be completed **during the building's hours of operation**, **Sunday through Thursday.** Students MUST present their ONE Card in order to log study hours at night. There will be a sign-in sheet for hours logged during the day.

EVENING TUTORING
Contact your academic support counselor if you need a tutor. **Tutoring will begin on Tuesday, August 28th and will run from 6:00pm -10:00pm, Sunday-Thursday evenings.** See staff on duty for nightly tutor schedule. This schedule may change during the term, so be sure to check in with the staff on duty each night. In order for the tutoring session to be useful and productive, please arrive on time with proper books, notes, materials, **and your computer**. YOU MUST HAVE A GOAL FOR YOUR TUTOR SESSION!

UNC/NCAA TUTOR POLICIES
The Academic Support Program for Student-Athletes provides a variety of resources to promote academic success. These resources are to be used with the utmost respect and regard for academic integrity.
The following are **NOT ALLOWED** when utilizing tutors and other academic staff/resources:

- Working with a tutor who is not currently employed by the University without paying the standard rate for such service.
- Contacting tutors, via telephone, text messaging, social networking sites, etc.--you must contact tutors through your academic counselor
- Having tutors write papers for you or do any of your class assignments for you
- Having tutors write thoughts and circle misspellings on your papers
- Meeting with ASPSA tutors for academic sessions outside of the Academic Center
- Socializing with tutors outside of academic sessions (ie dating or contact on social networking sites such as Facebook, MySpace, or Twitter)
- Providing tickets to tutors or putting tutors on pass lists
- Accepting cash, gifts, and other extra benefits from tutors
- ***IF YOU WISH TO HIRE A PRIVATE TUTOR YOU MUST MEET WITH TUTOR COORDINATOR, SUSAN MALOY!***

YOU ARE RESPONSIBLE FOR ALL OF YOUR OWN ACADEMIC WORK

GENERAL FACILITY RULES
Any violation of the following rules may result in removal from the facility and possible loss of tutor privileges

- Behave in a manner that does not disrupt others
- Must be respectful of all staff (part-time staff and tutors included)
- Discard all trash in appropriate receptacles
- Accessing non-academic websites during academic sessions is prohibited
- Cell phones and other similar electronic devices are prohibited during academic sessions
- Music use is at the discretion of your academic counselor
- Please do not put your feet on the furniture, also, if you move the furniture please put it back in its original location

---

IMPORTANT ACADEMIC INFORMATION & EVENTS

YOU MUST BE ENROLLED IN 12 HOURS TO BE CONSIDERED A FULL TIME STUDENT AND ABLE TO PRACTICE AND COMPETE

CLASS ATTENDANCE
Class attendance is mandatory and necessary. Attend and be on-time to all classes. **Please note that English 100 and 105 have a very strict attendance policy.** Make sure that you inform your professor of your competition schedule in advance!

DROP/ADD PROCEDURES
You MUST MEET with your academic counselor in order to add or drop a course. Your eligibility may depend on it! After the on-line drop/add period ends, you must see your academic advisor on campus to obtain a drop/add form. You must then obtain your academic counselor's signature. Should you go to the Registrar's Office without that signature, you will be turned away. REMEMBER, ONCE YOU RECEIVE THE DEAN'S APPROVAL, YOU WILL HAVE UNTIL THE END OF THAT DAY TO MAKE YOUR SCHEDULE CHANGE. DO NOT FORGET TO GET YOUR ACADEMIC SUPPORT COUNSELOR'S SIGNATURE/APPROVAL BEFORE SEEING THE REGISTRAR!

DECLARING/CHANGING YOUR MAJOR
You MUST MEET with your academic counselor in order to declare or change your major. Paperwork must be filled out and signed BEFORE you MEET with your academic advisor at the Steele Building. If you do not have the proper paperwork, you will not be able to declare/change your major with your campus advisor.

TRAVEL LETTERS
All students in their competition season need to contact their professors **during the first week of school** and make them aware of their travel schedule by handing them a copy of the travel letter with the conflict dates highlighted. Students need to make arrangements for these conflicts **as soon as possible.** Remind professors each week of pending competitions! After the second week of classes, letters will no longer be available at the Academic Center – they will *ONLY* be available at your coach's office. **NEW POLICY: You must obtain each professor's signature and return it to your academic counselor as verification that you have met with your professor.**

TEXTBOOK PURCHASE/PICK-UP POLICY ***(only for student-athletes designated to receive books as part of their scholarship)***

- Where (Book Forms): Loudermilk Center for Excellence, Pope Academic Center Room 2417 (by computer lab)
- When (Book Forms): 10:00am-2:00pm, Tuesday, January 8 thru Wednesday, January 16
- Where (Pre-Packaged Books): Student Stores/South Road Entrance/1st floor on the left
- When (Pre-Packaged Books): 7:30am-9:00pm during Student Stores hours of operation
- Last day to purchase books: March 7th
- Save receipts for ALL purchases and returns
- All books from dropped courses must be returned to either Student Stores (with proof of receipt of return) or your academic counselor—You will not be approved to drop a class unless you either return the books or show a receipt.
- Only textbooks and course materials that are listed in the official University Book list as "required" may be purchased.

ALL STUDENT-ATHLETES

- **YOU MUST MEET WITH YOUR MAJOR ADVISOR ON CAMPUS EACH SEMESTER IN ORDER TO REGISTER FOR CLASSES**
- **YOU MUST MEET WITH YOUR ACADEMIC SUPPORT COUNSELOR FOR AN INDIVIDUAL MEETING TO REVIEW YOUR ELIGIBILITY STATEMENT EACH SEMESTER**

GRADUATING SENIORS

- At least 120 hours/2.0 cum, 1 LFIT needed
- See major advisor on campus and complete an official degree audit during your senior year
- Resume on file with University Career Services, Career Guide
- Application for 9th or 10th semester (if necessary)
- Last day to file for Fall 2012 graduation – Friday, October 12th
- UNDERLOAD APPROVALS MUST BE COMPLETED BY THE END OF THE FIRST WEEK OF CLASSES—FRIDAY, AUGUST 24th

JUNIORS

- See major advisor on campus for academic worksheet update

SOPHOMORES

- You must declare a major with your major advisor on campus before your junior year, specifically during the second semester of your sophomore year before Fall registration!

FRESHMEN

- You must meet with your advisor in the College of Arts & Sciences for initial advising appointment before registration during the Spring semester.

ACADEMIC ELIGIBILITY REQUIREMENTS

***UNC* REQUIREMENTS FOR STUDENT-ATHLETES**

To enter…	All students must have…
1st semester	2.0 cum gpa and 9 hours
3rd semester	2.0 cum gpa and 24 hours
4th semester	2.0 cum gpa and 36 hours
5th semester	2.0 cum gpa and 51 hours
6th semester	2.0 cum gpa and 63 hours
7th semester	2.0 cum gpa and 78 hours
8th semester	2.0 cum gpa and 93 hours
9th semester	2.0 cum gpa and 105 hours and prior approval by a dean is required
10th semester	Prior approval by a dean is required

You must pass 9 hours with a 2.0 *each* semester in order to return to UNC.
The student-athlete is responsible for the appeals process. The Academic Support Program exists to counsel and assist.

***NCAA* REQUIREMENTS FOR CONTINUING ELIGIBILITY** (GPA & HOURS FOR AID, PRACTICE, AND COMPETITION)

To be eligible for…	All students must have…
3rd Semester	1.8 gpa and 24 total hours
4th Semester	1.8 gpa
5th Semester	1.9 gpa and 48 DA hours + declare major
6th Semester	1.9 gpa
7th Semester	2.0 gpa and 72 DA hours
8th Semester	2.0 gpa
9th Semester	2.0 gpa and 96 DA hours
10th Semester	2.0 gpa

DA = Degree Applicable

FOR SATISFACTORY PROGRESS

IMPORTANT!!! 6 degree hours each semester (fall and spring) and 18 degree hours (fall + spring) are needed to meet satisfactory progress.
Hours must be earned during the regular academic year. PHYA courses **DO NOT** count as academic hours or towards NCAA eligibility and therefore are not counted toward full-time enrollment. Only 1 **(one)** Lifetime Fitness course counts for graduation.

HOURS OF OPERATION

Monday-Thursday – 8:00 a.m. to 11:00 p.m, **Friday** – 8:00 a.m. to 5:00 p.m, **Sunday** – 6:00 p.m. to 11:00 p.m.

DROP/ADD PROCEDURES
Student-athletes are now required to get their Academic Support advisor's signature BEFORE any changes in enrollment will be allowed once the on-line drop/add period ends. Should you go to the Registrar's Office without that signature, you will be turned away. REMEMBER, ONCE YOU RECEIVE THE DEAN'S APPROVAL, YOU WILL HAVE UNTIL THE END OF THAT DAY TO MAKE YOUR SCHEDULE CHANGE. DO NOT FORGET TO GET YOUR ACADEMIC SUPPORT ADVISOR'S SIGNATURE/APPROVAL BEFORE SEEING THE REGISTRAR!

STRUCTURED STUDY PROGRAMS
First-year students participating in our structured study program will be required to complete 6 hours of structured study per week. **Upperclassmen who are below a certain GPA may also be required to attend according to his/her coach's guidelines** (this will not include computer lab usage). Structured Study starts on Friday, January 14th.

EVENING TUTORING
The Academic Center opens at 7pm and small group tutoring will run from 7:00 -10:00pm, Sunday-Thursday evenings. In order to guarantee sufficient time with the tutor please arrive promptly for each appointment. Evening tutoring will begin on Sunday, August 30th. The tutor schedule is posted on the bulletin boards in the Academic Center. This schedule is constantly changing so be sure to check it on a regular basis. If you need an individual tutor, see your counselor. In order for the tutoring session to be useful and productive please arrive with proper books, notes and materials.

COMPUTER LAB
All computers have Internet and email access. During peak hours you will be limited to one hour at the computer. If you have any questions about the computers or software please see the computer lab monitor. He/she will be glad to assist you. Computer lab monitors will be on duty Sunday through Thursday from 7:00pm to 10pm.

CLASS ATTENDANCE
Class attendance is mandatory. **Please note that English 100, 101, and 102 have a very strict attendance policy**. Make sure that you inform your professor of your competition schedule in advance! Your coach will furnish you with travel letters to give to your professors before you miss a class due to athletic competition. It is your responsibility to give the letters to your professors.

TRAVEL LETTERS
All students in their competition season need to contact their professors **during the first week of school** and make them aware of their travel schedule by handing them a copy of the travel letter with the conflict dates highlighted. Students need to make arrangements for these conflicts **as soon as possible**. Remind professors each week of pending competitions! After the second week of classes, letters will no longer be available at the Academic Center – they will ONLY be available at your coach's office.

SUPPLEMENTAL INSTRUCTION PROGRAM (SI)
SI is a series of weekly organized group study sessions facilitated by trained SI leaders. Please see your academic counselor for more information about participation in Supplemental Instruction.

TEXTBOOK PURCHASE PURCHASING POLICY *(for student-athletes designated to receive books as part of their scholarship)*
- Obtain a textbook purchasing form from the Academic Support Center, complete the form, and have your form signed between the hours of 10:00am & 2:00pm in the Academic Support Center.
- Book forms **will not** be signed without a copy of your schedule.
- Only textbooks and course materials that are listed in the official University Book List as "required" may be purchased.

- You are allotted a maximum of $600 per semester to buy books. Exceptions are approved on a case by case basis.
- **You must purchase all of your required textbooks by October 2nd.** Exceptions are approved on a case by case basis.
- If you drop a course, all textbooks and materials must be returned immediately to your academic counselor.
- If you are unsure of your scholarship status, check with your coach.
- For all "recommended" materials on your syllabi, please see your academic counselor.

IMPORTANT INFORMATION & EVENTS

GRADUATING SENIORS

- 1 PHYA or LFIT – depending upon initial enrollment date – needed (check with your Academic Support advisor to make sure that credit for playing your varsity sport has been added for those who entered prior to summer/fall 2006)
- See Academic Advisor in Arts & Sciences or Professional School and complete an official degree audit during your senior year
- Resume on file with University Career Services
- Career Guide
- At least 120 hours/2.0 cum
- Application for 10th semester (if necessary)
- Last day to file for Spring 2013 graduation ~ Friday, February 10th
- UNDERLOAD APPROVALS MUST BE COMPLETED BY THE END OF THE FIRST WEEK OF CLASSES

JUNIORS

- LFIT
- See Academic Advisor in Arts & Sciences or Business College

SOPHOMORES

- You must declare a major before your junior year, specifically during the second semester of your sophomore year! Go to Arts & Sciences and fill out the necessary paperwork.

MINIMUM ACADEMIC ELIGIBILITY REQUIREMENTS

Each student is required to attend an individual eligibility meeting with an academic counselor each term. Your counselor will contact you at the beginning of each semester about scheduling your eligibility meeting.

You must be enrolled FULL TIME (12 hrs) in order to practice and compete. Please contact your Academic Support Counselor PRIOR to dropping or adding a course.

***UNC* REQUIREMENTS FOR FRESHMAN & CONTINUING STUDENT-ATHLETES**

To enter…	Seniors must have…	Freshmen/Sophomores/Juniors must have…
3rd semester	1.5 cum gpa and 24 hours	2.0 cum gpa and 24 hours
5th semester	1.75 cum gpa and 51 hours	2.0 cum gpa and 51 hours
7th semester	1.9 cum gpa and 78 hours	2.0 cum gpa and 78 hours
9th semester	2.0 cum gpa and 105 hours	2.0 cum gpa and 105 hours and prior approval by a dean is required
10th semester	Prior approval by a dean is required	Prior approval by a dean is required

You must pass 9 hours with a 2.0 *each* semester in order to return to UNC. The student-athlete is responsible for the appeals process. The Academics Center exists to counsel and assist.

***NCAA* REQUIREMENTS FOR CONTINUING ELIGIBILITY** (GPA & HOURS FOR AID, PRACTICE, AND COMPETITION)

To be eligible for…	Must have…
3rd Semester	1.8 gpa and 24 total hours
4th Semester	1.8 gpa
5th Semester	1.9 gpa and 48 DA hours + declare major
6th Semester	1.9 gpa
7th Semester	2.0 gpa and 72 DA hours
8th Semester	2.0 gpa
9th Semester	2.0 gpa and 96 DA hours
10th Semester	2.0 gpa

DA = Degree Applicable

FOR SATISFACTORY PROGRESS

IMPORTANT!!! 18 degree hours needed to meet satisfactory progress must be earned during the regular academic year (i.e. fall and spring semester). Physical education activity classes **DO NOT** count as academic hours or towards NCAA eligibility and therefore are not counted toward full-time enrollment for all students following UNC's old curriculum standards. Lifetime fitness courses DO count for all students following the new curriculum.

Good morning Coach Hatchell,

I hope you had a blessed holiday season and that 2013 is off to a promising start.

The Faculty Athletics Committee (FAC) reviewed and discussed information regarding admissions at the December meeting. We will spend the January meeting to further discuss issues and offer any formal recommendations. The meeting is scheduled for tomorrow, Tuesday the 8th, at 4:30 p.m. I apologize for the short notice but circumstances over the winter break prevented an earlier communication.

If you would like to speak via phone then please let me know.

I hope you have a wonderful day.

To: Academic Advising Full-Time Advisors Listserv
Subject: [advisingfulltime] A special section of GEOL 101 this semester
Importance: High

GEOL 101.951 (T/TH 6-7:15pm) is now OPEN for enrollment to ALL general education students. Sponsored by the Friday Center, the course is traditionally reserved for continuing education students. However, due to poor publication, the enrollment is very low this semester. In an attempt to keep the class from being canceled, I've persuaded the powers that be to open the class up to all students for enrollment. It is a 1-time opportunity for general ed students to take an intro level science course in small class (capped at 25) environment. The small class would allow for more individualized instructor attention. I'm really looking forward to the opportunity to teach a more interactive and hands-on version of intro geology. I was hoping to use this semester as a way to help illustrate the importance of interactive teaching to my department, by inviting faculty in to observe—something that is difficult to do in my large sections of intro classes.

>>> "Parsons, Eileen R" <rparsons@email.unc.edu> 1/7/2013 11:40 AM >>>
Good morning Coach Hatchell,

I hope you had a blessed holiday season and that 2013 is off to a promising start.

The Faculty Athletics Committee (FAC) reviewed and discussed information regarding admissions at the December meeting. We will spend the January meeting to further discuss issues and offer any formal recommendations. The meeting is scheduled for tomorrow, Tuesday the 8th, at 4:30 p.m. I apologize for the short notice but circumstances over the winter break prevented an earlier communication.

If you would like to speak via phone then please let me know.

I hope you have a wonderful day.

Spring Semester - 2013

Dear Professor:

Student-athletes in your course may be absent from class due to travel for athletic events. This letter is to inform you as to when such absences will occur.

Attached is the varsity sport travel schedule for_____ who is a student-athlete in your course. Please note that because travel rosters often change, the student is responsible for notifying you prior to each expected absence. Not all student-athletes travel for every competition (e.g. Swimming & Diving, Track and Field, and other individual sports). A list of traveling student-athletes is maintained in the Department of Athletics. Should you wish to consult this list please contact me at 962-9534.

The Faculty Council's policy is stated in The Undergraduate Bulletin:

"Students who are members of regularly organized and authorized University activities and who may be out of town taking part in some scheduled event are to be excused during the approved period of absence. Notification of such an absence must be sent by the responsible University official to the instructor before the date(s) of the scheduled absence."

The student understands that s/he is responsible for all the work of all class meetings and must make arrangements with you to complete assignments or make-up quizzes or tests.

Please contact me with any questions or concerns regarding team travel or any academic matter concerning student-athletes.

Sincerely,

Harold Woodard

College Recruiting Weekly

January 8, 2013 Volume 9, Issue 2

Curing Your Prospect's Analysis Paralysis

You've heard of "analysis paralysis", right?

It's the term we use when someone over-analyzes a question, situation or choice so long that he or she is "paralyzed" with the inability to decide what to do. As a coach, you've had moments of analysis paralysis, right?

So do your prospects.

Especially as the recruiting process enters the final stages. The fun of being pursued is over, and now it's decision time. And making a final choice is tough for many prospects. Heck, it may happen way before the end of the process...some prospects freeze in the face of the decision of where to take a campus visit, or even which phone call to return. "Analysis paralysis" is at the root of a lot of the recruiting hurdles college coaches face when it comes to getting their recruits to get to the next step in the recruiting process.

If you want a more detailed, psychological study explaining the reasons behind the very real phenomenon that is analysis paralysis, **click here**. But if you're ready to jump into a strategy that will provide you with a good opportunity to help your prospect (and their parents) overcome paralysis analysis, let's get started...

Building Traditions: What Is Your Selling Point?

*by Ellen Sawin, **NCSA** College Relations*

College sports are home to some of the nation's most famous traditions: Wisconsin football fans "Jumping Around" before the 4th quarter, Florida fans "Gator Chomping" at their opponents, the Fighting Irish slapping their "Play Like A Champion" sign as they take to the field, and so on.

High school athletes dream of playing for a team with a tradition and fan base like these. But less than 1% will realize that dream. One school is changing that.

Picture this...

A gym packed to capacity with college kids and community members lining the court. Everyone is dressed in eccentric and hilarious outfits. And the crowd is perfectly still and dead silent. Two teams take to the court and nothing changes. Play begins and the crowd remains silent. Both teams put points on the board, and the crowd doesn't make a sound. Then, the home team scores their 10th point... and suddenly the gym erupts in absolute madness...

'Think Outside The Box" For Recruiting Strategies That Can Make A Difference

by Sean Devlin, ***Front Rush***

This week, I digressed from technology.

"Love something besides magic, in the arts. Get inspired by a particular poet, film-maker, sculptor, composer. You will never be the first Brian Allen Brushwood of magic if you want to be Penn & Teller. But if you want to be, say, the Salvador Dali of magic, we'll THERE'S an opening."

This excerpt is from an email between celebrity magician Teller (Penn & Teller) and a young up-and-coming magician Brian Bushwood.

I read the above in a blog post and my head exploded with the simplicity and obvious nature of it, yet we all practice this so little. It's true. Think about how often you look to your peers or predecessors for inspiration but rarely look outside the coaching world. Or think about how often you emulate your competition instead of seeing how others in a different domain dealt with their challenges. We all fall into this trap of tunnel vision so let's explore the idea of breaking away a bit...

Mom: The Last Line Of Defense

by Mitch Sherman, ESPN

We all saw it.

If not the live telecast last year during the Under Armour All-America Game, then surely the replay online as video went viral of Landon Collins' mother, April Justin, openly upset with his decision to attend Alabama over her preference, LSU.

It was uncomfortable. It was alarming. And it was real.

They say blood is thicker than water, an adage that often holds true in recruiting. But when two schools get between a player and his mother, the results can turn ugly, as Collins, the nation's No. 1 safety prospect in the Class of 2012, and Justin so clearly displayed.

"I was shocked to see that on television," said tight end O.J. Howard, a future Crimson Tide teammate of Collins and the No. 42 prospect in the ESPN 150 who's set to play in the UA Game at 5 p.m. ET Friday on ESPN. "But I guess they're happy now."

More than any figure in the lives of top recruits, mothers loom large. To avoid replays of the Collins saga -- be it on the sideline of an all-star game, in the living room or on campus during a visit -- recruiters value relationships with mom and work overtime to sell her on their school...

Looking for better recruiting results?

Coach Relies on Recruiting Legacy

by Carroll Rogers, Atlanta Journal-Constitution

Chuck Driesell comes from good recruiting stock.

His father Lefty, the legendary college basketball coach at Davidson, Maryland, James Madison and Georgia State, was a recruiting wizard, attracting the kind of talent to take four programs to the NCAA tournament, three of them from relative obscurity.

Stories have been passed down over the years about Lefty sleeping on a mattress in the back of his station wagon while recruiting for Davidson on a $500 budget. And he still was able to turn the small liberal arts school into a national power in the 1960s.

The running joke is you can't Driesell without "S-E-L-L."

Even with that pedigree, Chuck Driesell has taken on a tall task. He is three years into his first head college coaching job at The Citadel, the military school in Charleston, S.C., with demanding requirements, tough academics and 53 losing seasons in its 76 years of basketball history.

Driesell knew he was dealing with a different animal when he found himself on recruiting visits, informing prospects if they came to The Citadel, they'd have to get up at 5:30 a.m. every day. No sense in sugarcoating...

- Intrusive Advising (Minnesota State Colleges and Universities)
- Rethinking Advising: Developing a Proactive Culture to Improve Retention
- Developing Relationships to Foster Student Success

Webinar Overview

First formulated by Robert Glennan in the mid-1970s, the concept of Intrusive (sometimes referred to as Proactive) Academic Advising has been found to have a positive impact on student success. Intrusive academic advising means that colleges and universities-through instructional faculty, academic advisors, counselors, and others-take the initiative to reach out to students to offer advice, support, and assistance, rather than waiting for students to seek help. For example, intrusive academic advising expects that advisors will schedule meetings with their advisees at critical junctures, especially during the first year of enrollment, following receipt of notifications of academic difficulty, planning academic programs, and changing majors.

Intrusive academic advising does not mean "hand holding" or the return of in loco parentis. Rather, it suggests that faculty, counselors, academic advisors and others demonstrate an active concern for students' academic progress and a concomitant willingness to assist students to understand and utilize programs and services that can increase the likelihood for their success. Intrusive academic advising programs and advisors understand that many students, especially those who may be at greater risk for dropping out, often do not seek assistance in time for the assistance to have a positive impact on their progress. This webinar will look at the principles, philosophy, effects, best practices, and successful implementation of Intrusive Academic Advising.

Webinar Objectives

Participants will:

- Learn the principles and philosophy of intrusive academic advising
- Review how and why intrusive academic advising impacts student achievement, persistence, and success
- Discuss how to implement intrusive academic advising programs and interventions
- Discover professional development opportunities for intrusive academic advising programs and advisors
- Learn best practices in intrusive academic advising

Webinar Speaker

Thomas Brown is a lifelong student and academic affairs educator with an impressive record of effectiveness in creating academic and student affairs programs that promote increased learning, achievement, and success. Tom served as Dean of Advising Services/Special Program at Saint Mary's College of California, was a member of the Board of Directors and Vice President of the National Academic Advising Association, and was chairperson of the Prelaw Advisors National Council.

Tom is currently Managing Principal of a consulting network that assists campuses to increase student success, build inclusive communities, and manage change (www.tbrownassociates.com). He also writes an occasional column, The Advising Dean, for The St. Helena Star newspaper in California's Napa Valley.

His work is based on an integration of theories, research findings, and practical experience that makes a real difference for individuals and institutions.

January 8, 2013

Dear Parents:

This letter was drafted by me and Beth Bridger, our academic counselor, and with the help of Tom Timmermans in our UNC Athletic Compliance Office. It pertains to the fact that your son or daughter is currently receiving an athletic grant yet not currently participating on the team as a swimmer or diver.

The UNC Athletic Department has a vested interest in your son/daughter even though their athletic status has changed. In lieu of the new scholarship situation your son/daughter has with the Swimming and Diving program, some new policies have been set in order to monitor their academic progress in conjunction with receiving their grant-in-aid.

Before any financial award/check may be distributed by the Compliance Office (Tom Timmermans) at the beginning of each month, the student must meet with their Academic Counselor (Beth Bridger). At this time, the Academic Counselor will gather grade/course information and determine if the student is doing what they need to academically in order to earn their monthly check. This meeting could also include seeing proof of professor communication, tutor review session attendance, study hour completion, paperwork for drop/add procedures, etc.

If the student has not met the requirements during the meeting, their monthly check will not be given to them, or will not be given to them until the requirements have been met, no exceptions.

The same procedure will apply with other department obligations the student must fulfill. If they have not met the requirements requested of the coaching staff or other department staff, their check will be cancelled/held as well.

It is critical that even though your son/daughter may not be actively participating athletically as a part of the team, they are still accountable to UNC Athletics and the UNC Swimming and Diving program. They still contribute to our athletic department as a scholarship student, so their dedication to excellence must be a priority.

Please let us know if you have any questions.

Sincerely,

Rich DeSelm
Head Coach Swimming & Diving

Subject: FORMAL NOTICE: Message from the Chancellor: Changes in Information Technology Leadership

---

Dear Faculty, Staff and Students,

I'm writing to let you know that Larry Conrad, Carolina's vice chancellor for information technology and chief information officer, has been appointed as the University of California at Berkeley's chief information officer and associate vice chancellor for information technology, effective Feb. 18.

Larry has led the University's multi-faceted Information Technology Services (ITS) organization since February 2008. He has four decades of experience in both corporate and university settings, with extensive knowledge of academic and administrative computing.

Under Larry's leadership, the University launched ConnectCarolina, the massive campus-wide effort to streamline and integrate the computing systems that manage student information, human resources, payroll and finance. Within the last two years, the student information system has been successfully converted to PeopleSoft, the software underpinning ConnectCarolina, and efforts are now under way to convert the human resources, payroll and finance systems.

Larry has significantly advanced the information technology environment at Carolina. He and his colleagues have not only enhanced the University's IT infrastructure to support teaching and research, but they have also made the systems we rely on much more secure and stable. We wish him every success at UC-Berkeley, which faces similar challenges and opportunities in this area. Larry will be leaving Carolina well positioned for the future.

Even with these enhancements, the University has had to look for cost savings wherever possible. Larry has worked to make information technology more efficient as part of Carolina Counts, the University-wide initiative to improve the efficiency of campus operations and reduce administrative costs, based on the key recommendations from the 2009 Bain & Company study. In conjunction with IT partners in the campus units, ITS has worked to reduce the University's recurring IT costs by $12 million - a significant savings for our campus.

Larry came to Carolina from Florida State University, where he served for a decade as chief information officer in addition to other IT roles there. It isn't surprising that he will continue working in an academic setting.

I have asked Chris Kielt to serve as interim vice chancellor and assume the CIO responsibilities until our next chancellor makes the decision about a permanent successor. Chris, the associate vice chancellor for administrative systems and business transformation, came to Carolina last fall from Stony Brook University, where he served as CIO.

He has 25 years of higher education administrative experience, including more than two decades at Yale University where he worked in a variety of University roles including deputy CIO overseeing Yale's ITS application development, client support, systems infrastructure and information

security. With his extensive experience in large-scale enterprise resources planning implementations and project management (systems like ConnectCarolina), Chris' expertise is a tremendous asset as the University continues to convert the human resources, payroll and finance systems to PeopleSoft.

He already works closely with colleagues in the Finance Division and Office of Human Resources on the ConnectCarolina conversion, and I am so pleased that he has agreed to lead the University's many IT initiatives until a search for a permanent vice chancellor and CIO is launched.

Please join me in thanking Larry for all he has done at Carolina and wishing him well in his new role at Berkeley.

Sincerely,

Holden Thorp

CAROLINA LEADS

A STRATEGIC PLAN FOR CAROLINA ATHLETICS

2012–2016

WE **EDUCATE** AND **INSPIRE** THROUGH ATHLETICS.

> A Strategic Direction for Carolina Athletics

Success begins when teammates work together from the same playbook. The quarterback relies on the running back to hit the right hole just as the linemen create it. The point guard delivers the pass best when his teammates are at the right spot every time. The hit-and-run only works when the batter and the runner execute in concert.

The same is true for the athletics program at the University of North Carolina. This Strategic Plan seeks to provide the playbook — the strategic direction — for Carolina Athletics to make consistent decisions in its pursuit of the highest levels of success. In other words, we will work together to advance the ball, to score the basket, to move the runner.

This plan provides a template for strategic thinking for Carolina Athletics through 2016. It identifies our foundation — the Mission and Values. It communicates our program's future — the Vision. It establishes the detailed things we will do — the Priorities, Objectives and Initiatives we will undertake to reach our goals.

As CAROLINA LEADS the future of college athletics, our playbook is important. The implementation of this strategic plan positions Carolina Athletics to live its mission and values, and to achieve its vision.

LEAD

> Letter from the Director of Athletics

Fellow Tar Heels:

The Strategic Plan for Carolina Athletics is the result of nearly a year of assessment, discussion, analysis and feedback. It provides the direction to guide us as we educate, inspire and lead.

We do those things in support of the nearly 800 gifted student-athletes and the committed and passionate coaches who represent the University of North Carolina. We also do those things for our University community. Carolina Athletics has the responsibility to educate all Tar Heels through lessons that last a lifetime, and the opportunity to inspire them through action and example.

This plan was made possible through a great show of teamwork from people who saw a dynamic future for Carolina Athletics. My thanks go out to many people involved in this process: our consulting team led by Dr. Paul Friga of the Kenan-Flagler Business School; the athletics staff members who gave of their time to this process in addition to their regular responsibilities; an advisory committee of faculty, student-athletes, coaches and supporters; the athletics staff who participated in numerous surveys and briefings to provide valuable feedback; and numerous other members of the University community who offered vital input along the way.

With this strategic plan, we seek to renew Carolina's role in shaping the future of college athletics. By working together to accomplish the objectives in this plan, we will define a future where CAROLINA LEADS.

Go Heels!

Lawrence R. Cunningham
Director of Athletics

EXCEL

> The Strategic Planning Process

The University of North Carolina embarked upon a department-wide initiative for its athletics program with the arrival of Director of Athletics Bubba Cunningham in November 2011. The Department of Athletics quickly sought to shore up the foundations of excellence that built Carolina into a leader in intercollegiate athletics. The goal was to chart a path for Carolina Athletics' future success. With these objectives in mind, the strategic planning process was initiated in February 2012.

The process comprised three in-depth phases: Assessment, Visioning and Implementation. The initial Assessment phase involved research, surveys, discussion and an extensive SWOT analysis (Strengths, Weaknesses, Opportunities and Threats) of the program. These exercises were designed to benchmark Carolina against peer institutions and other athletics programs, as well as against its own past performance.

The Visioning phase involved discussion with a variety of constituencies interested in the future of Carolina Athletics, and resulted in strategy statements that will guide Carolina Athletics moving forward. The process established the Mission and Values — why we are here and what we believe in. It set forth the Vision for the future — what we strive to do. It identified our Priorities — the goals we want to accomplish.

The Implementation phase outlines the steps needed to accomplish the goals set out in the Strategic Plan. The objectives and initiatives that will help Carolina Athletics live its mission and values and achieve its vision are detailed in this publication. These efforts are supported by action steps that continually grow through constant evaluation.

The success of this strategic plan rests in its ability to be a living document. As an important next step, each unit and sports program in the Department of Athletics will develop its own action plan to ensure progress toward our identified goals. With a common strategic direction, we can lead in all that we do.

ACHIEVE

> Strategy Statements

MISSION	We educate and inspire through athletics.	
VALUES	Responsibility	Do what is right.
	Innovation	Find a better way.
	Service	Put others first.
	Excellence	Work hard. Play smart. Win together.
VISION	We will lead in all that we do—Academics, Athletics & Administration.	
PRIORITIES	Alignment	Align our operations to fulfill the mission of the University.
	Academic Achievement	Achieve a top 3 academic finish in the conference and a top 10 finish nationally in each sport.
	Athletic Performance	Perform to a top 3 athletic ranking in the conference and a top 10 ranking nationally in each sport.
	Administrative Engagement	Engage internal and external constituents to relentlessly pursue the resources and administrative structures necessary for success.

DEVELOP

> Alignment

Align our operations to fulfill the mission of the University.

Objective 1. Define and respect the importance of athletics within public research universities.

Initiatives:

A. Work with university-appointed task forces to develop operational and growth strategies for the athletics program.
B. Develop a culture that values athletics and academics as vital parts of the student-athlete experience.
C. Develop a compliance culture to serve as a model for responsibility and integrity.
D. Create the first multi-university coalition to monitor impact of athletics on a university.

Objective 2. Build stronger relationships within the university community.

Initiatives:

A. Launch campus-wide athletics/community partnership programs.
B. Create a campaign that celebrates athletics contributions to university life.
C. Operate in a transparent manner so that the university community is informed about decisions that are made within Carolina Athletics.

Objective 3. Actively shape the future of college athletics.

Initiatives:

A. Seek leadership roles on collegiate athletics committees (e.g., conference committees, NCAA task forces, NACDA and affiliate leadership organizations).
B. Offer the Carolina perspective in multiple venues on a national basis.

EDUCATE

> Academic Achievement

Achieve a top 3 academic finish in the conference and a top 10 finish nationally in each sport.

Objective 4. Improve the academic profile of incoming student-athletes.

Initiatives:

A. Track and annually improve the academic profiles of incoming student-athletes.
B. Aggressively recruit prospective student-athletes who exemplify and embrace the core values of Carolina Athletics.
C. Develop a compliance culture to serve as a model for responsibility and integrity.
D. Recognize coaches for their recruiting classes that meet high standards for academic profiles.

Objective 5. Support student-athletes' academic goals, performance and their efforts to graduate.

Initiatives:

A. Facilitate and support the University's efforts to offer an outstanding academic support system.
B. Develop and implement a comprehensive feedback system for academic support.
C. Monitor regularly the academic progress and graduation rates, giving increased attention to groups, teams and individuals that fall below established goals.
D. Create a program to recruit former student-athletes who have exhausted their eligibility to complete their education.
E. Recognize and celebrate individual and team academic achievement to all constituencies.

Objective 6. Develop student-athletes for a life of success beyond athletics.

Initiatives:

A. Enhance life skills programs.
B. Utilize the Baddour Carolina Leadership Academy to identify leaders among student-athletes and to develop their leadership skills.
C. Prepare student-athletes for careers after graduation.
D. Measure impact of athletics in life.

NCAA
NATIONAL CHAMPION
WIN

> Athletic Performance

Perform to a top 3 athletic ranking in the conference and a top 10 finish nationally in each sport.

Objective 7. Attract, develop and retain the best coaches.

Initiatives:

A. Seek aggressively the coaches in the hiring process who exemplify and embrace the core values of Carolina Athletics.
B. Embrace diversity in hiring practices.
C. Develop a systematic approach to reward coaches for performance.
D. Emphasize and support the importance of professional development and self-improvement.

Objective 8. Attract, develop and retain the best student-athletes to achieve their maximum potential.

Initiatives:

A. Develop the mindset that everything we do should enhance the student-athlete experience.
B. Attract the best student-athletes.
C. Develop a comprehensive student-athlete health and wellness program.
D. Emphasize the importance of living the core values of Carolina Athletics.

