NURSING DIAGNOSIS MANUAL

Planning, Individualizing, and Documenting Client Care

6TH EDITION

NURSE'S POCKET MINDER

Convert Nursing Problem Statement Into Nursing Diagnosis

Quickly Easily Accurately

THE NURSING REFERENCE

Below is a complete listing of NANDA-I nursing diagnoses list from 2018–2020.

Activity/Rest—*Ability to engage in necessary/ desired activities of life (work and leisure) and to obtain adequate sleep/rest*

Activity Intolerance, 28–32
Activity Intolerance, risk for, 32–34
Disuse Syndrome, risk for, 260–266
Diversional Activity Engagement, decreased, 266–269
Fatigue, 324–329
Insomnia, 504–508
Lifestyle, sedentary, 522–526
Sleep, readiness for enhanced, 818–820
Sleep Deprivation, 810–815
Sleep Pattern, disturbed, 815–818
Transfer Ability, impaired, 918–921
Walking, impaired, 952–955

Circulation—*Ability to transport oxygen and nutrients necessary to meet cellular needs*

Adaptive Capacity, decreased intracranial, 49–53
Autonomic Dysreflexia, 76–80
Autonomic Dysreflexia, risk for, 81–83
Bleeding, risk for, 93–96
Blood Pressure, risk for unstable, 101–104
Cardiac Output, decreased, 131–137
Cardiac Output, risk for decreased, 138–140
Shock, risk for, 792–796
Tissue Perfusion, ineffective peripheral, 902–907
Tissue Perfusion, risk for decreased cardiac, 907–911
Tissue Perfusion, risk for ineffective cerebral, 911–915
Tissue Perfusion, risk for ineffective peripheral, 915–918

Ego Integrity—*Ability to develop and use skills and behaviors to integrate and manage life experiences*

Anxiety, 63–68
Body Image, disturbed, 104–108
Coping, defensive, 213–216
Coping, ineffective, 219–224
Coping, readiness for enhanced, 227–229
Death Anxiety, 234–237
Decisional Conflict, 238–241
Decision-Making, readiness for enhanced, 241–244
Denial, ineffective, 244–247
Emancipated Decision-Making, impaired, 295–298
Emancipated Decision-Making, readiness for enhanced, 298–300
Emancipated Decision-Making, risk for impaired, 301
Emotional Control, labile, 302–304
Energy Field, imbalanced, 304–308
Fear, 329–333
Grieving, 384–388
Grieving, complicated, 388–392
Grieving, risk for complicated, 392–395
Hope, readiness for enhanced, 431–433
Hopelessness, 427–431
Human Dignity, risk for compromised, 434–436
Impulse Control, ineffective, 461–463
Mood Regulation, impaired, 557–559
Moral Distress, 559–562
Personal Identity, disturbed, 634–638
Personal Identity, risk for disturbed, 638–641
Post-Trauma Syndrome, 649–655
Post-Trauma Syndrome, risk for, 655–659
Power, readiness for enhanced, 667–669
Powerlessness, 659–663
Powerlessness, risk for, 664–667
Rape-Trauma Syndrome, 675–680
Relationship, ineffective, 680–683
Relationship, readiness for enhanced, 683–686
Relationship, risk for ineffective, 686–689

Religiosity, impaired, 690–692
Religiosity, readiness for enhanced, 693–695
Religiosity, risk for impaired, 695–698
Relocation Stress Syndrome, 698–702
Relocation Stress Syndrome, risk for, 702–705
Resilience, impaired, 705–709
Resilience, readiness for enhanced, 709–712
Resilience, risk for impaired, 712–715
Self-Concept, readiness for enhanced, 748–750
Self-Esteem, chronic low, 751–754
Self-Esteem, risk for chronic low, 755–758
Self-Esteem, risk for situational low, 759–761
Self-Esteem, situational low, 762–765
Sorrow, chronic, 829–831
Spiritual Distress, 832–836
Spiritual Distress, risk for, 836–839
Spiritual Well-Being, readiness for enhanced, 840–842
Stress Overload, 846–849

Elimination—*Ability to excrete waste products*

Constipation, 184–188
Constipation, chronic functional, 188–192
Constipation, perceived, 195–197
Constipation, risk for, 197–200
Constipation, risk for chronic functional, 192–195
Diarrhea, 255–260
Elimination, impaired urinary, 291–295
Gastrointestinal Motility, dysfunctional, 370–375
Gastrointestinal Motility, risk for dysfunctional, 376–379
[Gastrointestinal Perfusion, risk for ineffective], 380–383
Incontinence, bowel, 464–467
Incontinence, functional urinary, 467–470
Incontinence, overflow urinary, 471–473
Incontinence, reflex urinary, 474–476
Incontinence, risk for urge urinary, 477–479
Incontinence, stress urinary, 479–482
Incontinence, urge urinary, 483–486
Retention, urinary [acute/chronic], 715–720

Food/Fluid—*Ability to maintain intake of and utilize nutrients and liquids to meet physiological needs*

Blood Glucose Level, risk for unstable, 97–100
Breastfeeding, ineffective, 109–114
Breastfeeding, interrupted, 115–119
Breastfeeding, readiness for enhanced, 119–122
Breast Milk Production, insufficient, 122–126
Dentition, impaired, 247–251
Eating Dynamics, ineffective adolescent, 275–278
Eating Dynamics, ineffective child, 279–282
Eating Dynamics, ineffective infant, 282–285
Electrolyte Imbalance, risk for, 285–290
Feeding Pattern, ineffective infant, 333–336
[Fluid Volume, deficient (hyper/hypotonic)], 339–343
Fluid Volume, deficient [isotonic], 343–347
Fluid Volume, excess, 348–351
Fluid Volume, risk for deficient, 352–355
Fluid Volume, risk for imbalanced, 355–358
Liver Function, risk for impaired, 526–529
Metabolic Imbalance Syndrome, risk for, 542–544
Mucous Membrane Integrity, impaired oral, 562–568
Mucous Membrane Integrity, risk for impaired oral, 568–570
Nausea, 571–574
Nutrition, imbalanced: less than body requirements, 582–588
Nutrition, readiness for enhanced, 589–591
Obesity, 591–595
Overweight, 599–605
Overweight, risk for, 605–609
Swallowing, impaired, 874–879

Hygiene—*Ability to perform activities of daily living*

Self-Care, readiness for enhanced, 745–747

Self-Care Deficit: bathing, dressing, feeding,

toileting, 738–744

Self-Neglect, 774–777

Neurosensory—*Ability to perceive, integrate, and respond to internal and external cues*

Behavior, disorganized infant, 84–89

Behavior, readiness for enhanced organized infant, 89–91

Behavior, risk for disorganized infant, 92

Confusion, acute, 172–176

Confusion, chronic, 177–181

Confusion, risk for acute, 181–184

Memory, impaired, 538–541

Neurovascular Dysfunction, risk for peripheral, 578–582

[Sensory Perception, disturbed (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory)], 777–783

Unilateral Neglect, 931–935

Pain/Discomfort—*Ability to control internal/external environment to maintain comfort*

Comfort, impaired, 156–160

Comfort, readiness for enhanced, 160–163

Pain, acute, 609–614

Pain, chronic, 615–621

Pain, labor, 621–625

Pain Syndrome, chronic, 615–621

Respiration—*Ability to provide and use oxygen to meet physiological needs*

Airway Clearance, ineffective, 55–60

Aspiration, risk for, 68–72

Breathing Pattern, ineffective, 126–131

Gas Exchange, impaired, 366–370

Ventilation, impaired spontaneous, 935–940

Ventilatory Weaning Response, dysfunctional, 940–945

Safety—*Ability to provide safe, growth-promoting environment*

Acute Substance Withdrawal Syndrome, 41–45

Acute Substance Withdrawal Syndrome, risk for, 45–49

Adverse Reaction to Iodinated Contrast Media, risk for, 53–55

Allergy Reaction, risk for, 60–62

Contamination, 200–206

Contamination, risk for, 206–209

Dry Eye, risk for, 270–272

Dry Mouth, risk for, 272–275

Falls, risk for, 308–312

Female Genital Mutilation, risk for, 336–339

Frail Elderly Syndrome, 359–363

Frail Elderly Syndrome, risk for, 363–365

Health Maintenance, ineffective, 410–413

Home Maintenance, impaired, 423–426

Hyperbilirubinemia, neonatal, 436–441

Hyperbilirubinemia, risk for neonatal, 441–444

Hyperthermia, 444–448

Hypothermia, 448–452

Hypothermia, risk for, 453–455

Hypothermia, risk for perioperative, 455–457

Infection, risk for, 487–492

Injury, risk for, 492–497

Injury, risk for corneal, 497–500

Injury, risk for urinary tract, 500–504

Latex Allergy Reaction, 515–519

Latex Allergy Reaction, risk for, 520–522

Maternal-Fetal Dyad, risk for disturbed, 533–538

Mobility, impaired bed, 545–548

Mobility, impaired physical, 548–553

Mobility, impaired wheelchair, 553–556

Neonatal Abstinence Syndrome, 575–578

Occupational Injury, risk for, 595–599

Poisoning, risk for, 641–646

Positioning Injury, risk for perioperative, 646–649

Pressure Ulcer, risk for, 670–673

Protection, ineffective, 673–674

Self-Mutilation, 766–769

Self-Mutilation, risk for, 770–773

Sitting, impaired, 796–799

Skin Integrity, impaired, 800–806

Skin Integrity, risk for impaired, 806–810

Standing, impaired, 842–846

Sudden Infant Death, risk for, 850–853

Suffocation, risk for, 853–857

Suicide, risk for, 857–862

Surgical Recovery, delayed, 862–867

Surgical Recovery, risk for delayed, 867–870

Surgical Site Infection, risk for, 870–874

Thermal Injury, risk for, 880–883

Thermoregulation, ineffective, 884–886

Thermoregulation, risk for ineffective, 887–889

Thromboembolism, risk for venous, 890–892

Tissue Integrity, impaired, 892–898

Tissue Integrity, risk for impaired, 898–902

Trauma, risk for physical, 921–927

Trauma, risk for vascular, 927–930

Violence, risk for other-directed, 945

Violence, risk for self-directed, 946–951

Wandering [specify sporadic or continual], 955–959

Sexuality—*[Component of Ego Integrity and Social Interaction] Ability to meet requirements/characteristics of male/female role*

