Narrative Description

The scope is the installation of MXZ-4D30NL outdoor heat pump and required outlet and disconnect. All wiring and coolant lines will be run interior to the building. The proposed location of the outdoor heat pump is at the rear of the building in a zone designated for utilities and approved by the condominium. Currently the location has a bank of gas meters and a previously approved and installed outdoor heat pump. The new proposed outdoor heat pump would be wall-mounted, consistent with the existing unit and similarly screened from view by the existing mature plantings.