Objective 9. Win championships in every sport.

SERVE

> Administrative Engagement

Engage internal and external constituents to relentlessly pursue the resources and administrative structures necessary for success.

Objective 10. Create a culture that emphasizes strategic thinking, effective organizational structure and outstanding communications.

Initiatives:

A. Develop a comprehensive campaign to deliver the Strategic Plan, and to establish consistent strategic thinking at all levels.
B. Reinforce the strategic plan through review and renewal.
C. Define staff roles clearly for excellent staff interaction.
D. Encourage open communication between all units and management levels.
E. Encourage innovation by soliciting and celebrating new ideas at all levels and across business units.
F. Establish a coordinated information-gathering effort to track progress.

Objective 11. Attract, develop and retain the best staff.

Initiatives:

A. Seek aggressively the staff members who exemplify and embrace the core values of Carolina Athletics.
B. Embrace diversity in hiring practices.
C. Emphasize and support the importance of professional development and self-improvement.
D. Develop a systematic approach to reward staff for performance.

08
ENGAGE

> Administrative Engagement (continued)

Objective 12. Identify, secure and allocate the resources needed to achieve at the highest level.

Initiatives:

A. Identify resources needed to achieve our vision through benchmarking analysis.
B. Secure the resources identified to achieve our vision through accelerated fundraising and new revenue generation.
C. Allocate and track the resources to ensure maximum achievement and performance.

Objective 13. Develop an operational approach that emphasizes connections with fans, donors and partners through outreach and collaboration.

Initiatives:

A. Provide great customer service based on inventive programming, continuous improvement and systematic feedback.
B. Grow partner relationships to expand the reach and impact of Carolina Athletics.
C. Become a data-based decision-making organization.

Objective 14. Tell the "Carolina Story" through innovative communications, aggressive promotions and proactive public relations.

Initiatives:

A. Share stories across multiple platforms of the impact Carolina Athletics has on the University and its community.
B. Develop cutting-edge strategies to utilize digital, social and emerging media to inform, educate and engage all constituencies.
C. Develop a common brand positioning platform for all external communications.

INSPIRE

> Carolina Leads

In sports there is little better than the perfectly executed play. Whether it is teammates aligned in a choreographed play to accomplish a unified goal, or a lone athlete performing with an effort practiced over and over — the result is inspiring.

Carolina Athletics has proclaimed its vision for the next four years: We will lead in all that we do — Academics, Athletics and Administration. This Strategic Plan is the playbook for achieving that vision. It is the guide for making the decisions and executing the plays that will bring success to Carolina Athletics.

When we all play from the same playbook, we will move forward with the confidence that CAROLINA LEADS.

Carolina Athletics Department Announces Strategic Plan

CHAPEL HILL – "We educate and inspire through athletics" – that is the mission statement for the University of North Carolina's department of athletics that is a result of a recently completed strategic planning process developed by Bubba Cunningham, who is in his second year as the Tar Heels' director of athletics.

"Our number one priority is for athletics to be part of the educational experience of all students at the University, those who compete in our 28 varsity sports as well as those who do not," says Cunningham. "Athletics provides academic and competitive opportunities for more than 700 students, and is part of a unifying spirit for thousands of other students, faculty, staff and alumni.

"Through competition and achievement, our programs can be a source of inspiration for the student body, the community, our alumni, donors and future generations of Tar Heels."

Early in his tenure as director of athletics, Cunningham appointed a group of executive staff members that began developing a strategic plan that will guide the athletic department's decision-making over the next four years.

Dr. Paul Friga, associate professor of strategy and entrepreneurship at Carolina's Kenan-Flagler School of Business, led UNC's strategic planning process. Friga teaches management consulting and strategy, researches strategic decision-making and consults on management and strategy for numerous companies across the country. He is the director of S.T.A.R. (Student Teams Achieving Results), domestic business practices and consulting concentrations.

"Paul did an outstanding job guiding us through the planning process," says Cunningham. "He helped us to think more strategically each day and worked exceptionally well with Matt Terrell from the Rams Club, who coordinated much of the planning process from organizing meetings, getting input, feedback and ideas from various constituents in and out of the athletic department, and crafting the plan which will serve as a blueprint for us over the next several years."

"Strategy is critical to an organization's success," says Friga. "Strategic planning sets the stage for moving an organization forward to a new, positive direction. A strategy speaks to the employees, and also speaks to the external constituents about whom we are and where we're going. The goal is to have the decision-making of everyone in the organization to be particularly aligned with the mission, values, vision and priorities of that organization. That's when you know strategy is effective."

The planning team identified four core values for Carolina Athletics– Responsibility, Innovation, Service and Excellence.

“Our values are at the heart of what we do every day, whether you are a coach, a student-athlete or an administrator who supports our programs,” says Cunningham. “Number one, we must do what is right. If we make good choices and smart decisions based on what is the right thing to do, then we will be successful on and off the field. We must be creative and encourage people to find a better way, whether that is devising a better strategy to win an event, seeking new financial solutions to budget for 28 sports or identifying the students who have the best chance to succeed academically and athletically at an outstanding university.

“Service to the state of North Carolina and to our various constituents is an important part of our mission. We are fortunate to give young men and women the opportunity to attend a world-class university and compete in athletics, and we have an obligation as a department to put others first and use athletics to help people reach their goals and dreams.

“And we believe in excellence in all that we do. We are part of one of the top public universities in the country, the Tar Heel athletic program has succeeded at the highest levels and we want to challenge ourselves to win with integrity in all areas. It’s a take off from what Coach Dean Smith taught for many years – our goals are to work hard, play smart and win together.”

College athletics has seen many changes in recent years and Cunningham wants Carolina positioned to have a voice in the on-going conversation about the future, whether it is in the state university system, the Atlantic Coast Conference or at the NCAA level.

“Our vision is that we will lead in all that we do – academics, athletics and administration,” says Cunningham. “It is critical that with all that is being discussed about the role of athletics at all levels of higher education, the University of North Carolina be at the forefront of those conversations. The only way to do that is to have a program that is people can look to with pride in how we are recruiting and educating our student-athletes, how we are faring competitively at the ACC and national level and how we are growing and developing our professional staff.”

To support the department’s mission, values and vision, the strategic planning team established four priorities. Those include alignment with the university’s mission of educating students; finishing in the top three in the ACC and top 10 in the nation academically in each sport; finishing in the top three in the ACC and top 10 on the nation athletically in each sport; and engaging administratively with internal and external constituents to pursue the resources and structures to achieve those benchmarks of success.

“It’s important that every day that our team comes to work, every decision we make, whether it’s the executive staff, senior staff, coaches, unit managers and all levels of staff, they understand and live by our values, understand the vision to be leaders and abide by our four priorities. We must structure our program so that what we do compliments and helps to fulfill the true mission of the University of North Carolina; we will strive to succeed at the highest levels in the classroom and competitively; and our administrative staff will be accountable for supporting the goals and aspirations of our 28 sports and 700-plus students.”

“Success and winning is a by-product of your whole entire program and that comes from recruiting the right student-athlete, having the right resources here, having the right leadership, the right training and

the right focus," says Jenny Levy, head coach of the women's lacrosse team that has played in six final fours. "With that focus, the by-product will be winning.

"It's a constant climb to being the best that you can be, on the field, in the classroom and in the community," says Levy. "If you are sitting still then you are going to be passed. What we see as an overall athletic department goal is that we need to find a better way so we are constantly on an ascension to do something better."

Academic success may be measured by a number of indicators, including the NCAA's Academic Progress Rates, graduation rates, ACC Honor Roll, Dean's List, etc….

Athletic success may also be measured by a number of factors, including the NACDA Directors Cup, which UNC has finished in the Top 10 in 19 of the last 19 seasons, NCAA postseason appearances, national rankings, and NCAA and ACC finishes in regular-season and post-season play.

"What I like about this strategic plan is it's not just about me and the kids I am recruiting and training, it's about the entire athletic department on a mission to be the best at everything," says women's soccer coach Anson Dorrance, who has led the Tar Heels to 22 national championships, including the 2012 NCAA title. "To be the best not only on the fields but in the classrooms – to be the best in all of our functions beyond our coaching responsibilities; to lead in every conceivable way. I like the collective, communal ambition to be the best in everything we do."

Supporting the overall strategic plan are 14 objectives that the planning team identified as ways to implement the four priorities. Each of the objectives has action steps that serve as a daily roadmap to achieving the department's goals over the next four years.

The objectives that support each individual priority are as follows:

ALIGNMENT
• Define and respect the importance of athletics within public research universities
• Build stronger relationships within the university community
• Actively shape the future of college athletics

ACADEMIC ACHIEVEMENT
• Improve the academic profile of incoming student-athletes
• Support student-athletes' academic goals, performance and efforts to graduate
• Develop student-athletes for a life of success beyond athletics

ATHLETIC PERFORMANCE
• Attract, develop and retain the best coaches
• Attract, develop and retain the best student-athletes to achieve their maximum potential
• Win championships

ADMINISTRATIVE ENGAGEMENT
• Create a culture that emphasizes strategic thinking effective organizational structure and outstanding communications

• Attract, develop and retain the best staff
• Identify, secure and allocate the resources needed to achieve at the highest level
• Develop an operational approach that emphasizes connections with fans, donors and partners throughout outreach and collaboration
• Tell the "Carolina Story" through innovative communications, aggressive promotions and proactive public relations

"The objectives give us a starting point where we can really make an impact on the University community on a daily basis," says Cunningham. "These are the basic building blocks for continuing the many years of success that Carolina has been known for an respected throughout college athletics. Each of these objectives has ideas and action items that will change on a regular basis as we adapt to the world around us. But they give us a chance to be big and bold and chart a course for the future that is both exciting and rewarding.

"We truly are in an unprecedented time of change in college athletics and the whole point of this strategic plan is to position the University of North Carolina to move forward in ways that make productive citizens of our student-athletes, to create stimulating and challenging work environments for our coaches and staff, to enhance the educational experience of every student on this campus and to make all of our alumni, donors and fans proud to call themselves Tar Heels."

Summer Bridge Programs: Easing The Transition For First-Generation College Students

Register - http://www.innovativeeducators.org/product_p/293.htm

Overview
First-generation college-goers experience a variety of challenges as they enter and move through higher education. Much of the existing research indicates that students whose parents did not attend college are more likely than their non first-generation counterparts to be less academically prepared for college, to have less knowledge of how to apply for college and financial assistance, and to have more difficulty in acclimating themselves to college once they enroll (Tym, et al., 2005).

This webinar will present a plan for an effective Summer Bridge Program, one that supplements existing programmatic and institutional efforts to support first-generation students. Participants will learn the importance of building relationships between academic and student affairs divisions, as well as empowering students through the development of critical college knowledge to ensure their academic success and retention.

Presenter
Dr. Paz Maya Olivérez is Student Success Coordinator with the Title V Encounter to Excellence Program and Associate Director of the Educational Opportunity Program at CSU Dominguez Hills. She also currently holds a position as an Adjunct Assistant Professor in the Master of Arts in Teaching Program in the Rossier School of Education at the University of Southern California. Dr. Oliverez has spent the last 12 years working with underrepresented students from diverse backgrounds, including undocumented immigrant students, as a researcher, program evaluator, professor, and college advisor. She holds a Ph.D. in Education from the University of Southern

Supporting First-Generation Students: Best Practices From A Highly Successful Early Intervention Program

Register - http://www.innovativeeducators.org/product_p/299.htm

Overview
As 2-year and 4-year institutions place increased attention on student success and retention, the preparedness and transition of first-generation college-bound students, especially during the freshman and sophomore years, is more important than ever. We now understand that student success encompasses not only the academic achievement of the student, but also their level of satisfaction with the environment, as well as sustainability for their long-term professional development. So, how can faculty and administrators better identify and support first-generation college-bound students early in their academic career? How can they do this in a way that addresses student success at every level?

Now in its 25th year, the Early Identification Program (EIP) is George Mason University's college preparatory program. It provides academic support, access to educational resources, social development, and leadership training to first-generation college-bound students in seven participating school districts throughout Northern Virginia. Supporting 630+ middle and high school students, and an additional 125+ undergraduate George Mason students, EIP's mission is to produce engaged students who value learning, serve their communities, and establish meaningful careers.

This webinar will examine the path of first-generation students through the lens of George Mason University's highly successful Early Identification Program. Participants will learn strategies that address providing college access opportunities, maximizing student achievement, supporting successful transition and persistence to the college environment, and creating opportunities for global citizenship.

Presenters
Jason A. Moore joined George Mason University's Early Identification Program as Associate Director in June 2012. Formerly a school counselor and educational consultant in New Jersey, Moore was most recently Assistant Director in the Center for Academic Excellence at North Carolina A&T State University. Over the last 9 years, his experience with programmatic assessment, the minority male demographic, NCAA compliance processes and athletic academic support, and program facilitation at the K-12 and higher-ed levels has created a detailed framework for his student advocacy and educational access initiatives.

Lewis E. Forrest is currently the Executive Director of George Mason University' Early Identification Program. For the past 13 years he has served in many roles with Mason's Early Identification Program (EIP) including the positions of Tutoring Coordinator, Assistant, and Associate Director. Prior to returning to Mason he worked three-years in Prince William County (VA) Public Schools as a Professional School Counselor, and also served as the county's coordinator for the EIP. Forrest is a member of both the National College Access Network and Virginia College Access Network, and in Spring 2012, was honored with the George Mason University "University Life Positive Impact Award", recognizing him as a visionary leader, mentor, and friend who makes genuine connections with students and staff.

Subject:	FORMAL NOTICE: Message from the Chancellor: Faculty and Staff Feedback is Important

---

Dear Faculty and Staff,

A couple of years ago, following the completion of the Bain & Company study and report, I asked for your feedback about the University's organizational effectiveness. Your responses to that survey provided excellent information that helped us assess and improve our policies and practices.

Now, I'd like you to provide your opinions again - this time to examine how the University is doing in terms of goal-setting, leadership, communications and decision-making. I'm asking all Carolina employees, both faculty and staff, to respond to a survey that examines these issues in your own areas as well as across the broader University. Your responses will help us determine the degree of progress made since the 2010 survey and pinpoint areas that need improvement.

The link to the survey is https://www.surveymonkey.com/s/MZ69F9S. I assure you that all individual responses will be anonymous and completely confidential. We will publish the full results of the survey on the Carolina Counts website later this spring. If you'd like to see the results of the 2010 survey, you can find that information at http://hr.unc.edu/faculty-and-staff/survey/index.htm.

I strongly encourage everyone to take the current survey; it should take only 10 to 15 minutes. Your perspective is important as we continue to identify ways to improve campus operations, so please take this opportunity to let your voice be heard. The deadline for submitting your response is January 28.

Paper copies of the survey are available in English, Spanish, Karen and Burmese for employees who typically do not have access to computers. These employees can obtain a copy from their supervisors and follow the instructions on the cover sheet for returning the completed survey.

Again, I encourage everyone to participate. Thank you for your commitment to Carolina.

Sincerely,

Holden Thorp

Hello students, faculty & staff! Welcome back! We hope that you are well-rested and ready for all the programs and events that Campus Rec has to offer this spring!

THIS WEEK

Start the new semester off right with **Spring Into Fitness**! This event is today from 12:00pm – 7:00pm and will highlight all that our program has to offer, including nutrition information from experts, group fitness and TRX demos, and much more! For more information, visit the Spring Into Fitness page.

LAST CHANCE to start your New Year's Resolution! Sign up for **Get Fit With H.I.I.T.** for the most effective way to exercise and see quick results! This is a 10-week healthy lifestyle, weight loss, and physical activity program designed to help participants achieve an optimal state of health through modification of diet, exercise, and lifestyle. To learn more about this program or to sign up, visit the Get Fit with H.I.I.T. page.

From Aerobics to Ziplines, your UNC Campus Rec blogger, Stacey Northup, is back in action, bringing you new articles to read on the Tar Heel Tone Up blog. Be sure to subscribe when you visit the Tar Heel Tone Up blog today.

Stay up to date with Campus Rec programs and events with our **monthly online newsletter**. In it you'll find fun facts, fitness articles, events, and much more! Check out the January edition today!

For the best way to get updated information on programs and events, add UNC Campus Rec on Facebook.

SPECIAL EVENTS

Our **Jingle Bell Jog** was a success! Thank you to the 258 individuals and 24 teams who participated. Congratulations to the Office of Sponsored Research's team, "Whoville," who won Best Costume and the School of Public Health's team, "Public Health Prancers," who took home the title for Most Participants. Check out our Flickr album for photos of the 2012 Jingle Bell Jog.

Spring 2013 Special Events will be coming soon! Visit the Special Events page for more

information.

FACILITIES

We are currently operating on **Normal Hours**.

All facilities will be closed on January 21st for Martin Luther King Jr. Day.

Visit our Hours of Operation page for a current list of operating hours.

FITNESS

The regular, full Group Fitness Class Schedules start on Monday, January 14. For a complete list of classes and descriptions, please visit the Group Fitness page.

Diversify your workout routine with our **Specialty Fitness Programs**. This semester we are offering a new Specialty Fitness Program, Dynamic Stability, where participants will focus on their balance and stabilization for a fun-filled workout! Other Specialty Fitness Programs offered this spring are TRX Suspension Training, Bootcamp and more! For more information, please visit our Specialty Fitness Programs page.

Have you reached a plateau in your workout or do you need help getting started? Our **Personal Training Services** have all the necessary tools to help you reach your goals. We offer everything from Start-Up Sessions to individual Personal Training, meeting the needs of any fitness level. For more information on Personal Training packages, including how to register, please visit our Personal Training page.

Are you interested in becoming a Personal Trainer? Campus Recreation offers a **Personal Trainer Training Program**. This program prepares and teaches you how to understand and apply the basic principles of exercise training to become a personal trainer. Trainees receive training on exercise instruction fundamentals including physiology, anatomy, and program design. For more information on how to register, visit the PT Certification page.

Get in shape at home with Campus Rec's **Training Time Series**! These videos provide various workouts that are instructional, informational, and can be done any time at home or in the gym! Visit our YouTube Channel for all of our videos!

INTRAMURAL SPORTS

The Spring IM Sports schedule is here!

January IM Sports are Basketball, Spades, Wally Ball, Indoor Soccer, Doubles Table Tennis, Racquetball, Swim Meet, Paddle Tennis, and Innertube Water Basketball.

February IM Sports include Softball, Ultimate Disc, Tennis, 4v4 Flag Football, Primetime Basketball, and Street Hockey!

Please see our Intramural Sports page for a complete schedule and list of offerings.

OUTDOOR EDUCATION

The **Spring 2013 Outdoor Expeditions** schedule is here! Don't miss your chance to experience an adventure of a lifetime with the Outdoor Education Center. Trips vary from rock climbing, hiking, kayaking, yoga, and much more! Upcoming expeditions include:

- Jan. 26th – **Hike Hanging Rock**
- Feb. 2nd – **Climb Occoneechee Mountain**
- Feb. 3rd – **Climb Pilot Mountain**
- Feb. 10th – **Hike Medoc Mountain**
- Feb. 17th – **Hike Birkhead Mountain**

For a complete list of trips, visit the Expeditions Page.

Interested in working for the OEC? Find out what it takes to be part of the Outdoor Education program by participating in the **Outdoor Leadership Series**. This program, consisting of nine workshops, will teach participants what it takes to become an Apprentice and about the training required to become a Facilitator/Instructor for expeditions or challenge course. Visit the OEC Employment page for more information.

SPORT CLUBS

Get To Know Us! Each month we spotlight a couple of our Sport Clubs. This month, get to know the Ski and Snowboard Club and the Tae Kwon Do Club!

The UNC **Ski and Snowboard Club** compete in alpine ski racing and snowboard racing in both freestyle and slopestyle in seven locations across the Southeast. During the off-season, the team continues to stay active by participating in hiking, biking, and camping. This team welcomes all individuals with a desire to ski or snowboard competitively across all experience and ability levels. If interested in joining, please contact

The Carolina **Tae Kwon Do** club practices WTF-style Tae Kwon Do, including Tae Guek forms and Olympic style. All individuals from beginners to experienced black belts are encouraged to join, including those skilled in other martial arts. For more information on this club, please contact

Visit the Carolina Sport Club's website for up-to-date Sport Club tournament and race results, as well as a calendar of upcoming events.

Department of Geography
University of North Carolina
Spring 2013

Geography 225: Space, Place, and Difference
TR 11 am, Saunders Hall Room 220

Dr. Altha Cravey
Office: Saunders Hall Room 309
Phone: 962-5157
E-mail: cravey@unc.edu
Office Hours: Tuesdays 3:30 – 4:45 pm and Thursdays 3:30 – 4:45 pm

In this course, students can earn credit in Geography or Women's Studies (GEOG 225/WMST 225). We explore the politics and power of social distinctions, focusing special attention on the dynamics of gender, race, class, sexuality, and their interactive effects. Local examples – drawn from the UNC campus and urban/rural North Carolina – make the material accessible and provocative while global and regional examples provide a window on a variety of contexts that influence the way social distinctions become important (or not) in people's everyday lives. We will discuss and debate – and read scholarly work – that examines why and how geography matters in all of this.

The goal of the course is to examine cultural diversity in particular places and geographic patterns of social difference and social inequality. These examples provide feminist insights on the way "space" and "place" and "scale" are useful tools for understanding contemporary society and social change. Significant attention will be paid to the following ethic/racial groups: Latinos and Latin Americans, African Americans, and U.S. whites.

Feminist concepts about gender, race, sexuality, and class have transformed the way geographers examine social processes, the interaction between people and their environments, and the human perception and construction of landscapes. A geographical sensibility about society and social processes on the other hand, provides a different angle on social theory, and new possibilities for social theorization. In this course, students will examine globalization, global processes, and international development from a feminist geography perspective. In the second half of the course, we turn to local and regional concerns and try to "make feminist sense"of cultural diversity in North Carolina and in the United States South, examining Latino transnational migration to the region, as well as African American exodus, persistence, and return migration to the United States South.

In this research-exposure course, you will be working with a Graduate Research Consultant, Willie Wright, who will assist you in the research project. The GRC Program is sponsored by the Office of Undergraduate Research (www.unc.edu/depts/our), and you may be able to use this research-exposure course to meet a requirement of the Carolina Research Scholars Program (http://www.unc.edu/depts/our/students_crsp.html). I encourage you to visit the OUR website to engage in research, scholarship and creative performance while you are at Carolina.

Course requirements:

1. Short position papers (3)	25
2. Class participation	20
3. Local project/presentation/paper	20
4. Midterm exams (2)	20
5. Final exam	15
	100%

Required texts:
Morrison, Toni. 1993. *Jazz* Plume (reprint)
Stack, Carol. *Call to Home: African-Americans Reclaim the Rural South.* Basic Books.
Gonzalez, Juan. 2011. *Harvest of Empire: A History of Latinos in America.* Viking New edition.

Academic Support Program for Student-Athletes
University of North Carolina, Chapel Hill
919-962-9538
919-962-8247 (fax)

January 9, 2013

Dear Professor/Instructor,

I wanted to communicate with you regarding the travel schedule for the men's basketball team for the Spring 2013 semester. Our student-athletes and team managers will be missing class on the following days due to intercollegiate competition:

Tuesday, January 29

Tuesday, February 19

Thursday, February 28

Wednesday, March 6

An additional letter will be created for any post season competition in March/April.

I realize that these students are still responsible for any material missed during these class periods, but I would still like to ask you to allow them to make up any missed work at an alternate time that you believe is appropriate. If you have any questions or concerns, please do not hesitate to contact either myself of a member of my staff at 962-1154. You may also contact the team's academic counselor, Jenn Townsend, at 962-9538.

Thank you very much for your assistance.

Sincerely,

Roy Williams

Head Men's Basketball Coach

Subject: Exchange Email Migration

Over the next 3 months, we will be slowly migrating the entire Athletic Department off of the Groupwise Email server and over to the University's Exchange (Microsoft Outlook) Email. This will be a tedious undertaking for the Computer Services staff and they will need your help. When the time comes for your unit, and specifically your email account to be changed over, please be helpful in the process. We understand how valuable your time is, but this is something that must be done. We will work around your schedule as best we can to accommodate your needs, but please understand that there might be some minor inconveniences to complete the process.

Thanks for your effort as we continue to try and improve your computer services.

Go Heels!

Clint

Subject:	FORMAL NOTICE: Encouraging Faculty and Staff to Participate in Survey

---

Deans, Directors and Department Heads:

I recently sent all faculty and staff an email message encouraging their participation in a survey to help gauge how the University is doing in terms of goal-setting, leadership, communications and decision-making. This survey is a follow-up to the organizational effectiveness survey we conducted a couple of years ago after the completion of the Bain & Company study and report.

Because it's important for everyone's voice to be heard, I'm asking that you urge the faculty and staff members in your areas to complete the survey, which should take only 10 to 15 minutes. The link to the survey is https://www.surveymonkey.com/s/MZ69F9S and the deadline for submitting responses is January 28. All individual responses will be anonymous and completely confidential. The full results of the survey will be published on the Carolina Counts website later this spring.

Paper copies of the survey are available in English, Spanish, Karen and Burmese for employees who typically do not have access to computers. These employees can obtain a copy from their supervisors and follow the instructions on the cover sheet for returning the completed survey.

Thank you for your help in reminding people to participate. I hope you will provide your input as well since a good response is key as we continue to identify ways to improve campus operations.

Sincerely,

Holden Thorp

Subject:	FORMAL NOTICE: Nannerl Keohane Distinguished Visiting Professorship and Lecture

---

The Keohane Professorship recognizes the remarkable contributions of Dr. Nannerl Keohane during her term as President of Duke University, and the unprecedented level of collaboration she and former UNC Chancellor James Moeser created between these two great institutions. The award was created in 2004 by then Chancellor Moeser and is funded by Carolina graduate Julian Robertson and his wife, Josie, of New York (parents of Spencer Robertson '98) and the William R. Kenan, Jr. Charitable Trust.

The 2013 Keohane Distinguished Visiting Professor is Dr. Jeffrey McDonnell, a watershed hydrologist and eco-hydrologist at the Global Institute for Water Security at the University of Saskatchewan and Distinguished Professor at the University of Aberdeen and Oregon State University. He will discuss the issues faced by the world's freshwater resources during the 2013 Keohane Lecture.

McDonnell will present "Tracking raindrops: Basic science for understanding global change impacts on fresh water" at 5:30 p.m. on Jan. 16 in the Nelson Mandela Auditorium in the FedEx Global Education Center. The lecture is free and open to the public, however space is limited. A light reception will follow. For more on this event, please visit http://www.provost.duke.edu/pdfs/KeohaneLecture.pdf

Faculty and administrators at The University of North Carolina at Chapel Hill and Duke University are encouraged to nominate outstanding scholars, artists, or practitioners for the 2014-15 Nannerl Keohane Distinguished Visiting Professorship. Nominations are due by Monday, April 1, 2013.

For more about the Professorship, including instructions for submitting nominations, please visit https://provost.unc.edu/announcements/keohane_rfp/

Subject: Turnitin First Draft - Sources in Student Writing

Turnitin First Draft

Having trouble? View as Webpage

Sources in Student Papers

Which online sources do students most frequently use in their written work and what are the implications of these choices?

A new pair of studies from Turnitin analyzes the most frequently matched Internet sources in an analysis of over 156 million content matches from 37 million papers submitted to Turnitin in the United States between July 2011 and June 2012. Two separate reports are available for Secondary and Higher Education groups.

Across both segments, just over half of the Internet sources in student writing come from legitimate educational resources-categorized as Academic and Homework sites, news and portal sites, and encyclopedias. Just under half of the matched sites fell into less authoritative sites-categorized as social and user-generated content sites, cheat sites and paper mills, and shopping sites.

Download the white papers below for more findings and recommendations.

Overview

Supporting Military Veterans: How To Develop An Effective Academic Advising Protocol
Military veterans returning as students to the campus environment need a certain level of support as well as key academic services to help ensure that they have a successful, long-lasting experience. Academic advising is one very critical part of the picture.

This webinar will focus on the development of a protocol for academic advisors providing services to military veterans. This protocol takes into consideration military culture, life experiences of military veterans, previous military training, deployment issues, family issues, and traumatic life experiences.

Speaker

Roger P. Buck, Ph.D., is a retired Navy veteran with 22 years active duty serving during the Vietnam War era. Dr. Buck is a licensed Professional Clinical Counselor, a Doctoral Addictions Counselor, and a retired U.S. Navy Veteran. He earned a Ph.D. in Counseling and Human Development Services from Kent State University in August 1998, an M.Ed. in Community Counseling from Georgia State University in March 1984, and a B.A. in Psychology from the University of Toledo in June 1975. Dr. Buck has extensive advanced training and research in human responses to Trauma and the study of Post Traumatic Stress Disorder. He also has extensive experience as a counselor, teacher, consultant, and administrator spanning a professional career of nearly 30 years.

Overview

Veterans Resource Centers On Campus: How To Create, Staff & Fund A Thriving Center

A Veterans Resource Center (VRC) is a powerful way to assist those who defend our country and help them transition successfully to college once they return home. From applying for GI Bill benefits to veterans-only classes and veteran-to-veteran mentoring programs, a VRC plays an important role in the future of a community's veteran population.

This webinar will show you how to create a Veterans Resource Center (VRC) on your campus: how to staff it, how to get your local veteran community to help run it, and most importantly, how to fund it. We will show the financial and human impact that these centers have had on campuses and communities. We will provide data for over 11,000 student veterans on over 30 campuses on the impact of a VRC.

Overview

Establishing A Campus-Wide Veteran-To-Veteran Mentoring Program On Your Campus

A student veteran to student veteran mentoring program has the potential to have a significant impact on campuses and communities across the country, both financially and transitionally. This webinar will describe the successes, failures, and best practices of student-to-student mentoring programs for student veterans.

Participants will discover what grants and free programs are available that will help them create a program on their campus. They will also receive a step-by-step outline on how to create a student veteran to student veteran mentoring program, complete with timeline, types of student veterans to certify, and certification materials.

Speaker

Dr. John Schupp founded the SERV Program, a two-semester program at Cleveland State University designed just for veterans. These two semesters are just what the veterans needed to increase the freshmen retention graduation rates. Under his direction, the program helps veterans apply for GI bill benefits and offers veterans-only classes that help ease the transition back into the classroom for many veterans who have not been in a classroom for years. He works with the veterans to navigate VA issues and offers a veteran-to-veteran mentoring program. The Sunday New York Times, National Public Radio, all the Armed Forces media, and the Chronicle of Higher Education have taken an interest in SERV. John Schupp loses no chance to spread the word at conferences and conventions around the country, as he continues to remind us of our responsibility to those who've served.

Documentary Film and Culture
ENGL 143: Section 003
TuTh 8:00-9:15
Greenlaw 301

Instructor: Lauren Du Graf (dugraf@email.unc.edu)
Graduate Research Consultant: Pat Horn
Office: Greenlaw 408
Office Hours: 9:30 – 10:30
Website: https://www.unc.edu/sakai

Course Description

This course is an intensive introduction into the art of documentary cinema. We will sample a range of documentary films from around the globe, including the work of documentarians such as Werner Herzog, Errol Morris, Albert and David Maysles, Trinh Minh-Ha, Jean Rouch, Jafar Panahi and Ross McElwee. We will learn about the various schools and styles of documentary filmmaking, including Cinéma Vérité, Direct Cinema, experimental documentaries, and the autobiographical/personal documentary. Along the

way, we will explore the tenuous boundary between documentary and fiction while interrogating the ethics of documentary cinema. Students will attend the Full Frame Documentary Film Festival in Durham, NC, one of the country's most prominent film festivals devoted exclusively to documentary cinema.

This course will follow a rigorous schedule with frequent and varied assignments to test and build each student's body of knowledge and critical thinking and communication skills, including presentations, frequent quizzes, field trips, exams and papers. Those who signed up for a movie course with the expectation that this course will simply require the passive viewing of movies will be gravely disappointed.

Required Texts

While you are not required to purchase any books for this course, we will have readings throughout the semester. These readings will be posted on Sakai, and it will be your responsibility to print them out and bring them to class. In addition to these printing and copying costs, you may need to rent films throughout the semester from Blockbuster, Netflix, or Amazon. If you do not have an account with these film purveyors, you may consider getting one this semester in order to see all of the films that we will be discussing.

Students will also be required to purchase passes for the Full Frame Documentary film festival. These passes are available at a student-discounted rate of $100. As there are a very limited number of student passes for sale, there will be a pass reserved for each student in the class during the first week of pass sales (starting January 15). These passes will be released after the first week of sales.

Below is the link that our class should use to purchase tickets, once they go on sale at 11:00 am on January 15:

https://store.fullframefest.org/Online/seatSelect.asp?BOset::WSmap::seatmap::performance_ids=B288FBD5-057E-49AE-A405-9A6E4CEAF9BD&BOparam::WSmap::loadBestAvailable::promocode_access_code=FFSTUUNC

After clicking the link, each student should choose "Student Group Pass" as the type of pass. You may also call in to the box office (919-684-4444) and mention "UNC Du Graf". The code also tells us who has purchased a pass and when, so the Full Frame office can keep in touch with me regarding my students' progress on acquiring passes.

Assignments

Presentation Paper: For this assignment, you will write a 1,400-1,500 word research paper on a topic related to the day's reading, discussion or film assignment. A list of topics will circulate during the first week of classes for sign-up; if you have any questions or concerns about signing up for your topic and presentation, please let me know.

The successful presentation paper will clearly and concisely give an overview of its subject. Papers on people should focus on the major artistic achievements of the filmmaker, critical responses to his/her work, unique or notable formal qualities of his/her texts, and any biographical information that might inform our understanding of his/her work.

Papers on topics related to documentary filmmaking should provide a broad overview of the big concepts, key figures and historical development of the topic in question.

All papers must draw upon *at least* three scholarly sources and use proper MLA citation throughout. You will present your paper orally to the class on the day that it is due; 5% of your assignment grade will be based on your oral presentation. After you have submitted your paper, it will be posted to the class Sakai site to serve as study notes for your classmates. Presentation papers must be emailed to me at dugraf@email.unc.edu by *no later than* 8:00 A.M. on the day that they are due.

Full-Frame Festival Report:
In a brief, 500+ word paper, write a report on the Full Frame Documentary Festival. You are not expected to write a comprehensive survey of the festival, but you must include a synopsis and analysis of at least three films from the festival, as well as your general impressions of the festival.

Final Paper: In an essay of approximately 2,800 to 3,000 words, you will cultivate an argument based on the themes of English 143: Documentary Film and Culture. You are free to choose your own topic. The only requirement is that your essay in some way address documentary cinema using the themes of this course. You may wish to engage an aspect of one of the films or filmmakers we've discussed in this course.

Regardless of your topic, your final research paper must cite *at least* four academic sources and use proper MLA citation throughout. These scholarly sources could be used to support your arguments, or you could use them as examples of ideas that you hope to refute.

The successful paper will advance a critical thesis about the film, illustrate engagement with the work of other scholars who have also considered the film, display deft close reading skills, and make bold, assertive, and original claims about the importance of the paper's central argument. We will discuss this assignment in greater detail following the mid-term exam.

Participation

Because this class will be based largely on our free and open discussions as a group of scholars, it is of the upmost importance that we each participate as fully as possible during every class meeting. Classroom participation is, therefore, a substantial portion of your final grade. Participation includes, but is not limited to: constructive contributions to

class discussions and activities, engagement with and support of classmates, and timely completion of reading and homework assignments. Your participation grade represents your presence in the classroom—both physically and intellectually. Each student will receive a daily participation grade of 1-3 points. Students will receive 1 point for being present, 2 points for basic participation, and 3 points for being an active participant.

Note on In-class Performance
This course is based heavily on in-class discussion. For this to work, each class-member must maintain a critical, but open mind. This requires a somewhat gymnastic mentality in which you practice an unwillingness to merely accept, without scrutiny, the world as it has been given to you, a willingness to subject your observations and ideas to the scrutiny of others, and, most importantly, a willingness to respect the right of all others to express viewpoints different from your own, regardless of their ethnic, economic, sexual, or religious backgrounds. Arguing with viewpoints on the basis of disrespect for those personal qualities is intolerable, but arguing on the basis of the text is encouraged.