Childbearing Process, ineffective, 141–148

Childbearing Process, readiness for enhanced, 148–154

Childbearing Process, risk for ineffective, 155

Sexual Dysfunction, 784–788

Sexuality Pattern, ineffective, 789–792

Social Interaction—*Ability to establish and maintain relationships*

Attachment, risk for impaired, 72–76

Communication, impaired verbal, 164–169

Communication, readiness for enhanced, 169–172

Coping, compromised family, 210–212

Coping, defensive, 213–216

Coping, disabled family, 216–219

Coping, ineffective community, 224–226

Coping, readiness for enhanced community, 229–231

Coping, readiness for enhanced family, 232–234

Family Processes, dysfunctional, 313–317

Family Processes, interrupted, 317–321

Family Processes, readiness for enhanced, 321–323

Immigration Transition, risk for complicated, 458–461

Loneliness, risk for, 530–533

Parenting, impaired, 625–630

Parenting, readiness for enhanced, 630–633

Parenting, risk for impaired, 633–634

Role Conflict, parental, 720–723

Role Performance, ineffective, 723–727

Role Strain, caregiver, 727–733

Role Strain, risk for caregiver, 733–737

Social Interaction, impaired, 820–825

Social Isolation, 825–828

Teaching/Learning—*Ability to incorporate and use information to achieve healthy lifestyle/optimal wellness*

Development, risk for delayed, 251–255

[Growth, risk for disproportionate], 395–399

Health, deficient community, 403–406

Health Behavior, risk-prone, 400–403

Health Literacy, readiness for enhanced, 407–409

Health Management, ineffective, 417–420

Health Management, ineffective family, 414–416

Health Management, readiness for enhanced, 421–423

Knowledge, deficient, 509–513

Knowledge, readiness for enhanced [specify level], 513–515

NURSING DIAGNOSIS MANUAL

Planning, Individualizing, and Documenting Client Care

6TH EDITION

Marilynn E. Doenges, APN, BC—Retired

Clinical Specialist—Adult Psychiatric/Mental Health Nursing,
Adjunct Faculty (Ret)
Beth-El College of Nursing and Health Sciences, CU-Springs
Colorado Springs, Colorado

Mary Frances Moorhouse, RN, MSN, CRRN

Adjunct Nursing Faculty/Clinical Instructor
Pikes Peak Community College
Colorado Springs, Colorado
Nurse Consultant
TNT-RN Enterprises

Alice C. Murr, BSN, RN—Retired

Retired Legal Nurse Consultant, certified Rehabilitation Case
Manager, and certified practitioner in Critical Care Nursing
Parkville, Missouri

As new scientific information becomes available through basic and clinical research, recommended treatments and drug therapies undergo changes. The author(s) and publisher have done everything possible to make this book accurate, up to date, and in accord with accepted standards at the time of publication. The author(s), editors, and publisher are not responsible for errors or omissions or for consequences from application of the book and make no warranty, expressed or implied, in regard to the contents of the book. Any practice described in this book should be applied by the reader in accordance with professional standards of care used in regard to the unique circumstances that may apply in each situation. The reader is advised always to check product information (package inserts) for changes and new information regarding dose and contraindications before administering any drug. Caution is especially urged when using new or infrequently ordered drugs.

Nursing Diagnoses—Definitions and Classification 2018–2020. Copyright © 2018, 1994–2018 by NANDA International. Used by arrangement with Thieme. In order to make safe and effective judgments using NANDA-I nursing diagnoses, it is essential that nurses refer to the definitions and defining characteristics of the diagnoses listed in this work.

To our families and friends, who much of the time have had to manage without us while we work and dream, as well as cope with our struggles and frustrations.

The Doenges families: the late Dean, Jim; Barbara and Bob Lanza; David, Monita, Matthew, and Tyler; and John, Holly, Nicole, and Kelsey; and the Daigle families: Nancy, Jim; Jennifer, Brandon, Annabelle, Will, and Henry Smith-Daigle; and Jonathan, Kim, and Mandalyn JoAn.

The Moorhouse family: the late Jan; sons Paul, Jason, and Thenderlyn Moorhouse; granddaughters Alexa and Tanner Plant; Mary Isabella Moorhouse; and the perfect great-grandchild, Quinton Russell Plant.

To my children: Kevin and Tammy Carroll and Darin and Ck Carroll; the best grandchildren ever: Chelsea-Jane, Matthew, Joseph, Nathan, and Ben Carroll; and my perfect great-grandchildren: Maxwell Carroll Bockerstette and Easley Jo Bockerstette. You are my joy. Mom/Grammy Murr.

To our FAD family, especially Jacalyn Sharp and Amy Romano, our production team who assisted us in meeting deadlines and completing this new edition, and Robert Allen for teaching old nurses new technology.

To the nurses we are writing for, who daily face the challenge of meeting the needs of clients in varied settings and are looking for a practical way to organize and document this care. We believe that nursing diagnosis and these guides will help.

And to NANDA-I and the international nurses who are facilitating the development and dissemination of nursing diagnoses—we continue to champion your efforts and the work of promoting standardized languages.

PREFACE

The American Nurses Association (ANA) *Social Policy Statement* of 1980 was the first to define nursing as the diagnosis and treatment of human responses to actual and potential health problems. This definition, when combined with the ANA *Scope and Standards of Practice*, has provided impetus and support for the use of nursing diagnosis. Defining *nursing* and its effect on client care supports the growing awareness that nursing care is a key factor in client survival and in the maintenance, rehabilitative, and preventive aspects of healthcare. Changes and new developments in healthcare delivery in the past decades have given rise to the need for a common framework of communication to ensure continuity of care for the client moving between multiple healthcare settings and providers.

This book is designed to aid the student nurse and the practitioner in identifying interventions commonly associated with specific nursing diagnoses as disseminated by NANDA International. These interventions are the activities needed to implement and document care provided to the individual client and can be used in varied settings from acute to community/home care.

Chapter 1 presents a brief discussion of the nursing process and introduces the concept of evidence-based practice. Standardized nursing languages (SNLs) are discussed in Chapter 2, with a focus on NANDA-I (nursing diagnoses), NIC (interventions), and NOC (outcomes). NANDA-I has 244 diagnosis labels with definitions, defining characteristics, and related or risk factors used to define a client need or problem. NIC is a comprehensive standardized language providing more than 550 direct and indirect intervention labels with definitions and a list of activities a nurse might choose to carry out for each intervention. NOC language provides more than 540 outcome labels with definitions; a set of indicators describing specific client, caregiver, family, or community states related to the outcome; and a 5-point Likert-type measurement scale that can demonstrate client progress even when outcomes are not fully met. Chapter 3 addresses the assessment process using a nursing framework for data collection, such as the Diagnostic Divisions Assessment Tool.

A creative approach for developing and documenting the planning of care is demonstrated in

Chapter 4. Mind or Concept Mapping is a technique or learning tool provided to assist you in achieving a holistic view of your client, enhance your critical-thinking skills, and facilitate the creative process of planning client care. For more in-depth information and inclusive plans of care related to specific medical/psychiatric/obstetrical and newborn conditions (with rationale and the application of the diagnoses), refer to the larger work also published by the F. A. Davis Company: *Nursing Care Plans: Guidelines for Individualizing Client Care Across the Life Span*, 10th ed. (Doenges, Moorhouse, & Murr, 2019). Psychiatric/mental health and maternal/newborn plans of care are available on the Davis Plus Web site.

Chapter 6 contains 850 disorders and health conditions reflecting all specialty areas with associated nursing diagnoses written as client problem/need statements to aid you in validating the assessment and diagnosis steps of the nursing process.

In Chapter 5, the heart of the book, all the nursing diagnoses are listed alphabetically for ease of reference and include the diagnoses accepted for use by NANDA-I 2018–2020. The alphabetization of diagnoses follows NANDA-I's own sequencing, whereby diagnoses are alphabetized first by their key term, which is capitalized. Subordinate terminology or descriptors of the diagnosis are presented in lowercase words and are alphabetized secondarily to the key term (for example, chronic Pain is alphabetized under P, following acute Pain). Each approved diagnosis includes its location in NANDA-I's Taxonomy II (see Appendix A), definition, and information divided into the NANDA-I categories of Related or Risk Factors and Defining Characteristics. Related/Risk Factors information reflects causative or contributing factors that can be useful for determining whether the diagnosis is applicable to a particular client. Defining Characteristics (signs and symptoms or cues) are listed as subjective and/or objective and are used to confirm problem diagnoses, aid in formulating outcomes, and provide additional data for choosing appropriate interventions. We have not deleted or altered NANDA-I's listings; however, on occasion, we have added to their definitions and suggested additional criteria to provide clarification and direction. These additions are denoted with brackets [].

NANDA-I nursing diagnosis labels are designed to be multiaxial with seven axes or descriptors. An *axis* is defined as a dimension of the human response that is considered in the diagnostic process (see Appendix B). Sometimes an axis may be included in the diagnostic concept, such as ineffective community Coping, in which the unit of care (i.e., community) is named. Some are implicit, such as Activity Intolerance, in which the individual is the unit of care. At times, an axis may not be pertinent to a particular diagnosis and will not be a part of the nursing diagnosis label. For example, the time frame (e.g., acute, intermittent) or body part (e.g., cerebral, oral, skin) may not be relevant to each diagnostic situation.

Desired Outcomes/Evaluation Criteria are identified to assist you in formulating individual client outcomes and to support the evaluation process. Sample NOC linkages to the nursing diagnosis are provided.

Nursing priorities are used to group the suggested interventions, which are primarily directed to adult care, although interventions designated as across the lifespan do include pediatric and geriatric considerations and are designated by an icon. In general, the interventions can be used in multiple settings—acute care, rehabilitation, community clinics, home care, or private practice. Most interventions are independent or nursing originated; however, some interventions are collaborative orders (e.g., medical, psychiatric), and you will need to determine when this is necessary and take the appropriate action. Icons are also used to differentiate collaborative interventions, diagnostic studies, and medications, as well as transcultural

considerations. All of these “specialized” interventions are presented with icons, rather than being broken out under separate headings, to maintain their sequence within the prioritization of all nursing interventions for the diagnosis. Additionally, in support of evidence-based practice, rationales are provided for the interventions and references for these rationales are cited.

The inclusion of Documentation Focus suggestions is to remind you of the importance and necessity of recording the steps of the nursing process.