Don't be a Twit Face: Adequate participation requires that individuals refrain from non-productive activities during class time, such as texting, looking at Twitter or Facebook, emailing, carrying on extraneous conversations, or doing work for other classes. **This type of non-productive behavior will result in an absence for the day and will negatively impact your class participation grade.**

Attendance

If you miss three classes, your grade will be lowered a final letter grade. Students who miss eight or more classes are in danger of failing the course. Since UNC and the Writing Program does not recognize a difference between "excused" or "unexcused" absences, students who experience a personal crisis or severe illness which will take them away from the classroom for an extended period should see their academic advisors about withdrawing from the class.

Quizzes

Over the course of the term, you will be given a number of short quizzes on your reading and viewing assignments. I will drop your lowest *three* scores. If you are absent from class on the day of a quiz, you may *not* make up that quiz; that day's score will count as one of your dropped scores. Quizzes will be given during the first five minutes of each class. If you are tardy to class and miss the administration of a quiz, you may *not* make it up; that score will be dropped.

Plagiarism

Do not pass the work of others off as your own. Plagiarism, a grave violation of the Honor Code will not be tolerated. Plagiarism consists of the intentional or inadvertent submission of another's work as your own. Two examples of plagiarism are turning in a paper or parts of a paper purchased on the Internet or from another student, and failing to

adequately cite quoted or paraphrased source material in an original paper.

Formatting

All submitted work must be typed in precise MLA format. The basics: 12-point, serifed, variable-width font (see note below); 1" margins on all sides; last name/page numbers in upper right; full name/course info/date in upper left of first page; ALL double-spaced.

A note on fonts: Acceptable fonts include the following: Times or Times New Roman and closely related fonts (e.g. Baskerville, Garamond, Goudy Old Style). Courier and its fixed-width cousins will not work—a lowercase 'i' is not the same width as a capital 'W'. All of the below are 12-point:

If it is in ill advisement, I will not do it. (Times New Roman)
If it is in ill advisement, I will not do it. (Garamond)
If it is in ill advisement, I will not do it. (Courier New)

The Writing Center

The UNC Writing Center (http://www.unc.edu/depts/wcweb/) offers free tutoring services for students. You may visit the writing center to ask for help with a specific paper, whether you are concerned with developing ideas and content, organizing your assignment, or working on style issues. The Writing Center's main location is in the Student and Academic Services Building—the same building where the Cashier and the Registrar are located, and a satellite space is located in Greenlaw Hall, Room 221.

Accommodations and Concerns

If you need particular accommodations, I will gladly work with the UNC disabilities services and/or the UNC learning center to help make the course as productive and fulfilling for you as possible. Please contact me personally if this is the case.

Evaluation

Assignments will be evaluated as follows:

Presentation Paper	15%	Final Paper	25%
Participation	20%	Reading Quizzes	10%
Mid-Term Exam	20%	Festival Report	10%

Permanent grades are defined at UNC Chapel Hill as follows:
A: Mastery of course content at the highest level of attainment that can reasonably be expected of students at a given stage of development. The A grade states clearly that the student has shown such outstanding promise in the aspect of the discipline under study that he/she may be strongly encouraged to continue.

B: Strong performance demonstrating a high level of attainment for a student at a given stage of development. The B grade states that the student has shown solid promise in the aspect of the discipline under study.

C: A totally acceptable performance demonstrating an adequate level of attainment for a student at a given stage of development. The C grade states that while not yet showing any unusual promise, the student may continue to study in the discipline with reasonable hope of intellectual development.

D: A marginal performance in the required exercises demonstrating a minimal passing level of attainment for a student at a given stage of development. The D grade states that the student has given no evidence of prospective growth in the discipline; an accumulation of D grades should be taken to mean that the student would be well advised not to continue in the academic field.

F: For whatever reasons, an unacceptable performance. The F grade indicates that the student's performance in the required exercises has revealed almost no understanding of the course content. A grade of F should warrant an adviser's questioning whether the student may suitably register for further study in the discipline before remedial work is undertaken

Email: All class-related email must be formal, concise, and clear. Instructor and students should respond to each other swiftly and at least within 24 hours.

- Meaningful Subject heading: [Student Name; issue]
- Greeting: Dear [Professor's Name]; Dear Ms./Mr. [Student's Name]
- Message: Clear and concise. Ex: "May I request an appointment for this week on Thursday or Friday afternoon to discuss problems I'm having with obtaining sources?" "May I speak with you by telephone this evening about a family emergency that will require my attention this week?" "May I ask you to clarify one point on this week's writing assignment? What is the preferred page length?"
- Close: Sincerely, [Student's full name]

Subject: Robin Tanaka Request for Recommendation Letter

Dear Ms. Du Graf,

I am applying for the UNC Tokyo Summer Program and would like to request a recommendation letter from you. I can come to your Monday office hour next week to explain my interests in this program and my preparation for it. I appreciate your time and advice.

Sincerely,
Robin Tanaka (CMPL 143)
****

Subject: Robin Tanaka Request for Recommendation Letter
Dear Ms. Tanaka,

Thank you for your note. I'd be glad to meet you Monday, Aug. 27th at 4pm to talk about the Tokyo Summer Program. It would be helpful to know at that time how much Japanese you have had and what your long-term interests in Japanese are. This is a wonderful program and I am sure that you would enjoy it.

Sincerely,
Lauren Du Graf

Course Schedule

-Readings and assignments are due at the start of class on the dates indicated.
-This calendar may change. Email me if you have any questions about when assignments are due.

Week	Sunday Screening	Tuesday	Thursday
1			Jan. 10 Course Introduction/ Syllabus Overview Screening: Werner Herzog Eats His Shoe
2		Jan. 15 Actuality Films and the Birth of Cinema: the Lumière Brothers. Screening: *Arrival of a Train at La Ciotat* (1896) Reading: Bill Nichols, ch. 5; Gorky, In the Kingdom of Shadows Quiz on Syllabus Course Policies	Jan. 17 **NO CLASS**

3	Jan. 21 Screening: Robert Flaherty, Nanook of the North (1922)	Jan. 22 Report: Robert Flaherty Reading: John Grierson Report: Ethnographic Film and Ethnofiction	Jan. 24 Report: Trinh-Minh Ha Screening: Reassemblage (40 min, 1982)
4	Screening: Leni Riefenstahl, Triumph of the Will (1934)	Jan. 29 Report: Leni Riefenstahl Discuss Triumph of the Will Report: Wartime Propaganda Documentaries	Jan. 31 Report: Frank Capra Screening: Why We Fight (Clips)
5	Screening: Alain Resnais, *Hiroshima Mon Amour* (1959)	Feb. 5 Report: Alain Resnais Screening: *Night and Fog*	Feb. 7 Report: The Essay Film Screening: Chris Marker (TBD) Reading: Timothy Corrigan Report: French New Wave
6	Screening: Jean Rouch, Chronicle of a Summer (1960)	Feb. 12 Report: Jean Rouch Reading: On the Vicissitudes of the Self Report: Jump Cuts and Cine-trance	Feb. 14 Reading: TBD Report: Cinema Verite
7	Screening: Albert and David Maysles *Gimme Shelter* (1970)/ *Grey Gardens* (1976) TBD	Feb. 19 Report: Albert and David Maysles Report: Direct Cinema	Feb. 21 Report: TBD

8	Screening: Agnes Varda, *The Gleaners and I* (2000)	Feb. 26 Report: Agnes Varda Screening: L'Opera-Mouffe Report: Autobiographical Cinema	Feb. 28 Report: TBD
9	Screening: *Time Indefinite* Ross McElwee,	March 5 Report: Ross McElwee Continue discussion of Autobiographical Cinema. Questions before the Midterm *Last day to drop courses	March 7 MIDTERM
10		March 11 **Spring Break**	March 13 **Spring Break**
11		March 18 Report: Errol Morris Begin Screening *Thin Blue Line* (1988, 103 mins)	March 20 Finish Screening *Thin Blue Line*
12	Screening: Abbas Kiarostami, *Close-Up* (1990)	March 26 Report: Abbas Kiarostami Report: Iranian New Wave	March 28 Report: TBD
13	Screening: Chris Smith, *American Movie* (1999)	April 2 Report: *American Movie* Report: Full Frame Documentary Tribute Award Winner (TBD)	April 4 NO CLASS: Full Frame Documentary Film Festival

14	NO SCREENING: Full Frame	April 9 Due: 1-2 page festival Report Discuss Full Frame Report: The Role of Film Festivals in Film Distribution	April 11 Discuss Final Paper Report: Werner Herzog Reading: On the Absolute, Sublime, and Ecstatic Truth Begin screening *Grizzly Man* (2005)
15	Screening: *Into The Abyss*	April 16 Finish screening *Grizzly Man* Reading: Werner Herzog in conversation with Errol Morris: http://www.believermag.com/issues/200803/?read=interview_herzog	April 18 Report: TBD
16	Screening: This is Not a Film, Jahar Panahi	April 23 Report: Jahar Panahi Questions Regarding Final Paper Report: iPhone Documentary Filmmaking* *Permissible to use non-academic sources for report	April 25 FINAL PAPER DUE

MATH 110
Course Overview & Syllabus Spring 2013

Course Overview: The main goal of Math 110 is to ensure your preparation for other courses. However, because there may be topics that you only need to review briefly, and others that need more detailed study, we have designed a course where you can choose to take section tests earlier than the scheduled times, hence either completing the course early or allowing more time for those topics that you find challenging. You will use your computer to access online material on the web, including the textbook for the course. It provides tutorial support, illustrative examples and exercises with step-by-step hints and readiness tests with which you can gauge your preparedness for the exams.

Along with traditional lectures, instructors and assistants will be available at many regularly scheduled hours throughout the week for individual and small group work. This help takes place in a facility called the Math Help Center, which is staffed by instructors, graduate assistants, and undergraduate tutors in Phillips Hall. **The Math Help Center instructional staff are available for help on lesson topics, practice problems, graded homework, and test review.**

Currently all sections of Math 110 are taught using this format. Mr. Mark McCombs is the course coordinator for Math 110.

MATH HELP CENTER HOURS
Location: Phillips Hall 365
Monday – Thursday, 1:00pm – 6:00pm
Friday, 1:00pm – 3:00pm

Lecture Meetings: Students will attend traditional lecture meetings on Monday and Friday each week throughout the semester. Lecture meetings will last 50 minutes and will be devoted to instructors introducing and explaining course topics via specific examples.

Problem Sessions: Students will also attend a 50-minute problem session on Wednesday each week throughout the semester. During these 50-minute weekly sessions, you will work on a variety of practice problems in a small-group and/or individual setting.

Students should bring a calculator, textbook, and all relevant problem worksheets to each weekly session. Prior to each problem session meeting, students should read the appropriate section notes and sections from your text as per the Math 110 Semester Schedule.

IMPORTANT NOTE: Students should be aware that success in Math 110 requires self-motivation and a willingness to complete assignments each week. **There will be ample opportunity for you to get one-on-one or small group help many times each week throughout the semester in the Math Help Center.**

Sincerely,

Mark McCombs
Math 110 Coordinator
mccombs@math.unc.edu

Karl Petersen
Director of Undergraduate Studies
petersen@math.unc.edu

MATH 110
Course Overview & Syllabus Spring 2013

Course Website: http://webcom2.grtxle.com/mathcoach/

Textbook Information: This course uses an online textbook, available via an access code. The access code may be purchased using a credit card at the web address listed above, or in the UNC Textbook store.

Students must purchase an access code and enroll online in order to view and submit homework assignments.

Placement: Only students who scored below 520 on the SAT II Math Level IC or II–C test are eligible to receive credit for Math 110. MATH 110 placement carries no credit hours, although students who place into MATH 110 and complete it successfully will earn credit hours towards graduation. If you are not sure about your placement, contact Mark McCombs, mccombs@math.unc.edu.

Math 110 DOES NOT fulfill the Quantitative Reasoning requirement.

Honor Code: It is expected that each student in this class will conduct him or herself within the guidelines of the UNC Honor System. All academic work should be done with the high level of honesty and integrity that this University demands.

Accommodations: If there any special circumstances that will affect your performance in this class, please contact the staff at the Academic Success Program, 919-962-7227, so that we can work together to meet your needs.

Course Description: Math 110 is a college algebra course designed to provide you with the fundamental skills that are necessary for success in all subsequent math courses. Emphasis is given to the study of polynomial, exponential and logarithmic functions, and solving equations and inequalities. The course is divided into four units:

Unit I:	Solving Equations: Text Sections 1.1–1.4
Unit II:	Solving and Graphing Equations: Text Sections 2.1–2.4
Unit III:	Working with Functions: Text Sections 3.1–3.4
Unit IV:	Special Functions and Applications: Text Sections 4.1–1.4

Calculator: You will need a basic scientific calculator (i.e. one that will do trigonometric, logarithmic and exponential functions) for this course. Some test and exam problems will be impossible without one. You may use a graphing calculator. However, you will not be allowed to use the graphing or equation solving features on certain quiz, test and final exam problems.

Practice Problems: A set of practice problems (with solution keys) is available online for each lesson. You are expected to complete each of these problem sets. **These problems will not be collected or graded, but they are the foundation for the graded tests and the final exam.** You are encouraged to work together on these problems.

MATH 110
Course Overview & Syllabus Spring 2013

Graded Homework: You will submit a total of 8 online homework assignments during the semester. These assignments are open-book, open note, and must be submitted on the course website You may submit each homework assignment only once.

Graded homework deadlines are listed online. Deadlines are deadlines!
Do not expect any extensions. Your lowest homework score will be dropped.

Testing Procedures:

1. You will take 4 closed-book, closed-notes, pencil and paper tests. Test deadlines are listed on the Math 110 Semester Schedule. These tests will be proctored.

2. If you choose to take a test before the deadline date, you will take the test in the Math Help Center location in Phillips Hall. These tests will be proctored. You MUST schedule your testing time by emailing Mark McCombs at mccombs@math.unc.edu at least 24 hours in advance.
   Early testing will only be offered on Tuesdays and Thursdays at 6pm.

3. If you test on the deadline, you will take the test during your class meeting time in Phillips Hall.

4. As with the graded homework, deadlines are deadlines! Since you can always test early, do not expect any extensions. If a test is missed, it will be scored as a zero no matter what the excuse.

NO MAKEUPS WILL BE GIVEN

Final Exam: The cumulative final exam is a common exam taken by all sections of Math 110 at the same time. Uniform grading instructions for the final exam, applicable to all sections, allow only minimal partial credit.

You must have an official examination excuse in order to take the Make-up Exam. This excuse must be signed by an academic Dean. You must bring this excuse, along with a picture ID to the exam. **ABSOLUTELY NO EXCEPTIONS!**

Special Note: Your final exam grade will replace your lowest test grade, provided the final exam grade is higher.

Grading: All grades will be assigned according to a 10-point scale. That is, 90–100 is an A; 80–89 is a B, etc. Your overall average must be greater than or equal to 60% to earn a passing grade for the course.

Your course grade will be determined as follows:

HW Avg.: 10%	**Test 1: 14%**	**Test 2: 14%**
Test 3: 14%	**Test 4: 14%**	**Final Exam: 34%**

THERE ARE NO EXTRA CREDIT OPPORTUNITIES IN THIS COURSE.

N4A members,

The Research Committee would like to pass along information regarding grants. Many of you have used the NCAA Student-Athlete Affairs Grant in the past. With the 2013-14 application process beginning in the near future, new information regarding the grant has surfaced this morning. Below is a link from the NCAA office outlining the grant will no longer exist in its current state. Those seeking funds are to now go through the NCAA's Campus and Conferences services for leadership development training. The link may require a NCAAconnect login to read the memo.

Thank you and have a great 2013!

2013 SAA Grant Memo<http://www.ncaa.org/wps/myportal/ncaahome?WCM_GLOBAL_CONTEXT=/ncaa/NCAA/Academics%20and%20Athletes/Student-Athlete%20Affairs/2013%20SAA%20Grant%20Memo>

Divas Half Marathon

April 28th, 2013
Myrtle Beach, SC

This new year, commit to running and join us for our Divas Half Marathon & 5K in North Myrtle Beach on April 28, 2013!
This course starts right on Ocean Boulevard heading south toward Atlantic Beach, one of the Grand Strand's most historical areas. Along the way, you will encounter one of the most picturesque beachside residential communities right before coming upon Main Street, the SHAG capital of the world! Take a trip down 'millionaire row' featuring some of the most beautiful homes in North Myrtle Beach and pass by beautifully manicured golf courses, which lead you back to the finish line on hotel row, back on Ocean Blvd. If you have never visited North Myrtle Beach, but have always dreamed of a perfect beachside town, this is the destination for you!
The Divas Half Marathon & 5K Series is the most fun and glam women's half marathon series in the nation! Enjoy a great run not only in North Myrtle Beach, but in some of the country's best vacation destinations: San Francisco Bay, CA, DC's Wine Country, VA, Long Island, NY, San Juan, PR and SoCal, CA! For more information, visit us at www.runlikeadiva.com.

EXSS Chapter 3: Stress Management

What is stress?

What is a stressor?

What is the difference between eustress and distress?

The specific psychobiological changes that occur as the body attempts to cope with a stressor and return to homeostasis: _____

What is homeostasis?

List some of the physical reactions to stress:
1)

2)

3)

4)

5)

6)

7)

What are cortisol and adrenaline? What do they do?

What is the fight-or-flight response? Who first described it?

How/when can the fight-or-flight response prove unhelpful or even detrimental?

What are the protective physiological adaptations in response to stressors called?

The General Adaption Syndrome (GAS) was developed by _____ and has three stages. Describe:
1) Alarm:

2) Resistance:

3) Exhaustion:

What are allostasis and allostatic overload?

What is chronic stress syndrome?

What are some effects of stress on the:
*Cardiovascular System?

*Digestive System?

*Immune System?

- What area of science studies the interactions among _____ processes, the _____ system, _____, and the _____ system?

*Mood, Mind, and Mental Health?

Some Warning Signs of Stress Overload:
*Emotional

*Physical

*Behavioral

Likely Causes of Stress:
*Financial Stressors

*Daily Hassles

*Academic Pressure

*Job-Related Stressors

*Social Stressors

*Major Life Events

*Environmental Stressors

*Internal Stressors

Identify at least one way that stress varies by . . .
*Sex/Gender:

*Race:

*Age:

*Geography:

Strategies for Reducing Stressors/Managing Stress (List at least 3 strategies/habits for <u>each</u> category.):
*Healthy Lifestyle:

*Time Management:

*Test-Taking Skills:

*Exercise:

*Sleep:

- Define sleep debt:

*Relaxation:

- Define relaxation response:

*Thinking:

*Help from Professionals:

<u>SUPPLEMENT</u>: Physiological (_____) Effects of Stress on Body (from class slides):
*Nervous system:

- _____ nervous system –
- _____ nervous system –
    - _____ division
    - _____ division

*Endocrine system:

*Describe how these two systems work together during an emergency:

EXSS – Chapter 4: Nutrition

What is nutrition?

Nutrients:

6 Essential Nutrients:

1) Carbohydrates:

   A.
   B.

2) Fats:

   A.
   B.
      a.
      b.

3) Protein:

   a. Amino Acids:

4)

5)

6)

What is a kilocalorie?

Which three classes of essential nutrients supply energy and how much does each supply?

_____ = _____ calories per gram

_____ = _____ calories per gram

_____ = _____ calories per gram

What are the other healthful substances in food?

1.

2.

3.

4.

What are some strategies for eating right?

How do nutrition needs differ depending on the person?

What is a vegetarian?

A vegetarian who eats no animal products at all is a _____.

A vegetarian who includes milk and cheese products in the diet is a _____.

A vegetarian who eats no meat, poultry or fish but does eat eggs and milk products is a _____.

A vegetarian who includes eggs, dairy products, and/or small amounts of poultry and seafood in the diet is a _____.

What is a foodborne illness?

What is a food allergy?

What are food additives?

What are food residues?

What are genetically modified foods (GMFs)?

EXSS Chapter 6: Weight Management

Overweight:

Obese:

*An estimated _____ percent of American adults over age 20 are overweight or obese. Among children and teenagers, an estimated _____ percent of those aged 6 to 11 years and _____ percent of those aged 12 to 19 years are overweight.

Identify the health risks associated with being overweight or obese:

1.

2.

3.

4.

5.

6.

7.

8.

9.

10.

11.

12.

13.

Terms to know:

*insulin resistance

*LDL cholesterol

*HDL cholesterol

*atherosclerosis

*angina

Excess weight is also linked to . . .

An Oxford University study found that life expectancy of severely obese individuals may be reduced by _____ to _____ years, and federal estimates indicate that health problems caused by overweight and obesity cost our health-care systems about _____ each year.

Energy Balance:

Discuss the factors that contribute to weight gain:

1.

2.

3.

4.

5.

6.

7.

8.

More terms to know:

*thermogenesis

*BMR

*RMR

*FTO

Identify some weight trends . . . on campus:

. . . in the U.S.

. . . around the globe

Things to consider before assessing whether you are at a healthful weight:

1.

2.

3.

4.

5.

Methods for assessing healthful weight and body composition:

*BMI

--healthful weight

--underweight

--overweight

--obese

*Waist Circumference and Waist-to-Hip Ratio

*Body Composition Analysis

--

--

--

--

--(from slides)

Three Keys to Reaching a Healthful Weight:

1.

2.

3.

List five ways (in addition to portion control) that you can modify your eating habits healthfully:

1. portion control –

2.

3.

4.

5.

6.

Define hunger and appetite and indicate how they are different:

Satiety:

Three common dieting approaches (identify tips or guidelines for each):

1.

2.

3.

How much did Americans spend on over-the counter diet pills in 2007? _____

In one study, what percentage of college women at risk for eating disorders reported having used a diet drug? _____

Identify some problems with over-the-counter diet pills:

Describe some of the medical options for weight loss:
*prescription drugs

*surgery:

Identify four ways one can gain weight healthfully:
1.
2.
3.
4.

List six ways you can maintain a healthful weight:
1.
2.
3.
4.
5.
6.

Body Image:

According to the class slides, what five areas does body image encompass?
1.
2.
3.
4.
5.

List the three identified body image concerns that affect men and women:
1.
2.
3.

Eating Disorders:

For each of the disorders, define and list at least two signs; define all other terms:
1. anorexia nervosa
   a)
   b)
2. bulimia nervosa
   a)
   b)

   - binge eating

   - purging

3. binge-eating disorder
   a)
   b)

Disordered Eating:

1. compulsive overeating
   a)
   b)
2. extreme dieting
   a)
   b)

What should you do if you think someone you know has an unhealthful eating behavior?

1.

2.

3.

4.

5.

What have studies revealed about the ways that overweight and obesity affect people by race, ethnicity, and socioeconomic class? List some findings/trends/factors:

<u>ADDITIONAL INFORMATION FROM CLASS SLIDES</u>:

**body fat categories for men and women

**body fat distribution and health (apples and pears)

**anaerobic vs. aerobic exercise

**creating individual weight management program

**key components of legitimate programs to help you overcome weight problem

**recommended healthful weight loss (rate and amount of fat and calories)

**specific types of surgeries

EXSS Chapter 7: Drug Use and Abuse

drug:

psychoactive:

Drug Use on Campus:

Identify trends in drug use:

*overall:

*race:

*sex:

*geography:

*age:

The inappropriate use of a legal drug for a reason for which it was not medically intended or by a person without a prescription: _____

drug abuse:

addiction:

The brain's "feel good" chemical: _____

A feeling of intense pleasure: _____

tolerance:

psychological dependence:

physical dependence:

Physical symptoms that develop when a person stops using a drug: _____

List five of the characteristics of substance dependence:

1.

4.

2.

5.

3.

intoxicate:

List the factors that affect the rate and effects of intoxication:

Identify and describe the five basic ways people self-administer drugs:

1.

2.

3.

4.

5.

How do drugs leave the body?

Explain the physiological impact of drugs:

-additive interactions:

-antagonistic interactions:

-toxicity:

How are prescription medications most commonly misused?

1.

2.

3.

4.

What are some other problems with prescription medications?

What are some problems with over-the-counter (OTC) drugs?

COMMONLY ABUSED DRUGS:

(For each of the following, define the drug and any aliases and then describe its/their effects on the body.):

****MARIJUANA:**

-psychoactive ingredient of marijuana: _____

****STIMULANTS:**

+caffeine:

+cocaine:

+amphetamines:

+methamphetamine:

****HALLUCINOGENS:**

+LSD:

+PCP (Include definition of dissociative drugs.):

+psilocybin:

****CLUB DRUGS:**

+MDMA:

+GHB:

+Rohypnol:

+ketamine:

****INHALANTS:**

+solvents:

+aerosols:

+gases:

+nitrites:

****DEPRESSANTS:**

+barbiturates:

+benzodiazepines:

****OPIOIDS:**

+heroin:

+prescription opioids:

Prevention:

Signs of Drug Addiction:

-12-step programs:

-intervention:

-polyabuser:

codependency:

enablers:

Preventing Relapse:

Other Addictive Behaviors:

EXSS Chapter 8: Alcohol and Tobacco Use and Abuse – Alcohol (p. 165-176)

binge drinking:

Why do students drink?

ethyl alcohol (ethanol):

proof value:

standard drink:

absorption:

metabolism:

acute intoxication:

blood alcohol concentration:

What factors can affect your blood alcohol concentration?

alcohol intoxication:

What are the immediate effects of alcohol on the body?

-hangover:

-alcohol poisoning:

What are the long term effects of alcohol on the body?

fetal alcohol syndrome:

Effects of Alcohol on Behavior:

alcohol abuse:

alcoholism (alcohol dependence):

Risk Factors for Alcoholism:

-self-medicating:

Common Alcoholic Profiles:

What are the treatment options for an alcoholic?

relapse:

EXSS Chapter 8: Alcohol and Tobacco Use and Abuse – Tobacco (p. 177-184)

Why do students smoke?

nicotine:

carcinogenic:

tar:

carbon monoxide:

What are the short-term effects of smoking on the body?

-dopamine:

What are the long term effects of smoking on the body?

-COPD:

-emphysema:

-chronic bronchitis:

-asthma:

Smoking & Pregnancy:

secondhand smoke (environmental tobacco smoke):

*sidestream smoke:

*mainstream smoke:

What are the health effects of secondhand smoke?

Other Forms of Tobacco:

-leukoplakia:

Why is it difficult to quit smoking?

What is the START method for quitting smoking?

Treatment Options:

relapse:

EXSS 141 Chapter 9: Relationships and Communication

Self-disclosure:

Identify the nine suggested communication strategies:

1.

2.

3.

4.

5.

6.

7.

8.

9.

Another phrase for nonverbal communication is _____. Give some examples of nonverbal communication:

List four ways to be a good listener:

1.

2.

3.

4.

Describe four ways that the content and/or style of communication differ between men and women:

1.

2.

3.

4.

Conflict avoidance:

Conflict resolution:

Conflict escalation:

List eight strategies for effective conflict resolution:

1.

2.

3.

4.

5.

6.

7.

8.

Describe the personal factors that influence the way we develop relationships with others:

***Self-Perception:**

***Early Relationships (Make sure you address/define attachment theory.):**

***Gender Roles:**

Why are friendships important?

Identify at least two tips for maintaining old friendships:

What are some of the criticisms of social media networks like Facebook?

List six tips for safe, effective use of social media networks:

1. **4.**

2. **5.**

3. **6.**

According to _____'s _____ Theory of Love, what are the three primary components of healthy, loving relationships (numerals) and the seven different types of love (letters)?

1. **C.**

2. **D.**

3. **E.**

A. **F.**

B. **G.**

What eighth category of love did the above theorist identify?

Assortative Mating:

Which similarity appears to be the most indicative of a happy relationship? Explain.

In what ways has traditional dating changed (Address both hooking up and online dating.)?

What safety precautions should you keep in mind when trying online dating?

Homosexual:

The number of people in the U.S. who identify themselves as lesbian, gay, or bisexual: _____.

Heterosexual:

Homophobia:

Identify six tips for maintaining strong, healthy relationships:

1. **4.**

2. **5.**

3. **6.**

List six signs that a relationship is dysfunctional:

1. **4.**

2. **5.**

3. **6.**

Jealousy:

When does jealousy become especially problematic in a relationship?

How should you deal with jealousy in a relationship?

List four strategies for recovering from a breakup:

1. **3.**

2. **4.**

Cohabitation:

The estimated percentage of U.S. couples that live together before getting married is _____.

Why do couples cohabitate?

What are some of the negative effects of cohabitation?

The estimated percentage of Americans who will marry at some point is _____.

According to the text, what are the benefits of marriage?

In the U.S., an estimated _____ percent of marriages end in divorce.

Identify at least four possible reasons or risk factors for divorce:

1. **3.**

2. **4.**

Identify two factors that decrease the risk of divorce:

Domestic Partnerships (Include the minimum time period that <u>most</u> identified domestic partnerships have spanned.):

Between 1980 and 2005, the median age at marriage for <u>women</u> increased from _____ to _____ years and that age for <u>men</u> increased from _____ to _____ years. Why?

List three recent trends in childbearing/families:

If you choose to have children, you must be ready for what three dramatic changes?

You should also consider the following:

1. **4.**

2. **5.**

3. **6.**

In the U.S., _____ percent of women who have a child less than a year old are in the labor force.

Women with children spend _____ hours a week on housework, caregiving, and professional responsibilities, while men spend about _____ hours a week on these tasks.

One out of every _____ Americans is now a member of a stepfamily.

Of the 74.2 million children living in the United States in 2009, _____ percent lived with only one parent.

List 6 qualities of a strong family.

1. **4.**

2. **5.**

3. **6.**

EXSS Chapter 10: Sexuality, Contraception, and Reproductive Choices (p. 210-216)

SEXUAL ANATOMY & HEALTH

sexuality:

Female Sexual Anatomy (collective external organs also known as _____; know internal v. external organs):

1.

2.

3.

4.

5.

6.

7.

8.

Common sexual health problems in females:

ADDITIONAL FEMALE TERMS TO KNOW: womb, endometrium, cervix, ova, estrogen, VVC, yeast infections

Male Sexual Anatomy (know internal v. external organs):

1.

2.

3.

4.

5.

6.

7.

Common sexual health problems in males:

ADDITIONAL MALE TERMS TO KNOW: shaft, glans, erection, foreskin, circumcision, seminal vesicles, seminal fluid, prostate gland, Cowper's glands

THE MENSTRUAL CYCLE:

menarche:

menstruation:

menopause:

Phases of the Menstrual Cycle:
*menstrual phase:

*proliferative phase:

- ovulate:

*secretory phase:

Disorders Associated with the Menstrual Cycle:
*premenstrual syndrome (PMS) :

*premenstrual dysphoric disorder (PMDD) :

*Pain during menstruation that is severe enough to limit normal activities or requires medication: _____.

*endometriosis:

*amenorrhea:

*A rare bacterial infection linked to tampon use: _____.

ADDITIONAL MENSTRUAL CYCLE TERMS TO KNOW: FSH, follicles, cervical mucus, LH, corpus luteum, progesterone, hCG, SSRI, prostaglandins, *Staphylococcus aureus*

EXSS Chapter 11: Preventing Infectious Diseases and Sexually Transmitted Infections (p. 258-266)

SEXUALLY TRANSMITTED INFECTIONS (STIS)

What are the risk factors for STIs?

1.
2.
3.
4.
5.
6.
7.
8.

*HIV & AIDS
Opportunistic diseases:

How is HIV transmitted?

How do you test for and treat HIV?

What steps can you take to reduce your risk of contracting HIV or any STI?

1.
2.
3.
4.
5.
6.
7.
8.
9.
10.

*Hepatitis B:

*Genital Herpes:

*Human Papillomavirus (HPV):

*Chlamydia:

- ectopic pregnancy:

*Gonorrhea

*Pelvic Inflammatory Disease (PID):

*Syphilis:

*Pubic Lice & Scabies:

*Trichomoniasis:

EXSS Chapter 12: Preventing Cardiovascular Disease, Diabetes, and Cancer (p. 272-287)

chronic disease:

What four key health-risk behaviors influence chronic diseases?

1. 3.

2. 4.

A fifth behavior is wreaking havoc as well. What is it?

diabetes mellitus:

-glucose

-mellitus

insulin:

pancreas:

type 1 diabetes (aka _____ diabetes):

type 2 diabetes (Once known as _____ diabetes, most cases begin with _____.):

-hyperglycemia:

gestational diabetes:

type 1.5 diabetes:

Identify six physical signs and symptoms of diabetes:

1. 4.

2. 5.

3. 6.

What is the FPG?

prediabetes:

What are the long-term effects of diabetes?

In addition to _____, the four risk factors for diabetes include . . .

1.

2.

3.

4.

. . . and metabolic syndrome:

What behavior changes can you make to reduce your risk of diabetes?

1.

2.

3.

4.

5.

How do you control type 1 diabetes?

How do you control type 2 diabetes?

cardiovascular disease (CVD):

The normal cardiovascular system includes:

*arteries-

*veins-

*myocardium-

*atria-

*ventricles-

*coronary arteries-

*capillaries-

*sinus node-

atherosclerosis (*athero* = Greek for _____):

-blood pressure:

-plaque

-angina

hypertension (aka _____):

-systole:

-diastole:

-compliance:

-sphygmomanometer:

coronary heart disease (aka _____):

-angina pectoris:

-myocardial infarction (or _____):

-arrhythmia:

*bradycardia-

*tachycardia-

-fibrillation-

*ventricular fibrillation-

*sudden cardiac arrest-

congestive heart failure:

stroke:

-ischemic stroke:

-hemorrhagic stroke:

-transient ischemic attack (TIA):

Other forms of CVD:

-congenital heart disease:

-heart valve disorders:

-rheumatic heart disease:

-peripheral artery disease:

Describe six detection methods for CVD (Address LDL, HDL, ECG/EKG, stress test, echocardiogram, coronary angiography.):

1.

2.

3.

4.

5.

6.

Identify ten healthy behaviors that will help reduce your risk for CVD:

1.

2.

3.

4.

5.

6.

7.

8.

9.

10.

Which risk factors will these healthy behaviors help you offset?

Why do men have greater CVD risk?

List ways you can help control CVD (Address statins, balloon angioplasty, bypass surgery.):

What two things should you do if you encounter someone in a CVD emergency?

1.

2.

In addition, you can also do the following for someone suffering . . . a heart attack:

. . . sudden cardiac arrest:

. . . a stroke:

EXSS : Chapter 12 (286-297)

What is cancer?

Carcinogen

Oncogene

Tumor

*benign tumor

*malignant tumor

Metastasis

What are some genetic and biological factors for cancer?

What are some lifestyle factors for cancer?

What are some environmental factors for cancer?

What infectious agents often lead to cancer?

1.

2.

3.

How do you detect cancer?

Biopsy

What are the different types of cancer?

1. Carcinomas

2.

3.

4.

5.

What are the most common cancers and what are the risk factors?

1. Skin cancer

2. Lung cancer

3. Colon and rectal cancer

4. Pancreatic cancer

5. Leukemia

6. Oral cancer

The cancers most commonly found in men are:

1.

2.

The cancers most commonly found in women are:

1.

2.

3.

violence:

Identify ten factors that lead to violence:

1.

2.

3.

4.

5.

6.

7.

8.

9.

10.

Describe some of the special concerns for young men:

What is the difference between assault and aggravated assault?

murder:

homicide:

gangs:

hazing:

hate crimes:

terrorism:

domestic (family) violence:

intimate partner violence:

physical and emotional abuse:

Describe the three steps in the cycle of violence:

1.

2.

3.

stalking:

List six common stalking behaviors:

1.

2.

3.

4.

5.

6.

child abuse:

elder abuse:

To stop family and intimate partner violence:

Identify five factors that lead to sexual violence:

1.

2.

3.

4.

5.

sexual harassment:

Identify some of the circumstances in which sexual harassment may occur:

rape:

sexual assault:

statutory rape:

date (acquaintance) rape:

date rape drugs:

Six precautions to help you avoid accidentally consuming a date rape drug:

1.

2.

3.

4.

5.

6.

How can <u>women</u> reduce the risk of date rape?

1.

2.

3.

4.

5.