As noted, with few exceptions, we have presented NANDA-I’s recommendations as formulated. We support the belief that practicing nurses and researchers need to study, use, and evaluate the diagnoses as presented. Nurses can be creative as they use the standardized language, redefining and sharing information as the diagnoses are used with individual clients. As new nursing diagnoses are developed, it is important that the data they encompass are added to assessment tools and current databases. As part of the process by clinicians, educators, and researchers across practice specialties and academic settings to define, test, and refine nursing diagnosis, nurses are encouraged to share insights and ideas with NANDA-I at the following address: NANDA International, PO Box 72, Mountain, WI 54149; e-mail: info@nandainternational.com

The Nursing Process: The Foundation of Quality Client Care

DEFINING THE PROFESSION

In the world of healthcare, nursing has long struggled to establish itself as a profession. Dictionary terms describe nursing as “a calling requiring specialized knowledge and often long and intensive academic preparation; a principal calling, vocation, or employment; the whole body of persons engaged in a calling.”¹ Throughout the history of nursing, unfavorable stereotypes (based on the view of nursing as subservient and dependent on the medical profession) have negatively affected the view of nursing as an independent entity. In its early developmental years, nursing did not seek or have the means to control its own practice. Florence Nightingale, in discussing the nature of nursing in 1859, observed that “nursing has been limited to signify little more than the administration of medicines and the application of poultices.”² Although this attitude may persist in some small degree, the nursing profession has defined what makes nursing unique and has identified a body of professional knowledge. As early as 1896, nurses in the United States banded together to seek standardization of educational programs and laws governing their practice. The task of nursing since that time has been to create descriptive terminology reflecting specific nursing functions and levels of competency.³ Erickson, Tomlin, and Swain stated the belief that “nursing will thrive as a unique and valued profession when nurses present a theory and rationalistic model for their practice, correct misleading stereotypes, locate control with clients, and actively participate in processes for change.”⁴

In the past several decades, more than a dozen prominent nursing scholars (e.g., Rogers, Parse, and Henderson) have developed conceptualizations to

define the nature of nursing. Because much of nursing is nonphenomenological or nonobservable, the nature of nursing cannot be explained using the usual parameters of scientific investigation. Kikuchi proposes that conceptualizations about nursing are philosophic in nature and as such are still testable.⁵ As nursing research continues the work of establishing the profession as independent in its own right, the value of nursing goals is being understood and the difference between nursing and other professions is being delineated. Nursing is now recognized as both a science and an art concerned with the physical, psychological, sociological, cultural, and spiritual concerns of the individual. The science of nursing is based on a broad theoretical framework; its art depends on the caring skills and abilities of the individual nurse. The importance of the nurse within the healthcare system is noted in many positive ways, and the profession of nursing is acknowledging the need for its practitioners to act professionally and be accountable for the care they provide.

Barely a century after Florence Nightingale noted that “the very elements of nursing are all but unknown,” the American Nurses Association (ANA) developed its first Social Policy Statement in 1980, defining nursing as “the diagnosis and treatment of *human responses* to actual or potential health problems.”⁶ Human responses (defined as people’s experiences with and responses to health, illness, and life events) are nursing’s phenomena of concern. In 1995, this statement was revisited, updated, and titled “Nursing’s Social Policy Statement.” This policy statement acknowledged that since the release of the original statement, “nursing has been influenced by many

social and professional changes, as well as by the science of caring.”⁷

The statement delineated four essential features of today’s contemporary nursing practice:

1. Attention to the full range of human experiences and responses to health and illness without restriction to a problem-focused orientation
2. Integration of objective data with knowledge gained from an understanding of the client’s or group’s subjective experience
3. Application of scientific knowledge to the processes of diagnosis and treatment
4. Provision of a caring relationship that facilitates health and healing⁷

Thus, nursing’s role includes the promotion of health as well as the performance of activities that contribute to recovery from or adjustment to illness. This is reflected in ANA’s 2003 *Nursing’s Social Policy Statement*, which recognized nursing’s full scope of care by defining nursing as “the protection, promotion, and optimization of health and abilities, prevention of illness and injury, alleviation of suffering through the diagnosis and treatment of human response, and advocacy in the care of individuals, families, communities, and populations.”⁸ Also, nurses support the right of clients to define their own health-related goals and to engage in care that reflects their personal values. Emphasis is placed on the mind-body-spirit connection with a holistic view of the individual as nurses facilitate the client’s efforts in striving for growth and development.

In your readings, you will likely encounter other definitions of nursing. As your knowledge and experience develop, your definition of nursing may change to reflect your personal nursing philosophy, your focus on a particular care setting or population, or your specific role. For example, although the definition of nursing developed by Erickson, Tomlin, and Swain is more than 30 years old, it remains viable and timely because it incorporates the concepts noted previously with today’s holistic approach to care. Their definition includes what nursing is, how it is accomplished, and the goals of nursing: “Nursing is the holistic helping of persons with their self-care activities in relation to their health. This is an interactive, interpersonal process that nurtures strengths to enable development, release, and channeling of resources for coping with one’s circumstances and environment. The goal is to achieve a state of perceived optimum health and contentment.”⁴

An understanding of human nature is certainly important in the development of a philosophy of nursing. Understanding that “needs motivate behavior” helps the nurse to determine the client’s needs at a particular moment in time. Maslow’s hierarchy of needs⁹ provides a basis for understanding that unmet needs can interfere with an individual’s holistic growth and may even result in physical or mental distress and illness. Other theorists have also studied how people are similar, providing the nurse with more information to help understand the client. For example, Erik Erikson’s observations on the stages of psychological development suggest that the individual is a “work in progress” accomplishing age-specific maturational tasks throughout the life span. Piaget’s cognitive stages address how thinking develops and how individuals adapt to and organize their environment intellectually.⁴ However, in the end, the individual is the primary source of information about himself/herself. The nurse needs to listen with an open mind and empathic, unconditional acceptance to what the client is relating. Knowing how people are alike provides a basis to understanding human nature. However, each person is unique, and the nurse needs to look for the client’s model of the world and how it relates to the client’s own situation.

The nursing profession is further defined by fundamental philosophical beliefs that have been identified over time as essential to the practice of nursing. These values and assumptions offer guidance to the nurse and need to be kept in mind to enhance the quality of nursing care provided:

- The client is a human being who has worth and dignity.
- Humans manifest an essential unity of mind/body/spirit.⁷
- There are basic human needs that must be met (Maslow’s hierarchy of needs).
- When these needs are not met, problems arise that may require intervention by another person until the individuals can resume responsibility for themselves.
- Human experience is contextually and culturally defined.⁷
- Health and illness are human experiences.⁷
- Clients have a right to quality health and nursing care delivered with interest, compassion, and competence with a focus on wellness and prevention.

- The presence of illness does not preclude health, nor does optimal health preclude illness.⁷
- The therapeutic nurse-client relationship is important in the nursing process and provision of individualized care.

Finally, the ANA Code of Ethics for Nurses¹⁰ addresses the need for nurses to respect human dignity, acknowledge the uniqueness of each client, and honor the client's right to privacy. The Code (which has been updated on several occasions, the latest in 2015) states (in part) "Nursing encompasses the protection, promotion, and restoration of health and well-being, the prevention of illness and injury; and the alleviation of suffering in the care of individuals, families, groups, communities, and populations . . .", revealing the broadening of understanding of nursing's civic professionalism. The Code calls on nurses to assume responsibility for individual nursing judgments and actions and for the delegation of nursing activities to others. Nurses are encouraged to maintain competence in nursing, contribute to the ongoing development of the profession, and participate in the implementation and improvement of standards. This last goal can be accomplished by using the results of nursing research to engage in evidence-based nursing practice.

The roots of evidence-based practice lie in the efforts of many in the past. Hippocrates described the symptoms and course of illnesses and related them to the seasons, geographical area, and types of people associated with each. These hypotheses founded the rational approach to the understanding of disease. As knowledge grew and the germ theory of disease was accepted, epidemiology began to count disease events, leading to the establishment of a central government agency to collect and record data. This led to the posing of questions in the form of testable hypotheses, the collection of data to support or refute hypotheses,

and the development of statistical tools to summarize numerical data.¹¹ The work of Pasteur and Koch expanded the understanding of causal relationships between bacterial causes of many diseases, leading to reducing illness and mortality.

Florence Nightingale used statistics to measure health, identify causes of mortality, evaluate health services, and reform institutions. After the Crimean War, she began organizing committees, assembling data, and preparing reports and hearings on how administrative inadequacies affected clients' health. Her work resulted in British Army Hospital and government reforms in the interest of preventing death and disease. She became an honorary member of the American Statistical Association in 1874, and her papers were read at a National Social Science Congress in 1863 and at the nurses' congress of the Chicago World's Fair in 1893. The efforts of these pioneers laid the groundwork for the development of evidence-based practice.

Barnsteiner and Provost note that "the current definition [of evidence-based practice] is the integration of best research evidence with clinical expertise and patient values"¹²—that is, both research and nonresearch components are combined to create evidence-based practice. Quantitative research is invaluable in measuring the effectiveness of nursing interventions, while qualitative studies capture the preferences, attitudes, and values of healthcare consumers. However, the nurses' clinical judgment and individual client needs and perspectives must also be included. Research supports that evidence-based practice includes "enhancing the quality and reliability of health care, improving health outcomes, and reducing variations in care and costs." As nurses work to provide cost-effective care in the best setting for the client, "the most important [and challenging] requirement for practicing nurses in the 21st century will be to utilize [appropriate] evidence available to improve practice."¹³

ADMINISTERING NURSING CARE

Nursing leaders have identified a process that "combines the most desirable elements of the art of nursing with the most relevant elements of systems theory, using the scientific method."¹⁴ This *nursing process* incorporates an interactive and interpersonal approach with a problem-solving and decision-making process that serves as a framework for the delivery of nursing care.^{15–17}

The concept of a nursing process was first introduced in the 1950s as a three-step process of assessment, planning, and evaluation based on the scientific method of observing, measuring, gathering data, and analyzing the findings. Years of study, use, and refinement have led nurses to expand the nursing process to five distinct steps that provide an efficient method of organizing thought processes for clinical decision

making, problem solving, and the delivery of higher-quality, individualized client care. The nursing process now consists of the following:

- *Assessment* or the systematic collection of data relating to clients;
- *Diagnosis or need identification* involving the analysis of collected data to identify the client's needs;
- *Planning*, which is a two-part process of identifying goals and the client's desired outcomes to address the assessed health and wellness needs along with the selection of appropriate nursing interventions to assist the client in attaining the outcomes;
- *Implementation* or putting the plan of care into action; and
- *Evaluation* by determining the client's progress toward attaining the identified outcomes and the client's response to and the effectiveness of the selected nursing interventions for the purpose of altering the plan as indicated.

Because these five steps are central to nursing actions in any setting, the nursing process is now included in the conceptual framework of nursing curricula and is accepted as part of the legal definition of nursing in the Nurse Practice Acts of most states.

When a client enters the healthcare system, whether as an inpatient, a clinic outpatient, or a home-care client, the nursing process steps are set into motion. The nurse collects data, identifies client needs

(nursing diagnoses), establishes goals, creates measurable outcomes, and selects nursing interventions to assist the client in achieving these outcomes and goals. Finally, after the interventions have been implemented, the nurse evaluates the client's responses and the effectiveness of the plan of care in reaching the desired outcomes and goals to determine whether or not the needs or problems have been resolved and the client is ready to be discharged from the care setting. If the identified needs or problems remain unresolved, further assessment, additional nursing diagnoses, alteration of outcomes and goals, or changes of interventions are required.

Although we use the terms *assessment*, *diagnosis*, *planning*, *implementation*, and *evaluation* as separate, progressive steps, in reality they are interrelated. Together these steps form a continuous circle of thought and action that recycles throughout the client's contact with the healthcare system. Figure 1.1 depicts a model for visualizing this process. You can see that the nursing process uses the nursing diagnosis, which is the clinical judgment product of critical thinking. Based on this judgment, nursing interventions are selected and implemented. Figure 1.1 also shows how the progressive steps of the nursing process create an understandable model of both the products and the processes of critical thinking contained within the nursing process. The model graphically emphasizes both the dynamic and cyclic characteristics of the nursing process.

Figure 1.1 Diagram of the nursing process. The steps of the nursing process are interrelated, forming a continuous circle of thought and action that is both dynamic and cyclical.

APPLICATION OF THE NURSING PROCESS

The scientific method of problem solving introduced in the previous section is used almost instinctively by most people, without conscious awareness.

FOR EXAMPLE While studying for your semester finals, you snack on pepperoni pizza. After going to bed, you are awakened by a burning sensation in the center of your chest. You are young and in good health and note no other symptoms (assessment). You decide that your pain is the result of the spicy food you have eaten (diagnosis). You then determine that before you can return to sleep, you need to relieve the discomfort with an over-the-counter preparation (planning). You take a liquid antacid for your discomfort (implementation). Within a few minutes, you note the burning sensation is relieved, and you return to bed without further concern (evaluation).

As you see, this is a process you routinely use to solve problems in your life that can be readily applied to client-care situations. You need only to learn the new terms describing the nursing process rather than having to think about each step (assessment, diagnosis/need identification, planning, implementation, and evaluation) in an entirely new way.

To effectively use the nursing process, the nurse needs to possess and apply some basic abilities. Particularly important is a thorough knowledge of science and theory, not only as applied in nursing but also in

other related disciplines such as medicine and psychology. Creativity is needed in the application of nursing knowledge, as is adaptability in handling change and the many unexpected happenings that occur. As a nurse, you must make a commitment to practice your profession in the best possible way, trusting in yourself and your ability to do your job well and displaying the necessary leadership to organize and supervise as your position requires. In addition, intelligence, well-developed interpersonal skills, and competent technical skills are essential.

FOR EXAMPLE A diabetic client's irritable behavior could be the result of low serum glucose or the effects of excessive caffeine intake. However, it could also arise from a sense of helplessness regarding life events. A single behavior may have varied causes. It is important that your nursing assessment skills identify the underlying etiology to provide appropriate care.

The practice responsibilities presented in the definitions of nursing and the nursing process are explained in detail in the publication *Nursing: Scope & Standards of Practice*.¹⁸ The standards provide workable guidelines to ensure that the practice of nursing can be carried out by each nurse. Table 1.1 presents

an abbreviated description of the standards of clinical practice. With the ultimate goal of quality healthcare, the effective use of the nursing process will result in a viable nursing care system that is recognized and accepted as nursing's body of knowledge and that can be shared with other healthcare professionals.

ADVANTAGES OF USING THE NURSING PROCESS

There are many advantages to using the nursing process:

- The nursing process provides an organizing framework for meeting the individual needs of the client, the client's family/significant other(s), and the community.
- The steps of the nursing process focus the nurse's attention on the "individual" human responses of a client/family or group to a given health situation, resulting in a holistic plan of care addressing the specific needs of the client/family or group.
- The nursing process provides an organized, systematic method of problem solving (while still allowing for creative solutions) that may minimize dangerous errors or omissions in caregiving and avoid time-consuming repetition in care and documentation.
- The use of the nursing process promotes the active involvement of clients in their healthcare, enhancing

[illegible]

Standards of Practice

Describe a competent level of nursing care as demonstrated by the nursing process that encompasses all significant actions taken by the nurse in providing care and forms the foundation of clinical decision making.

1. **Assessment:** The registered nurse (RN) collects comprehensive data pertinent to the healthcare consumer's health and/or situation.
2. **Diagnosis:** The RN analyzes the assessment data to determine the diagnoses or the issues.
3. **Outcome Identification:** The RN identifies expected outcomes for a plan individualized to the healthcare consumer or the situation.
4. **Planning:** The RN develops a plan that prescribes strategies and alternatives to attain expected outcomes.
5. **Implementation:** The RN implements the identified plan.
 - a. **Coordination of Care:** The RN coordinates care delivery.
 - b. **Health Teaching and Health Promotion:** The RN employs strategies to promote health and a safe environment.
 - c. **Consultation:** The graduate-level specialty nurse or advanced-practice RN provides consultation to influence the identified plan, enhance the abilities of others, and effect change.
 - d. **Prescriptive Authority and Treatment:** The advanced-practice RN uses prescriptive authority, procedures, referrals, treatments, and therapies in accordance with state and federal laws and regulations.
6. **Evaluation:** The RN evaluates progress toward attainment of outcomes.

Standards of Professional Performance

Describe roles expected of all professional nurses appropriate to their education, position, and practice setting.

7. Ethics: The RN integrates practices ethically.
8. Culturally Congruent Practice: The RN practices in a manner that is congruent with cultural diversity and inclusion principles.
9. Communication: The RN communicates effectively in a variety of formats in all areas of practice.
10. Collaboration: The RN collaborates with the healthcare consumer, family, and others in the conduct of nursing practice.
11. Leadership: The RN demonstrates leadership in the professional practice setting and the profession.
12. Education: The RN attains knowledge and competence that reflects current nursing practice.
13. Evidence-Based Practice and Research: The RN integrates evidence and research findings into practice.
14. Quality of Practice: The RN contributes to quality nursing practice.
15. Professional Practice Evaluation: The RN evaluates her or his own nursing practice in relation to professional practice standards and guidelines, relevant statutes, rules, and regulations.
16. Resource Utilization: The RN utilizes appropriate resources to plan and provide nursing services that are safe, effective, and financially responsible.
17. Collegiality/Environmental Health: The RN practices in an environmentally safe and healthy manner.

consumer satisfaction. Such participation increases clients' sense of control over what is happening to them, stimulates problem solving, and promotes personal responsibility, all of which strengthen the client's commitment to achieving the identified goals.

- The use of the nursing process enables you as a nurse to have more control over your practice. This enhances the opportunity for you to use your knowledge, expertise, and intuition constructively and dynamically to increase the likelihood of a successful client outcome. This, in turn, promotes greater job satisfaction and your professional growth.
- The use of the nursing process provides a common language (nursing diagnosis) for practice,

unifying the nursing profession. Using a system that clearly communicates the plan of care to coworkers and clients enhances continuity of care, promotes achievement of client goals, provides a vehicle for evaluation, and aids in the development of nursing standards. In addition, the structure of the process provides a format for documenting the client's response to all aspects of the planned care.

- The use of the nursing process provides a means of assessing nursing's economic contribution to client care. The nursing process supplies a vehicle for the quantitative and qualitative measurement of nursing care that meets the goal of cost-effectiveness and still promotes holistic care.

Nursing is continuing to evolve into a well-defined profession with a more clearly delineated definition and phenomena of concern. Fundamental philosophical beliefs and qualities have been identified that are important for the nurse to possess in order to provide quality care.

The nursing profession has developed a body of knowledge that contributes to the growth and well-being of the individual and the community, the prevention of illness, the maintenance and/or restoration of health, and the relief of pain and provision of support when a return to health is not possible. The nursing process is the basis of all nursing actions and is the essence of nursing, providing a flexible, orderly, and logical problem-solving approach for administering nursing care so that client (whether individual, community, or population) needs for such care are met comprehensively and effectively. It can be applied in any healthcare or educational setting, in any theoretical or conceptual framework, and within the context of any nursing philosophy.

Each step of the nursing process builds on and interacts with the other steps, ensuring an effective practice model. Inclusion of the standards of clinical nursing practice provides additional information to reinforce understanding and opportunities to apply knowledge.

Please note, the term *client* rather than *patient* is used in this book to reflect the philosophy that the individuals or groups you work with are legitimate members of the decision-making process with some degree of control over the planned regimen and are able, active participants in the planning and implementation of their care.⁴

Next, we introduce the language described in the nursing process. This includes NANDA International's classification of nursing diagnoses,¹⁹ the Iowa Intervention and Outcome Projects: Nursing Interventions Classification (NIC),²⁰ and the Nursing Outcomes Classification (NOC).²¹ NANDA-I, NIC, and NOC have combined their classification systems (NNN Alliance) to provide a comprehensive nursing language.

The Language of Nursing: NANDA, NIC, NOC, and Other Standardized Nursing Languages

In this chapter, we look at the process and progress of describing the work of nursing because, as Lang has stated, “If we cannot name it, we cannot control it, practice it, teach it, finance it, or put it into public policy.”¹ At first glance, nursing seems to be a simple task. However, over many years, the profession has struggled, in part as a result of changes in healthcare delivery and financing, the expansion of nursing’s role, and the dawning of the computer age. Gordon reminded us that classification system development parallels knowledge development in a discipline.² As theory development and research have begun to define nursing, it has become necessary for nursing to find a common language to describe what nursing is, what nursing does, and how to codify it. Thus, the terms “classification systems” and “standardized language” have been embraced, and the work continues.

Changes in the healthcare system occur at an ever-increasing rate. One of these changes is the movement to a paperless (computerized or electronic) client record. The use of electronic healthcare information systems is rapidly expanding, and the focus has shifted from its original uses—financial and personnel management functions—to the efficient documentation of the client encounter, whether a single office visit or a lengthy hospitalization. The move to electronic documentation is being fueled by changes in healthcare delivery and reimbursement as well as the growth of alternative healthcare settings (outpatient surgeries, home health, rehabilitation or subacute units, extended or long-term care facilities, etc.), all of which increase the need for a commonality of communication to ensure continuity of care for the client who moves from one setting or level of care to another.

These changes in the business and documentation of healthcare require the industry to generate data about its operations and outcomes. Evaluation and improvement of provided services are important to the delivery of cost-effective client care. Therefore, providers and consumers interested in outcomes of care benefit from accurate documentation of the care provided and the client’s response. With the use of language or terminology that can be coded, healthcare information can be recorded in terms that are universal and easily entered into an electronic database and that can generate meaningful reporting data about its operation and outcomes. In short, standardized language is required.

A standardized language contains formalized terms that have definitions and guidelines for use. For example, if the impact of nursing care on financial and clinical outcomes is to be analyzed, coding of this information is essential. While it has been relatively easy to code medical procedures, nursing is more of an enigma because its work has not been so clearly defined.

Since the 1970s, nursing leaders have been working to define the profession of nursing and to develop a commonality of words describing practice (a framework of communication and documentation) so that nursing’s contribution to healthcare is captured, is visible in healthcare databases, and is thereby recognized as essential. Therefore, the focus of the profession has been on the effort to classify tasks and to develop standardized nursing languages (SNLs) to better demonstrate what nursing is and what nursing does.