How can <u>men</u> reduce the risk of date rape?

1.

2.

3.

4.

What should you do if you are raped or sexually assaulted?

sexual abuse of children:

What are some of the effects of sexual violence?

List five specific things you can do to help prevent violence:

1.

2.

3.

4.

5.

EXSS Chapter 15: Your Environment, Your Health

ecosystem:

environmental health:

pollution:

Your environment includes:

Why/How is environmental health a global issue?

Describe the evolution of environmental health:

sustainability:

The collective impact of an entity on its resources, ecosystems, and other key environmental features: _____

globalization:

Effects of Overpopulation and Globalization:

-zero population growth

-negative population growth

ozone:

greenhouse gases:

The primary way we have disrupted our delicately balanced system is _____.

Common Air Pollutants:

1.

2.

3.

4.

5.

6.

Air Quality Index (AQI):

global warming:

Environmental Effects of Air Pollution:

*smog-

*ozone depletion-

*global warming-

*acid rain-

To: Bridger, Beth <bridgerb@email.unc.edu>
Subject: FORMAL NOTICE: Message from the Chancellor: Vice Chancellor for Development Search Update

---

Dear Faculty and Staff:

I have appointed an 11-member search committee to help identify candidates to become the University's vice chancellor for development. I will charge the committee, chaired by Lowry Caudill, an alumnus and member of our Board of Trustees, co-founder of Magellan Laboratories and an adjunct faculty member, at its first meeting next week.

With the search for the University's next chancellor well under way, it's important to initiate the process now to time the vice chancellor search so my successor will have an opportunity to provide input and be involved in the interview process and final selection. (We also are using this strategy with the search for the executive vice chancellor and provost, as I outlined in a recent campus email.)

I consulted with Chancellor Emeritus James Moeser, who had to deal with two vacant administrative positions when he became chancellor in 2000. He confirmed my thinking that initiating these key searches now would help accelerate the transition process within the administration and put my successor in the best position after taking office.

I am grateful to Julia Sprunt Grumbles for her continued service as interim vice chancellor. A Carolina alumna, Julia is the former corporate vice president of Turner Broadcasting in Atlanta. She has done an excellent job overseeing the central development office since last September.

Joining Trustee Caudill on the search committee are faculty, administrators and alumni representing a cross-section of the University community. They are:

* Alice Ammerman, professor of nutrition, Gillings School of Global Public Health, and director, Center for Health Promotion and Disease Prevention;

* David Anderson, associate dean for advancement and president of the Medical Foundation of North Carolina, Inc., which supports the School of Medicine and UNC Health Care;

* James Dean, Sarah Graham Kenan Distinguished Scholar and professor of organizational behavior and dean, Kenan-Flagler Business School;

* Douglas Dibbert, president, General Alumni Association;

* John Ellison, president and chief executive officer of the Ellison Company, Inc. and a former member of the University's Board of Trustees;

* Michael Kennedy, senior client partner with Korn/Ferry International, an Atlanta-based executive recruitment and leadership development firm, and past chair of UNC's Board of Visitors;

* John Montgomery, executive director of the Educational Foundation, Inc. and senior associate athletic director, Department of Athletics;

* Terry Rhodes, professor of music and senior associate dean for fine arts and humanities, College of Arts and Sciences;

* Barbara Rimer, Alumni Distinguished Professor and dean, Gillings School of Global Public Health; and

* Anna Wu, assistant vice chancellor for facilities operations, planning and design, Finance and Administration Division.

Sincerely,

Holden Thorp

COLLEGIATE STRATEGIES

College Recruiting Weekly

January 15, 2013 Volume 9, Issue 3

When Your Timeline Doesn't Match Your Prospect's Timeline

They are common problems we see unfolding this time of year:

You had set a deadline for your prospect to make a decision by last week, but mom and dad just emailed you to tell you that they really need to visit just one more campus at the end of the month.

You have a verbal commitment from a prospect, and you just got an email saying that they're having second thoughts and are going to talk to the other coach again before they make their final decision.

Or, you think you have until late Winter to bring one of your prime recruits on campus, but they've decided (unbeknownst to you) that they want to make their final choice in the early Fall, and surprise you with an email announcing their decision before you even have the chance to get them to campus.

Any of these scenarios sound familiar to you, Coach?

It all comes down to this reality: Your timeline as a college coach doesn't match your prospect's timeline that he or she has set in their mind.

There are two different ways this usually materializes in the recruiting process. The most common is that you have a timeline that you need your recruit to comply with sooner rather than later, and your prospect is dragging their feet. However, there is a more treacherous timeline scenario that sneaks-up on coaches, too: Your prospect is going to make their decision earlier than you think, and you never...

Exact Sports Brings Psychology To The Recruiting Table

*by Joe Cice, **Front Rush***

*Front Rush recently partnered with a company called Exact Sports (**exactsports.com**), to provide coaches with a mental achievement profile (MAP) of each of their recruits.*

This helps schools see beyond the physical side and evaluate recruits' on their mental strengths and weaknesses as well. Below is an article by Front Rush's own Joe Cice who is a doctoral candidate in psychology. We thought it most appropriate for him to discuss the mental side of sports and introduce this partnership.

-Sean Devlin

The idea of psychology has always been prevalent in society. Before it could be defined as a science, it was folded into the ancient mystic idea of philosophy. In sports it can be described as the intangibles. That underlying makeup of an athlete that cannot be explained by mere physical attributes. These intangibles are vital to the success of an athlete or a team, but may often be forgotten when recruiting...

Dan 2006 Picture

IN DEFENSE OF THE RECRUITING HAT DANCE

It goes like this: A recruit holds a ceremony. In front of him are the flat-brim hats of four or five schools that have offered him a scholarship. He picks up one hat ... and puts its down. He picks up a second hat ... and puts it down. Finally, he picks up the right hat and announces his commitment. Is this the best way to do it? **CLICK HERE**

Impressive Results Abound for Division III Athletes

by Dennis D. Berkey, President & CEO
Worcester Polytechnic Institute

We recently bid farewell to quite a tough year for NCAA Division I (DI) collegiate athletics, from the tragedy of Penn State football to the ineligibility of top teams for post-season competition due to various gross violations of ethical standards.

Many see high-profile D1 sports programs as being out of control. Schools increasingly hop from one conference to another, causing odd distortions to once sensible leagues. And there are the usual concerns over graduation rates and career prospects for players not making the professional ranks. Some of the harsher critics argue that the major D1 sports ought to be regarded as professional entertainment, with recruited athletes paid handsomely for their performances, rather than their current status as students with full scholarships and extensive special amenities.

How many D1 athletes would have enrolled at their current institutions were it not for the potential financial benefits and career prospects in professional sports?...

Football Coaches Wary Of Upcoming NCAA Recruiting

Rule Changes

by Mitch Sherman, ESPN

In the wake of the American Football Coaches Association convention this week and the NCAA's explanation to college coaches on several proposed legislative changes that threaten to impact recruiting significantly, I've repeatedly heard one question.

Why?

Why would the Division I Board of Directors consider a vote to deregulate all private electronic communication, including text messaging, from coaches to prospects, as it will do next week at the NCAA convention with Proposal 13-3?

Why would the NCAA, with Proposal 13-2, consider giving coaches more off-campus access to prospects, adding six potential home visits from every school during a prospect's junior year to the six already allowed in his senior year?

Coaches say they're already stretched too thin. If these proposals pass, quality of life for assistants, in particular, will take a huge hit. How are they supposed to coach their teams while keeping up with hundreds of text messages and twice as many home visits?...

Subject: Guest Coach dates

Hello Beth Bridger:

I'd be thrilled to be a guest coach. How about Valentine's Day, February 14? Is that still available? If not, perhaps the February 28 date is available? Let me know. I could probably make one of the January dates, yet February is much better for me.

Thanks for this kind invitation.

HW assignments must be submitted online at http://webcom2.grtxle.com/mathcoach/

MATH 110
Course Overview & Syllabus Spring 2013

Course Overview: The main goal of Math 110 is to ensure your preparation for other courses. However, because there may be topics that you only need to review briefly, and others that need more detailed study, we have designed a course where you can choose to take section tests earlier than the scheduled times, hence either completing the course early or allowing more time for those topics that you find challenging. You will use your computer to access online material on the web, including the textbook for the course. It provides tutorial support, illustrative examples and exercises with step-by-step hints and readiness tests with which you can gauge your preparedness for the exams.

Along with traditional lectures, instructors and assistants will be available at many regularly scheduled hours throughout the week for individual and small group work. This help takes place in a facility called the Math Help Center, which is staffed by instructors, graduate assistants, and undergraduate tutors in Phillips Hall. **The Math Help Center instructional staff are available for help on lesson topics, practice problems, graded homework, and test review.**

Currently all sections of Math 110 are taught using this format. Mr. Mark McCombs is the course coordinator for Math 110.

MATH HELP CENTER HOURS
Location: Phillips Hall 365
Monday – Thursday, 1:00pm – 6:00pm
Friday, 1:00pm – 3:00pm

Lecture Meetings: Students will attend traditional lecture meetings on Monday and Friday each week throughout the semester. Lecture meetings will last 50 minutes and will be devoted to instructors introducing and explaining course topics via specific examples.

Problem Sessions: Students will also attend a 50-minute problem session on Wednesday each week throughout the semester. During these 50-minute weekly sessions, you will work on a variety of practice problems in a small-group and/or individual setting.

Students should bring a calculator, textbook, and all relevant problem worksheets to each weekly session. Prior to each problem session meeting, students should read the appropriate section notes and sections from your text as per the Math 110 Semester Schedule.

IMPORTANT NOTE: Students should be aware that success in Math 110 requires self-motivation and a willingness to complete assignments each week. **There will be ample opportunity for you to get one-on-one or small group help many times each week throughout the semester in the Math Help Center.**

Sincerely,

Mark McCombs
Math 110 Coordinator
mccombs@math.unc.edu

Karl Petersen
Director of Undergraduate Studies
petersen@math.unc.edu

MATH 110
Course Overview & Syllabus Spring 2013

Course Website: http://webcom2.grtxle.com/mathcoach/

Textbook Information: This course uses an online textbook, available via an access code. The access code may be purchased using a credit card at the web address listed above, or in the UNC Textbook store.

Students must purchase an access code and enroll online in order to view and submit homework assignments.

Placement: Only students who scored below 520 on the SAT II Math Level IC or II–C test are eligible to receive credit for Math 110. MATH 110 placement carries no credit hours, although students who place into MATH 110 and complete it successfully will earn credit hours towards graduation. If you are not sure about your placement, contact Mark McCombs, mccombs@math.unc.edu.

Math 110 DOES NOT fulfill the Quantitative Reasoning requirement.

Honor Code: It is expected that each student in this class will conduct him or herself within the guidelines of the UNC Honor System. All academic work should be done with the high level of honesty and integrity that this University demands.

Accommodations: If there any special circumstances that will affect your performance in this class, please contact the staff at the Academic Success Program, 919-962-7227, so that we can work together to meet your needs.

Course Description: Math 110 is a college algebra course designed to provide you with the fundamental skills that are necessary for success in all subsequent math courses. Emphasis is given to the study of polynomial, exponential and logarithmic functions, and solving equations and inequalities. The course is divided into four units:

Unit I:	Solving Equations: Text Sections 1.1–1.4
Unit II:	Solving and Graphing Equations: Text Sections 2.1–2.4
Unit III:	Working with Functions: Text Sections 3.1–3.4
Unit IV:	Special Functions and Applications: Text Sections 4.1–1.4

Calculator: You will need a basic scientific calculator (i.e. one that will do trigonometric, logarithmic and exponential functions) for this course. Some test and exam problems will be impossible without one. You may use a graphing calculator. However, you will not be allowed to use the graphing or equation solving features on certain quiz, test and final exam problems.

Practice Problems: A set of practice problems (with solution keys) is available online for each lesson. You are expected to complete each of these problem sets. **These problems will not be collected or graded, but they are the foundation for the graded tests and the final exam.** You are encouraged to work together on these problems.

MATH 110
Course Overview & Syllabus Spring 2013

Graded Homework: You will submit a total of 8 online homework assignments during the semester. These assignments are open-book, open note, and must be submitted on the course website You may submit each homework assignment only once.

Graded homework deadlines are listed online. Deadlines are deadlines!
Do not expect any extensions. Your lowest homework score will be dropped.

Testing Procedures:

1. You will take 4 closed-book, closed-notes, pencil and paper tests. Test deadlines are listed on the Math 110 Semester Schedule. These tests will be proctored.

2. If you choose to take a test before the deadline date, you will take the test in the Math Help Center location in Phillips Hall. These tests will be proctored. You MUST schedule your testing time by emailing Mark McCombs at mccombs@math.unc.edu at least 24 hours in advance.
   Early testing will only be offered on Tuesdays and Thursdays at 6pm.

3. If you test on the deadline, you will take the test during your class meeting time in Phillips Hall.

4. As with the graded homework, deadlines are deadlines! Since you can always test early, do not expect any extensions. If a test is missed, it will be scored as a zero no matter what the excuse.

NO MAKEUPS WILL BE GIVEN

Final Exam: The cumulative final exam is a common exam taken by all sections of Math 110 at the same time. Uniform grading instructions for the final exam, applicable to all sections, allow only minimal partial credit.

You must have an official examination excuse in order to take the Make-up Exam. This excuse must be signed by an academic Dean. You must bring this excuse, along with a picture ID to the exam. **ABSOLUTELY NO EXCEPTIONS!**

Special Note: Your final exam grade will replace your lowest test grade, provided the final exam grade is higher.

Grading: All grades will be assigned according to a 10-point scale. That is, 90–100 is an A; 80–89 is a B, etc. Your overall average must be greater than or equal to 60% to earn a passing grade for the course.

Your course grade will be determined as follows:

HW Avg.: 10%	**Test 1: 14%**	**Test 2: 14%**
Test 3: 14%	**Test 4: 14%**	**Final Exam: 34%**

THERE ARE NO EXTRA CREDIT OPPORTUNITIES IN THIS COURSE.

Summer Bridge Programs: Easing The Transition For First-Generation College Students

Register - http://www.innovativeeducators.org/product_p/293.htm

Overview
First-generation college-goers experience a variety of challenges as they enter and move through higher education. Much of the existing research indicates that students whose parents did not attend college are more likely than their non first-generation counterparts to be less academically prepared for college, to have less knowledge of how to apply for college and financial assistance, and to have more difficulty in acclimating themselves to college once they enroll (Tym, et al., 2005).

This webinar will present a plan for an effective Summer Bridge Program, one that supplements existing programmatic and institutional efforts to support first-generation students. Participants will learn the importance of building relationships between academic and student affairs divisions, as well as empowering students through the development of critical college knowledge to ensure their academic success and retention.

Presenter
Dr. Paz Maya Olivérez is Student Success Coordinator with the Title V Encounter to Excellence Program and Associate Director of the Educational Opportunity Program at CSU Dominguez Hills. She also currently holds a position as an Adjunct Assistant Professor in the Master of Arts in Teaching Program in the Rossier School of Education at the University of Southern California. Dr. Oliverez has spent the last 12 years working with underrepresented students from diverse backgrounds, including undocumented immigrant students, as a researcher, program evaluator, professor, and college advisor. She holds a Ph.D. in Education from the University of Southern California and a B.A. in Sociology from the University of California, Santa Cruz. She recently completed a Masters in Counseling at CSU Long Beach.

Supporting First-Generation Students: Best Practices From A Highly Successful Early Intervention Program

Register - http://www.innovativeeducators.org/product_p/299.htm

Overview
As 2-year and 4-year institutions place increased attention on student success and retention, the preparedness and transition of first-generation college-bound students, especially during the freshman and sophomore years, is more important than ever. We now understand that student success encompasses not only the academic achievement of the student, but also their level of satisfaction with the environment, as well as sustainability for their long-term professional development. So, how can faculty and administrators better identify and support first-generation college-bound students early in their academic career? How can they do this in a way that addresses student success at every level?

Now in its 25th year, the Early Identification Program (EIP) is George Mason University's college preparatory program. It provides academic support, access to educational resources, social development, and leadership training to first-generation college-bound students in seven participating school districts throughout Northern Virginia. Supporting 630+ middle and high school students, and an additional 125+ undergraduate George Mason students, EIP's mission is to produce engaged students who value learning, serve their communities, and establish meaningful careers.

This webinar will examine the path of first-generation students through the lens of George Mason University's highly successful Early Identification Program. Participants will learn strategies that address providing college access opportunities, maximizing student achievement, supporting successful transition and persistence to the college environment, and creating opportunities for global citizenship.

Presenters
Jason A. Moore joined George Mason University's Early Identification Program as Associate Director in June 2012. Formerly a school counselor and educational consultant in New Jersey, Moore was most recently Assistant Director in the Center for Academic Excellence at North Carolina A&T State University. Over the last 9 years, his experience with programmatic assessment, the minority male demographic, NCAA compliance processes and athletic academic support, and program facilitation at the K-12 and higher-ed levels has created a detailed framework for his student advocacy and educational access initiatives.

Lewis E. Forrest is currently the Executive Director of George Mason University' Early Identification Program. For the past 13 years he has served in many roles with Mason's Early Identification Program (EIP) including the positions of Tutoring Coordinator, Assistant, and Associate Director. Prior to returning to Mason he worked three-years in Prince William County (VA) Public Schools as a Professional School Counselor, and also served as the county's coordinator for the EIP. Forrest is a member of both the National College Access Network and Virginia College Access Network, and in Spring 2012, was honored with the George Mason University "University Life Positive Impact Award", recognizing him as a visionary leader, mentor, and friend who makes genuine connections with students and staff.

2013-14 NCAA Postgraduate Internship Writing Exercise – Communications

1. **Use the below information to write a 300 - 400 word story for NCAA.org. You are not required to include all of the information; use just what you need to write a complete story.**

Sally Jones, former cross country student-athlete at NCAA University, recently completed 51 half marathons, one in every state and Washington D.C. In October 2009, she took the first step of her remarkable journey by competing in San Diego, Calif. She completed her goal on December 9, 2012 in Tampa, Fla.

- **51:** Number of half-marathons completed (one in every state and Washington D.C.)
- **668.1:** Number of miles ran in 51 half marathons (13.1 miles per race)
- **160,000:** Number of frequent flyer miles accumulated traveling from race to race
- **2, 17, 20, and 12:** Number of half marathons ran in 2009, 2010, 2011 and 2012, respectively
- **1:39:** Best time (Minneapolis, Minn.)
- **3 years, 2 months:** Time it took to Jones to complete her goal
- **13:** Number of pairs of shoes needed to complete 668.1 miles
- **$25,000:** Estimated money spent on travel
- **0:** Number of times Jones was injured during completion of goal

Quotes:

- "I wanted to see the country and have fun doing it."

- "I set many smaller goals toward the end goal."

- "I felt so happy and blessed to have such a great support base. My family and friends were my biggest cheerleaders, motivators and fans along the way."

2. **Answer the following essay question in 150 – 250 words. What are the two biggest issues facing college sports?**

Subject: The Important Role of Safety Incentive Programs

HR | Resource

Hello,

As the Member Benefits Director of The Workers' Comp Group, I would like to encourage you to download our new free white paper, **"The Important Role of Safety Incentive Programs."**

Download this white paper

Every business wants to operate a safe workplace. While some workplaces are more dangerous than others - a warehouse vs. an office, for example - most businesses have experienced some sort of accident in the workplace. According to OSHA, businesses pay nearly one billion dollars a week in workers' compensation costs. What's more, businesses suffer about $60 billion in losses each year due to loss of productivity. Download this white paper to learn the importance of a safety incentive program.

About the Workers' Comp Group:
The Workers' Comp Group is a leading provider in continuing education for HR professionals, attorneys and safety and risk management professionals. We offer audio conferences, webinars, seminars, articles and other resources covering the latest law updates, regulations and best practices that impact the success of your business. We continually add new content and programs to keep thousands of professionals, like you, informed and up-to-date on industry hot topics. Visit our website to learn more.

Communication

Class Meetings:

Course Website: https://sakai.unc.edu/portal/site/comm:

Instructor: *Email:* @email.unc.edu

Office: *Office Hours:* Thursday 1:45-2:45pm and by appointment

---

About the Course

Course Objective

The primary objective of is to introduce you to communication skills that are relevant to creating and sustaining interpersonal relationships. The specific objectives of this course include:

- increasing your awareness of the process of interpersonal communication
- increasing your sensitivity to the influences of culture on communication
- increasing your competence as an interpersonal communicator

The fundamental assumption of this course is that communication can be conscious, reality-based, and highly satisfying, and that interpersonal communication skills can be acquired, changed, developed, and/or improved.

Target Audience

This course is designed to benefit everyone. The course, while broadly useful, is also part of the requirements of a Communication Studies major. As a required, introductory course option for the Communication Studies major, we will also explore interpersonal and organizational communication as fields of knowledge and academic disciplines.

Many students find this course most useful when they share their personal stories and experiences, but this is not the only way to engage the subject matter. We will be watching tv episodes, clips from movies, and engaging other media in order to have a deep supply of examples to draw from. If you are uncomfortable sharing your own personal stories in class, that is OK, just make sure you are participating through other examples.

Methods of Instruction

We are only together for 50 minutes, 3 times each week. In order to get the most out of this time, you will need to be wholly responsible for reading your textbook and understanding it as best as possible. It is inevitable that some things will be harder to understand, and we can go over these things in class, but class time will primarily be spent applying these ideas, not explaining them. Should you have a question, please make an appointment to meet with me during my office hours or at another time.

This class will require you to listen, speak, perform, write, take notes, work independently, and work in small groups with other students. If you are uncomfortable with any of these skills make an appointment to talk with me!

Required Textbook

Wood, Julia. *Interpersonal Communication: Everyday Encounters.* 7Th Ed. Boston: Wadsworth, 2013. Print.

Course Policies

Respect

I will not tolerate any harassment based on age, sex, gender identification, sexuality, race, economic class, size, or other group affiliation. I don't think that this will be a problem at all, but given the personal nature of this course it is extremely important that we treat each other with respect and do our best to create a supportive, welcoming environment. Class should be a place where we all feel comfortable, and this is not possible if some people are being treated poorly. If you are uncomfortable in class for ANY reason, please get in touch with me.

Privacy

What takes place in this class is private, confidential. Information shared is privileged. This means you are not to discuss with people outside the class any specific comments and behaviors of members of the class. Of course, you may share material covered in the class, as well as your *own* reactions, insights, and so on.

Late Work

Late work will be accepted via email up to 1 week after the original assignment was due. You will receive 5% deduction in your final grade for each calendar day your work is late. This includes holidays, Saturdays and Sundays.

Missed Midterm

If you miss the midterm for a university-approved excuse, the weight of that test will be added to the weight of your final exam (making your final exam worth 30% of your total grade). University excused absences include the sickness of a student, the death of a family member, university-sponsored event, and other circumstances covered by UNC policies. All excused absences must be accompanied by a written excuse. Tests missed without a university-approved excuse will receive a grade of 0. There are no exceptions.

Attendance

Attendance is a requirement for success in this course. You may miss up to 3 class periods for ANY REASON (have a cold, a *Sopranos* marathon, whatever) with no penalty. For each absence beyond 3 your final grade will be deducted by one letter grade. You are responsible for obtaining any material/information distributed in a missed class period. Please make an appointment with me if you believe you have earned an exception to this rule.

Communicating with the Instructor

- All out-of-class communication should either occur directly through email (@email.unc.edu) or through Sakai. If you want to discuss something please do so in person by either setting an appointment or signing up to meet during my office hours on Sakai (through the "sign up" feature).
- You should not expect a reply for at least 24 hours after you submit your email/message.
- Questions about exams and assignments will not be answered if turned in within 24 hours of the due date, so plan ahead!
- All assignments will be returned within 14 days. Please don't ask me about it before then, and feel free to bug me incessantly after then.
- If you are planning on attending office hours, please either email me or sign up via the "Sign

Subject: Testing

Hey Beth,

I have tried to find time recently to go through the invoices for you, but it doesn't look as though that is gonna happen anytime in the near future. I can scan the individual invoices over to you and see if someone in your office can go through them, but I do not have time as of now. I am not sure if this is something Nate could do, or even a student intern. I apologize, but we have so much going on right now and this isn't something that can be added to the list right now. Let me know how you would like to proceed.

Subject: [cccs_staffusers] Outage Affecting ConnectCarolina Campus Solutions Thurs., Jan. 24, 5pm to 11pm

---

There will be an outage affecting ConnectCarolina Campus Solutions on the evening of Thursday, Jan. 24, related to the Spring session Census. Due to the need to "freeze" the database to take the census snapshot, users will not be able to access ConnectCarolina Campus Solutions pages from 5:00 p.m. to 11:00pm on Jan. 24. We request that all faculty and staff be logged out of ConnectCarolina by 5:00 p.m. on Jan. 24. Students will NOT be able to use ConnectCarolina Campus Solutions for all functions during this time.

The latest information about the outage will be posted on this page:
http://its.unc.edu/enterprise/enterprise-applications/connectcarolina/system-status/

Webinar Overview

In spite of the fact that faculty academic advising has the potential to become a central component in the delivery of quality services to students, its power is often unrealized by individuals in leadership positions on the college campus. National surveys find academic advising is second only to the quality of instruction among student priorities, while faculty surveyed at two- and four-year colleges overwhelmingly agree there is a relationship between advising and retention. Nevertheless, some individuals continue to view advising as a perfunctory and mundane process of helping students plan their class schedules. This session is intended to provide faculty members, decision makers, and resource allocators with a better understanding of the essential, multifaceted role faculty advisors play in student success and institutional effectiveness.

Part 1 of this 2-part workshop will focus on the critical nature of academic advising and affirm the importance of the role faculty play in its delivery. Part 2 will focus on best practices in support of faculty advisors.

Webinar Objectives

- Part 1 participants will:
  - Review factors that underscore the centrality of faculty academic advising
  - Understand the status of critical components that support faculty advising
  - Discuss what students think about faculty advisors
  - Discuss what faculty members say about their role as advisors
  - Build a blueprint for the enhancement of faculty advising
- Part 2 participants will:
  - Understand the critical relationship between training, assessment, and recognition and reward for faculty advisors
  - Delineate the components of a quality faculty advisor development

Thomas Brown is a lifelong student and academic affairs educator with an impressive record of effectiveness in creating academic and student affairs programs that promote increased learning, achievement, and success. Tom served as Dean of Advising Services/Special Program at Saint Mary's College of California, was a member of the Board of Directors and Vice President of the National Academic Advising Association, and was chairperson of the Prelaw Advisors National Council. Tom is currently Managing Principal of a consulting network that assists campuses to increase student success, build inclusive communities, and manage change (www.tbrownassociates.com). He also writes an occasional column, The Advising Dean, for The St. Helena Star newspaper in California's Napa Valley (http://napavalleyregister.com/star/).
His work is based on an integration of theories, research findings, and practical experience that makes a real difference for individuals and institutions.

- A consultant to more than 350 colleges and universities in the US and abroad
- Regularly invited to deliver keynote addresses at national conferences, campus colloquia, and professional development workshops for faculty and staff.
- Nationally recognized author and expert in retention, academic advising, promoting the success of at-risk students, international education, and diversity/inclusivity training.
- Recent publications include: Fulfilling the Promise of the Community College: Increasing First-Year Student Success," (co-editor and author) "Critical Concepts in Academic Advising" in The Academic Advising Handbook, Jossey Bass, 2008; "Preparing Providers to Foster Student Success", in Fostering Student Success in the Campus Community, 2008; "Advising Students of Color", in Academic Advising for Student Success and Retention, 1997, 2004

Dr. Wes Habley is a Principal Associate and Coordinator of ACT's Office of State Organizations. He received his BS in music education and M.Ed. in student personnel from the University of Illinois-Urbana/Champaign, and his EdD. from Illinois State University in educational administration. Prior to joining ACT, Habley directed advising programs at Illinois State University and the University of Wisconsin-Eau Claire.
Habley is co-editor of both the first (2000) and the second (2008) editions of Academic Advising: a comprehensive handbook and the author of monographs on four of ACT's National Surveys of Academic Advising. Habley's more recent publications include two chapters in Fostering Student Success in the College Community and What Works in Student Retention? a series of four research reports on college retention practices. He contributed chapters to Developmental Academic Advising, Foundations: a college reader, and Faculty Advising Examined as well as numerous journal articles and chapters in monographs published by Jossey-Bass, the Center for the First Year Experience, and NACADA.

Subject: FORMAL NOTICE: Check UNC Homepage for Updates About Winter Weather

---

Dear Students, Faculty and Staff:

With a winter weather advisory in effect for the area this evening, January 17, until tomorrow morning, January 18, including possible freezing precipitation, the following are some reminders about the University's adverse weather practices.

Any announcements about a change in the University's operations will be posted as soon as possible to www.unc.edu. Unless a change is announced, the University always operates under Condition 1 - regular schedule (classes will be held; offices will be open).

Employees (SPA and EPA non-faculty) are reminded of the University's Adverse Weather Policy, http://hr.unc.edu/faculty-and-staff/adv-wx-land/index.htm. Emergency employees should report for work. Other employees are responsible for their regular duties, making up any missed work time, and making their own decisions about work based on personal safety.

UNC uses three main adverse weather operating conditions: Condition 1 (open), Condition 2 (classes canceled; offices open) or Condition 3 (classes canceled; offices closed). Reports of state government closings do not apply to the University.

The University announces adverse weather news on www.unc.edu, the campus information sources listed below and through the news media:

* Adverse Weather and Emergency Phone Line (919-843-1234) for recorded information and announcements about campus operations.

* UNC Traveler's Information System Radio, 1610 AM, near campus.

* UNC Department of Public Safety, http://www.dps.unc.edu/, for details including parking lot conditions.

* Chapel Hill Transit, http://www.townofchapelhill.org/index.aspx?page=696, for inclement weather updates, routes and schedules, and actual bus arrival times.

Sincerely,

Office of University Relations

Greetings!

Ever wonder how the environment around you impacts your life or your child's ADHD?

Looking for a great family experience this summer that helps you all see the sunny side of ADHD?

Interested in learning mindfulness skills or finding out how ADHD differs from bipolar?

That's just a "taste" of what's in store for you in this month's redesigned newsletter.

We hope you like it - and as always, please feel free to send your feedback and questions. We love to hear from you!

Melissa Orlov, editor

Dr Hallowell's ADHD Summer Enrichment Camp

Hallowell Centers Strength-Based Philosophy:

First we search for what is good, strong and healthy in a person, then what is in need of remediation.

The Hallowell Centers integrate the latest research on brain, body and heart. We help people with emotional issues and learning disabilities lead happier, more productive lives through a positive, balanced treatment approach.

FAQ

Q: Can you please explain the difference between ADHD and Bipolar Disorder? My son was diagnosed with ADHD in third grade but last week his psychiatrist suggested that he may have Bipolar Disorder. What is the difference between the two?

A: The symptoms of bipolar disorder and ADHD overlap considerably, especially ADHD with pronounced hyperactivity and impulsivity. As with ADHD, there is no surefire test for bipolar disorder and social problems usually accompany both. The hallmark of bipolar disorder is severe mood swings, that include mania. To be a true manic episode, the grandiose or irritable mood must last at least one week.

The major symptom must be evaluated to distinguish the

Trouble focusing? - Check this Working Memory Quiz to see if your score warrants further investigation. Rebecca Shafir

two conditions. If the major symptom is a disturbance or mood, then think of bipolar disorder. If it is disturbance of attention, then think of ADHD. Keep in mind that you may see both in the same person. A second good way to differentiate is to look at the history: ADHD is a long-standing, chronic condition that is not marked by cycling. To learn more, read chapter 15 in Delivered from Distraction.

Mothers Wonder About Alternative ADHD Treatment

Rebecca Shafir M.A.CCC

A recent study shows that mothers of children taking prescription medication for ADHD feel empowered to manage their child's treatment and see improvements in their child's behavior at home and at school, however, 47% say that at times they had not felt fully informed about all available treatment options, including Alternative/Complementary approaches. **Learn More Here.**

Make Your Environment a Partner in Your Success

Sarah Reiff-Hekking, Ph.D.

I've heard so much lately about using your mindset to improve your performance. There is a lot of science behind "the head game" which can make changes in your thinking and affect how you act and feel and ultimately the quality of your day to day life. It affects your moods. It affects your path in daily life. It affects how you interact with others. It affects your ability to fight off difficulties on your path to success.

The thing that I think is often missing in the "change your mindset" conversation is that environment predicts a lot of our behavior too. **Learn More**

ADHD Summer Camp for Children and Parents with Dr. Hallowell -
Designed for children in grades 5 - 12, this camp helps families build stronger bonds in a beautiful setting. July 15-19, 2013. **Register by February 1st for a 10% discount**. Watch the video and learn more here.

Recent Advances to Manage Distractions - Dr. Hallowell calls the trials of this game-based software application a tremendous breakthrough and is working with Attentiv in the Hallowell Centers to study the technology further. Read more here.

M.A.CCC, speech/language pathologist and neurotherapist is offering free 15 minute phone inquiry sessions to discuss how Cogmed Working Memory Training (a very powerful executive function) can help you. Contact the Hallowell Center or call 978 287 0810.

Flying Off the Handle? Use Mindfulness Skills for Adults with ADHD to get your 2013 resolutions in check. Starting January 30th at 10a.m. for 1.5 hours, $480. Contact Sarah Reiff-Hekking at 978 287 0810, Sarah@TrueFocusCoaching.com at the Sudbury Hallowell Center.

NYC Center

CrazyBusy: Introduction to Mindfulness - Learn techniques to support work/life balance and reduce stress, anxiety, physical and mental discomfort. Use a combination of breath, sound, movement and visualization to break habitual patterns so that you can slow down and listen to your innate intelligence.
8 sessions: 1/21 to 3/11 7-8pm

The CrazyBusy Family
These 'separate but similar' workshops are designed to introduce both you and your teen to skills designed to reduce stress, anxiety, and physical/mental distress.
For Grades 6-8 or 8-10
Learn more here.

Social Skills for Children
These 12 week programs (6 children/group) will help children with self-regulation and social competence. For ages 6-9 or 10-12. Starts January 22. Learn more here

Calm and Collected - Parenting Your Child with ADHD - Learn the tools to support your child's success in school, at home, and in life! Starts January 23. Learn more here.

ADHD & Marriage

The ADHD Effect on Couples CE - This Web Conference will pay special attention to the behavioral patterns specific to ADHD-impacted relationships and provide an overview of the healing progression and stages specific to couples impacted by ADHD. January 25 by phone. Learn more here.

How to Thrive in Your

Learning and Organizing Skills for Students - Does your child save everything for the last minute, is homework a battle, and do the school papers never make it home? Dr. Hallowell recommends the strategies in the SOAR Program designed to help your child be more efficient and effective at school. Learn more here.

Help Children with ADHD Develop Strategies Early - This study points to a startling conclusion that children with ADHD will earn less and work less than their counterparts. It is important that families directly and aggressively help children with ADHD develop strategies for success as early in life as possible, using all means that are known to be effective for managing symptoms.

Free ADHD Parent Care Package - This care package is designed to give parents the support and guidance they need to help their children become successful, contributing adults. Find out more at Edge Foundation.

Math Anxiety for High Achieving Students A study of first and second graders found that many high-achieving students experience math anxiety, with worry and fear, undermining them so much that they can fall behind other students who don't have that anxiety. Read more here.

Software Training Programs for Young Children - These activities are for children ages 4-6 with attention problems who may be too young for some of the more structured and rigorous software training programs. Find out more here.

ADHD and Adults

Is ADHD Making You Moody, Anxious and Exhausted? - 90% of women who have ADHD don't know it. It's usually not until a woman is seeking help for her own child who is struggling in school or in relationships, that she finally gets the ADHD diagnosis that has eluded her. Dr. Hallowell describes ADHD in women on the Dr. Oz Show. Read the article and watch the video.

Think You Might Have ADHD? - Read this introspective blog post on preparing for an evaluation at the Hallowell Center here.

5 ADHD-Friendly Steps to Clean up Your Office Fast - Do you have trouble keeping your workspace organized? Are there papers and objects everywhere? Piles upon piles? If so, check out these tips at adhdmarriage.com.

Quillivant XR™ is now available in the U.S. This is the first, once-daily, extended-release liquid medication for patients with ADHD. Read more.

CrazyBusy Tip

Learn to Put on the Brakes

In order for energy to get focused, a person must be able to put the brakes on incoming stimuli and outgoing impulses long enough to concoct a complex thought. Life is a powerful accelerator these days; what separates the successful from the frustrated is the quality of their brakes and their ability to use them.

ADHD Marriage -
Melissa Orlov will discuss the many ways that ADHD can affect our relationships and offer some proven strategies to manage struggles and enhance intimate relationships. January 31, London, UK. Learn more here.

The challenge of modern life, even for people who do not have ADD, is to learn how to put on the brakes, and to turn this fast-paced world into an advantage.

One way to do this is to invest your time wisely and don't fritter it away on activities that do not yield a positive return. Set time aside to do the things that really matter to you.

CrazyBusy is available in book, CD and MP3 format

Quote of the Month:

"Let's try to use often, and well, the most powerful force we have...connection & love. It's free and infinite in supply, ready to be used all the time."

- Edward M. Hallowell, M.D., "Item" #43 in 100 Ways to Make 2013 Your Best Year! by SuperHeroYou.com

- Dealing with Suicidal Students on College Campuses

Webinar Overview

Should suicidal students stay on campus or should they go? If they stay, how should a school address suicidal behavior on campus? If they go, under what circumstances can they return?

The Department of Education's Office of Civil Rights (OCR) made significant changes in policy that leave colleges and universities in a catch-22 when managing suicidal students on campus or addressing requests for re-entry for students who continue to struggle with active suicidal thoughts. Remove these students from campus through a forced medical withdrawal and face an ADA lawsuit for discrimination against the student. Leave the student on campus struggling with suicidal ideations and be sued for not having the services available to adequately treat the student's medical condition.

Found under Title II of the Americans with Disabilities Act (ADA), the revised regulation now deems it unlawful to involuntarily separate, suspend, or expel a student on the basis of self-harmful or suicidal behaviors.

As suicide continues to be a leading cause of death among U.S. college students age 18-24, this new regulation leaves schools and administrators struggling with some important questions regarding both institutional legal risk and student safety:

- How do you handle a chronically suicidal student who is vocal about his/her intentions?
- How do you address a student who engages in high-risk eating disorder behavior?
- How do you work with a student who has had a public overdose attempt and demands to return to school after a hospital stay?
- How do you address a student who is engaging in cutting and self-mutilation and is discovered by a roommate?
- How do you deal with a student who presents delusional speech and odd behavior that is disruptive and concerning to other students?
- How do you handle these potentially dangerous situations without running afoul of the new OCR standards?

13
Supporting Military Veterans: How To Develop An Effective Academic Advising Protocol

13

This webinar will present a variety of creative solutions that aim to reduce institutional legal risk and increase student safety. The presenters will discuss how to address suicidal and self-harm behaviors on campus through the Behavioral Intervention Team (BIT), counseling services and the student conduct office. They will also address critical dos and don'ts when working with sensitive students in crisis situations.

Webinar Objectives

Participants will learn:

- To address the issues of suicide, self-harm and delusional/psychotic behavior through counseling, conduct, and administrative interventions
- The importance of addressing behavior through case management, team meetings, and parental involvement
- How to pursue an involuntary medical withdrawal with a student through tuition refunds, incompletes, and housing refunds
- When to pursue inpatient hospital admissions, partial day treatment, and off-campus counseling referrals
- How to discuss these changes with the campus community, frustrated parents, and students while respecting FERPA and privileged communication

Webinar Speaker

Dr. Brian Van Brunt has worked in the counseling field for more than 15 years. He served as Director of Counseling at New England College from 2001-2007 and currently serves as Director of Counseling and Testing at Western Kentucky University. His counseling style draws from a variety of approaches, though primarily from the humanistic/person-centered style of treatment with its emphasis on warmth, compassion, empathy, unconditional positive regard, individual choice, and personal responsibility. He is a certified QPR suicide prevention trainer and trained in BASICS alcohol intervention. Brian is also a senior trainer in John Byrne's Aggression Management program.

Brian was the president of the American College Counseling Association in 2010-2011. He has presented nationally on counseling ethics, mandated counseling, and testing and assessment for the American College Counseling Association (ACCA), Association of College and University Counseling Center Directors (AUCCCD), American College Personnel Association (ACPA), Association for Student Conduct Administration (ASCA) and the National Association of Forensic Counselors (NAFC). He serves on the advisory boards for the National Behavioral Intervention Team Association (NaBITA) and School and College Organization for Prevention Educators (SCOPE).

Laura Bennett, M.Ed. is a student conduct and campus behavioral intervention practitioner. She currently serves as the Student Conduct Officer at Harper College, where she also coordinates the campus threat assessment and behavioral intervention team. Prior to her role in the community college setting, she worked in student conduct at the University of California, Berkeley, and in residential life at the Colorado College. In addition to student conduct and behavioral intervention, Laura has over 10 years of experience as a student affairs administrator including the areas of: policy analysis and development, gender & LGBT studies, preventing and addressing sexual misconduct/harassment, supporting students with disabilities and mental health conditions, conducting investigations, staff supervision/management, classroom management, academic integrity, residential life/housing, organizational change, privilege and social justice, crisis response, assessment and marketing, and strategic planning.

Laura received her Master's degree in College Student Services Administration from Oregon State University and her Bachelor's degree in English from the University of Kansas. She serves on the Board of Directors for the Association for Student Conduct Administration (ASCA), is an active member of the National Behavioral Intervention Team Association (NaBITA), and recently conducted research on threat assessment and behavioral intervention in four-year public and community college settings.

EXSS : Chapter 2: Psychological Health

WHAT IS PSYCHOLOGICAL HEALTH?

psychological health:

mental health:

emotional health:

spiritual health:

People in good psychological health usually:

1.

2.

3.

4.

5.

6.

autonomy:

- True/False: Autonomy means others' opinions are irrelevant.

assertiveness:

- Assertiveness is NOT_____.

realism:

self-esteem:

Strategies for building self-esteem:

1.

2.

3.

4.

5.

6.

7.

optimism:

Strategies for building optimism:

1.

2.

3.

4.

mind-body connection:

Psychologist _____ _____'s _____ of _____ pyramid illustrates _____.

The pyramid's five levels from [top/bottom] to [top/bottom] (include examples and/or definitions):

1.

2.

3.

4.

5.

A close relationship with another person is _____. _____ is one of its key components.

emotional intelligence:

spirituality:

Main themes of personal development:

1. 3.

2. 4.

values:

Spiritual health thrives when _____.

The ways to accomplish this include _____ and _____, which often trigger the _____ response (which is defined as _____ _____.

gratitude:

The practice of helping and giving to others out of genuine concern for their well-being is _____.

<u>COMMON PSYCHOLOGICAL PROBLEMS</u>:

shyness (include social isolation):

loneliness (include options for more meaningful connections):

anger (include negative effects of released and unreleased anger):

bad moods (define mood and indicate strategies for breaking bad moods):

MENTAL DISORDERS:

definition:

Mental disorders are classified in the U.S. in the _____.

causes:

***DEPRESSIVE DISORDERS:**

- depression:

- depressive disorder:

- symptoms:

- major depressive disorder:

- dysthymic disorder:

- causes:

- seasonal affective disorder (SAD) (include definition and treatment):

- trends/manifestations of depression in men versus women:

- treatments:

***BIPOLAR DISORDER:**

- definition:

- symptoms:

- treatments:

***ATTENTION DISORDERS:**

- definition (include most common form):

- symptoms:

- treatments:

***ANXIETY DISORDERS:**

- definition:

Six types (include definition and symptom or two):

1.

2.

3.

4.

5.

6.

- treatments:

***SCHIZOPHRENIA:**

- definition:

- symptoms:

- treatments (?):

SUICIDE AND SELF-INJURY:

self-injury:

suicide (include causes and warning signs):

GETTING HELP:

self-care options:

professional options:

- mental health professionals:

- therapies:

destructive thoughts (patterns to watch out for):

EXSS Chapter 4: Nutrition and You

nutrition:

diet:

WHAT ARE NUTRIENTS?

nutrients (define and differentiate between macro- and micro-):

calorie (also called _____):

List the three classes of essential nutrients that supply energy (and how much energy they supply):

- _____ = _____ calories per gram
- _____ = _____ calories per gram
- _____ = _____ calories per gram

Identify the non-nutrient substance that also provides energy (and how much energy it supplies):

- _____ = _____ calories per gram

ESSENTIAL NUTRIENTS (6):

definition:

1. CARBOHYDRATES (define and include examples where applicable):
   a. simple –
   b. complex –
   c. whole grains (include why you should choose) –
   d. recommended intake –
   e. strategies for choosing healthful carbohydrates –

2. FATS (define and include examples where applicable):
   a. saturated –
   b. unsaturated –
   c. trans fats (include why you should avoid) –
   d. recommended intake –

e. strategies for choosing healthful fats –

3. PROTEINS (define and include examples where applicable):

a. complete –

b. incomplete –

c. amino acids (include types and functions) –

d. recommended intake –

e. strategies for choosing lean protein –

4. VITAMINS (define and include examples where applicable):

a. fat-soluble (include functions/sources) –

b. water-soluble (include functions/sources) –

c. intake needs/recommendations/precautions –

5. MINERALS (define and include examples where applicable):

a. major (include functions/sources) –

b. trace (include functions/sources) –

c. intake needs/recommendations/precautions –

6. WATER (define):

a. functions –

b. intake needs/recommendations/precautions –

c. sources –

OTHER HEALTHFUL SUBSTANCES:

1. fiber:

a. benefits –

b. sources –

c. intake needs/recommendations/precautions –

2. phytochemicals:
   a. benefits –
   b. sources –
   c. intake needs/recommendations/precautions –
3. antioxidants:
   a. benefits –
   b. sources –
   c. intake needs/recommendations/precautions –
4. probiotics:
   a. benefits –
   b. sources –
   c. intake needs/recommendations/precautions –

STRATEGIES FOR EATING RIGHT:

Dietary Reference Intakes (DRIs):

1. 3.

2. 4.

Information to look for on food labels:

percent Daily Value (% DV):

List some of the Dietary Guidelines for Americans:

1. 4.

2. 5.

3. 6.

Food Guide Pyramid (define and list some of its recommendations):

serving:

ounce-equivalent:

Identify some strategies for eating "on the run":

1.

2.

3.

4.

HOW DO NUTRITION GUIDELINES VARY FOR DIFFERENT GROUPS?

*over time:

*men versus women:

*athletes:

*vegetarians:

- _____ eat no animal products at all
- _____ include dairy products and eggs
- _____ eat seafood, dairy products, and eggs
- _____ avoid only red meat or eat animal-based foods once or twice per week

IS OUR FOOD SUPPLY SAFE?

foodborne illness:

Primary culprits of foodborne illnesses (3):

Steps to keep food safe:

1.

2.

3.

4.

food allergy:

food intolerance:

food additive:

food residues:

genetic modification (define and include types of things that can be/have been modified):

PERSONALIZED NUTRITION PLAN:

Identify some strategies/things to consider:

Webinar Overview

Over 65,000 college-ready undocumented students graduate from our nation's high schools each year and this number is likely to increase. As such, higher education professionals are compelled to address the needs of this growing population. College-ready undocumented students have jumped the same hurdles as other college-eligible students, yet they have not been given the samedegree of access to higher education. Without improvements in relevant college knowledge, guidance, and financial support, these students, many of whom are among the best their communities have to offer, will continue to be shut out of a system that is virtually their only means for upward mobility.

Based on six years of research and practice with college-bound undocumented immigrant students, this webinar will offer participants insight into best practices for improving the college access and success of this growing population. The presenter will share information to dispel the myths about college-going, immigration, and educational rights for undocumented immigrants across the nation. In doing so, she will provide up-to-date information about policies and practices to provide undocumented immigrant students with greater access to higher education. The session will include information about state and federal policies that shape college access for undocumented students and offer best practices for helping undocumented students persist through the college admissions, college attendance, and financial aid acquisition processes. A major component of the session will be best practices for assisting undocumented immigrants in securing funds to support their college education.

Webinar Objectives

Participants will:

- Review the impact of state and federal education and immigration policies on college access for undocumented students in their state
- Learn how to assist undocumented students as they apply for college admission
- Address the unique needs of undocumented college-goers
- Brainstorm ways to help undocumented students fundraise to pay for college
- Discover ways to help undocumented students develop a network of support once they get to college
- Learn how to help undocumented students improve their potential for employment or graduate school attendance upon college graduation
- Review ways to help undocumented students determine if they are eligible to adjust their residency status

Webinar Speaker

Dr. Paz Maya Olivérez is Student Success Coordinator with the Title V Encounter to Excellence Program and Associate Director of the Educational Opportunity Program at CSU Dominguez Hills. She also currently holds a position as an Adjunct Assistant Professor in the Master of Arts in Teaching Program in the Rossier School of Education at the University of Southern California. Dr. Oliverez has spent the last 12 years working with underrepresented students from diverse backgrounds, including undocumented immigrant students, as a researcher, program evaluator, professor, and college advisor. She holds a Ph.D. in Education

College Recruiting Weekly

January 22, 2013 Volume 9, Issue 4

Using Email to Get Your Prospect's Attention

Your email subject line

Winter is a tough time to recruit, Beth.
For most of your prospects, you're either trying to get a final "yes" from a Junior or Senior, or working to figure-out how to keep the conversation going with a Junior (or Sophomore). Primarily, most coaches are going to rely upon email to achieve either of those two goals. And if that's the case, how well you communicate in your email will largely depend on whether or not it gets opened.
So in a sense, much of the success (or failure) rests on how well you write your email subject line. Why? Because according to our **research**, when they check their email (which is usually only once or twice a week for most prospects) they tend to judge whether or not your message is worth their time by the subject line (the same way we adults do as we're filtering through our Inbox).
So the question then becomes, *"How much thought do you put into the subject lines in your recruiting emails?"* It's an important question, because the degree of creativity you put into your email subject lines is most likely directly proportional to the number of times your email gets opened by your prospects.
It's something we factor into messages that we create. For example, when we produce our **Total Recruiting Solution** plans for clients around the country, subject lines are something we pay close attention to. Why? Because our job is to get more prospect click-throughs for our clients. And, great subject lines are a big key to that.
So, if you want to take this little aspect of your recruiting a little more seriously in an effort to get more prospects to open more of your emails, here are some ideas that we've seen work...

NCSA Athletic Recruiting

BREAKING NEWS:
NCAA Passes Important New Recruiting Guidelines at Annual Convention

The anticipated recruiting contact rule changes passed this weekend at the annual NCAA convention, meaning that college coaches at virtually all levels will see new strategy and tactics at their disposal for upcoming recruiting classes.

In all cases, one of the primary changes true for all coaches is daunting: Coaches will need to effectively recruit their student-athlete prospects for a longer ongoing period of time. Failing to become an effective ongoing communicator will mean greater struggles as they pursue recruits.

Here's a rundown of the important changes at each division level:
DIVISION I
Division I took its first steps toward a rulebook that is more meaningful, enforceable and supportive of student-athlete success when the Board of Directors on Saturday adopted a set of proposals aimed at creating a more flexible manual based on common sense...

CLICK HERE TO CONTINUE

DIVISION II
Division II found itself in an unusual position at the conclusion of the 2013 Convention with attention focusing more on what delegates did not approve more than on what they did...
CLICK HERE TO CONTINUE

DIVISION III
Division III delegates produced another narrow margin on their way to expanding the realm of contact to prospects to include private communication through social networking sites...

Shaq Speaks Out Against "One and Done" in Men's College Basketball

Shaquille O'Neal

Shaquille O'Neal took an advocate role in the discussion of whether or not allowing players to leave their college for the NBA draft, offering his opinion on the controversial topic.
O' Neal, who joined NCAA President Mark Emmert on stage at this weekend's NCAA convention, said earning that his doctoral degree in education, which he received last May from Barry College in Florida, was harder than anything he ever did athletically. He also talked about the importance of education, saying in the age of one-and-done basketball players that they should have to stay in school at least three years before going pro, such as the rule for NCAA football players.
"A lot of guys do it because of their financial situation and they need to do it. That's the only way to provide a better means for their family. So when you look at it from that aspect, I understand it," said O'Neal, who added that if up to him the rule would "probably say three-and-done"...

Recruit Who Said His College Visit "Went Great" Actually Never Visited Campus

Recruit mixes-up his campus visit story

Sometimes, recruiting gets so confusing and stressful for recruits that they get a little confused.
But this? This one might cross the line.
A story emerged this weekend of high-profile recruit Stanley Williams, who committed to the University of Georgia two summers ago. But as his stock has risen, other programs have caught his attention.
And that's where the story gets a little embarrassing.
Read what happens when a recruit isn't truthful with the media about a visit to the University of Notre Dame that apparently didn't actually happen...

From: Martha J. Pendergrass, Director, Procurement Services

Campus ePro Queries now available

We are pleased to announce the creation of ePro queries available to all users with ePro access. The instructions for running the queries and the information provided by each, is on the Finance website under the Training – eProcurement section and also attached to this announcement.

Please call 962-HELP or submit a ticket at help.unc.edu with any issues or questions. Please include the word QUERY in the problem description.

FINANCE DIVISION
UNIVERSITY of NORTH CAROLINA at CHAPEL HILL
Training

PROCUREMENT SERVICES

eProcurement: Queries

Purpose: To provide information to ePro campus users.

Security Access Requirement: All eProcurement users have access.

Prerequisites: None.

Find Help: For technical assistance contact 962-HELP or place a ticket at help.unc.edu. Please ensure "QUERY" is included in the problem description.

NOTE: If a logout screen appears when the Query section is clicked for the first time, clear your cache and browsing history, close Internet Explorer and log back into ePro.

Table of Contents

Query Viewer 3
Time Saving Tip – Favorites 4
Running Query to Excel 6
Scheduling Queries 7
Run Controls 7
Completing Process Request 9
Distribution Detail 10
Report 11
Appendix A: List of the queries and prompts 12
Appendix B: Fields returned by query 13

Query Viewer

Under Reporting Tools, select Query and then Query Viewer.

All campus queries begin with UNC, so you can type this in the Search By box and click Search

A list of queries will appear. The ones that are campus queries are:

UNC_ALL_ORDERS
UNC_ORDER_DETAILS
UNC_REQ_DEPT_SUM
UNC_REQ_DEPT_DTL
UNC_SOP_ORDERS
UNC_SOP_ORD_W_DAS

Please see Appendix A for prompts (what the query will ask for once you click Run to Excel or Schedule) and Appendix B for information returned by query.

Time Saving Tip – Favorites

If these queries will be run regularly, add these queries to favorites as follows: After running the search above, click on the Add to Favorites link next to each of the queries you wish to add to Favorites

Search Results

*Folder View: -- All Folders --

Query Name	Description	Owner	Folder	Run to HTML	Run to Excel	Schedule	Add to Favorites
UNC_ACCOUNT_WO_DEPT	FRS Accounts w/o DEPT Id's	Public		HTML	Excel	Schedule	Favorite
UNC_ALL_ORDERS	All Orders	Public		HTML	Excel	Schedule	Favorite
UNC_DEPT_DETAILS	UNC Department Details	Public		HTML	Excel	Schedule	Favorite
UNC_DISPATCHED_PO_BY_DATE	List PO's Dispatched for Day	Public		HTML	Excel	Schedule	Favorite
UNC_EPR_ORDERS_ON_HOLD	Orders with Dispatch Issues	Public		HTML	Excel	Schedule	Favorite
UNC_INVALID_EMPLID	Invalid Employee ID (PID)	Public		HTML	Excel	Schedule	Favorite
UNC_ITEM_CAT_TO_OBJECT_MAP	Category to object code map	Public		HTML	Excel	Schedule	Favorite
UNC_ITEM_VENDOR_STAGE_ERRORS	Custom Item to Vndr Stage Errs	Public		HTML	Excel	Schedule	Favorite
UNC_ORDER_DETAILS	ePRo Order Details	Public		HTML	Excel	Schedule	Favorite
UNC_REQ_DEPT_DTL	Req details	Public		HTML	Excel	Schedule	Favorite
UNC_REQ_DEPT_SUM	Sum. of reqs for specific dept	Public		HTML	Excel	Schedule	Favorite
UNC_REQ_LINE_DETAILS	Req & PO line details	Public		HTML	Excel	Schedule	Favorite
UNC_SOP_COVER_SHEET	UNC Small Order Process Cover	Public	UNC	HTML	Excel	Schedule	Favorite
UNC_SOP_ORDERS	SOP Orders	Public		HTML	Excel	Schedule	Favorite
UNC_SOP_ORD_W_DAS	All SOP Orders With DAS Fields	Public		HTML	Excel	Schedule	Favorite

The query will then appear under the Favorites section (I used UNC_ALL_ORDERS)

The list can be cleared by clicking this button, or a particular favorite can be removed by clicking this button.

These will only clear the queries you set as favorites. These will **not** delete the queries.

Running Query to Excel

Click the Excel hyperlink (underlined "Excel" to the right of the query you want to run).

The following window will appear:

A date can be manually typed in the box or if a calendar icon appears to the right, this can be clicked on and the following appears:

Clicking on a specific date will populate the value in the box. Either the drop down boxes at the top or the arrows at the bottom may be used to navigate to the desired month and year.

The Dept ID can be up to 6 characters, or a wildcard can be utilized. For example, you need several departments' information, but they all begin with "22". You can type "22%" in the Dept. ID box and retrieve all information for any department where the ID begins with "22". **Please do not run a query with a wildcard AND a date range longer than a month**, it will take too long and cause performance issues. If you need a longer period of time or many departments, see the instructions for scheduling a query beginning on the following page.

Once the three prompts are complete, click View Results. The following message may appear:

Choose to Open the file, or Save, Save As or Save and Open (choices which are available once the down arrow is selected to the right of the Save button). We recommend selecting Save As and renaming the file to something meaningful and saving in a folder created for ePro query results. **Note**: the file will be saved in Compatibility mode if you are running Excel 2010. To convert the file to 2010, once the file is opened, go to the File tab and click Convert. Click "Yes" when asked if you want to close and reopen workbook.

Scheduling Queries

Under Reporting Tools, select Query and then Query Viewer. Click on the Schedule link to the right of the query you want to schedule.

Run Controls

A Run Control ID needs to be established the first time a query is scheduled. Run Control ID's need to follow these rules:

- Only include alphanumeric characters
- Do not include spaces in the name – use underscores between words
- This is specific to your user name – other users will not see this run control.

Once you have entered a name for the Run Control, click Add.

The prompts for the query selected then appear (for the first time a run control is set-up). An example has been completed here. Click OK.

The following screen appears:

Verify all information is correct and click Apply.

Completing Process Request

The type is Web, and the recommended format is XLS.

You do **not** have to pick server

The Recurrence is how often the query should be run with the chosen parameters, or it may be left blank for single queries (to be run immediately).

A partial list of available recurrence options is here, click on drop down menu and scroll to see more options.

Once Recurrance, Type, and Format are selected, click on **Distribution** link on the far right of the screen.

Distribution Detail

The email will be sent to the ONYEN listed at the time the query is scheduled or after it is submitted as follows:

- A Comprehensive Model for Campus Death Postvention
- When a Student Dies
- Coping with Death on Campus
- The Sudden Empty Chair

Webinar Overview

It's the last thing any campus administrator, counselor, or psychologist wants to think about: the death of a student.

Whether related to physical or mental health challenges, poor decision-making, or unexplained circumstances, the loss of any young life is tragic and difficult to prepare for. As seen on several college campuses this past fall, when the light of a student-our brightest hope-is snuffed out prematurely, it can be devastating.

Any responsible campus crisis plan must include provisions for dealing with student death. Regardless of circumstances, how a campus responds can make all the difference to both the immediate family and the greater campus community that suddenly finds itself in mourning.

Inevitably, community and individual reactions will be varied and will elicit a wide range of responses. How will you deal with public reaction? How will you address questions from students and support them through their grief process? How will you respect and offer both support and information to the affected families? How will you respond to media inquiries and national press coverage? Every institution must be fully prepared to deal with a variety of possible tragedies, scenarios, and proactive responses.

This webinar will offer an overview of grief theory, as well as plans for how administrators can respond to student death on campus. Participants will review the stages of grief, consider extremely sensitive considerations such as suicide, and devise concrete plans for dealing with the aftermath of such a tragedy.

Webinar Objectives

Participants will:

- Review the stages of grief
- Understand the importance of "helping the helpers"
- Learn about special considerations when coping with suicide
- Review scenarios that involve complicated grief responses
- Devise plans for outreach to faculty and the classroom
- Discuss the importance of hosting memorials
- Review student death checklists

Webinar Speaker

Dr. Brian Van Brunt has worked in the counseling field for more than 15 years. He served as Director of Counseling at New England College from 2001-2007 and currently serves as Director of Counseling and Testing at Western Kentucky University. His counseling style draws from a variety of approaches, though primarily from the humanistic/person-centered style of treatment with its emphasis on warmth, compassion, empathy, unconditional positive regard, individual choice, and personal responsibility. He is a certified QPR suicide prevention trainer and trained in BASICS alcohol intervention. Brian is also a senior trainer in John Byrne's Aggression Management program.

Brian was the president of the American College Counseling Association in 2010-2011. He has presented nationally on counseling ethics, mandated counseling, and testing and assessment for the American College Counseling Association (ACCA), Association of College and University Counseling Center Directors (AUCCCD), American College Personnel Association (ACPA), Association for Student Conduct Administration (ASCA) and the National Association of Forensic Counselors (NAFC). He serves on the advisory boards for the National Behavioral Intervention Team Association (NaBITA) and School and College Organization for Prevention Educators (SCOPE).

Subject:	FORMAL NOTICE: Message from the Chancellor: Provide Your Input About Carolina by January 28

Dear Faculty and Staff,

Earlier this month, I sent a message encouraging your participation in a survey to help gauge how the University is doing in terms of goal setting, leadership, communications and decision-making. This survey is a follow-up to the organizational effectiveness survey we conducted a couple of years ago after the completion of the Bain & Company study and report.

Because it's important for everyone's voice to be heard, I'm asking that you take a few minutes to complete the survey, if you haven't already done so. The link to the survey is https://www.surveymonkey.com/s/MZ69F9S and the deadline for submitting responses is next Monday, January 28.

All individual responses will be anonymous and completely confidential. The full results of the survey will be published on the Carolina Counts website later this spring.

Paper copies of the survey are available in English, Spanish, Karen and Burmese for employees who typically do not have access to computers. These employees can obtain a copy from their supervisors and follow the instructions on the cover sheet for returning the completed survey.

Again, I encourage everyone to participate because a good response is key as we continue to identify ways to improve campus operations. Thank you for your commitment to Carolina.

Sincerely,

Holden Thorp

National Football Foundation and Pop Warner Announce Partnership

Participation, health and safety, and character development top the list of common goals.

IRVING, Texas, (January 23, 2012) - The National Football Foundation (NFF) and Pop Warner Little Scholars, Inc., the nation's largest and oldest youth football organization, today announced a partnership to enhance the sport through a variety of initiatives and research projects that promote participation, health and safety, academic achievement, and the community involvement of the young athletes who play football.

"Pop Warner's partnership with the National Football Foundation presents a tremendous opportunity to positively influence more athletes and improve the sport of football," said **Jon Butler**, executive director of Pop Warner Little Scholars. "Both organizations share a common belief in the life-long lessons that come from playing football, and we look forward to collaborating."

The two organizations will work closely to identify trends and opportunities to strengthen the youth sports experience. Spearheaded by Pop Warner, areas of collaboration will include coaches training, equipment changes, and the promotion of academic achievement and community leadership by those involved with the sport.

"We are excited to team with Pop Warner, using the full power of the National Football Foundation to expand on our collective initiatives to promote the good in the game," said NFF President & CEO **Steve Hatchell**. "Pop

Warner and the NFF share a mutual understanding of the power of football in developing leadership and academic achievement in our nation's young people, and by working together we will magnify our ability to ensure the strength of our sport."

The NFF and Pop Warner have entered a partnership to work closely to identify trends and opportunities to strengthen the youth sports experience.

ABOUT THE NATIONAL FOOTBALL FOUNDATION & COLLEGE HALL OF FAME

Founded in 1947 with early leadership from General Douglas MacArthur, legendary Army coach Earl "Red" Blaik and immortal journalist Grantland Rice, The National Football Foundation & College Hall of Fame is a non-profit educational organization that runs programs designed to use the power of amateur football in developing scholarship, citizenship and athletic achievement in young people. With 120 chapters and 12,000 members nationwide, NFF programs include the College Football Hall of Fame, the NFF Scholar-Athlete Award presented by Fidelity Investments, Play It Smart, the NFF Hampshire Honor Society, the NFF National Scholar-Athlete Alumni Association, and scholarships of more than $1.3 million for college and high school scholar-athletes. The NFF presents the MacArthur Bowl, the William V. Campbell Trophy endowed by HealthSouth, and releases the Bowl Championship Series (BCS) Standings. NFF corporate partners include the Allstate Sugar Bowl, the BCS, Fidelity Investments, Herff Jones, Liberty Mutual Insurance, NCAA Football, and Under Armour. For more information, please visit www.footballfoundation.org.

About Pop Warner Little Scholars, Inc.

Founded in 1929 and headquartered in Langhorne, PA, Pop Warner Little Scholars is the world's largest youth football, cheerleading and dance organization and the only youth sports organization that emphasizes academics as a prerequisite for participation. Currently there are over 400,000 children in Pop Warner organizations in 43 states, Scotland, Germany, Russia, Japan and Mexico. The NFLPA estimates that 70% of all current NFL Players got their start in Pop Warner programs. For more information on Pop Warner and its programs visit www.popwarner.com our Facebook page and follow us on Twitter.

Webinar Overview

With diminishing resources and a new generation of students who have high expectations for information being available 24/7, colleges need to identify and implement an extensive menu of online student support services. In addition to providing much needed support to our students, online services assist faculty and staff with many things such as reducing repetitive inquiries, preparing students ahead of time for counseling and advising appointments, and providing detailed and consistent information.

Additionally, with more and more colleges moving to online and hybrid class offerings, it is critical to serve these students with comparable services to meet accreditation standards and support student success. This webinar will review and discuss several of the programs that have proven successful for colleges in meeting the ever-growing needs of today's students.

Webinar Objectives

Participants will:

- Reconsider conceptions of non-traditional students
- Define and describe characteristics of new non-traditional students
- Identify the current needs of new non-traditional students
- Consider the necessary partnership between student services and instruction to engage new non-traditional students
- Develop strategies to communicate this information to the campus community

Webinar Speaker

Dr. Denise Swett is currently the interim Vice President of Student Development & Instruction and the Associate Vice President of Middlefield Campus & Community Programs at Foothill College. Denise has worked at both 2 and 4-year colleges,

including 11 years at the University of San Francisco in student life, Chabot College as Dean of Students, and Cañada College as Vice President of Student Services.

Denise has been with Foothill College since July of 2007. As vice president she provides leadership and guidance for the student services division. As associate vice president she supervises a collaborative team of faculty and staff providing coursework, programs, and services at Middlefield Campus, area high schools and Regional Occupational Programs, and community based organizations. She also oversees career and workforce grants, the Workforce Innovation Partnership, and the Family Engagement Institute and college-wide professional development.

She was Administrator of the Year, Foothill College, 2008-09 and has been recognized for her work by the Association of Mexican American Educators of Silicon Valley receiving the Educator of the Year award for 2010-11, and recently received the National Community College Administrator of the Year 2011-12 from NASPA, Student Affairs Administrators in Higher Education. Denise earned her BA and MPA at San Jose State University and her Ed.D. in organization and leadership (with a concentration in higher education administration) from the University of San Francisco.
Dr. Christina Royal has been involved in education for over 15 years, in both academic (community college and private four-year institutions) and corporate environments. She currently serves as the Associate Vice President of eLearning & Innovation at Cuyahoga Community College (Tri-C), and has district-wide oversight over one of the largest distance-learning units in the state of Ohio. Her extensive experience as an administrator and faculty member allows her to bring significant expertise and value to discussions, and a forward-thinking approach to ideas associated with contemporary higher education teaching and learning practices, approaches, issues, and solutions.

Dr. Royal is leading Tri-C's $2MM Title III grant to enhance distance learning in four key areas: student success and retention, innovative faculty development, infrastructure and technology, and quality. She also led the College in obtaining its first regional accreditation (Higher Learning Commission) for fully online programs at Tri-C. Dr. Royal developed and led the College in its most comprehensive strategic planning process for distance learning. Under her leadership, Tri-C has advanced policy and program development, virtual support services, faculty professional development and training, and technology system integration and innovation in support of teaching and learning.

Dr. Royal received her Ph.D. in Education/Instructional Design for Online Learning and a Graduate Certificate in Teaching Online from Capella University. She also received a Master's in Educational Psychology and Bachelor's in Mathematics from Marist College.

Announcement

In recognition of excellence in community college teaching and leadership, the League is proud to announce the establishment of the John & Suanne Roueche Excellence Awards.

Attach: 13 spring kids rock.docx

Good afternoon,
UNC Campus Recreation offers Carolina faculty and staff an opportunity to play and exercise with your children through our Kids ROCK (Recreational Opportunities for Carolina Kids) program. Two special programs will be offered this spring-- VOLLEYBALL and BASKETBALL. This is a free program thanks to the generosity of our staff and special guest instructors.

Volleyball is scheduled for 10AM- noon, Saturday, January 26, 2013.
For more information and to sign up visit--

http://campusrec.unc.edu/programs-services-facilities

In health,
Lauren Mangili

OBJECTIVES:

- For Carolina students, faculty and staff to have an opportunity to play and exercise with their kids;
- To expose Carolina kids to a variety of fun, healthy activities; and
- To combat a national rise in the incidence of juvenile obesity and diabetes.

COST: This is a **free** program thanks to the generosity of our staff and special guest instructors. All we ask is that you **register at least 2 days ahead of the program** you want to attend so we can plan appropriately.

REGISTRATION:
To register visit http://campusrec.unc.edu/special-events

PARKING is always difficult on campus. For programs at Hooker Fields, park in the Visitor Lot at the top of Hwy. 54. For Rams Head programs or Fetzer Hall, park on Stadium Drive if available or in the Rams Head parking deck right below the Rec Center. For maps and directions visit http://www.unc.edu/visitors/getting-here/index.htm

Spring 2013

VOLLEYBALL● Saturday, January 26, 2013
Time: 10am-12pm
Location: Rams Head Rec Center

Join Coach Joe Sagula and our varsity Volleyball Team for some expert instruction, drills, and brief demonstration. Players will be on hand to sign autographs at the end of this active session.

BASKETBALL●TBA
Time: 10am-12pm
Location: Rams Head Rec Center

What would a Carolina sports program be without basketball? Come to the Rams Head Rec Center to sharpen your basketball skills in a variety of games and contests with members of the women's UNC Club Basketball team.

Subject: FORMAL NOTICE: UNC Section 403(b) Plan Universal Availability Notice for 2013

TO: All Employees

FROM: Ashley Nicklis, Benefits & Work/Life Programs,
Office of Human Resources

The University of North Carolina offers you a choice of voluntary supplemental retirement programs on a pre-tax and post-tax (Roth) basis in accordance with Section 403(b) of the Internal Revenue Code. Under The University of North Carolina Section 403(b) Plan ("the 403(b) Plan"), eligible employees may elect to defer a portion of their compensation to the 403(b) Plan to supplement their retirement savings.

The 403(b) Plan is designed to help you invest more money today so that you have the income you need in your retirement years. It provides a supplement to either the N.C. Teachers' and State Employees' Retirement System or the UNC Optional Retirement Program, the State's mandatory retirement plans available to permanent employees who work 30 or more hours per week. Voluntary contributions to the 403(b) Plan have become an increasingly important part of saving for retirement.

Eligibility
All employees who receive compensation reportable on a W-2 and pay FICA are eligible to participate in the 403(b) Plan, so long as the employee elects to contribute at least $200 each calendar year.

Contributions
An eligible employee may elect to defer a portion of his or her compensation on a pre-tax or post-tax (Roth) basis.