Around the world, nursing researchers continue their efforts to identify and label people’s experiences with (and responses to) health, illness, and life processes as they relate to the scope of nursing practice.

The use of universal nursing terminology directs our focus to the central content and process of nursing care by identifying, naming, and standardizing the “what” and “how” of the work of nursing—including both direct and indirect activities. This wider application for a standardized language has spurred its development.

A recognized pioneer in SNL is NANDA International’s “nursing diagnosis.”³ Simply stated, a nursing diagnosis is defined as a clinical judgment about individual, family, or community responses to actual or potential health problems and life processes. Nursing diagnoses provide the basis for selecting nursing interventions to achieve outcomes for which the nurse is accountable.⁴ NANDA-I nursing diagnoses currently include 244 labels with definitions, defining characteristics, and related or risk factors used to define a client need or problem. Once the client’s need is defined, outcomes can be developed and nursing interventions chosen to achieve the desired outcomes.

The linkage of client problems or nursing diagnoses to specific nursing interventions and client outcomes has led to the development of several other SNLs, including Clinical Care Classification (originally Home Health Care Classification),^{5,6} Nursing Interventions Classification (NIC),⁷ Nursing Outcomes Classification (NOC),⁸ Omaha System-Community Health Classification System (OS),⁹ Patient Care Data Set (now retired),¹⁰ and Perioperative Nursing Data Set (PNDS).¹¹

Whereas some of these languages (e.g., OS and PNDS) are designed for a specific client population, the NANDA-I, NIC, and NOC languages are comprehensively designed for use across systems and settings and at individual, family, and community or population levels.¹²

NIC is a comprehensive standardized language providing 565 direct and indirect intervention labels with definitions. A list of activities a nurse might choose to carry out for each intervention is also provided and can be modified as necessary to meet the specific needs of the client. These research-based interventions encompass a broad range of nursing practices, addressing both general practice and specialty areas, including direct care as well as support or administrative activities.

NOC is also a comprehensive standardized language providing 540 outcome labels with definitions; a set of indicators describing specific client, caregiver, family, or community states related to the outcome; and a five-point Likert-type scale that facilitates tracking clients across care settings and that can demonstrate client progress even when outcomes are not fully met. The outcomes are research based and are

applicable in all care settings, clinical specialties, and across the life span.

In addition, NIC and NOC have been linked to the Omaha System problems, to resident assessment protocols used in extended/long-term care settings, and to NANDA-I. This last linkage created the NANDA, NIC, NOC (NNN) Taxonomy of Nursing Practice. The combination of NANDA-I nursing diagnoses, NOC outcomes, and NIC interventions in a common unifying structure provides a comprehensive nursing language recognized by the American Nurses Association (ANA) that is coded in the Systematized Nomenclature of Medicine (SNOMED), a multidisciplinary terminology supporting the electronic client record.

Having an SNL entered into international-coded terminology allows nurses to describe the care received by the client and to document the effects of that care on client outcomes, and it facilitates the comparison of nursing care across worldwide settings and diverse databases. In addition, it supports research by comparing client care delivered by nurses with that delivered by other providers, which is essential if nursing’s contribution is to be recognized and nurses are to be reimbursed for the care they provide.

The current 12 versions of SNLs (consisting of two data element sets and 10 terminologies) recognized by the ANA have been submitted to the National Library of Medicine for inclusion in the Unified Medical Language System Metathesaurus. The Metathesaurus provides a uniform, integrated distribution format from over 100 biomedical vocabularies and classifications (the majority in English and some in multiple languages), and it links many different names for the same concepts, establishing new relationships among terms from different source vocabularies.

Indexing of the entire medical record supports disease management activities (including decision support systems), research, and analysis of outcomes for quality improvement for all healthcare disciplines. Coding also supports telehealth (the use of telecommunications technology to provide medical information and healthcare services over distance) and facilitates access to healthcare data across care settings and different computer systems.

So, to those who stated “Nursing will thrive as a unique and valued profession when nurses present a theory and rationalistic model for their practice . . . and actively participate in processes for change,”¹³ we answer, “We are actively participating in processes for change, and as a profession, we will continue to grow.”

CHAPTER 3

The Assessment Process: Developing the Client Database

*Nursing: Scope & Standards of Practice*¹ addresses the assessment process. The standard stipulates that the data-collection process is systematic and ongoing, with the registered nurse collecting comprehensive data pertinent to the healthcare consumer's health and/or situation involving the healthcare consumer, family, and healthcare providers as appropriate, in holistic data

collection. The priority of the data collection is based on the healthcare consumer's immediate condition or the anticipated needs of the healthcare consumer or situation. Data are collected using appropriate evidence-based assessment techniques, instruments, and tools with the relevant data documented in a retrievable format.

THE CLIENT DATABASE

The assessment step of the nursing process is focused on eliciting a profile of the client that allows the nurse to identify client problems or needs and corresponding nursing diagnoses, to plan care, to implement interventions, and to evaluate outcomes. This profile, or *client database*, supplies a sense of the client's overall health status, providing a picture of the client's physical, psychosocial, emotional, sexual, cultural, spiritual/transpersonal, cognitive, age-related, and developmental levels; economic status; functional abilities; and lifestyle. It is a combination of data gathered from the history-taking interview (a method of obtaining SUBJECTIVE information by talking with the client

or significant others and listening to their responses), from the physical examination (a "hands-on" means of obtaining OBJECTIVE information), and from the results of laboratory tests and diagnostic studies. To be more specific, subjective data are what the client/significant others perceive and report, and objective data are what the nurse observes and gathers from other sources.

Assessment involves three basic activities:

- Systematically gathering data
- Organizing or clustering the data collected
- Documenting the data in a retrievable format

GATHERING DATA—THE INTERVIEW

Information in the client database is obtained primarily from the client (who is the most important or primary source) and then from family members/significant others (secondary sources), as appropriate, through conversation and by observation during a structured interview. Clearly, the interview involves more than simply exchanging and processing data. Nonverbal

communication is as important as the client's choice of words in providing the data. The ability to collect data that are meaningful to the client's health concerns depends heavily on the nurse's knowledge base; on the choice and sequence of questions; and on the ability to give meaning to the client's responses, integrate the data gathered, and prioritize the resulting information.

Insight into the nature and behavior of the client is essential as well.

The nurse's initial responsibility is to observe, collect, and record data without drawing conclusions or making judgments or assumptions. Self-awareness is a crucial factor in the interaction because perceptions, judgments, and assumptions can easily color the assessment findings unless they are recognized.

The quality of a history improves with experience with the interviewing process. Tips for obtaining a meaningful history include the following:

- Be a good listener.
- Listen carefully and attentively for whole thoughts and ideas, not merely isolated facts.
- Use the skills of active listening, silence, and acceptance to provide ample time for the person to respond. Be as objective as possible.
- Identify only the client's or significant others' contributions to the history.

The interview question is the major tool used to acquire information. How the question is phrased is an important skill for obtaining the desired results and getting the information necessary to make accurate nursing diagnoses. *Note:* Some questioning strategies to avoid include closed-ended and leading questions, probing, and agreeing or disagreeing that implies that the client is "right" or "wrong." It is important to remember, too, that the client has the right to refuse to answer any question, no matter how reasonably phrased.

The following are nine effective data-collection questioning techniques:

1. Open-ended questions allow clients maximum freedom to respond in their own way, impose no limitations on how the question may be answered, and can produce considerable information.

2. Hypothetical questions pose a situation and ask the client how it might be handled.
3. Reflecting or "mirroring" responses is a useful technique in getting at underlying meanings that might not be verbalized clearly.
4. Focusing consists of eye contact (within cultural limits), body posture, and verbal responses.
5. Giving broad openings encourages the client to take the initiative in what is to be discussed.
6. Offering general leads encourages the client to continue.
7. Exploring pursues a topic in more depth.
8. Verbalizing the implied gives voice to what has been suggested.
9. Encouraging evaluation helps clients to consider the quality of their own experiences.

The client's medical diagnosis can provide a starting point for gathering data. Knowledge of the anatomy and physiology of the specific disease process and severity of the condition also helps in choosing and prioritizing precise portions of the assessment. For example, when examining a client with severe chest pain, it may be wise to evaluate the pain and the cardiovascular system in a focused assessment before addressing other areas, possibly at a later time. Likewise, the duration and length of any assessment depend on circumstances such as the client's condition and the situation's urgency.

The data collected from the client or significant others contain a vast amount of information, some of which may be repetitious. However, some of the data will be valuable for eliciting information that was not recalled or volunteered previously. Enough material needs to be noted in the history so that a complete picture is presented and yet not so much that the information will not be read or used.

GATHERING DATA—THE PHYSICAL EXAMINATION

The physical examination is performed to gather objective information and serves as a screening device. Four common methods used during the physical examination are inspection, palpation, percussion, and auscultation. These techniques incorporate the senses of sight, hearing, touch, and smell. For the data collected during the physical examination to be

meaningful, it is vital to know the normal physical and emotional characteristics of humans well enough to be able to recognize deviations. To gain as much information as possible from the assessment procedure, the same format should be used each time a physical examination is performed to lessen the possibility of omissions.

GATHERING DATA—LABORATORY TESTS/DIAGNOSTIC PROCEDURES

Laboratory and other diagnostic studies are a part of the information-gathering stage providing supportive evidence. These studies aid in the management, maintenance, and restoration of health. In reviewing and interpreting laboratory tests, it is important to remember that the origin of the test material does not always correlate to an organ or body system (e.g., a urine test to detect the presence of bilirubin and urobilinogen could indicate liver disease, biliary obstruction, or hemolytic disease). In some cases, the results of a test are *nonspecific* because they indicate only a disorder

or abnormality and not the location of the cause of the problem (e.g., an elevated erythrocyte sedimentation rate [ESR] suggests the presence but not the location of an inflammatory process).

In evaluating laboratory tests, it is advisable to consider which medications (e.g., heparin, promethazine) are being administered to the client, including over-the-counter and herbal supplements (e.g., vitamin E), because these have the potential to alter, blur, or falsify results, creating a misleading diagnostic picture.

DOCUMENTING AND CLUSTERING THE DATA

Data gathered during the interview and physical examination, as well as from other records/sources, are organized and recorded in a concise, systematic way and clustered into similar categories. Various formats have been used to accomplish this, including a review of body systems. This approach has been utilized by both medicine and nursing for many years but was initially developed to aid the physician in making medical diagnoses. Currently, nursing is developing and fine-tuning its own tools for recording and clustering data. Several nursing models available to guide data collection include Doenges and Moorhouse's Diagnostic Divisions

(Table 3.1),^{2,3} Gordon's Functional Health Patterns,⁴ and the Nursing Assessment Tool for Data Collection (NATDC).⁵

The use of a nursing model as a framework for data collection (rather than a body systems approach [assessing the heart, moving on to the lungs, etc.] or the commonly known head-to-toe approach) has the advantage of focusing data collection on the nurse's phenomena of concern—the human responses to health, illness, and life processes.⁶ This facilitates the identification and validation of *nursing* diagnosis labels to describe the data accurately.

REVIEWING AND VALIDATING FINDINGS

The nurse's initial responsibility is to observe, collect, and record data without drawing conclusions or making judgments or assumptions. Self-awareness is a crucial factor in this interaction because perceptions, judgments, and assumptions can easily color the assessment findings.

Validation is an ongoing process that occurs during the data-collection phase and upon its completion, which is when the data are reviewed and compared. The nurse should review the data to be sure that the recordings are factual, to identify errors of omission, and to compare the objective and subjective data for incongruencies or inconsistencies that require additional investigation or a more focused assessment. Data that are grossly abnormal are rechecked, and any temporary factors that may affect the data are identified and noted. Validation is particularly important when

the data are conflicting, when the data sources may be unreliable, or when serious harm to the client could result from any inaccuracies. Validating the information reduces the possibility of drawing wrong inferences or conclusions that could result in inaccurate nursing diagnoses, incorrect outcomes, or inappropriate nursing actions. This can be done by sharing the assumptions with the individuals involved (e.g., client, significant other/family) and having them verify the accuracy of those conclusions. Sharing pertinent data with other healthcare professionals, such as the physician, dietitian, or physical therapist, can aid in collaborative planning of care. Data given in confidence should not be shared with other individuals (unless withholding that information would hinder appropriate evaluation or care of the client).

TABLE 3.1 General Assessment Tool

This is a suggested guideline/tool applicable in most care settings for creating a client database. It provides a nursing focus (Doenges & Moorhouse's Diagnostic Divisions of Nursing Diagnoses) that will facilitate planning client care. Although the sections are alphabetized here for ease of presentation, they can be prioritized or rearranged to meet individual needs. (Sample excerpts from psychiatric and obstetrical assessment tools are available on Davis Plus.)

Adult Medical/Surgical Assessment Tool

General Information

Name: _____ Age: _____ DOB: _____ Gender: _____ Race: _____
 Admission Date: _____ Time: _____ From: _____
 Reason for this visit/admission (primary concern): _____
 Source of information: _____ Reliability (1-4, with 4 = very reliable): _____

Activity/Rest

Subjective (Reports)

Occupation: _____ Able to participate in usual activities/hobbies: _____ Leisure time/diversional activities: _____
 Ambulatory: _____ Gait (describe): _____ Activity level (sedentary to very active; use scale if available): _____
 Regular exercise (type): _____
 Changes in muscle mass/tone/strength: _____
 History of problems/limitations imposed by condition (e.g., immobility, transfer difficulties, weakness, breathlessness): _____
 Feelings (e.g., exhaustion, restlessness, boredom, dissatisfaction): _____
 Developmental factors (e.g., delayed/age appropriate): _____
 Sleep: Hours: _____ Naps: _____ Aids: _____ Insomnia: _____ Related to: _____
 Difficulty falling asleep: _____ Difficulty staying asleep: _____
 Rested on awakening: _____ Excessive grogginess: _____ Bedtime rituals: _____
 Relaxation techniques: _____ Sleeps on more than one pillow: _____
 Use of oxygen (type): _____ When used: _____
 Medications or herbals for/affecting sleep: _____

Objective (Exhibits)

Observed response to activity: Heart rate: _____ Rhythm (reg/irreg): _____ Blood pressure: _____ Respiratory rate: _____
 Pulse oximetry: _____
 Mental status (e.g., cognitive impairment, withdrawn/lethargic): _____
 Neuromuscular assessment: Muscle mass/tone: _____ Posture (e.g., normal, stooped, curved spine): _____
 Tremors (location): _____ ROM: _____
 Strength: _____ Deformity: _____
 Mobility aids (list): _____

Circulation

Subjective (Reports)

History of/treatment date: High blood pressure: _____ Brain injury: _____ Stroke: _____ Heart condition/surgery: _____
 Rheumatic fever: _____ Palpitations: _____ Syncope: _____ Pain in legs: _____ Ankle/leg edema: _____ Blood clots: _____
 Bleeding tendencies: _____ Spinal cord injury/dysreflexia episodes (describe): _____
 Slow/delayed healing (describe): _____
 Extremities: Numbness (location): _____ Tingling (location): _____
 Cough (describe)/hemoptysis: _____
 Change in frequency/amount of urine: _____
 Medications/herbals: _____

Objective (Exhibits)

Color (e.g., pale, cyanotic, jaundiced, mottled, ruddy): Skin: _____ Mucous membranes: _____ Lips: _____ Nailbeds: _____
 Conjunctiva: _____ Sclera: _____
 Skin moisture (e.g., dry, diaphoretic): _____
 BP (R & L): Lying: _____ Sitting: _____ Standing: _____ Pulse pressure: _____ Auscultatory gap: _____
 Pulses (palpated 1-4 strength): Carotid: _____ Temporal: _____ Jugular: _____ Radial: _____ Femoral: _____ Popliteal: _____
 Posttibial: _____ Dorsalis pedis: _____
 Cardiac (palpation): Thrill: _____ Heaves: _____

TABLE 3.1 continued

Heart sounds (auscultation): Rate: _____ Rhythm: _____ Quality: _____ Friction rub: _____
 Murmur (describe location/sounds): _____
 Vascular bruit (location): _____ Jugular vein distention: _____
 Breath sounds (describe location & sounds): _____
 Extremities: Temperature: _____ Color: _____ Capillary refill (1–3 sec): _____ Edema (+1 to +4): _____ Varicosities (location): _____ Nail abnormalities: _____ Distribution/quality of hair: _____ Trophic skin changes: _____

Ego Integrity

Subjective (Reports)

Relationship status: _____
 Expressed concerns (e.g., financial, relationships, recent or anticipated lifestyle/role changes, recent tour(s) of combat duty): _____
 Stress factors: _____ Usual ways of handling stress: _____
 Expression of feelings of: Anger: _____ Anxiety: _____ Fear: _____ Grief: _____ Helplessness: _____ Hopelessness: _____
 Powerlessness: _____
 Cultural factors/ethnic ties: _____
 Religious affiliation: _____ Active/practicing: _____ Practices prayer/meditation: _____
 Religious/spiritual concerns: _____ Desires clergy visit: _____
 Expression of sense of connectedness/harmony with self and others: _____
 Medications/herbals: _____

Objective (Exhibits)

Emotional status (check those that apply):
 Calm: _____ Anxious: _____ Angry: _____ Withdrawn: _____ Fearful: _____ Irritable: _____ Restive: _____ Euphoric: _____
 Observed body language: _____ Observed physiological responses (e.g., crying, change in voice quality/volume): _____
 Changes in energy field: Temperature: _____ Color: _____ Distribution: _____ Movement: _____ Sounds: _____

Elimination

Subjective (Reports)

Usual bowel elimination pattern: _____ Character of stool (e.g., hard, soft, liquid): _____ Stool color (e.g., brown, black, yellow, clay colored, tarry): _____ Last BM/character of stool: _____ Constipation (acute/chronic): _____ Diarrhea (acute/chronic): _____ Bowel incontinence: _____ History of bleeding: _____ Hemorrhoids/fistula: _____
 Laxative use: _____ How often: _____ Enema/suppository: _____ How often: _____
 Usual voiding pattern and character of urine: _____
 Difficulty voiding: _____ Urgency: _____ Frequency: _____ Retention: _____ Bladder spasms: _____
 Pain/burning: _____
 Urinary incontinence (type & time of day usually occurs): _____
 History of kidney/bladder disease or stones: _____
 Diuretic use: _____ Other medications/herbals: _____

Objective (Exhibits)

Abdomen (auscultation): Bowel sounds (location/type): _____ Abdomen (palpation): Soft/firm: _____ Tenderness/pain (quadrant location): _____ Distention: _____ Palpable mass: _____ Size/girth: _____
 Bladder palpable: _____ Residual (per scan): _____ Overflow voiding: _____
 Rectal sphincter tone (describe): _____ Hemorrhoids/fistulas: _____
 Stool in rectum: _____ Impaction: _____ Occult blood: (+ or -): _____
 Presence/use of catheter or continence devices: _____ Ostomy appliances (describe appliance and location): _____

Food/Fluid

Subjective (Reports)

Usual diet (type): _____ Calorie/carbohydrate/protein/fat (g/day): _____ # of meals daily: _____
 Snacks (# daily, time consumed, type): _____
 Last meal consumed/content: _____
 Food preferences: _____ Food allergies/intolerances: _____
 Cultural or religious food preparation concerns/prohibitions: _____
 Usual appetite: _____ Change in appetite: _____
 Usual weight: _____ Unexpected/undesired weight loss or gain: _____
 Nausea/vomiting: _____ Related to? _____ Heartburn/indigestion: _____ Related to? _____ Relieved by? _____

(table continues on page 16)

TABLE 3.1 General Assessment Tool (continued)

Chewing/swallowing problems: _____ Gag/swallow reflex (present): _____
 Facial injury/surgery: _____ Stroke/other neurologic deficit: _____
 Teeth: Normal: _____ Dentures (full/partial): _____ Loose/absent teeth: _____ Sore mouth/gums: _____
 Dental hygiene practices: _____ Professional dental care/frequency: _____
 Diabetes/type: _____ Controlled with diet/pills/insulin: _____
 Vitamin/food supplement use: _____ Medications/herbals: _____

Objective (Exhibits)

Current weight: _____ Height: _____ Body build: _____ Body fat %: _____
 Skin turgor (e.g., firm, supple, dehydrated): _____ Mucous membranes (moist/dry): _____
 Edema (describe): Generalized: _____ Dependent: _____ Feet/ankles: _____ Periorbital: _____ Abdominal/ascites: _____
 Jugular vein distention: _____
 Breath sounds (auscultation)/location: Normal: _____ Diminished: _____ Crackles: _____ Wheezes: _____
 Condition of teeth/gums: _____ Appearance of tongue: _____ Mucous membranes: _____
 Bowel sounds (quadrant location/type): _____ Hernia/masses: _____
 Urine S/A or Chemstix: _____ Serum glucose (Glucometer): _____

Hygiene**Subjective (Reports)**

Ability to carry out activities of daily living: Independent/dependent (levels 1–4, with 1 = *no assistance needed* to 4 = *completely dependent*): _____

Mobility: _____ Needs assistance (describe): _____ Assistance provided by: _____
 Equipment/prosthetic devices required: _____
 Feeding: _____ Needs assistance preparing/eating (describe): _____ Assistive devices: _____
 Bathing: _____ Needs assistance setup/regulating water temperature/washing body parts (describe): _____
 Preferred time of personal care/bath: _____
 Dressing: _____ Needs assistance selecting clothing/dressing self (describe): _____
 Toileting: _____ Needs assistance transferring/cleaning self (describe): _____