Pre-tax Contributions: If you elect to make contributions on a pre-tax basis, both federal and state income taxes are deferred on any contributions and earnings until a distribution is made from the plan. Distributions are taxed as ordinary income for federal and state income tax purposes. Generally, a participant must begin receiving a distribution no later than April 1 following the year in which age 70 = or retirement is attained, whichever is later.

Post-tax Contributions (Roth): A Roth 403(b) account allows you to designate some or all of your contributions on an after-tax basis, rather than the traditional pre-tax contributions. Interest and earnings on these contributions when withdrawn are generally tax-free. In the event of either retirement or termination, your earnings can be withdrawn tax-free as long as it has been five tax years since your first Roth 403(b) contribution and you are at least 59= years old.

Contribution Limits
Annual contribution limits are set by the Internal Revenue Service (IRS). The IRS allows an eligible employee to make an additional catch-up contribution beginning in the year in which he or she turns age 50. For 2013, the calendar year limit under the 403(b) Plan is as follows:

Calendar Year Annual Contribution Limit: $17,500
Age 50+ Catch-up Contribution Limit: $5,500
Note: This is a combined limit for pre-tax and Roth after-tax contributions.

Approved Vendors
The University has approved Fidelity Investments and TIAA-CREF as the two financial services companies offering options under the 403(b) Plan. Fidelity and TIAA-CREF provide a wide range of mutual fund investment options and annuity products through their own funds and other investment managers in the industry. Both companies offer resources and tools to help participants plan their investment strategy. Eligible employees should contact each vendor for information about plan investment options and services provided.
-- Fidelity Investments: 800-343-0860
-- TIAA-CREF: 800-842-2888

Enrollment Process
Eligible employees may enroll immediately upon date of hire or at any time. To start the enrollment process, please visit the website and follow the steps listed:
Step 1 - Complete a Salary Reduction Agreement (SRA) (forms and instructions available on the website)
Step 2 - Enroll in the plan with Fidelity and/or TIAA-CREF

Contributions may be designated as a percent of salary or as a flat dollar amount depending on your campus payroll capability. The SRA will apply only to amounts earned after enrolling in the Plan, and an

employee's election under the SRA will continue until the SRA is modified or revoked by the employee.

Modifying a Deferral Election
An eligible employee may increase, decrease or stop his or her future contributions to the plan at any time by completing an SRA. Employees may also change from one vendor to another at any time by completing an SRA to stop contributions with the existing vendor, and following the Steps above to enter into a new agreement with another vendor. It is also possible to make contributions to more than one vendor at a time.

More Information
If you have questions about the 403(b) Plan, please contact your Benefits Representative.

This notice is provided as a source of information and does not constitute legal, tax or other professional advice. If legal advice, tax advice or other professional assistance is required, the services of a professional advisor should be sought. Every effort has been made to make this notice as thorough and accurate as possible. However, there are other legal documents, laws, and regulations that govern the operation of the Program. It is understood that in the event of any conflict, the terms of the Plan Document, applicable laws, and regulations will govern.

To: A Closed Mailing List for EPA Non-Faculty (Emp Forum Division 1) <forum-div1@listserv.unc.edu>
Subject: [forum-div1] Employee Forum Update

It's time to update you once again on happenings involving the Employee Forum.

First, I should note that the Chancellor's survey on University goal-setting, leadership, communications and decision-making is still open until Monday, January 28. Please take the estimated 10-15 minutes to fill out the survey; it will make the University a better place in which to work. The survey is located at https://www.surveymonkey.com/s/MZ69F9S

Secondly, I should note that the Employee Forum delegate elections are coming very soon. We will initiate electronic voting for the first time in the Forum's 20-year history this year, thanks to the work of Forum Delegate Charles Streeter.

If you are interested in running for Forum delegate please write the Forum at forum_office@unc.edu

Thirdly, please take a moment to check out the Forum's new and fully functional website, which went on-line in December. Forum Delegates Charles Streeter and Katie Turner were instrumental in getting the new website up and active. The website is at http://forum.unc.edu

Finally, please be on the lookout for the Forum's Community Award and Peer Recognition Award nominations. These nominations will also be handled electronically.

To: Bridger, Beth <bridgerb@email.unc.edu>; Supplemental Instruction Discussion List <SINET@LISTSERV.UMKC.EDU>
Subject: Re: Embedded Tutoring

We did a very small pilot comparing both embedded and out of class 'mentors' for a developmental math class -- for the students who participated, we saw an increase in success. But we made it voluntary, so our numbers were very small. We would like to try it again, and found it was better for the class dynamics if the tutor was embedded in the classroom; rather than out of the class. However, our embedded tutors were students taking the class at the same time, and just performing better; rather than already taking the class and going back. So we would definitely change some things for future projects.

Webinar Overview

A professor reports a student is argumentative in class and seems to respond with odd and strange associations when confronted. Is this the next Jared Loughner?

A student handles stress poorly, isolates himself, and gives other students 'the creeps.' Students demand that staff do something before the student 'flips out.'

A student in the residence halls frequently talks to a poster on his wall, draws strange symbols on his arms, and talks rapidly to other students about the end of the world.

Much has been discussed lately regarding the legal and policy issues related to managing suicidal students on campus following the federal OCR policy update. However, there is another important component to consider - what to do about those students who present a risk to others based on their paranoid, delusional, or psychotic symptoms. This webinar will discuss the issues and review how these students should be treated under the recent federal OCR policy changes.

Jason Ebbeling, J. D. will discuss issues related to legal risk when managing these students through the conduct, application, and re-entry process at both community and four-year residential colleges. Dr. Van Brunt will review the common treatment and management struggles encountered when addressing students exhibiting psychotic, delusional, and paranoid thoughts and behaviors.

Case examples and a lively, interactive discussion will provide audience members with some insight into how these cases should be handled on campus, how students can be successfully referred to treatment, and some of the limits related to conduct and medical leave sanctions under the new OCR policy.

Webinar Objectives

Participants will:

- Develop an understanding of how these students become involved in the conduct process at a college or university and common legal and policy pitfalls schools encounter when attempting to manage their behavior
- Learn how to identify the common symptoms of bi-polar disorder, psychotic disorders, and schizophrenia
- Understand the components of the four-part direct threat test related to a

Webinar Speaker(s)

Dr. Brian Van Brunt , past president of the American College Counseling Association, is Senior Vice President for Professional Development Programs at the National Center for Higher Education Risk Management (NHCERM, www.ncherm.org). He is the president-elect of the National Behavioral Intervention Team Association (NaBITA, www.nabita.org), current president of the School and College Organization for Prevention Educators (SCOPE, www.wearescope.org) and the managing editor for Student Affairs eNews (SAeN, www.studentaffairsenews.com). Over the past thirteen years Brian has taught counseling theory, ethics, program evaluation, statistics and sociology topics at both public and private schools for both graduate and undergraduate students at five different colleges and universities. Brian has served as the director of counseling at New England College and Western Kentucky University. He is the author of several books including: Ending Campus Violence: New Approaches in Prevention and A Faculty Guide to Addressing Disruptive and Dangerous Behavior in the Classroom. Brian is an expert on campus violence and has been interviewed by the New York Times, National Pubic Radio, LA Times, USA Today and has appeared on Headline News and Anderson Cooper 360.

Jason Ebbeling, J.D. is Vice President of Student Affairs at Mitchell College in New London, Connecticut. He previously served as Director of Residential Education and Services at Southern Oregon University, Associate Dean of Student Affairs at Menlo College in Atherton, CA, Director of Campus Life at New England College, Residence Community Coordinator at California State University, Chico, and as Director of Residence Life at Edgewood College in Madison, Wisconsin. He completed doctoral coursework in Educational Administration at the University of Wisconsin-Madison and received a Juris Doctorate from The Ohio State University Moritz College of Law.

Subject: FORMAL NOTICE: Distinguished Professorships - Call for Nominations

---

January 25, 2013

MEMORANDUM

TO: Carolina Faculty

FROM: Bruce W. Carney, Executive Vice Chancellor and Provost

RE: Nominations for Distinguished Professorships

I am pleased to inform you that we will be able to name several of our faculty members to distinguished professorships this year. These professorships may include the following: Kenan Professorships; William R. Kenan, Jr. Professorships, and Cary C. Boshamer Professorships. All are
open to faculty members throughout the University. I ask for your nominations of exceptionally distinguished faculty members to be considered for these various professorships. Any individual nominated must be a tenured full professor and must have a record of scholarly and educational distinction. Self-nominations will not be accepted.

To nominate a faculty member, please submit electronic copies (each as an individual attachment) of the following to Nelia Resendes Cooper at nrcooper@unc.edu no later than 5pm on Friday, February 22, 2013:

- your nomination letter
- a copy of the individual's curriculum vitae
- a letter of support from the individual's Dean
- a list of three references for your nominee with complete contact information, including email addresses
- in units with departments, a second letter of support from the Department Chair

A faculty committee composed of current distinguished professors will review the nominations. The Chair of this committee will be Professor Sheryl Zimmerman from the School of Social Work. The committee will recommend to me individuals to be considered for the available professorships, indicating which professorship may be most appropriate for a particular individual.

Questions may be directed to Dr. Ron Strauss, Executive Vice Provost at ron_strauss@unc.edu.

Thank you for your careful consideration of this request.

Subject:	FORMAL NOTICE: Encourage Survey Participation by January 28

Deans, Directors and Department Heads,

Earlier this week, I sent all faculty and staff an email message reminding them to participate in a survey to help gauge how the University is doing in terms of goal setting, leadership, communications and decision-making. This survey is a follow-up to the organizational effectiveness survey we conducted a couple of years ago after the completion of the Bain & Company study and report.

Because it's important for everyone's voice to be heard, I'm asking that you urge the faculty and staff members in your areas to take a few minutes to complete the survey if they haven't already done so. The link to the survey is https://www.surveymonkey.com/s/MZ69F9S and the deadline for submitting responses is next Monday, January 28.

All individual responses will be anonymous and completely confidential. The full results of the survey will be published on the Carolina Counts website later this spring.

Paper copies of the survey are available in English, Spanish, Karen and Burmese for employees who typically do not have access to computers. These employees can obtain a copy from their supervisors and follow the instructions on the cover sheet for returning the completed survey.

Thank you for reminding people to participate, and I hope you will complete the survey as well. The stronger the response, the more effective we can be in identifying ways to improve campus operations.

Sincerely,

Holden Thorp

This email is sponsored by: Office of the Chancellor

Subject: Classes canceled starting at noon today; offices open

Classes will be canceled starting at noon today; offices will be open on Friday, January 25. Condition 2

Employees (SPA and EPA non-faculty) are reminded of the University's Adverse Weather Policy. Emergency employees should report for work. Other employees are responsible for their regular duties, making up any missed work time, and making their own decisions about work based on personal safety.

UNC uses three main adverse weather operating conditions: Condition 1 (open), Condition 2 (classes canceled; offices open) or Condition 3 (classes canceled; offices closed). Reports of state government closings do not apply to the University. The University generally announces adverse weather news on www.unc.edu, the campus information sources listed below, and through the news media. Unless a change is announced, the University always operates under Condition 1 – regular schedule.

Other information sources:

- (919) 843-1234. Adverse Weather and Emergency Phone Line for recorded information and announcements about campus operations.
- UNC Traveler's Information System Radio, 1610 AM, near campus.
- UNC Department of Public Safety for details including parking lot conditions.
- Chapel Hill Transit inclement weather news and routes and schedules.

Math 118

Topics in Math-Section 002- Spring 2013

INSTRUCTOR: Perry Harabin **E-MAIL**: gharabin@email.unc.edu
OFFICE: Phillips 404
OFFICE HOURS: Monday 12:00 to 1:00, Wednesday 12:00 to 1:00, Tuesday 11:00 to 12:00 or by appointment.

Meeting Time and Place: Smith 107, MWF from 11:00 to 11:50
Prerequisites: None
Class webpage: Sakai website

TEXT: I will draw from many sources in this class, including:

-*Excursions in Modern Mathematics*, Tannenbaum (I am using the sixth edition for material)

-*The Heart Of Mathematics,* Edward B. Burger & Michael Starbird (I will photocopy the relevant sections and post them to Sakai as they are needed).

-*Miscellaneous Outside Materials*: These will be posted to the Sakai Webpage as needed. There will also be optional material posted to Sakai.

ATTENDENCE: It is extremely important that you come to class prepared and ready to learn. I cannot guarantee that all the material will come from one source; in class material is fair game on all exams. There will also be **NO make-up Exams or assignments without a valid university excuse.**

Course Description: This course is intended as a nontechnical introduction to Mathematical topics not covered in traditional courses. I want for this course to be enjoyable by all students, and the emphasis will be on developing logical skills. This course is a wonderful opportunity for students to see what mathematics is really like. I intend for this course to be very flexible: if I feel that the class doesn't understand a topic, I will devote extra time to it. I also hope that there can be fun activities which help us explore the material further. Of course, all of this will become clearer with the development of the class.
Finally, we will cover a range of topics, including but not limited to: Probability, Symmetry, Circuits, The Mathematics of Money and various other topics covered in your textbook and in the additional material. All the material is subject to change, and some topics may be covered more deeply than others.

Calculator Use: Calculators are wonderful tools for exploring the material; however, students will be expected to know how to perform basic operations without a calculator. With this in mind, calculators (all models) will be allowed on all work, but definitely not required. In fact, some questions on homework and tests may ask students to explain their thought process.

Graded Work: Outlined Below

Homework: You will be required to submit weekly homework assignments online using the course website. These assignments will help you be better prepared for in-class tests and the final exam. Each assignment will have a submission deadline. Late work will not be accepted.

You will also be required to submit a short reading assignment quiz prior to each lecture meeting. These quizzes will help you be better prepared for the topics presented during class. Late work will not be accepted.

Tests: I expect that there will be 3 tests throughout the semester. No make-up tests will be given unless you have a university approved excuse. There will be no collaboration on tests. Here are the *tentative* dates:

Test 1: February 8th

Test 2: March 8th

Test 3: April 12th

Final Exam: There will be a final exam on Tuesday, May 7th and will be cumulative.

Grading: I will grade on a 10 point scale with plusses and minuses as I see fit:
90-100 A, 80-90 B, 70-80 C, 60-70 D, Below 60 F

The assignment types are below with a point value for each (tentative).

Homework: 1/6th of your grade (100 points total)
Tests: 1/6th each (100 points each)
Final: 1/3rd (200 points)

Honor Code: Students at the University of North Carolina at Chapel Hill are expected to conduct themselves with the utmost honor and integrity (academic and otherwise). I expect each student in this class to uphold the honor code. Every assignment turned in must be pledged by the student to conform to highest standards of honor and integrity.

Resources: I highly encourage students to come to my office hours if they are having trouble with the material. Remember that this course is intended to engage YOU! There is also a math help center in Phillips which is a great resource for all math questions.

Hoping for a happy semester!

HOW SUPPLEMENTAL INSTRUCTION (SI) GENERATES REVENUE FOR COLLEGES AND UNIVERSITIES

Abstract

Many colleges and universities still do not understand how an SI program can retain tuition revenue ordinarily lost to attrition. The purpose of this article is to increase awareness of the ability of SI to generate retained tuition revenue far beyond the costs of an SI program. Furthermore, formulas are presented to help prospective and existing SI programs determine the amount of retained revenue SI can generate for individual institutions.

HOW SUPPLEMENTAL INSTRUCTION (SI) GENERATES REVENUE FOR COLLEGES AND UNIVERSITIES

Introduction

As an SI Coordinator and certified SI trainer, I am bewildered when college and university administrators say that they cannot find the money to begin or expand an SI program. That response is on the same level as turning down tens of thousands of dollars in unrestricted donations because the paperwork to process them costs money. There is much research on SI's positive influence on retention beginning in the 1980's (Blanc and others, 1983; Burmeister, 1994; Collins, 1982; Hill and others, 1998; Ramirez, 1997.). Perhaps the reason for administrators' negative or reserved responses to SI is that many of them are still not aware of the potential financial windfall that an SI program can deliver to an institution.

SI programs keep a sizeable sum of tuition money in an institution otherwise lost to attrition and SI minimizes money spent on recruiting replacement students. In 1997, public institutions reported a mean cost of $433 to recruit each new student for fall 1997 which is 26% higher than in 1995. Private institutions reported a mean cost of $1,624 which is 4% higher than in the fall of 1995 (Noel-Levitz, 1998). We know from national research on SI that about 10% more of students who attend SI sessions persist until graduation when compared to non-participants with similar incoming characteristics (Arendale & Martin, 1997; Center for Supplemental Instruction, 1998). How do recruiting costs and retention translate into revenue?

The State Supported College and University Bonanza

It is easier to understand how SI can increase tuition revenue if an example is used. Old Ivy State University has a medium size SI program where SI support is available in 10 classes in fall and spring semesters. In the fall semester, 419 freshmen at-

tend SI sessions. We will call this first group of SI freshmen the alpha class and use the letters of the Greek alphabet to identify each successive semester's group of SI attendees. With 419 SI attendees, it is very likely that the SI program will influence approximately 41 of these students to reenroll at Old Ivy each semester until graduation who we would otherwise be lost to attrition (using the 10% figure from the national study).

If we use Old Ivy student's tuition of $64.32 per credit hour times an average of 12 credit hours (estimated) per student, the student's contribution in tuition for 1 semester is $772. Further adding in the contribution from the state per student of $2316 per semester, the total in tuition revenue for Old Ivy State is about $3088 per semester per student. Since we anticipate that 41 more students will persist at Old Ivy due to SI session attendance, the potential in retained revenue is $126,608 from these alpha SI students *per semester*. For the sake of a simpler, more comprehensible example, we will assume that 419 freshmen attend SI sessions each semester for the 4 years covered in this example. This figure will not include retained revenue from upper classes and transfer students who may attend SI sessions or retained revenue from auxiliary services such as the bookstore, housing, and meal plans. It will not include tuition and revenue from summer school attendance, either. Also, it is typical for SI attendance to increase each year as students learn of the benefits and as SI expands to other classes and sections and this increase in potential tuition revenue is also not included in the example below for simplicity.

The chart below is an example of the potential retained revenue per year from year 1 to year 4 of Old Ivy's SI program. It charts the potential in retained tuition reve-

nue for each subsequent incoming group of SI attendees over 4 years of OI's SI program.

Insert Table 1 about here

One common reason used by administrators for not supporting an SI program is lack of funds. From the above chart a small investment in an SI program can bring large returns and provide money for many other institutional ventures. In this example of Old Ivy State University, their investment in SI amounts to about $50,000 per year for:

1. An SI Coordinator's salary and benefits totaling $35,000 year.
2. 5 SI leaders at $1200 per semester for 2 semesters is $12,000.
3. Office supplies totaling $3000.

Subtracting that $50,000 from the annual retention revenue figure of $886,265 (4 years of SI retainees), the influence of SI still retains about $836,265 annually as long as there is an SI program of the same size and level of attendance. Another way to look at this is there is one SI leader for every $167,253 retained.

The Private College Gold Mine

In light of potential retained revenue, private colleges and universities face greater gains from an SI program. As tuition amounts increase, SI becomes more and more cost effective. For example, many private institutions have tuitions in excess of $15,000 per year. SI does not have to influence many SI attendees to persist in order become cost effective. If the costs of an SI program are $50,000 per year, only 4 students *per year* need be retained by SI (at $15,000 tuition annually) to more than break even on

this institution's investment in SI. If only 50 freshmen attend SI sessions each semester (and this is a very low figure), about $75,000 in potential revenue is kept from the 10% retained students group (5) each semester in subsequent semesters until graduation. That is $150,000 for every 2 semesters per year. As soon as the SI program is 4 years old, the retained revenue in this private school example from this initial group of 10 SI retainees is $525,000 *over 3.5 academic years or 7 semesters!* (retained revenue accrues when persisting students matriculate beginning with the first semester subsequent to SI attendance). With this knowledge, what private school administrator would not covet SI on campus and gratefully invest in this moneymaker?

If SI attendance is constant at 100 per year, there are likely to be 10 more retainees *each year* this SI program is in existence (10% of 100). Every year that 10 SI retainees graduate, the institution has had the benefit of a total of $525,000 in retained revenue over the past 3.5 academic years or 7 semesters. With 7 semesters of SI attendees in the pipeline toward graduation, the *annual retained revenue after 4 years and every year thereafter as long as there is an SI program is $525,000!*

Computing Retained Revenue

When a student is lost to attrition after the first year in a baccalaureate program the cost is three to four years of lost revenue, not one year as some may assume (Bean, 1992). Therefore, it is prudent to include the costs of recruiting replacement students for those unretained when computing retention revenue from SI. Below is a formula to determine the potential retained revenue for students attending SI sessions. It includes retained tuition and savings in recruiting costs to replace students lost to attrition.

HOW SUPPLEMENTAL INSTRUCTION (SI) GENERATES REVENUE FOR COLLEGES AND UNIVERSITIES

$$(T)(N) + (C)(r) - S = RS$$

C = savings in recruiting costs

G = the number of groups who attended SI sessions to date (1 group per semester)

n = number of semesters enrolled until graduation minus 1 semester

N = 10% of SI attendees for a given semester

r = number of replacement students to compensate for those unretained

RC = retained revenue from SI attendees among current enrollees

RG = total retained revenue per semester to graduation

RS = potential retained revenue per semester

S = Costs of an SI program

T = tuition revenue per student per semester

For example, Old Ivy has $3088 in tuition per student, 41 retainees, $500 per student in recruiting costs, and $50,000 for the annual costs of an SI program.

(T) (N) + (C) (r) – S = RS

($3088)(41) + ($500)(41) - $50,000 = Retained revenue per semester

$126,608 + $20,500 - $50,000 = $97,108 of retained revenue per semester

This $97,108 in retained revenue applies only for the first semester for which students are retained each year since in this example, we deduct the total annual costs of an SI program here. During the next semester, the retained revenue is $126,608 per semester from this one group of SI attendees until graduation. That projects to $223,716 in retained revenue per academic year from this one group of SI retainees until graduation.

HOW SUPPLEMENTAL INSTRUCTION (SI) GENERATES REVENUE FOR COLLEGES AND UNIVERSITIES

To determine the retained revenue per each group of SI attendees per semester until graduation, use the following formula. We will use Old Ivy's tuition, SI attendance, and recruiting costs in this example also:

$$(n-1) \quad (T) \quad (N) + \quad (C) \quad (r) - \quad S \quad = RG$$

$$(8-1)(\$3088)(41) + (\$500)(41) - \$50{,}000 = \$679{,}756$$

To determine the amount of retained revenue per semester from currently enrolled students who attend SI sessions, we can use Old Ivy State University's 8 groups of SI attendees over 4 years. Since retention at the end of a first semester of SI attendance generates no retained revenue up to this point, we will use the multiplier of 7 semesters of SI attendees that do generate retained revenue:

$$(G) \quad (T) \quad (N) - \quad S \quad = \quad RC$$

$$(7)\ (\$3088)(41) \ - \ \$50{,}000 = \$679{,}756$$

Beginning in an SI program's fourth year, there is $679,756 per year in retained revenue in the pipeline as long as there is an SI program!

Problems

Some would say that an unretained student is not that costly because another student will take the place of the unretained student. In that case, we must consider the costs of recruiting a replacement student. If the cost of recruiting a student to a public institution such as Old Ivy is an average of $500 per student, and if 100% of those students lost to attrition (82 in our example – 41 each semester) after the first year of SI are replaced in the subsequent academic year, the cost to an institution is $41,000 in recruiting costs and no lost tuition revenue. If a student leaves and is not replaced in the semester subsequent to attrition, there is unrecoverable tuition revenue per student

for each semester until that student is replaced plus the costs spent recruiting a replacement.

As an example, if only 90% of the 82 unretained students or 74 students are replaced in the semester subsequent to their attrition, there is lost tuition revenue from 8 unreplaced students ($3088 each) or $24,704 plus the cost of recruiting those 74 replacement students of $37,000. The total in lost tuition revenue and recruiting costs comes to $61,704 ($11,704 more than the cost of an SI program). If only 80% of those 82 unretained students are replaced, that is 66 students, the lost tuition revenue from 16 unreplaced students is $49,408 plus recruiting costs for 66 students of $33,000. The combined total is $82,408 in lost tuition and recruiting expenses ($32,408 more than the cost of an SI program). As the numbers of students increase who are not replaced in the semester immediately after attrition, recruiting costs mount and losses in tuition revenue rise dramatically.

As you can see in the examples above, recruiting costs accumulate quickly and do not guarantee replacement students. Once tuition revenue is lost, it is money not recovered and tuition revenue is lost every semester until the unretained student is replaced with one who successfully matriculates.

Other Benefits of SI

SI also increases the quality of the educational experience by fostering those all-important and retention-related affective connections between students. SI is proactive in that students begin attending during the first week of classes. Problems in content understanding and skills for learning can be identified and addressed in SI sessions early. Students also make early connections with veteran peers (SI leaders) whose goal is

to help these students learn better ways to succeed in college. Faculty members notice higher quality questions and answers in class and on exams. Faculty see fewer students with basic content and study skills problems during office hours. It follows that when baccalaureate students graduate with higher gpa's that more of them meet entrance requirements for grade point averages in graduate, medical, and law schools. It also follows that students who are happy with their educational experience are more likely to contribute to alumni annual giving programs and capital expansion efforts. While it is somewhat easier to measure the direct financial gains in terms of retained revenue, there are many intangible benefits from SI that accrue to institutions with SI programs.

Conclusions

Overall, SI appears to be a wise investment not only from the retained revenue viewpoint. SI reduces recruiting costs and retains incoming tuition dollars for longer periods of time, supplements the quality of the educational experience, and potentially may impact the fund raising efforts of an institution.

HOW SUPPLEMENTAL INSTRUCTION (SI) GENERATES REVENUE FOR COLLEGES AND UNIVERSITIES

Table 1 - Example of Retained Revenue For An SI Program Over 4 Years

Assumption: Constant rate of 419 SI attendees per semester and 41 SI attendees persisting each semester until graduation. SI program costs not deducted

Fall semester of year 1 of SI. (Y1Fall)	**Spring semester of year 1 of SI. (Y1Sp.)**	**Fall semester of year 2 of SI. (Y2 Fall)**	**Spring semester of year 2 of SI. (Y2 Sp.)**	**Fall semester of year 3 of SI. (Y3 Fall)**	**Spring semester of year 3 of SI. (Y3 Sp.)**	**Fall semester of year 4 of SI. (Y4 Fall)**	**Spring semester of year 4 of SI. (Y4 Sp.)**	**Total retained persistence revenue.**
Alpha SI attendees. At the end of Y1Fall, 41 alpha attendees produce a retained revenue of 0.	**Alpha SI attendees.** At the end of Y1 Spring., 41 alpha attendees produce a retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y2FALL, alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y2Spring, 41 alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y3Fall, 41 alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y3 Spring, 41 alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y4Fall, 41 alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees.** At the end of Y4 Spring, 41 alpha attendees produce additional retained revenue of $126,608.	**Alpha SI attendees. 7 semesters of persistence produce a retained revenue of $886,265**
	Beta SI attendees. At the end of Y1 Spring, 41 beta attendees produce a retained revenue of 0.	**Beta SI attendees.** At the end of Y2Fall, 41 beta attendees produce a retained revenue of $126,608.	**Beta SI attendees.** At the end of Y2 Spring, 41 beta attendees produce additional retained revenue of $126,608.	**Beta SI attendees.** At the end of Y3Fall, 41 beta attendees produce additional retained revenue of $126,608.	**Beta SI attendees.** At the end of Y3 Spring,41 beta attendees produce additional retained revenue of $126,608.	**Beta SI attendees.** At the end of Y4Fall, 41 beta attendees produce additional retained revenue of $126,608.	**Beta SI attendees.** At the end of Y4 Spring, 41 beta attendees produce additional retained revenue of $126,608.	**Beta SI attendees. 6 semesters of persistence produce a retained revenue of $759,648**
		Gamma SI attendees. At the end of Y2Fall, 41 gamma attendees produce a retained revenue of 0.	**Gamma SI attendees.** At the end of Y2 Spring, 41 gamma attendees produce a retained revenue of $126,608.	**Gamma SI attendees.** At the end of Y3Fall, 41 gamma attendees produce additional retained revenue of $126,608.	**Gamma SI attendees.** At the end of Y3 Spring, 41 gamma attendees produce additional retained revenue of $126,608.	**Gamma SI attendees.** At the end of Y4Fall, 41 gamma attendees produce additional retained revenue of $126,608.	**Gamma SI attendees.** At the end of Y4 Spring, 41 gamma attendees produce additional retained revenue of $126,608.	**Gamma SI attendees. 5 semesters of persistence produce a retained revenue of $633,040**
			Delta SI attendees. At the end of Y2 Spring, 41 delta attendees produce a retained revenue of 0.	**Delta SI attendees.** At the end of Y3Fall, 41 delta attendees produce a retained revenue of $126,608.	**Delta SI attendees.** At the end of Y3 Spring, 41 delta attendees produce additional retained revenue of $126,608.	**Delta SI attendees.** At the end of Y4Fall, 41 delta attendees produce additional retained revenue of $126,608.	**Delta SI attendees.** At the end of Y4 Spring, 41 delta attendees produce additional retained revenue of $126,608.	**Delta SI attendees. 4 semesters of persistence produce a retained revenue of $506,432**
				Epsilon SI attendees. At the end of Y3Fall, **41** epsilon attendees produce a retained revenue of 0.	**Epsilon SI attendees.** At the end of Y3 Spring, 41 epsilon attendees produce a retained revenue of $216,608	**Epsilon SI attendees.** At the end of Y4Fall, 41 epsilon attendees produce additional retained revenue of $216,608	**Epsilon SI attendees.** At the end of Y4 Spring, 41 epsilon attendees produce additional retained revenue of $216,608	**Epsilon SI attendees. 3 semesters of persistence produce a retained revenue of $379,824**
					Zeta SI attendees. At the end of Y3 Spring, 41 zeta attendees produce a retained revenue of 0.	**Zeta SI attendees.** At the end of Y4Fall, 41 zeta attendees produce a retained revenue of $126,608	**Zeta SI attendees.** At the end of Y4 Spring, 41 zeta attendees produce additional retained revenue of $126,608	**Zeta SI attendees. 2 semesters of persistence produce a retained revenue of $253,216**
						Eta SI attendees. At the end of Y4Fall, 41 eta attendees produce a retained revenue of 0.	**Eta SI attendees.** At the end of Y4 Spring, 41 eta attendees produce a retained revenue of $126,608	**Eta SI attendees. 1 semester of persistence produces a retained revenue of $126,608**
							Theta SI attendees. At the end of Y4 Spring, 41 theta attendees produce a retained revenue of 0.	**Theta SI attendees. 0 semesters of persistence produce a retained revenue of $0**

Y1 Fall retained revenue	$0	Y1Spring retained revenue	$126,608	Y2 Fall retained revenue	$253,216	Y2 Spring retained revenue	$379,824	Y3 Fall retained revenue	506,432	Y3 Spring retained revenue	$633,040	Y4 Fall retained revenue	$759,648	Y4 Spring retained revenue	$886,265	**Total retained revenue over 4 years of OI's SI program is $3,545,033.**

Webinar Overview

Higher education must face increasing ethical and practical demands in order to successfully serve special at-risk student populations. Providing services for these students can be difficult and successfully evaluating the programs that target at-risk populations presents its own challenges. Many traditional measures of student success such as course grades and retention are reported for the entire student population. These broad reporting practices make it nearly impossible to get an accurate reflection of the quality of at-risk programs, as the experiences of these limited groups are often not common to the student population as a whole.

This webinar will look at some processes for examining the effectiveness of targeted programming, such as seminars for students on probation or returning from suspension, workshops for international students, learning communities for veterans, summer bridge programs, intensive pre-semester skills review for conditionally admitted students, and other programs for specific populations that struggle for academic success and retention. Participants will look at both quantitative and qualitative data as well as short- and long-term perspectives on success. A limited bibliography of sample evaluations and related resources will be provided.

Webinar Objectives

Participants will be able to:

- Identify categories of at-risk students
- Describe their personal and academic characteristics
- Design and provide programs that address those characteristics
- Identify some of the challenges involved in evaluation for at-risk student programs
- Write outcomes and/or select baseline measures
- Create a comparison group for evaluation
- Develop an evaluation plan that combines qualitative and quantitative measures as well as direct and indirect measures of effectiveness
- Understand the importance of "big picture" data
- Identify campus partners and assistance for evaluation projects

Webinar Speaker(s)

"One could easily argue that every student coming to college is academically at risk in some way - otherwise college retention rates would all be closer to 100 percent. However, we are aware of certain patterns of high risk, so we design programs based upon those patterns. How well are those programs working? How do you measure success for students whose chances for success are, by definition, below average?"

Jan Norton received her Master's in Educational Research & Psychology. In

addition to managing comprehensive, multi-discipline learning centers, she has worked as an evaluation consultant for tutoring programs and developmental education in several states and been a reviewer for NADE, CRLA, and NCLCA certifications. Her training includes Supplemental Instruction, the Kellogg Institute, the Winter Institute, the NCLCA Summer Institute, TIDE, a NACADA Summer Institute, and NADE certification training; she was one of the featured trainers at the 2006 Winter Institute and the 2005 NCLCA Summer Institute. For CRLA, she has served as the leader for the Learning Assistance Center Management SIG and the Research & Evaluation SIG. Currently working for Academic Programs and Student Development at the University of Iowa, Jan continues to be an occasional author and a frequent presenter at conferences.

Subject: Super Bowl Gambling Reminder

Attach: Header; Super Bowl Sports Wagering Reminder Notice 2013.pdf

---

All,

In anticipation of Super Bowl weekend, the NCAA has issued the attached reminder regarding its prohibition on gambling.

Please note that this regulation applies to all athletics department employees, as well as nonathletics staff members who have responsibilities within or over the athletics department (e.g., Chancellor, FAR).

We will send this same reminder to our student-athletes, as well.

Please do not hesitate to contact me with any questions you may have.

DON'T BET ON IT!!!

Thanks,
Tom

Subject: Super Bowl Gambling Reminder

Super Bowl Sports Wagering Reminder Notice

Dear NCAA student-athletes, coaches and administrators:

With the Super Bowl coming soon, we wanted to take this time to remind all student-athletes, coaches and administrators of the NCAA's policy on gambling.

- The NCAA membership has adopted specific rules prohibiting athletics department staff members and student-athletes from engaging in gambling activities as they relate to intercollegiate or professional sporting events.

- NCAA member colleges and universities have defined sports wagering as putting something at risk, such as an entry fee, with the opportunity to win something in return. Because of this, student-athletes, coaches and administrators may not participate in competitions where there is both a required entry fee and an opportunity to win a prize.

If you have any questions regarding this material, please do not hesitate to contact Mark Strothkamp, NCAA associate director of enforcement, at mstrothkamp@ncaa.org or 317/917-6222.

Subject: NC State Conference--Informative Email

You are invited to NC State's Academic Support Program for Student-Athletes

12th Annual Drive In Conference!

ASPSA would like to invite you and your support staff to this event. We are still in the planning process, but want to send information out as soon as possible.

The ASPSA intern class plans an annual Athletic Academic Support conference for those institutions in driving distance (all are welcome, but that is the target audience). The purpose of this conference is to provide professional resources to those in our profession who may have a limited budget or restrictions and might not be able to attend the National Convention. This conference will also provide networking opportunities. The date of the conference is Friday, April 26, 2013. The conference will start at 9:00 and end at approximately 4:00 with a social at a local restaurant.

Some of our committed presenters include academic support staff from Clemson University, University of Virginia, University of Georgia, University of North Carolina at Charlotte, and North Carolina Central University.

There will be more information and a formal invitation to follow. If you have any questions or concerns please feel free to contact me by email or by phone at 919-513-1047. Hope all is well!

Subject: FORMAL NOTICE: Administrative Review of Bill McDiarmid, Dean, School of Education

---

MEMORANDUM

DATE: January 28, 2013

TO: Members of the UNC Chapel Hill - Faculty, Staff, Students and Alumni

FROM: Bruce Carney, Executive Vice Chancellor and Provost

RE: Administrative Review of Bill McDiarmid, Dean, School of Education

I am pleased to invite your participation in the review process on behalf of the committee appointed to review the performance of Bill McDiarmid as Dean, School of Education

This review, required by University regulations, will focus on Bill McDiarmid's performance as Dean of the School of Education over the past four years. The committee consists of Kristen Swanson, Chair Wendy Brewster, Matthew Green, Barbara Holland Chapman, Jim Ketch, Lloyd Kramer, Michael Lee, Donna LeFebvre, Xue Lan Rong, Lynne Vernon-Feagans and Bill Ware. As required by University regulations, this committee will review Dean McDiarmid's accomplishment as dean with respect to long-range planning, intellectual leadership, faculty and staff recruitment, retention and promotion, curriculum and program development, fundraising and entrepreneurship, and the day-to-day management of the School of Education. The committee invites your comment on these and related issues. It is important for the committee to have some sense of how Dean McDiarmid is viewed by his peers at UNC-Chapel Hill as a colleague and citizen of the University Community.

We encourage you to contribute to this review in the following different ways:

1. The committee has scheduled two open sessions to receive comments. These times are:

February 11 - 10:00-11:00 - 307 South Building

February 12 - 10:00-11:00 - 307 South Building

If you wish to meet with the committee, please contact Debbie Stevenson in the Office of the Executive Vice Chancellor and Provost (debbie_stevenson@unc.edu or 962-7882). She will schedule a specific time (usually about 10-15 minutes) within that time period. While all comments received during these sessions will be kept strictly confidential, a master list of attendees will be retained as part of Dean McDiarmid's personnel file. All requests for a meeting during these session times must be received no later than February 4, 2013.

2. You also may contribute to this review by providing written comments to the Chair. The review committee will treat your comments as strictly confidential. However, by law, all written communications, whether on paper or by email, become a confidential part of Dean McDiarmid's personnel file and as such, are open to examination by him. Oral communications (by telephone or in person) and the committee's notes generated from these conversations do not become part of Dean McDiarmid's personnel file. If you wish to provide oral comments, please contact the Chair or any member of the committee. University regulations prohibit consideration of anonymous letters in the review process.

All written comments should be sent to: Dean Kristen Swanson c/o Debbie Stevenson, 104 South Building, CB # 3000, or by emailing debbie_stevenson@unc.edu.

3. You may telephone or meet privately, in person, with committee members. Oral communications (by telephone or in person) and the committee's notes generated from these conversations do not become part of Dean McDiarmid's personnel file but may be reflected in the committee's report without identifiers.

The deadline for receiving comments is February 25, 2013.

Thank you very much for your help in this important task.

This email is sponsored by: Office of the Executive Vice Chancellor and Provost

5 Things Your Prospect's Silence Could Be Signaling

Sure, it may be a virtue, but patience is still tough to come by if you're a college coach who isn't getting the kind of response he or she expects from their prospect.
Especially this time of year.
Early winter is one of the roughest times of year to maintain, or continue, good communication with recruits you have been in contact with. I could be describing some of your Seniors who have an offer, but haven't come to their final decisions yet. Or, I might be talking about your underclass prospects, who are done with the initial excitement of first hearing from you and are now feeling ill-equipped to continue the conversation with so much time left to go before they are close to reaching a final decision.
In either scenario, or a cavalcade of others that you and your fellow college coaches could easily add to that list, the immediate reaction is a combination of frustration and urgency. And when a college recruiter is frustrated and feeling pressured when engaged in ongoing communication with their recruits, bad things often follow.
Those are the coaches who set unfair deadlines late in the game...stop communicating all-together...ask end-of-the-process questions way too soon in an effort to get a decision (or the hint of one).
All of these actions could be devastating, not only in your efforts to continue effective communication with your prospects, but also in your efforts to eventually win over that prospect as their final choice.
But rather than give you a list of things you should be asking or doing with your recruits at this point in the process (check our blog archives for lots of information on that topic), I wanted to take you inside your prospect's head and give you...

3 More Tools For Personal Organization

by Mandy Greene, Head Soccer Coach, Univ of South Dakota, Time Management Expert
I know that early in my coaching career I fell into the trap of conventional thinking that to be more productive, I just needed to work harder. My thought about time management was that if I spend more and more hours at my desk, I will get more done. Makes sense right?
In the book, *The Power of Full Engagement*, author Tony Schwartz talks about how we shouldn't worry about time management. Rather, we should focus on managing our energy levels because that is the key to productivity and getting things done.
When I first read this book, the concept of managing my energy over managing my time got me thinking. I looked at what I was currently doing to increase or at least manage my energy and how it was affecting my productivity throughout the day. Pretty sure I smacked myself on the forehead and thought "Duh, why wasn't I doing this stuff before?"

The Attitude And Fire Of Super Bowl Coach Jim Harbaugh

by Charlie Adams
StokeTheFireWithin.com

I have used a quote by Jim Harbaugh many times over recent years when delivering the "Stoke the Fire Within" keynote or the "How to Build a Positive Attitude and KEEP the Darn Thing!" seminar.

It is this: "I vow I will attack this endeavor with an enthusiasm unknown to mankind."

That's what Jim Harbaugh said when he was introduced as Stanford University's new head football coach in December of 2006. He then made Stanford a national power.
Two years ago, Harbaugh left Stanford to become head coach of the San Francisco 49ers. Using that same approach he has guided them to the Super Bowl where they will take on the Baltimore Ravens, who, ironically are coached by his brother John.
When they were kids, their Dad Jack would drop them off at school. Each morning he would say, "Okay men, grab your lunch boxes and attack this day with an enthusiasm unknown to mankind!"
Years later Jack Harbaugh told writer Jeff Arnold this...

Two Coaches Linked by incredible Bond of Coaching and Recruiting Success

by Alex Scarborough

He's insistent. Basketball is a sport of five, Kentucky coach John Calipari says, not of 22. He'll say this a handful of times during a roughly 20-minute phone conversation, reiterating the numbers that separate him from Alabama football coach Nick Saban.

Calipari needs just a handful of recruits to buy into his program, while his counterpart needs dozens to be convinced. Winning titles this past season has helped both men in this respect. They don't trudge up and down the recruiting trail -- they dance along it, picking out blue-chip prospects like produce at an overstocked supermarket.

Saban and Calipari, Calipari and Saban.

Say it enough times and it will stick with you, like apples and oranges. They're a study in how two wildly different coaches can yield similar results. They're a study in mathematics. They apply different formulas, yet end up with similar outcomes. Calipari is the soothsaying salesman with charm to spare, and Saban is ... well, none of those things...

BEING HONEST WITH RECRUITS CAN GO A LONG WAY

One recruit knew what he was doing when he asked a coach the question: "Be honest: Do you plan on staying here four years?"

In recruiting, the answer can mean a world of difference. Most coaches vowed to him they weren't going anywhere. Let us know what you think about coaches moving and the impact it has on the team. **CLICK HERE**

International Recruits Help Fuel Women's College Tennis

by Ron Morris

South Carolina played a women's tennis doubleheader this past week involving Winthrop and USC Upstate. Of the 26 players listed on the three rosters, 19 called another country home - from Algeria to Brazil to Russia.

College tennis, particularly on the women's side, has taken on an international flavor. So much so that when college coaches go abroad to recruit players, they often sit courtside with 30 or 40 of their colleagues.

"It's all cats in an aquarium store, really," USC women's tennis coach Kevin Epley says. "We're all looking at the same goldfish for a good dinner."

Coaches around the state say the predominance of international players in women's tennis is the result of a numbers game, one in which the United States has fallen short in producing top-level talent for decades...

Three Generations, One Classroom: Using Generational Theory To Understand & Motivate Your Students

Wednesday, February 27 ~ 3:00-4:30pm EST

Registration - http://www.innovativeeducators.org/product_p/271.htm

Innovative Educators

Free Resources

- Millennials are More "Generation Me" Than "Generation We" Study Finds
- How Millennial Are You?
- Gen X as Transitional

Webinar Overview

Today's university classroom is not filled exclusively with traditional-age students. Instead, instructors are likely to encounter traditional, adult, and returning students spanning an age range from 17 to 67 years of age. To effectively reach the three main generations you might encounter - Baby Boom, GenX, and Millennial - you must understand who they are, how their generation shaped their motivations and expectations, and how to use this knowledge to communicate class material.

Participants will learn basic generational theory and how it applies to teaching the most common generations in the classroom: Baby Boom, GenX, and Millennial. They will also explore ways to motivate each generation in the classroom, taking into account the specific challenges and distractions that each group will most likely exhibit.

Webinar Objectives

Participants will:

- Understand generational theory as it relates to the three main generations in higher education
- Describe the different historical factors that influence each generation
- Understand why each generation may be in school
- Explore ways of motivating each generation in the classroom
- Discover what challenges and distractions may impede each generation's learning

Webinar Speaker(s)

"Most of us no longer have just a single generation in our classrooms; we usually have students who range in age from 17 to 67. As faculty members, it is important to understand what these students' generational experiences mean for their motivation as students - what sorts of actions from instructor and fellow students will inspire them to learn and which will cause them frustration."

Jennifer Patterson Lorenzetti is an experienced writer, speaker, and consultant

- Ten Takeaway Tips for Teaching Critical Thinking
- University of Texas - Critical Thinking in the College Classroom

Webinar Overview

Critical thinking is a concept that is widely used and has high visibility in the accreditation and mission statements of educational institutions across the world. However, many educators and institutions have difficulty clarifying the concept and infusing it within curriculum and instruction. This three-part workshop focuses on explicating those concepts and principles that inform a foundational, cross-disciplinary conception of critical thinking as well as how these fundamentals translate into concrete teaching and learning strategies that, when done well, help our students improve the quality of their thinking.

Session Titles & Descriptions:
Part 1: Introduction To Foundational Critical Thinking Concepts & Principles
In this first segment, participants will be introduced to a robust, cross-disciplinary conception of critical thinking. We will discuss what critical thinking is and explore how it can be substantively infused into our content areas and instructional contexts. It will be argued that critical thinking is not something that is merely added to our existing curriculum and workload, but should be the way we teach and learn. When critical thinking is treated as the organizing idea of teaching and learning, substantive understanding will naturally result.

Part 2: Question-Generating Concepts
The critical mind is the questioning mind. The extent to which students ask genuine questions and seek to answer them reflects the extent to which students take content seriously and think it through. The problem is that our students rarely know how to systematically ask questions that probe content by searching for assumptions, concepts, purposes, information, inferences and solutions, points of view, or implications. They rarely seek out intellectual standards to evaluate the quality of their thought and the thoughts of others: questions that target clarity, depth, relevance, validity, significance, and accuracy. We want to create a classroom culture where students actively, reflectively, and fair-mindedly question the content and each other. Such a culture cultivates important intellectual skills and abilities as well as virtuous dispositions like intellectual flexibility, empathy, humility, integrity, open-mindedness, and perseverance, to name a few. This session will focus on the relationship between our ability to question and our ability to think critically. Participants will explore various ways to help students develop questions that analyze and evaluate content and their thinking.

Part 3: Focus On Instructional Strategies That Promote Critical Thought
This session will build on the foundational critical thinking concepts and principles addressed in the first session. In doing so, participants will explore the intimate relationship between what it means to think critically and how we can design instruction to promote critical thought. Based on best practices in teaching and learning, participants will engage and discuss specific instructional strategies designed to foster critical thought and the cultivation of higher order thinking skills. The instructional strategies act as examples of what instructors can do on a typical day of class. At the end of this session participants will have a short list of practical strategies they can immediately incorporate into their instruction.

Seven Steps To Service Learning: A Practical Approach To Course Design

Dr. Enoch Hale has been a Fellow at the Foundation for Critical Thinking since 2004, and he is now the executive director of the Institute for Critical and Integrated Thinking. He has over fifteen years of instructional experience in secondary, post-secondary and graduate education. For close to a decade, Dr. Hale has worked with faculty and administrators, nationally and internationally, from primary schools, secondary schools, graduate schools, businesses and government agencies in the design and facilitation of professional development workshops. This work focuses on infusing critical thinking into curriculum, instruction and classroom/organizational culture. Dr. Hale has published work on various dimensions of critical thinking in multiple peer-reviewed journals including the Journal of College Teaching and Learning, Action Learning Research and Practice, and the International Journal of Human Resources Development and Management (IJHRDM). His research interests focus on the practical application and assessment of critical thinking, meta-cognition, and professional development studies. His PhD dissertation, entitled "A Critical Analysis of Richard Paul's Substantive Trans-disciplinary Conception of Critical Thinking" is, to date, the most comprehensive analysis of Paul's conception of critical thinking.

From: Alert Carolina <no_reply@unc.edu>
Sent: Wednesday, January 30, 2013 8:49 PM
To: Bridger, Beth <bridgerb@email.unc.edu>
Subject: Timely Warning: Orange County under tornado watch

Dear Students, Faculty and Staff:

The National Weather Services has issued a TORNADO WATCH IN ORANGE COUNTY.

That means conditions are favorable for tornadoes and severe thunderstorms in and close to the watch area. The weather service says people in these areas should be on the lookout for threatening weather conditions and listen for later statements and possible warnings.

Remain alert for approaching storms.

The weather service updates this information regularly, so be sure to check the National Weather Service website listing the current status of watches, warnings or advisories for Orange County at http://alerts.weather.gov/cap/wwaatmget.php?x=NCC135.

The University will not send additional text, email or other notifications to the campus community about a tornado watch since the status of those often change frequently during a weather event. If a new weather pattern enters the area that prompts a fresh watch after a 24-hour period, the University plans to reissue the watch notice as part of ongoing monitoring efforts for potential serious weather conditions.

If the weather service issues a tornado warning for Chapel Hill and Carrboro, the University will activate the emergency sirens. A tornado warning means that a tornado has been spotted, or that radar indicates a thunderstorm circulation that can spawn a tornado, according to the National Weather Service. The University will activate the sirens for a significant emergency or immediate health or safety threat, send a text message to registered cell phones and start other notifications including campus email.

For more information refer to http://www.alertcarolina.unc.edu/go/doc/1395/1075683/About-Tornado-Warnings-and-Watches

ABOUT THIS EMAIL: Campus-wide email is not an instant source of information as part of the University's timely warning notification process. Text messages sent to registered cell phone users are the fastest way for the University to notify you. That's why email messages like this one will always include a timestamp to indicate when the message was sent. The University's Emergency Notification System is activated using a strategy that is based on redundancy, using multiple methods to communicate. The best, most up-to-date source of information will always be the Alert Carolina website, http://alertcarolina.unc.edu.

Subject:	FORMAL NOTICE: Request to Update Personal Information in Campus Directory

---

This is a request that you check your information in the online campus directory to ensure that it is current and accurate. This request is sent to you on a quarterly basis.

It is very important that your information is correct in the online campus directory (http://directory.unc.edu) which is part of ConnectCarolina, the University's integrated administrative system. Because ConnectCarolina centralizes management of person information in one integrated system, any information in the directory is duplicated in all of the University's administrative systems (e.g., payroll).

To review and update your directory information, please go to http://www.unc.edu/myunc/, click on Update Personal Information (upper left of screen under Account Information in the Service Menu) and log-in using your Onyen and password. You can also choose whether certain information is publicly viewable in the directory.

Your home and business addresses are explained below:

Home address: This is your "permanent" address; as such, your home address is the address where your tax forms (W-2, 1098T, etc.) will be sent.

Business address: This is your University work address and, by virtue of University policy, is viewable by all. You can update your business address but you cannot delete it.

Privacy
You can change whether your home address and/or your home phone appears in the directory (i.e., is public) or not by going to http://www.unc.edu/myunc/ and clicking Update Personal Information.

If you need help using the online campus directory, please contact the Help Desk at (919) 962-HELP (962-4357).

Your time and effort is appreciated.

To: EHS Notifications <ehs_notifications@listserv.unc.edu>
Subject: REQUIRED ENVIRONMENT HEALTH & SAFETY ORIENTATION TRAINING

North Carolina OSHA regulations and University policies require that you complete safety orientation training appropriate to your work here at UNC. This training is mandatory for all full-time, part-time, and temporary employees, including student/federal work study employees. Training is easy to complete. If you have access to the internet, take this training on-line at http://ehs.unc.edu; select Training and then go to "Online Orientation". Select the Work Environment that best describes your job activities. EHS will be automatically notified upon successful completion of the post test.

If the link does not open properly you may type in the address in your web browser address box. Once you have typed it in and arrived at the EHS website, click on Workplace Safety in the box to the left. Then click on safety trainings and then click online orientation. Select the orientation that best fits your job description. After reading the modules, be sure to take the test to receive credit for the training.

All of the following training is online.

If you are unsure which work environment you fall under, review the descriptions below and select the one that most closely describes your job activities.

Laboratory Environment: Work activities in laboratories in which chemicals, radioactive materials or biological agents are used or stored.

Clinic Environment: Duties involving patient contact or closely associated activities at ACC, SHS, UNCH, etc.

Office Environment: Work activities in an office environment, academic classroom, or library.

Support Services Environment: Work Activities involving Public Safety, Housekeeping, or Animal Handling.

IMAC Environment: Duties involving industrial, maintenance, and construction work.

For additional classroom dates, go to ehs.unc.edu and select Workplace Safety, then Safety Training, then Instructional Led Courses.

Please make sure that you complete your training as soon as possible either on-line or by attending an instructor-led class. Under the Enforcement Policy, EHS will be reporting compliance status to Deans, Directors, and Department Heads.

Safety orientation training is important for your safety as well as others.

Addressing Plagiarism: Why Students Plagiarize

Turnitin

Dear Beth,

- How serious is the issue of student plagiarism?
- What motivates students to plagiarize?
- How can educators create a culture of academic integrity?

These are three of the questions answered in Why Students Plagiarize, a 30-minute webcast featuring Jason M. Stephens, an expert on academic motivation, moral judgment, self-regulation, and cheating behavior among students. Dr. Stephens gives you the information you need to address the issue of plagiarism at your institution and provides you with some additional resources.
This is just one resource we have to help you and your colleagues manage written assignments. Once a week over the next several months I will send you additional articles, briefs, videos and white papers to help you use technology to:

* Understand and address plagiarism
* Fully engage students in the writing process
* Teach essential 21st century skills
* Reduce grading time & effort---while providing richer feedback to students

Want to learn faster?
Click ACCELERATE and I will expedite the program so you receive these emails twice a week.
.

From: Supplemental Instruction Discussion List <SINET@LISTSERV.UMKC.EDU> on behalf of Craig M [D S O] Zywicki <czywicki@IASTATE.EDU>
Sent: Thursday, January 31, 2013 3:26 PM
To: Bridger, Beth <bridgerb@email.unc.edu>; Supplemental Instruction Discussion List <SINET@LISTSERV.UMKC.EDU>
Subject: Re: In session surveys

Dear Katie:
We encourage our SI Leaders to develop their own simple and quick methods to gather feedback during the semester. The method we model for Leaders to use is the "plus delta" classroom assessment technique, but a common alternative is a simpler one-minute paper with one question or prompt. The descriptions we provide to Leaders for each method are online at:
http://www.dso.iastate.edu/asc/supplemental/SIShowcaseFeedbackPlusDelta.pdf
http://www.dso.iastate.edu/asc/supplemental/SIShowcaseFeedbackMinutePaper.pdf
We generally prefer written or verbal qualitative feedback during the semester, since likert scale information from regular participants tends to give predictable results.
We also use formal surveys near the end of the term, with one version for SI participants and a second for non-participants.

Subject: In session surveys
Good Afternoon All-
I am currently trying to put together a short, in-session survey that can give our leaders immediate feedback about how they are doing. I wanted to know if other institutions are doing this, and if so, what types of questions do you include?
Thanks!
Katie

Ten Tips for Dealing With Difficult People
Dealing With Difficult People: 17 Tips to Keep You Sane

Webinar Overview

A student shows up at your front desk...

yelling, crying, upset, frustrated, tearful, angry, overwhelmed, pushy, aggravated, annoyed, demanding, obnoxious, smelly, drunk, disoriented...

...what do you do?

Front office staff, like soldiers on the front lines of battle, are often placed in situations where they are nose-to-nose with students, faculty, and staff who are not at their best. They are asked to create a warm, caring, customer-service focused place for students, faculty, and staff to have their questions answered.

Problems occur from the Registrar to the Admissions office, from Residential Life to Advising, from Counseling to Testing. Students demand services from Parking and Transportation and often become frustrated with front-line service staff such as cashiers in dining services and financial aid tellers. People become upset with Student Affairs office staff and Academic Affairs.

This program will offer some practical advice on how to work with emotional and at-risk faculty, staff, and students who approach front office staff in person, on the phone, or through email in a disrespectful manner. The presenters will also discuss ways to create an office waiting room environment that will help reduce conflict and prevent problems before they start.

Webinar Objectives

Participants will:

- Learn how to address phone and Internet communications
- Discuss how to create a safe, warm, and comfortable waiting room
- Address how front office staff can receive support from listserv and professional groups
- Discover how to use food and beverages to de-escalate and calm
- Be able to address problems specific to different areas, including:
  - Counseling and Testing, Residential life, Health Services, Admissions Office, Student Affairs Reception, Financial Aid, Registrar, Police Dispatch, Bookstore, Food Service, Library, Computer IT services, Athletics, Fitness Center, President's office, Academic Affairs
- Brainstorm ways to reduce conflict with someone who is potentially going to be a problem
- Learn how to say no or redirect in a manner that doesn't escalate
- Leave with strategies to create an office environment that supports students, faculty, and staff in crisis
- Generate innovative, fun ideas to calm people who are stressed (popsicles, music, TV) and learn how to implement these approaches on their campus

Webinar Speaker(s)

Dr. Brian Van Brunt , past president of the American College Counseling Association, is Senior Vice President for Professional Development Programs at the National Center for Higher Education Risk Management (NHCERM, www.ncherm.org). He is the president-elect of the National Behavioral Intervention Team Association (NaBITA, www.nabita.org), current president of the School and

College Organization for Prevention Educators (SCOPE, www.wearescope.org) and the managing editor for Student Affairs eNews (SAeN, www.studentaffairsenews.com). Over the past thirteen years Brian has taught counseling theory, ethics, program evaluation, statistics and sociology topics at both public and private schools for both graduate and undergraduate students at five different colleges and universities. Brian has served as the director of counseling at New England College and Western Kentucky University. He is the author of several books including: Ending Campus Violence: New Approaches in Prevention and A Faculty Guide to Addressing Disruptive and Dangerous Behavior in the Classroom. Brian is an expert on campus violence and has been interviewed by the New York Times, National Pubic Radio, LA Times, USA Today and has appeared on Headline News and Anderson Cooper 360.

Julia Johnson, Office Associate /Assistant Coordinator of Testing Services at Western Kentucky University. Ms. Johnson has been serving the Counseling & Testing Center at WKU since August 2008. Before working at the university, she worked as a Development Officer for WKYU Public Media. Julia has always been a people person and enjoys the face-to-face interaction with others. She is a very caring individual and strives to make the center warm and inviting. For instance, when she started in the office she even had it repainted to "inviting ivory."

As a mother, her mothering skills come out in all parts of the office. Julia tries to make not only the center staff, but also the clients feel welcome and show compassion to them. Julia tries to look at everything with a positive spin, even when working with students, staff, faculty and concerned family members during difficult situations. She prides herself in possessing the ability to listen and communicate with others on all levels.

Julia is a graduate of WKU and has always enjoyed working at a university because she believes it keeps you young at heart and helps you learn new things. She has been married to Brandon for eight years and has two children Rachel & Logan. She also enjoys shopping, doing crafts with her kids and traveling.

Julia always says "look at the positive side of anything and SMILE while doing everything."

Subject:	[academic-services-staff] [all-college-staff] UNC College Calendar: Love, history, and all that jazz

---

It may be our shortest month, but the College's February calendar is packed with African-American history and culture, the Carolina Jazz festival, a little bit of love, and more. Highlights and links below.

Feb. 2: Bart Ehrman, professor of religious studies, will answer the question, Did Jesus Exist? as part of a humanities symposium. $75; free for UNC undergraduates. 919.962.1544. Register at: http://humanities.unc.edu.

Feb. 5: Film screening of When the Drum Is Beating, about the journey of the Haitian band, Septentrional. $4 or free with student ID. 7 pm, Varsity Theatre. http://isa.unc.edu/

Feb. 6-8: Global Sustainability Symposium: Water and Energy in the Crosshairs. http://areastudies.unc.edu/sustainability-symposium/

Feb. 6: Michelle Robinson, UNC American studies, will discuss Love Freaks (And Order Avenges) at Art for Lunch. Free for members $5 for One Card holders. 12 noon. Ackland. RSVP: http://tiny.cc/lunch_rsvp

Feb. 6-27: Tournees Festival of New French Films on Campus. 7 pm, FedEx Global Education Center, Mandela Auditorium. Complete schedule: http://tinyurl.com/bhmuv6m

Feb. 7-April 26: Bloodlines: The Work of Toni Scott, exhibit featuring sculptures, paintings, montages, maps, recordings and more. Reception Feb. 7 at 7 pm. Sonja Haynes Stone Center, Brown Gallery. http://sonjahaynesstonectr.unc.edu/

Feb. 7: Research Ethics and You, Jan Boxill, Parr Center, and Tim Kuhn, Office of Human Research Ethics, will discuss IRB processes and requirements. Lunch provided. 12:30 pm, Hyde Hall. Register at http://parrcenter.unc.edu

Feb. 7: Frank Costigliola, University of Connecticut, will discuss The Process of Thought in George Kennan's Imagining of Russia. 4 pm, Hamilton Hall 569. K.larres@unc.edu

Feb. 7: Explore Italo Calvino's Difficult Loves with Xin Liu, teaching fellow in Romance languages. Free to students, $10 others. 6:30 pm, Ackland. RSVP: acklandRSVP@unc.edu

Feb. 7: Recital and master class by pianist Keiko Sekino. 7:30 pm, Hill Hall Auditorium. http://music.unc.edu/

Feb. 8-9: Southern Sounds/ Out of Bounds: Music and the Global American South, a two-day exploration of the culture, meaning and practices surrounding music in and from the global American south. Free with registration. http://cgi.unc.edu/

Feb. 8: Carolina Women's Choral Showcase, 8 pm, Hill Hall Auditorium. http://music.unc.edu/

Feb. 9: A symposium on Picture Making in the Age of Hals, Rembrandt and Vermeer, with art curator Dennis Willer and art historian Hans Van Miegroet. $140, free for UNC undergraduates. 919.962.1544. 9:30 am to 5 pm. http://humanities.unc.edu

Feb. 9: TEDxUNC, Common Threads, an all-day student-run series of talks and performances at Memorial Hall. Free tickets are sold out but you can get on a wait list or learn more at http://www.tedxunc.com

Feb. 11: Independent historian David Cecelski will discuss Music All Over the Ocean: Voices from the Menhaden Fishery's Last Days. 3:30 pm, Greenlaw, Donovan Lounge. @live.unc.edu

Feb. 12: Hanes Visiting Artist Kerry Tribe discusses film, video and installations exploring the phenomenology of memory. 6 pm, Hanes Art Center. http://art.unc.edu/index.htm

Feb. 12: Film screening of Los Chigualeros, celebrating the music of one of Ecuador's most famous orchestras. $4 or free with student ID. 7 pm, Varsity Theatre. http://isa.unc.edu/

Feb. 15: UNC blues historian William Ferris shares stories, photos, music and film clips, with performances by Ben Wiley Payton and the Black Student Movement. 6 pm reception and exhibit; 7 pm program. Friday Center for Continuing Education. http://FridayCenter.unc.edu/Ferris

Feb. 15-16: Interpreting Black Politics, 7th Annual Triangle African Americna History and Culture Conference. http://taahc.web.unc.edu/

Feb. 16: Free play and discussion on civil discourse by Christian Lundberg, communication studies, and dramatic art alumnus Mike Wiley. Based around PlayMakers presentation of Clybourne Park. 2 pm, Center for Dramatic Art. Register to reserve free seating, 919.962.1544. http://humanities.unc.edu

Feb. 17: Carolina Jazz Festival: Valentine Concert, featuring Jazz Ensembles from Duke, NCCU and UNC, $10, Tickets: 919.843.3333. More info: 919.962.1039. 4 pm, Kenan Music Building. http://music.unc.edu/

Feb. 18: Melvyn Leffler, UVA, will discuss George W. Bush and Saddam Hussein: Why Did the US Go to War Against Iraq in March 2003? 4 pm, Hamilton Hall 569. K.larres@unc.edu

Feb. 18: Religious studies scholar Katharine von Kellenbach will discuss Absolved from the Guilt of the Past? Memory as Burden and as Grace in the Post-War Lives of Perpetrators of the Shoah. 5:30 pm, Hyde Hall. http://www.unc.edu/ccjs/

Feb. 19: Carolina Jazz Festival: NC Jazz Repertory Orchestra. $5-$15. 919.843.3333. 7:30 pm, Hill Hall. http://music.unc.edu/

Feb. 20: Carolina Jazz Festival: NCCU and UNC Jazz Faculty Jazz Ensembles. 919.962.1039. 7:30 pm, Hill Hall. http://music.unc.edu/

Feb. 21: Kim Severson, New York Times Atlanta Bureau Chief, Talking About the South. 4:30 pm, Graham Memorial 039. @live.unc.edu

Feb. 21: Carolina Jazz Festival: Essentially Ellington High School Jazz Festival. 919.962.1039. 9 am, Student Union. http://music.unc.edu/

Feb. 21: Bettie Allison Rand Lectures in Art with Lisa Monnas, independent scholar, on silk. 5:30 pm. Hanes Art Center. http://art.unc.edu/index.htm

Feb. 21: Ninth Annual African American History Month Lecture with gender historian Tera Hunter, Princeton University, discussing African-American Marriage, Slavery and Freedom. 7 pm, Wilson Library, Pleasants Family Assembly Room. Davila@email.unc.edu

Feb. 21: Reckford Lecture in European Studies: Martin Puchner, Harvard professor of drama and English, will discuss Theater and Philosophy: Socrates on the Modern Stage. 919.843.2654. 7:30 pm Gerrard Hall. http://iah.unc.edu/events/lectures/reckford

Innovative Educators

Webinar Overview

With increasingly limited resources and high demands from today's staff and faculty, institutions are finding it difficult to provide professional development in a cost-effective manner. In addition, they are finding it difficult to track participation and provide certificates of completion. Several institutions are turning to technology-based solutions to solve these problems. This webinar will explore 2 case studies from clients currently using Go2Knowledge, a suite of 75+ on-demand professional development trainings. The presenters will focus on how they utilize Go2Knowledge to provide on-going training for staff as well as part-time, online faculty, full time faculty.

Webinar Objectives

Presenters will discuss ways they utilize Go2Knowledge such as:

- **Flexible Training:** Hybrid and On-Demand
- **In-Service Training:** Plan an in-service around one of the trainings or use the training sessions as part of a brown bag lunch series and invite faculty and staff to brainstorm and discuss implications for your college.
- **Online Faculty and Staff Learning Communities:** Distribute Go2Knowledge to all faculty and staff so they can watch when it is convenient for them.
- **Staff Recognition:** Develop a program around the trainings with monthly themes and recognize the staff members that implement the best idea related to the theme.
- **Team-Building:** Utilize these trainings to develop cross-functional and cross-discipline teams to foster collegiality.
- **New Employee Training:** Include these trainings and our free trainings as part of your new employee training program to ensure consistency.

Webinar Speaker(s)

Dr. Denise Swett is the Vice President of Student Services at Foothill College. Denise has worked at both 2 and 4-year colleges, including 11 years at the University of San Francisco in student life and at Chabot College as Dean of Students and Cañada College as Vice President of Student Services.

Denise has been with Foothill College since July of 2007. As vice president she provides leadership and guidance for the student services division. She also supervises a collaborative team of faculty and staff providing coursework, programs, and services at Middlefield Campus, area high schools and Regional Occupational Programs, and community based organizations. She also oversees career and workforce grants, the Workforce Innovation Partnership and the Family Engagement Institute and college-wide professional development.

She was Administrator of the Year, Foothill College, 2008-09 and has been recognized for her work by the Association of Mexican American Educators of Silicon Valley receiving the Educator of the Year award for 2010-11, and recently received the National Community College Administrator of the Year 2011-12 from NASPA, Student Affairs Administrators in Higher Education. Denise earned her BA and MPA at San Jose State University and her Ed.D. in organization and leadership (with a concentration in higher education administration) from the University of San Francisco.

Dr. Rhonda Tracy was born in Sumter, South Carolina and graduated summa cum laude with a B.A. degree in education from the University of South Carolina. She later completed a Master of Education degree from West Virginia University and a Ph.D. in Reading Education with a concentration in educational administration from Ohio University. Dr. Tracy has authored over 30 professional publications on issues related to education, literacy, and technology and has served as lead investigator and/or grant writer for over 20 grants. She currently chairs the West Virginia Community and Technical College System-wide Developmental Assessment Committee and is on the board of the Southeastern Association of Community College Research (SACCR). She has experiences in research, technology, and literacy. During her educational career she directed the Instructional Technology Center at Winthrop University, served as Director of Institutional Research and Assistant Vice Chancellor at University of Arkansas-Monticello, and directed the

From:	Supplemental Instruction Discussion List <SINET@LISTSERV.UMKC.EDU> on behalf of Christine Connerly <CConnerly@CSUCHICO.EDU>
Sent:	Friday, February 1, 2013 2:18 PM
To:	Bridger, Beth <bridgerb@email.unc.edu>; Supplemental Instruction Discussion List <SINET@LISTSERV.UMKC.EDU>
Subject:	Re: Supplemental Instruction/Tutoring Tracking Systems
Attach:	SI Comparison fall2012.xlsx

We have been using TutorTrac for SI and have been able to get all kinds of data and reports. Very easy to put into Excel by just copying and pasting into a spreadsheet (you may have to paste the data as HTML or Unicode to get the format right though). The SI grade comparison report is fantastic and very easy to run. I am attaching a sample SI Grade Comparison report to show that it automatically compares students who visited to students who did not. It also shows the differences in grades based on how many times students attended SI. You can also pull demographic reports. Of course this only works if you download student database information into TutorTrac, but once that is set up, it is easy to maintain. I think the best feature of TutorTrac is the reports.

From: Supplemental Instruction Discussion List [mailto:SINET@LISTSERV.UMKC.EDU] **On Behalf Of** HAMBERG, KERI
Sent: Friday, February 01, 2013 9:02 AM
To: SINET@LISTSERV.UMKC.EDU
Subject: Re: Supplemental Instruction/Tutoring Tracking Systems

The features that I have found to be somewhat weak with Tutortrac are:

- Very basic SI report (no bar charts, etc) and no ability to customize
- No export feature – to send reports to excel for manipulation
- If you want to export the data so that you can run your own reports (to compare non-attendees to more/different groups), you can't because TT will not run a report that lists students with zero visits

Subject: Re: Supplemental Instruction/Tutoring Tracking Systems

Hello.

I am investigating TutorTrac because it was recommended to me by a number of attendees at the January SI Training session in Kansas City. I contacted TutorTrac on my return to Canada and participated in a Demo yesterday; I liked a number of the features (import from Banner, text message capability, simple interface for students to book appts, reporting capabilities, etc.). The Demo site is left active for "play" (30 days), so I look forward to some sandbox time. That said, though, it will be a hard sell because it is pricey.

Hope this helps,

Helen

To: SINET@LISTSERV.UMKC.EDU
Subject: Supplemental Instruction/Tutoring Tracking Systems

Hello!

Florida Atlantic University is in the process of replacing its current Academic Advising software and have been reviewing three specific companies: Starfish Solutions, Insight Advising and Grades First. Based on our current system, the Center for Teaching and Learning uses a subcomponent to track Tutoring, Writing and Math Learning Center appointments in addition to tracking Supplemental Instruction attendance. As we are reviewing the above companies, the Center for Learning And Student Success (CLASS) is interested in hearing from our colleagues about your tracking of Tutoring appointments and entering of Supplemental Instruction attendance if you use any of the mentioned systems. If you do not use any of the above systems, please let us know what tracking method you currently utilize for tracking of appointments/attendance and for statistical purposes. Please comment to the questions below:

1. Which system is implemented by your Center?
2. What are the functions, of the respective system, that your Center utilizes? (i.e. tracking, grade comparisons, scheduling, etc.)
3. What is the general view of your respective system from your students/colleagues? What are the pros and cons?