Objective (Exhibits)

General appearance: Manner of dress: _____ Grooming/personal habits: _____
 Condition of hair/scalp: _____
 Body odor: _____ Presence of vermin (e.g., lice, scabies): _____

Neurosensory**Subjective (Reports)**

History of brain injury, trauma, stroke (residual effects): _____
 Fainting spells/dizziness: _____ Headaches (location/type/frequency): _____
 Tingling/numbness/weakness (location): _____
 Seizures: _____ History/onset: _____ Type (e.g., generalized, partial): _____ Frequency: _____ Aura (describe): _____
 Postictal state: _____ How controlled: _____
 Vision loss/changes: _____ Glasses/contacts: _____ Last exam: _____ Glaucoma: _____ Cataract: _____ Eye surgery (type/date): _____
 Hearing loss: _____ Sudden/gradual: _____ Hearing aids: _____ Last exam: _____
 Sense of smell (changes): _____ Epistaxis: _____
 Sense of taste (changes): _____
 Other: _____

Objective (Exhibits)

Mental status (note duration of change):
 Oriented: Person: _____ Place: _____ Time: _____ Situation: _____
 Check all that apply: Alert: _____ Drowsy: _____ Lethargic: _____ Stuporous: _____ Comatose: _____
 Cooperative: _____ Follows commands: _____ Agitated/restless: _____ Combative: _____
 Delusions (describe): _____ Hallucinations (describe): _____
 Affect (describe): _____ Speech: _____
 Memory: Recent: _____ Remote: _____
 Pupil shape: _____ Size/reaction: R/L: _____ Accommodation: _____
 Facial droop: _____ Swallowing: _____
 Hand grasp/release, R: _____ L: _____

TABLE 3.1 continued

Coordination: _____ Balance: _____ Walking: _____ Sitting: _____ Standing: _____
 Deep tendon reflexes (present/absent/location): _____ Tremors: _____ Posturing: _____ Paralysis (L/R): _____

Pain/Discomfort

Subjective (Reports)

Primary focus: Location: _____ Intensity (use pain scale/pictures): _____
 Quality (e.g., stabbing, aching, burning): _____ Radiation: _____
 Frequency: _____ Duration: _____
 Precipitating/aggravating factors: _____
 How relieved: OTC/prescription: _____ Nonpharmaceuticals/therapies: _____
 Associated symptoms (e.g., nausea, sleep problems, photosensitivity): _____
 Effect on daily activities: _____ Relationships: _____ Job: _____ Enjoyment of life: _____
 Additional pain focus/describe: _____
 Cultural expectations regarding pain perception and expression: _____

Objective (Exhibits)

Facial grimacing: _____ Guarding affected area: _____ Posturing: _____ Behaviors: _____ Narrowed focus: _____
 Emotional response (e.g., crying, withdrawal, anger): _____
 Vital sign changes (acute pain): BP: _____ Pulse: _____ Respirations: _____

Respiration

Subjective (Reports)

Dyspnea/related to: _____ Precipitating factors: _____ Relieving factors: _____
 Airway clearance (e.g., spontaneous/device): _____
 Cough (e.g., hard, persistent, croupy): _____ Sputum color/character: _____ Requires suctioning: _____
 History of/date: Bronchitis: _____ Emphysema: _____ Tuberculosis: _____ Recurrent pneumonia: _____
 Exposure to noxious fumes/allergens, infectious agents/diseases, poisons: _____
 Smoker: _____ packs/day: _____ # of pack years: _____ Cigar use: _____ Smokeless: _____ Vapes: _____
 Use of respiratory aids: _____ Oxygen (type, frequency, rate): _____
 Medications/herbals: _____

Objective (Exhibits)

Respirations (spontaneous/assisted): _____ Rate: _____ Depth: _____ Chest excursion (e.g., equal/symmetrical): _____ Use of accessory muscles: _____ Nasal flaring: _____ Fremitus: _____
 Breath sounds (describe): _____ Egophony: _____
 Skin/mucous membrane color (e.g., pale, cyanotic): _____ Clubbing of fingers: _____
 Sputum characteristics: _____
 Mentation (e.g., calm, anxious, restless): _____
 Pulse oximetry: _____

Safety

Subjective (Reports)

Allergies/sensitivity (medications, foods, environment, iodine, latex): _____
 Type of reaction: _____
 Blood transfusion/number: _____ Date: _____ Reaction (describe): _____
 Exposure to infectious diseases (e.g., measles, influenza, pink eye, whooping cough): _____
 Exposure to pollution, toxins, poisons/pesticides, radiation (describe reactions): _____
 Geographic areas lived in/recent travel: _____
 Immunization history/date: Tetanus: _____ MMR: _____ Polio: _____ Hepatitis: _____ Pneumonia: _____ Influenza: _____ HPV: _____
 Altered/suppressed immune system (list cause): _____
 History of sexually transmitted infection (date/type): _____ Testing: _____
 High-risk behaviors (specify): _____
 Uses seat belt regularly: _____ Uses bike helmet: _____ Other safety devices: _____
 Workplace safety/health issues (describe): _____ Occupation: _____ Currently working: _____ Rate working conditions (e.g., safety, noise, heating, water, ventilation): _____
 History of injuries (e.g., fall, vehicle crash, blast, gunshot, electrical, chemical): _____ Fractures/dislocations: _____
 Arthritis/unstable joints: _____ Joint replacement surgeries (type and date): _____ Back problems: _____
 Skin problems (e.g., rashes, lesions, moles, breast lumps, enlarged nodes)/describe: _____

(table continues on page 18)

TABLE 3.1 General Assessment Tool (continued)

Delayed healing (describe): _____
 Cognitive limitations (e.g., disorientation, confusion): _____
 Sensory limitations (e.g., impaired vision/hearing, detecting heat/cold, taste, smell, touch): _____
 Prosthesis (type and date received): _____ Ambulatory devices: _____
 Violence (episodes or tendencies): _____

Objective (Exhibits)

Body temperature/method (e.g., oral, rectal, temporal, tympanic): _____
 Skin integrity (mark location on diagram): Scars: _____ Rashes: _____ Lacerations: _____ Ulcerations: _____ Bruises: _____
 Blisters: _____ Drainage: _____ Burns (degree/% of body surface): _____

Musculoskeletal: General strength: _____ Muscle tone: _____ Gait: _____ ROM: _____ Paresthesia/paralysis: _____
 Results of testing (e.g., cultures, immune function, TB, hepatitis): _____

Sexuality (Component of Social Interaction)**Subjective (Reports)**

Sexually active: _____ Monogamous/committed relationship: _____ Use of condoms: _____
 Birth control method: _____
 Sexual concerns/difficulties: _____ Recent change in frequency/interest: _____ Pain/discomfort: _____

Objective (Exhibits)

Comfort level with subject matter: _____

Female: Subjective (Reports)

Menstruation: Age at menarche: _____ Length of cycle: _____ Duration: _____ Number of pads/tampons used/day: _____
 Last menstrual period: _____ Bleeding between periods: _____ Menopausal: _____ Last period: _____ Hysterectomy (type/date): _____
 Problems with: Hot flashes: _____ Night sweats: _____ Vaginal lubrication: _____ Vaginal discharge: _____
 Gynecological/breast surgery (type and date): _____
 Infertility concerns: _____ Type of therapy: _____
 Pregnant now: _____ Para: _____ Gravida: _____ Due date: _____
 Practices breast self-examination: _____ Last mammogram: _____ Last Pap smear: _____
 Hormonal therapy: _____ Supplemental calcium: _____ Other medications/herbals: _____

Female: Objective (Exhibits)

Breast examination: _____
 Genitalia: _____ Warts/lesions: _____ Vaginal bleeding/discharge: _____
 Test results: _____ Pap: _____ Mammogram: _____ STI: _____

Male: Subjective (Reports)

Penis: Circumcised: _____ Lesions/discharge: _____ Vasectomy: _____
 Prostate disorder/voiding difficulties: _____

TABLE 3.1 continued

Practices self-examination: Breast: _____ Testicles: _____
 Last proctoscopic/prostate examination: _____ Last PSA: _____
 Medications/herbals: _____

Male: Objective (Exhibits)

Genitalia: Penis: _____ Warts/lesions: _____ Bleeding/discharge: _____ Testicles (e.g., descended, lumps): _____
 Prostate: _____
 Breast examination: _____
 Test results: _____ STI: _____ PSA: _____

Social Interactions

Subjective (Reports)

Relationship status: Single: _____ Married: _____ Living with partner: _____ Divorced: _____ Widowed: _____
 Years in relationship: _____ Perception of relationship: _____ Concerns/stresses: _____
 Role within family structure: _____ Number/age of children: _____
 Individuals living in home: _____ Caregiver (to whom & how long): _____
 Extended family/availability: _____ Other support person(s): _____
 Perception of relationship with family members: _____
 Ethnic/cultural affiliation: _____ Strength of ethnic identity: _____ Lives in ethnic community: _____
 Feelings of (describe): Mistrust: _____ Rejection: _____ Unhappiness: _____ Loneliness/isolation: _____
 Problems related to illness/condition: _____
 Difficulties with communication (e.g., speech, another language, brain injury): _____
 Use of communication aids (list): _____ Requires interpreter: _____
 Genogram: (complete on separate form)

Objective (Exhibits)

Communication/speech: Clear: _____ Slurred: _____ Unintelligible: _____ Aphasic: _____
 Unusual speech pattern/impairment: _____ Laryngectomy present: _____
 Use of speech/communication aids: _____
 Verbal/nonverbal communication with family/significant other(s): _____
 Family interaction (behavioral) pattern: _____

Teaching/Learning

Subjective (Reports)

Communication: Dominant language (specify): _____ Second language: _____
 Literate (reading/writing): _____
 Education level: _____ Learning disabilities (specify): _____ Cognitive limitations: _____
 Culture/ethnicity: _____ Where born: _____ If immigrant, how long in this country: _____
 Health and illness beliefs/practices/customs: _____
 Which family member makes healthcare decisions/is spokesperson for client: _____
 Presence of Advance Directives: _____ Code status: _____ Durable Medical Power of Attorney: _____ Designee: _____
 Organ Donor status: _____ Health goals: _____
 Current health problem/need: _____ Client understanding of problem: _____
 Special healthcare concerns (e.g., impact of religious/cultural practices, healthcare decisions, family involvement): _____
 Familial risk factors (indicate relationship): Diabetes: _____ Thyroid (specify): _____ Tuberculosis: _____
 Heart disease: _____ Stroke: _____ High BP: _____
 Epilepsy/seizures: _____ Kidney disease: _____ Cancer: _____ Mental illness/depression: _____ Other: _____
 Prescribed medications (list each separately): _____
 Drug: _____ Dose: _____ Times (circle last dose): _____
 Take regularly: _____ Purpose: _____ Side effects/problems: _____
 Nonprescription drugs/frequency: _____
 OTC drugs: _____ Vitamins: _____ Herbs: _____ Street drugs: _____
 Alcohol (amount/frequency): _____ Tobacco: _____ Smokeless tobacco: _____
 Admitting diagnosis per provider: _____
 Reason for hospitalization/visit per client: _____
 History of current problem/concern: _____
 Client expectations of this hospitalization/visit: _____
 Will admission cause any lifestyle changes (describe): _____

 Dietary: _____ Home care: _____ Resp/O₂: _____ Equipment: _____ Supplies: _____ Other: _____

SUMMARY

The assessment step of the nursing process emphasizes and should provide a holistic view of the client. The generalized assessment done during the overall data-gathering process creates a profile of the client. A focused, or more detailed, assessment may be warranted given the client's condition or emergent time constraints, or it may be done to obtain more information about a specific issue that needs expansion or

clarification. Both types of assessments provide important data that complement each other. A successfully completed assessment creates a picture of clients' states of wellness, their response to health concerns or problems, and individual risk factors—this is the foundation for identifying appropriate nursing diagnoses, developing client outcomes, and choosing relevant interventions necessary for providing individualized care.