4. Please describe the reliability/dependability of pulling data each semester from your Center's respective system?
5. Would you recommend this system to other Colleges/Universities? Why or Why Not?
6. Will you be available for additional questions about your respective system?
7. Additional Comments.

Thank you so much for your time and attention. Once your comments are received, I will be more than happy to compile the responses and submit it to the Listserv. I apologize, in advance, for duplication of this email as it will be posted again to an additional listserv.

Have a great day and I look forward to hearing from you soon!

Subject: Fwd: National College Learning Center Association (NCLCA) - Call for All Proposals - 2013 Annual Conference

---

<!--[endif]-->NCLCA Call for All Proposals
Deadline is Monday, April 1, 2013

The Mission of NCLCA, the National College Learning Center Association, is to support learning center professionals as they develop and maintain learning centers, programs, and services that enhance student learning at the post-secondary level. To help meet that mission, the 2013 annual conference will be held Sept. 26-28, 2013 at The Embassy Suites Hotel Airport/Convention Center in North Charleston, SC.

The NCLCA Board of Directors and the Conference Planning Committee are excited to announce this year's theme – "Weaving a Legacy of Student Success". The theme reflects the idea that there are layers of learning strategies and campus partnerships needed to help all students reach their full academic potential. If you have any experience in one of the following areas dedicated to student excellence, submit a proposal to share your experiences and expertise with your colleagues at the conference:

- Best Practices for Learning Centers
- Academic Support Programs for Specific Populations (Student with Disabilities, International Students, Athletes, Veterans, etc.)
- Developing Tutor and Mentor Training
- Developing and Assessing Learning Center Outcomes
- Program Start-up and/or Evaluation
- Small Group Academic Support Programs
- Using Available Technology in Creative Ways
- Developing Independent Learners
- Finding Funding in Tough Times

There are three types of proposals: regular concurrent sessions which offer in-depth information about a topic, poster sessions which are relatively informal conversations about the basics of a topic, and a one-page great idea to share at the conference. You can view a sample session proposal, a sample poster session proposal, and a great idea proposal online for you to follow as a guide. Submit proposals electronically at http://www.nclca.org/2013conference/proposal_submission.html.
The deadline for submitting proposals is Monday, April 1, 2013.

All presenters must register for the conference upon proposal acceptance. If you have any questions about developing and/or submitting a proposal, please contact Jenny Pippen (jlpippen@noctrl.edu), NCLCA Professional Development Officer. Any other questions about the conference can be directed to me.

Sincerely,

Laura Sanders

NCLCA Vice-President and Conference Chair

Personality INSIGHTS

Tip of the Week

by Robert A. Rohm, Ph.D.

Tip: When preparing to deal with a situation, get "up" for it first!

A few days ago I experienced a difficult situation with the airlines that left me completely exhausted and drained. I was trying to book some tickets for family members for a vacation. They were coming from three different locations and I was trying to make reservations in order to connect everyone to be on certain legs of the flight together. The entire process took four and a half hours from start to finish! And even though the experience drained me, I took the time to immediately process what had happened when it was over. I want to share with you ten things that I discovered that I believe will help you immensely in the event that you find yourself in a similar situation some day needing good customer service.

1. Set aside enough time. Before you even begin, you need to prepare yourself mentally and give yourself plenty of time to successfully accomplish your goal. Do not start the process if you only have five minutes to give to the task or when you feel rushed. When you are in a hurry, you tend to be "short" with other people and they can hear it in your tone of voice. I find that thirty minutes to an hour of uninterrupted time is usually a good amount to plan for. Now, I realize that I told you this particular situation took four and a half hours. That is extremely unusual, but I was "up" for it and believe I was successful because I had prepared my mind and used each of these steps I am sharing with you.
2. Have pen and paper in hand. Do not call until you are ready to start the process with something to write on and a pen that works. Nothing is more frustrating than to have to waste time looking for a piece of paper or pen once you have begun the conversation. I would suggest having a notepad so you can take good notes and have them handy for future reference.
3. Be friendly. Set the tone in the very beginning. Realize that the other person probably does not want to help you in the first place! I know that may sound negative, but it is usually true. However, if you are friendly and upbeat, you can set the tone for a good experience.
4. Give your name. Rather than asking for the other person's name, be the first to give yours. And when you do, speak clearly and slowly.
5. Ask for their name. When they give it to you, write it down and if their name could be spelled more than one way, like Shawn or Sean, ask for the correct spelling. Then thank them and use their name from time to time as you continue your conversation with them. It will show them that you are paying attention and it will also raise their awareness that you have documented their name for future reference.
6. Show respect. You can do this by thanking them in advance for helping you. I usually start by saying, "Thank you so much for taking the time to take my call and helping me with this particular situation." By showing respect to others, cooperation, team work and respect are more likely to come back to you.
7. Write a brief description. Before you begin your call, write out a brief description (twenty words or less) of the situation. This will keep you from rambling and help to keep you focused as you explain the purpose of your call.
8. Explain your perspective. As you explain the situation, let them know you are aware that there may be another way of looking at it, but that you are simply stating things from your own perspective. By approaching it in this manner, you then

give them the opportunity to help you better.

9. Ask if they are the right person to help. After you have given your brief explanation of the situation from your perspective, be sure to ask if they are the person who can help you. You don't want to go on and on for five minutes only to have them say, "Let me transfer you to the department who handles that." State the problem briefly and succinctly and then give them the opportunity to tell you whether they are actually the one who can help you or not.

10. Find a place where you will not be interrupted. I have occasionally gone to my vehicle with paper and pen in hand to make my call so that I will be assured of not being interrupted. Also, many phones allow you to hit *67 before you actually dial the number so that if anyone calls while you are on the phone, they will get a busy signal. After you hang up, your phone will go back to normal mode, but the *67 trick prevents anyone from interrupting you while you are on your phone call.

Some of you may think that all of this is ridiculous and going way overboard. Yet, I have discovered that reducing stress in my own life and having success in situations like these requires thought, effort and energy. I know this information works and I know it will help you the next time you are called upon to deal with a difficult situation. If you get "up" for it in your mind first and have a plan, you will have a much better chance of succeeding in all that you do. I hope that will be the case!

Tip: When preparing to deal with a situation, get "up" for it first!

Have a great week! God bless you!

INFORMATIONAL MESSAGE FROM ALERT CAROLINA: Sexual Assault Reported near Campus

The Chapel Hill Police Department is seeking assistance from anyone with information related to a sexual assault of a female which took place at the West End Wine Bar, during the early morning hours Sunday (Feb. 3).

The victim, who was not affiliated with UNC, reported that a male suspect had started talking to her, then followed her into the women's bathroom and sexually assaulted her. The suspect was described as tall, wearing a collared blue shirt, jeans, and brown shoes.

Chapel Hill Police reported Monday morning that they are asking anyone with information about this incident, please call the Chapel Hill Police Department at 919-968-2760 or contact the Chapel Hill-Carrboro-UNC CrimeStoppers at (919) 942-7515. Calls are confidential and anonymous. You can also submit information to Crime Stoppers online at www.crimestoppers-chcunc.org.

Continue to monitor Alert Carolina website (alertcarolina.unc.edu) for any updates in the investigation into this incident. Call 911 immediately to report any and all suspicious activity on campus. For a list of safety tips, see the following link through the Alert Carolina page:

http://www.alertcarolina.unc.edu/go/doc/1395/158078/

About Informational Messages: The University sends an Informational Message to inform the campus community about a situation that is not an emergency, but is expected to be of significant interest to the campus. An Informational Message is one of three tiers of communication under the University's revised emergency communications plan. Emergency Warning refers to a siren activation for a significant emergency. And a Timely Warning is issued if there is a continuing danger AND notification will not compromise law enforcement efforts.

Sponsored by the UNC Department of Public Safety

California State University, Fresno

Learning Center

Vacancy # 11943

Learning Center Director

General Information:

California State University, Fresno is one of 23 campuses in the California State University System. The University's mission is to offer high quality educational opportunities to qualified students at the bachelor's and master's levels, and in certain applied disciplines at the doctoral level. The current enrollment is approximately 20,000 students with diverse and culturally rich backgrounds. The University serves the San Joaquin Valley while maintaining deep involvement with the state, nation, and world. California State University, Fresno promotes student learning and community engagement through faculty scholarship and service learning opportunities in collaboration with community organizations, education, industry, business and government. The university was one of the first US Colleges and Universities to be selected by The Carnegie Foundation for the Advancement of Teaching for its new Community Engagement Classification.

Metropolitan Fresno, with a multi-ethnic population of over 600,000, is located in

Salary:

Commensurate with experience and qualifications

Overview:

Reporting to the Assistant Vice President of Student Success Services, the director has primary responsibility for providing vision, leadership, and management of programs and services designed to facilitate student learning and promote student success. This includes tutorial services, academic skills workshops, supplemental instruction and an early warning program (SupportNet). The director will also assist the assistant vice president with research, development and implementation of initiatives designed to improve student success and serve on campus wide committees as assigned.

Position Summary:

- Provide management to the development and implementation of innovative strategies to support student learning and retention through graduation.
- Collaborate with academic departments and support programs to develop and implement innovative programs and strategies to support student learning in the classroom.
- Oversee the development of a comprehensive tutor training program and the expansion of Supplemental Instruction and SupportNet (early warning program).
- Provide group and individual student advising on personal development, learning skills and academic issues.
- Develop and execute a comprehensive assessment plan to improve services, gauge the effectiveness of programs and services.
- Budget planning and fiscal management for the Learning Center, the Tutorial Center, and SupportNet.
- Supervise and evaluate professional, administrative, and student support staff.

Secondary Duties of the job include the following:

1. Work closely with Academic Affairs and other Student Affairs

the heart of the San Joaquin Valley on the western edge of the Sierra Nevada Mountain Range. The campus is within easy driving distance of San Francisco, Los Angeles, Yosemite, Kings Canyon and Sequoia National Parks, the Monterey Peninsula, Lake Tahoe, beaches, sailing, lakes, and numerous ski resorts. Fresno boasts one of the most reasonable housing markets in California and offers a wide array of locally grown fruits and produce.

programs and departments to develop partnerships, services, and activities which support student retention and graduation;
2. Conduct research on how student learn and use knowledge to develop and expand learning assistance programs and services;
3. Work to ensure quality control in services offered through the Learning Center;
4. Seek grant-funding opportunities to supplement funding for the Learning Center;
5. Performing other duties appropriate to the position as assigned by the assistant vice president.

Qualifications:

1. A master's degree
2. A minimum of three years of progressively responsible management experience in a student service program such as a Learning Center or tutorial program and experience with program development, evaluation, fiscal management and supervision;
3. Demonstrated knowledge of learning theory and sensitivity to issues and needs of students from low-income, diverse ethnic and cultural backgrounds;
4. Knowledge of statistical and research methods;
5. Highly developed leadership and supervisory skills in applying sound personnel practices and procedures;
6. Strong problem-solving and conflict resolution skills;
7. Solid interpersonal skills;
8. Excellent oral and written communication skills;
9. Proven ability to manage a service-oriented learning center;

Demonstrated ability to do the following:

- Develop, organize, implement and evaluate programs which support student learning and development
- Reach practical, logical, objective decisions and put effective changes into practice

Filing Deadline:

Applications received by March 1, 2013, will be reviewed for minimum qualifications and given full consideration by the hiring manager and/or search committee. Qualified applicants received after that date will be forwarded upon request to the hiring manager and/or search committee.

Application Procedures:

Individuals interested in being considered for this position must submit an on-line application and attach the following supporting documents: 1) resume, 2)

letter of interest which includes a narrative detailing how the candidate fulfills each of the required and preferred items listed under Qualifications, and 3) names, email addresses and telephone numbers of three references who can provide current assessments of the candidate's qualifications for the position.

Pursuant to Executive Order 883, reasonable accommodation is to be provided upon request from an employee or applicant with disabilities, unless doing so would impose an undue hardship on the campus. What constitutes a reasonable accommodation is to be determined by the campus on a case-by-case basis after it has received the individual's request for accommodation and engaged in an interactive process. Employees or applicants requiring reasonable accommodation should contact Human Resources directly at (559) 278-2032.

How To Apply:

To apply for this or any open position at Fresno State visit our online employment site at: http://jobs.fresnostate.edu/

Other Requirements:

Pursuant to the requirements of the Immigration Reform and Control Act of 1986, any offer of employment is contingent upon verification of individual's eligibility to be employed in the United States.

Background investigations will be conducted, as required, depending upon the job requirements of a position. These could include, but are not limited to, processing of fingerprints through the Department of Justice and degree and license verifications. An offer of employment may or may not be extended based upon the results of these verifications.

California State University, Fresno annual security report includes statistics for the previous three years concerning reported crimes that occurred on campus, in certain off-campus buildings or property owned or controlled by Fresno State, and on public property within, or immediately adjacent to or accessible from the campus. The report also includes institutional policies concerning campus security, alcohol/drug use, crime prevention, reporting of crimes, sexual assault, and other matters. You can obtain a copy of this report by contacting the Campus Police Department or by accessing the following web site: http://www.csufresno.edu/police/report.htm.

Other Applicant Information:

Applicants will receive confirmation of receipt of their application materials via automatic email reply. In addition, qualified applicants will receive email notification at the conclusion of the recruitment process.

This is a full-time management position covered by the California State University Management Personnel Plan. Under this plan, employees are subject to management reviews and serve at the pleasure of the University President of that campus.

Equal Employment Opportunity:

California State University, Fresno is committed to maintaining and implementing employment policies and procedures in compliance with applicable state and federal equal employment opportunity laws and regulations. Executive Order 883 prohibits discrimination and Executive Order 927 prohibits harassment on the basis of protected status: race, color, religion, national origin, ancestry, age, sex (including gender identity, per HR 2004-12), sexual orientation, marital status, pregnancy, mental disability, physical disability, medical condition and covered veteran status. Retaliation against individuals for complaining about proscribed conduct, opposing such conduct, or participating in an investigation or proceeding involving such conduct is prohibited by both executive orders.

Further, California State University, Fresno's statement of commitment to equal employment opportunity principles is also found in the various collective bargaining agreements.

The Immigration Reform and Control Act of 1986 requires the University to inform you that we can employ only U.S. citizens and aliens lawfully authorized to work in the U.S. Each new employee is required to present documentation verifying his/her identity and authorization to accept employment.

Webinar Overview

A student shows up at your front desk...

yelling, crying, upset, frustrated, tearful, angry, overwhelmed, pushy, aggravated, annoyed, demanding, obnoxious, smelly, drunk, disoriented...

...what do you do?

Front office staff, like soldiers on the front lines of battle, are often placed in situations where they are nose-to-nose with students, faculty, and staff who are not at their best. They are asked to create a warm, caring, customer-service focused place for students, faculty, and staff to have their questions answered.

Problems occur from the Registrar to the Admissions office, from Residential Life to Advising, from Counseling to Testing. Students demand services from Parking and Transportation and often become frustrated with front-line service staff such as cashiers in dining services and financial aid tellers. People become upset with Student Affairs office staff and Academic Affairs.

This program will offer some practical advice on how to work with emotional and at-risk faculty, staff, and students who approach front office staff in person, on the phone, or through email in a disrespectful manner. The presenters will also discuss ways to create an office waiting room environment that will help reduce conflict and prevent problems before they start.
Nationally, student retention rates are declining even though investments in student success strategies and support services have been increasing on many campuses. Thus, it is important to explore the underlying factors leading to this phenomenon as well as other emerging trends impacting retention rates. This two-part webinar will cover the five critical elements of a retention framework along with constructs and principles for effective retention research, planning, implementation, and assessment.

Part 1: Elements Of The Retention Framework

- Five critical ingredients to creating and sustaining a student success culture
- A learner-centered ethos
- Top 10 retention research questions and retention metrics
- Conditions for student success
- The strategic allocation of resources
- Campus-wide engagement

Webinar Objectives

Participants will:

- Review the five critical elements of a retention framework
- Explore the top 10 retention research questions and retention metrics
- Discuss constructs and principles for effective retention research, planning, implementation, and assessment
- Learn how to utilize student communications and social media to affect retention
- Understand the importance of early intervention models and practice

Webinar Speaker(s)

Dr. Jim Black is the president and CEO of SEM Works and an internationally recognized expert in enrollment management and change management. He has published a monograph titled, Navigating Change in the New Millennium: Strategies for Enrollment Leaders, and four books, The Strategic Enrollment Management Revolution, considered to be a groundbreaking publication for the enrollment management profession, Gen Xers Return to College, Essentials of Enrollment Management: Cases in the Field, and Strategic Enrollment Intelligence. Among his other published works are numerous articles and book chapters including a feature article in College & University, Creating Customer Delight; a chapter, Creating a Student-Centered Culture, for a book on best practices in student services published by SCUP and sponsored by IBM; a chapter on enrollment management in a Jossey-Bass book on student academic services; as well as a bimonthly feature in The Greentree Gazette.

Dr. Black is the founder of the National Conference on Student Retention in Small Colleges and cofounder of the National Small College Admissions Conference and the National Small College Enrollment Conference. He formerly served as the director of AACRAO's Strategic Enrollment Management Conference.

Black was honored as the recipient of the 2005 AACRAO Distinguished Service Award and in 2012, he was selected as the Alumnus of the Year for the Higher Education and Student Affairs graduate program at the University of South Carolina. He has been interviewed by publications such as The Chronicle of Higher Education, Converge Magazine, The Enrollment Management Report, The Lawlor Review, and was interviewed for AACRAO's Data Dispenser. Black also was featured in an international teleconference on enrollment management sponsored by The Center for the Freshman Year Experience at the University of South Carolina, and a PBS broadcast on "Blending High Tech and High Touch Student Services." In 1999, Jim Black was named an IBM Best Practices Partner, one of only twenty-three in the world. He was invited by The College Board to Heidelberg, Germany, to evaluate the APIEL Exam and most recently was invited to lead conferences on enrollment management and student services in the United Kingdom and the Netherlands.

Three Logical Ways to Earn Your Prospect's "Yes"

Phone calls seem to be on the minds of college coaches recently, since many of you are focused on trying to keep communication going with recruits who are in the midst of making final decisions.

And it's not a surprise, really. The NCAA is giving coaches more flexibility when it comes to calling recruits, and there's no doubt that a phone call is critical to moving the recruiting process forward.

Forward, that is, towards getting a "yes". The yes is what every coach is looking for, and there are definite rules that apply when it comes to putting yourself in the best position to get that thumbs-up from a recruit.

So with that in mind, here are three really important strategies when it comes to getting a "yes" from a prospect you are recruiting:

YES STRATEGY #1: Don't react negatively

We've all sent an email, or said something in haste over the phone, that we wish we could take back. Either we're upset by what we've just heard, or we say something that just doesn't put us in the best light with a recruit (or their parents) as the recruiting process gets started.

It doesn't even have to do anything with recruiting...we've all overreacted to something trivial, and wish we could take it all back and start fresh.

What it means to your recruiting conversation: It's great to feel passionate about what you're selling, especially if your school or program has a lot to be proud of. But before launching into a feverish sales "rationale" with your teenage prospect or their parents, take a minute to...

Dealing With Adversity: Those Who Stay Will Be Champions

by John Brubaker, Author and Performance Consultant

Picture for a moment this scenario playing out in your organization:

The board of directors just decided to eliminate your department and its $800,000 annual drain on the company's already struggling operating budget.

You are now faced with having to tell your employees that you all will be out of a job at the end of the quarter and not reassigned within the company.

After being on life support for four sub-par years, your department was now declared officially dead.

Now fast forward one month from that fateful day. Thanks to the Herculean efforts of the department manager (which may be you) who enlisted the support of former colleagues, customers, community members, managers at competing companies and other industry peers, your department has been moved from the morgue back to the critical care unit, so to speak.

By 5-4 vote of the board, the decision was reversed and your department is reinstated, but there's a catch. Your management team has been cut in half, your payroll for the remaining staff has been cut by 21 percent, and your operating budget was also halved.

What would you do?...

Windows 8 for College Coaches: What You Need To Know

*by Justin Chud, **Front Rush***

With the release of Windows 8 last month, many consumers' curiosity has piqued as to whether we can expect another Vista blunder by Microsoft or something spectacular.

Microsoft's new advertising campaign seems to suggest the latter, however, the reality falls somewhere in-between.

All comparisons to previous versions of Windows will be made against the Windows 7 OS. I will attempt to break down the ins and outs of this new operating system as your average consumer - and college coach - would use it...

Has Social Media Has Led To Communication Overload In Recruiting?

by Michael Rothstein, ESPN

When Ray McCartney started coaching college football, there were phone calls, handwritten notes and visits crisscrossing the country to find recruits. Three options and done.

Recruiting has taken a long, digital trip for everyone involved -- high school and college coaches, the media covering college football and all the way down to the recruits.

As the NCAA has continually tweaked its legislation of what is legal and not legal -- often far from the latest innovation -- lines of communication have shifted.

Welcome to the new state of recruitment, for now. New rules will change recruiting again Aug. 1, when unlimited phone calls and text messages to the Class of 2014 are allowed. These are the last vestiges of some restrictions in the recruiting world.

For good and bad...

In Recruiting, Top Recruits Now More Willing To Split Workload

by Andy Staples, SI.com

Tail Back

Even before he had Alabama rolling to three national titles in four years, Nick Saban didn't bother catering to the egos of high school tailbacks.

Brad Bolding, Tenpenny's coach at North Little Rock High, said Alabama coaches have stressed using multiple backs throughout the recruiting process. "It's unique how they recruit," Bolding said. "They tell you just flat-out that, 'Hey, we're going to run two or three backs in the game. The shelf life in the NFL is a lot longer.'"

According to the NFL Players Association, the average career of an NFL tailback lasts 2.57 years. The more pounding a player takes for free (in high school) or for a scholarship (in college), the less he can take for big money in the NFL.

Because backs absorb the hardest hits whether they're carrying or blocking, they are the most at risk to suffer a career-ending injury on a given play. That has made the tailback the most expendable position in the NFL, and it has forced Saban and other coaches to change how they use and recruit tailbacks. If high school tailbacks are smart, it should change how they choose a college program. The schools that can divide the workload should have the advantage...

OLE MISS COACH CALLS OUT RECRUITING SKEPTICS

Many who follow college football recruiting do not believe it, or at minimum, are questioning how it has happened. That's nothing new. Any school that crashes the recruiting rankings the way Ole Miss has will make people scratch their heads... **CLICK HERE**

College Prospects Hitting The Road More Often To Find

A Good Fit

by Dallas Jackson

Most people would prefer to work close to home, and it's not much different for football recruits choosing a school. But as in life, it's not always possible.

By and large, kids want to stay close to home or even a state away. But with more games on television, families can see more games, and with the expansion of recruiting, when an SEC school comes calling it is hard to pass up that lure.

Some of it is spot recruiting -- and teams will go anywhere to get a quarterback they like -- and some of it is relationship-based. More and more there are guys coaching far away from where they played, but they still have roots in the area and so they reach out to coaches they know and get kids out of areas that don't seem natural...

Recruits Who Keep Their Verbal Commitments Become More Rare

by Christy Cabrera, Sun Sentinal

In the fast-paced, often-crazy world of college football recruiting, it seems almost quaint.

A highly-recruited prospect makes an early verbal commitment, endures overtures from other programs, watches his teammates experience all the perks the recruiting process has to offer undecided athletes, and through it all, manages to make it to National Signing Day with his commitment intact.

That's the dream scenario for most of the nation's top college football coaches, but with numerous top-notch prospects changing their minds often, it's becoming increasingly rare to keep a high-profile recruit from wavering.

So what's the secret? How do college coaches and their prospects keep those rare long-term relationships together? They work at it, day and night...

Subject: INFORMATIONAL MESSAGE FROM ALERT CAROLINA: Alert Carolina Siren Test – Tuesday, February 12

INFORMATIONAL MESSAGE FROM ALERT CAROLINA: Alert Carolina Siren Test – Tuesday, February 12

Dear Students, Faculty and Staff:

The University will TEST the emergency sirens and text messages on Tuesday, February 12th, between noon and 1 p. m. We test the sirens each semester to make sure the equipment works.

During the test, anyone outside on or near campus likely will hear the sirens. (The sirens are not designed to be heard inside or while you are in a vehicle.) The sirens will sound an alert tone along with a brief pre-recorded voice message. When testing is complete, a different siren tone and voice message will signal "All clear. Resume regular activities."

The sirens sound only for a major emergency or an immediate safety or health threat such as:

- An armed and dangerous person on or near campus;
- A major chemical spill or hazard;
- A tornado warning for the Chapel Hill-Carrboro area issued by the National Weather Service; or
- A different emergency, as determined by the Department of Public Safety.

The University also sends a text message to cell phone users who registered their numbers in the online campus directory. In an emergency, the University will post safety-related announcements on the Alert Carolina website, alertcarolina.unc.edu, along with updates.

No action is required during the siren test. But we hope you have taken the time to review the poster, "What You Should Do For An Emergency Warning," posted in all campus classrooms and accessible online, http://www.alert.unc.edu/external/content/document/1395/1255639/1/AlertClassroomPoster.pdf.

The sirens are part of the University's Emergency Notification System and a communications strategy that uses multiple ways to reach students, faculty and staff, as well as visitors, local residents, parents and the public. To support that system, we launched Emergency Notification Protocols that inform the campus community using three types of notifications – Emergency Warning (sirens), Timely Warning and Informational Message.

In a real emergency, we strongly encourage students and employees to use the American Red Cross Safe and Well List to let their parents and families know they are okay in the while keeping cell phone lines open for emergency calls. The Safe and Well list is especially helpful in communicating with family members who are outside the emergency area.

You may also now access a mobile-friendly version of the Alert Carolina website during an emergency at http://m.alertcarolina.unc.edu/

About Informational Messages: The University sends an Informational Message to inform the campus community about a situation that is not an emergency, but is expected to be of significant interest to the campus. An Informational Message is one of three tiers of communication under the University's revised emergency communications plan. Emergency Warning refers to a siren activation for a significant emergency. And a Timely Warning is issued if there is a continuing danger AND notification will not compromise law enforcement efforts. Sponsored by the UNC Department of Public Safety

Seven Steps To Service Learning: A Practical Approach To Course Design

Tuesday, March 5 – 1:30-2:30pm EST

Registration - http://www.innovativeeducators.org/product_p/i08.htm

Innovative Educators

Free Resources

- Service Learning for Students
- Impact of Service Learning on College Students
- Community-Campus Partnerships for Health - Service Learning
- Marquette University - Service Learning Program
- Health Professor, Honored for Civic Work, Developed a Metric for Student Learning
- Does Service Learning Really Help?
- A Deeper Kind of Service

Webinar Overview

There is no doubt that service learning enriches traditional classroom learning and at the same time instills an important sense of civic responsibility in students. Although faculty and administrators might understand the importance of service-learning programs, they might not know where to start or how to navigate tricky and time-consuming logistics outside of the campus environment.

This webinar will provide participants with an understanding of the historical context and positive effects of service learning on students, the campus, and the surrounding community. Participants will also learn a proven, seven-step course development model that will take them through each critical phase of designing a successful service-learning course. While primarily designed for novices, this presentation will also benefit faculty and staff currently involved in service learning, as the presenter will reinforce guiding service-learning principles and provide new ideas for accomplishing goals.

Webinar Objectives

Participants will learn how to develop a service-learning course via seven steps:

- Define student learning outcomes
- Define scholarship and/or creative activity outcomes
- Plan community collaboration
- Design the course
- Handle logistics, contracts, and risk management
- Incorporate pedagogical tools (reflection, analysis, delivery and display)
- Perform meaningful assessment

Webinar Speaker(s)

Maureen Shubow Rubin was appointed Associate Dean of the Mike Curb College of Arts, Media, and Communication at California State University, Northridge in 2010. She served as Director of Undergraduate Studies from 2006 to 2010. Prior to this position, since 1998 she served as founding director of the Center for Community-Service Learning where she helped to develop and secure funding for over 300 new service-learning classes. She has written and implemented successful grant proposals to help students on her campus participate in projects centered on gang prevention, school readiness, computer literacy, self-help legal assistance, and bringing English and citizenship skills to immigrant elders, among others. An experienced faculty trainer and peer mentor, she has published widely about service-learning pedagogy, civic engagement, community collaboration and effective outreach. In 2001, she was awarded the Richard E. Cone Award from California Campus Compact for excellence and leadership in cultivating community partnerships in higher education.

Rubin joined the University in 1984 as a professor of journalism where she specialized in teaching law, public relations and media ethics, all of which have been subjects of numerous articles she wrote for both scholarly journals and mainstream media. In 1993, she was voted Outstanding Journalism Educator in the State of California by the California Newspaper Publishers Association. Prior to joining the university, Rubin was Director of Public Information for President Carter's Special Assistant for Consumer Affairs in the White House, and held similar

Subject: HAPPY BIRTHDAY!

Beth ~

Have a great birthday today (February 6th) ~ I wish you many more birthdays to come!

Thank you for all you continue to do for our student-athletes, University, and Department of Athletics. I understand that the last couple of years have been challenging, and at time, "not that much fun." I appreciate all you do, and I am glad that you are part of our Department.

Take care of yourself, and HAPPY BIRTHDAY!

Be well,
Larry Gallo, Jr.

Turnitin First Draft

Having trouble? View as Webpage

WHAT'S WRONG WITH WIKIPEDIA

Evaluating Sources

Educators are well aware of the shortcomings of relying on crowd-sourced content for authoritative information, yet the fact that Wikipedia continues to reign supreme as a top match in Turnitin suggests that students don't see things the same way. In short, what constitutes "research" for students today has come to mean "Googling."

Evaluating Sources Webcast

This on-demand webcast explores the connection between student source choices and the development of research and critical thinking skills. We'll also discuss the development of the Turnitin website evaluation rubric to help students enhance their competencies in evaluating online sources.

Sources White Paper

This white paper highlights the recent findings regarding student research practices, presents SEER, and offers guidance on using the rubric to improve student research skills.

Read White Paper

HOW DO STUDENTS DO RESEARCH ONLINE?

While the internet has been a boon for information access and availability, three out of four educators strongly agree that "search engines have conditioned students to expect to be able to find information quickly and easily," according to a Pew Internet & American Life Project study entitled, How Teens Do Research in the Digital World.

Most of the advanced placement (AP) and National Writing Project teachers in this study said students are "very likely" to use Google, Wikipedia, and social media sites for typical research assignments.

- Google or other online search engine (94%)
- Wikipedia or other online encyclopedia (75%)
- Social media sites (52%)
- Their peers (42%)
- Study guides (41%)
- News sites (25%)
- Print or electronic textbooks (18%)
- Online research databases (17%)

- A research librarian at their school or public library (16%)
- Printed books other than textbooks (12%)
- Student-oriented search engines(10%)

  * Pew Internet & American Life Project

This is consistent with findings from Turnitin's recent research that analyzes the most frequently matched Internet sources (released in January) which show that Wikipedia, Yahoo! Answers, and eNotes were the top three among secondary students. At the college and university level, the top three were Wikipedia, OPPapers (a paper mill), and SlideShare. Subject: INFORMATIONAL: Call for 2013 Carolina Summer Reading Program Discussion Leaders

Dear Faculty and Staff:

Please consider joining us as a discussion leader for the Carolina Summer Reading Program. The program invites all first-year and transfer students to read a book and participate in small group discussions facilitated by faculty and staff volunteers with college teaching or group facilitation experience.

"Home" by Toni Morrison will be the 2013 summer reading book. "Home" is the story of a man who joins the army to escape his too-small world, leaving behind his cherished and fragile little sister, Cee. After the war, his shattered life has no purpose until he hears that Cee is in danger.
For additional information about "Home" and the author, please visit the Carolina Summer Reading website at http://summerreading.web.unc.edu

If you are interested in serving as a discussion leader, please complete the online sign-up form at http://summerreading.web.unc.edu/discussion-leader-resources/. You are welcome to facilitate a group on your own or collaborate with a UNC-CH faculty member, staff member, or student. The priority date for signing up to serve as a discussion leader is Wednesday, February 27, 2013.

You will be notified electronically by March 8, 2013 if you are selected to serve as a discussion leader. Discussion leaders will be provided a free paperback copy of "Home" by March 15, 2013. For information about the Carolina Summer Reading Discussion sessions, please visit http://summerreading.web.unc.edu. Throughout the summer, the Carolina Summer Reading website will be updated with inter-disciplinary materials to assist you in planning and conducting your session.

In addition, we are interested in involving the UNC community through programming related to the themes explored in "Home." If your department plans to offer related programming, please contact New Student & Carolina Parent Programs at newstudents@unc.edu

Thank you for your continued support of this exciting intellectual endeavor!

Regards,
Office of New Student & Carolina Parent Programs newstudents@unc.edu
919-962-8304

Subject: Postgraduate Scholarship Opportunity - WINTER SPORTS
Attach: NCAA POSTGRADUATE SCHOLARSHIP.docx

This email is intended for all senior student-athletes that participate in the following sports:

M/W Basketball, Gymnastics, M/W Swimming and Diving, M/W Indoor Track, Wrestling

NCAA POSTGRADUATE SCHOLARSHIP for Winter Sports

(SUBMISSION DUE DATE: MARCH 21, 2013)

Are you interested in attending graduate school in the next three years? If so, you may be eligible to apply for the NCAA Postgraduate Scholarship for Winter Sports!

The NCAA awards up to 174 postgraduate scholarships annually, 87 for men and 87 for women. The scholarships are awarded to student-athletes who **excel academically and athletically** and who are in their final year of intercollegiate athletics competition during the 2012-13 academic year.

The one-time grants of $7,500 each are awarded for fall sports, winter sports and spring sports. Each sports season (fall, winter and spring), there are 29 scholarships available for men and 29 scholarships available for women.

The scholarships are one-time, non-renewable grants.

CRITERIA:

- In final season of NCAA athletics eligibility or will not be using any remaining athletics eligibility after Winter 2012.
- Overall undergraduate minimum cumulative grade-point average of **3.200** or higher.
- Have **performed with distinction as a member of the varsity team** in the sport in which the student-athlete is being nominated. The degree of the student-athlete's athletics achievement will be weighed in conjunction with academic performance, university involvement and volunteer community service.
- Intend to continue academic work beyond the baccalaureate degree and enroll in a graduate degree program on a part- or full-time basis at an academically accredited graduate or degree-granting professional school.
- Are outstanding citizens and excellent role models for the institution and intercollegiate athletics as a whole.

If you are interested in learning more, please see Spencer Welborn in the Academic Support Center for Student-Athletes or contact him (919-843-2328, swelborn@email.unc.edu) prior to February 25, 2013.

Webinar Overview

"If only my students were motivated to learn!" Perhaps you have heard that lament or something similar. Sometimes the discussion devolves into a search for "techniques" to move our students from the edges of sleep to the edges of their seats. It can be a slippery slope. Technique without connection, without meaning, and without understanding will not help us-or our students.

For those of us that work with students day in and day out, we need the HOW! We need clear explanations about strategies and exercises that will help us engage our students-and enable our students to take more and more responsibility as they move toward their dreams. This webinar will examine the topic of student motivation, but not from a technique perspective. While research in the area of student motivation provides a necessary foundation to understand our students, this webinar will not spend a lot of time on the WHY of student motivation.

Our starting premise will be that student success is our goal. We help students move toward their life dreams, achieve their academic goals, and care for their health and well-being. Participants in this webinar will examine commonly accepted principles associated with student success. You will learn HOW the basic principle of "active student involvement" will help us help our students to focus on their sense of purpose, reflect on and strengthen their internal locus of control, and build connections that will help them socially, academically, physically, and emotionally.

Participants will examine common best practices in education and have an opportunity to engage in their own reflective practice as to how they measure up. Creating a conducive college classroom climate does not happen by accident. It happens on purpose. Join us for this webinar to examine HOW effective teachers motivate their students.

Webinar Objectives

Participants will:

- Differentiate between the WHY and the HOW of student success and motivation
- Examine the underlying principles of student success
- Examine common best teaching practices in a college classroom
- Reflect on and describe how their teaching practices compare with the best practices
- Identify teaching strategies that are appropriate for their student population
- Apply basic principles of student success to their own teaching success (e.g. validation, self-efficacy, collaboration, active involvement)

Webinar Speaker