CHAPTER 4

Concept or Mind Mapping to Create and Document the Plan of Care

The plan of care may be recorded on a single page or in a multiple-page format, with one page for each nursing diagnosis or client diagnostic statement. The format for documenting the plan of care is determined by agency policy. As a practicing professional, you might use a computer with a plan-of-care database, preprinted standardized care plan forms, or clinical pathways. Whichever form you use, the plan of care enables visualization of the nursing process and must reflect the basic nursing standards of care; personal client data; nonroutine care; and qualifiers for interventions and outcomes, such as time, frequency, and amount.

As students, you are asked to develop plans of care that often contain more detail than what you see in

the hospital plans of care. This is to help you learn how to apply the nursing process and create individualized client care plans. However, even though much time and energy may be spent focusing on filling in the columns of traditional clinical care plan forms, some students never develop a holistic view of their clients and fail to visualize how each client need interacts with other identified needs. A new technique, or *megacognitive* learning tool, has been developed to assist you in visualizing the linkages and understanding the interrelationships among a client's health concerns, to enhance and evaluate your critical thinking skills, and to facilitate the creative process of planning client care.^{1,2}

CONCEPT OR MIND MAPPING CLIENT CARE

Have you ever asked yourself whether you are more right-brained or left-brained? Those who naturally use their left brains are more linear in their thinking. Right-brain thinkers see more in pictures and illustrations. It is best for nurses to use the whole brain (right and left) when thinking about providing the broad scope of nursing care to clients.

No More Columns!

Traditional nursing care plans are linear—that is, they are designed in columns. They speak almost exclusively to the left brain. The traditional nursing care plan is organized according to the nursing process, which guides us in problem-solving the nursing care we give. However, the linear nature of the traditional plan does not facilitate interconnecting data from one

“row” to another or between parts in a column. Concept mapping allows us to show the interconnections among various client symptoms, interventions, and problems as they impact each other.

You can keep the parts that are great about traditional care plans (problem-solving and categorizing), but change the linear or columnar nature of the plan to a design that uses the whole brain—bringing left-brained, linear problem-solving together with the free-wheeling, interconnected, creative right brain. Joining concept mapping and care planning enables you to create a whole picture of a client with all the interconnections identified.

There are several diverse and innovative ways to mind map or to concept map nursing care plans.³ The examples in this chapter use mind mapping and require placing the client at the center, with all ideas

on one page (for a whole picture); the examples also use color coding and creative energy.^{4,5} When doing a large mapped plan of care, a light poster board is often used so that all ideas fit on one page.

Components of a Concept Map

Tony Buzan developed the idea of mind mapping as a way to depict how ideas about a main subject are related. Mapping represents graphically the relationships and interrelationships of ideas and concepts.⁶ It fosters and encourages critical thinking through brainstorming about a particular subject. Mueller, Johnston, and Bligh took the process of mind mapping and combined it with care planning to enhance nursing students' critical thinking and provision of holistic nursing care.³ This process has also been referred to as concept mapping.

Instead of starting at the top of the page, concept mapping starts at the page's center. The main concept of our thinking goes in this center stage place.

From that central thought, simply begin thinking of other main ideas that relate to the central topic.

These ideas radiate out from the central idea like spokes of a wheel (see subsequent discussion); however, they do not have to be added in a balanced manner. The “wheel” does not have to be round.

You will generate further ideas related to each spoke (see subsequent discussion), and your mind will race with even more ideas from those thoughts, which can be represented through pictures or words.

As you think of new ideas, write them down immediately. This may require going back and forth from one area of the page to another. Writing your concept map by hand allows you to move faster. Avoid

using a computer to generate a map because it hinders the fast-paced process. You can group different concepts together by color coding or by placement on the page (see subsequent discussion).

As you see connections and interconnections among groups of ideas, use arrows or lines to connect those concepts (refer to the dotted lines). You can also add defining phrases that explain how the interconnected thoughts relate to one another, as in the figure above.

Some left-brain thinkers find it very difficult to start their ideas in the middle of a page. If you are this type of thinker, try starting at the top of the page (see subsequent discussion), but you must still represent your ideas in illustration form, not in paragraphs.

Concept maps created by different people look different. They are unique to the mind's eye picture, so do not expect your map to be the same as someone else's.

CONCEPT MAPPING A PLAN OF CARE

Concept mapping is an exciting alternative format for illustrating a written plan of care. A mapped care plan will look very different from traditional plans of care, which are usually completed on linear forms.

To begin mapping a client plan of care, you must begin with the central topic—the client. Now you are thinking like a nurse. Create a shape that signifies “client” to you and place it at your map’s center. If your hand just cannot start at the center, then put the shape at the top. This will help you remember that the client, not the medical diagnosis or condition, is the focus of your plan. All other pieces of the map will be connected in some manner to the client. Many different pieces of information about the client can be connected directly to the client. For example, each of the following pieces of critical client data could stem from the center:

- 78-year-old widower
- No family in the state
- Obese
- Medical diagnosis of recurrent community-acquired pneumonia

Now, you must do a bit of thinking about how you think. To create the rest of your map, ask yourself how *you* plan client care. For example, which of these

items do you see first or think of first as the basis for your plan: the clustered assessment data, nursing diagnoses, or outcomes? Whichever piece you choose becomes your first layer of connections. Suppose when thinking about a plan of care for a female client with heart failure, you think first in terms of all the nursing diagnoses about that woman and her condition. Your map would start with the diagnoses featured as the first “branches,” with each one listed separately in some way on the map.

Completing the map then becomes a matter of adding the rest of the pieces of the plan using the nursing process and your own way of thinking or planning as your guide. If you began your map using nursing diagnoses, you might think, “What signs and symptoms or data support these diagnoses?” Then, you would connect clusters of supporting data to the related nursing diagnosis. Or you might think, “What client outcomes am I trying to achieve when I address this nursing diagnosis?” In that case, you would next connect client outcomes (or NOC labels) to the nursing diagnoses.

To keep your map clear, as suggested previously, use different colors and maybe a different shape, spoke, or line for each piece of the care plan that you add. For example:

- Red for signs and symptoms (to signify danger)
- Yellow for nursing diagnoses (for “stop and think what this is”)
- Green for nursing interventions or NIC labels (for “go”)
- Blue (or some other color) for outcomes or NOC labels

When all the pieces of the nursing process are represented, each branch of the map is complete. There should be a nursing diagnosis (supported by subjective and objective assessment data), nursing interventions, desired client outcome(s), and any evaluation data, all connected in a manner that shows there is a relationship among them.

It is critical to understand that there is no preset order for the pieces because one cluster is not more or less important than another (or one is not “subsumed” under another). It is important, however, that those pieces within a branch be in the same order in each branch.

So, you might ask, how is this different from writing out information in a linear manner? What makes mapping so special? One of the things you may have discovered about caring for clients is that the care you deliver is very interconnected. Taking care of one problem often results in the simultaneous correction of another. For example, if you resolve a fluid volume

problem in a client with heart failure, you will also positively impact the client’s gas exchange and decrease his or her anxiety. These kinds of interconnections cannot be shown on linear plans of care, yet they are what practicing nurses see in their mind’s eye all the time. These interconnections can be represented on a map with arrows or dotted or dashed lines that tie related ideas together. Then, defining phrases that explain the nature of the interconnection can be added to further clarify the relationship, as shown in Figure 4.1.

In addition to the pieces of the nursing process, other components of care can be illustrated on a map. Nurses have certain responsibilities when clients have diagnostic tests (such as an angiography or a bronchoscopy). These tests can be connected to the appropriate piece of your map, along with the correct nursing interventions related to those tests. Another item to be added is potential complications or collaborative problems.

Taking your clients’ needs one step further, try asking every client you have (medical, surgical, or otherwise), “What is the most important thing to you now in relation to why you are here?” Obtaining this information builds an alliance between you and your client, and together you can work toward that desired outcome. Add it to your map and see how your plan of care becomes more client centered (refer to Fig. 4.2).

SUMMARY

Concept maps allow you to do something that is different and creative. They require you to think (and learn), make connections, and use colors and shapes. They help you to focus on the client, and having the map on one page helps you to understand the “whole picture” better. Concept maps also help you become better organized and develop your own unique approach to “thinking like a nurse” much sooner.

A student who had written many traditional plans of care in her previous nursing program wrote the following about concept-mapped care plans:

Concept mapping is painting a picture using colors of the rainbow on blank paper to tell the story of your client using “NANDA” nursing diagnoses and the nursing process. Previously, I was a

student in prison (my mind) who hated the words “CARE PLAN,” writing page after page in narrative form. It was laborious to do and boring to read. There was no life or heartbeat.

Concept mapping opened the prison doors, and my care plan took on human form with a VOICE, a beating HEART, and COLOR while still incorporating the nursing process and standardized nursing language. My mind now took on the professional thought process for which NANDA, NIC, and NOC were created to facilitate nursing; however, the magic was in concept mapping, which removed all my fears, and the client became a beautiful painting with a heartbeat.³

Figure 4.1 Concept map of a plan of care for a client with heart failure.

Figure 4.2 Concept map of a plan of care for a client with pneumonia.

Nursing Diagnoses in Alphabetical Order

Activity Intolerance [Specify Level]

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/Pulmonary Responses (00092) [**Diagnostic Division:** Activity/Rest], Submitted 1982, revised 2017

DEFINITION: Insufficient physiological or psychological energy to endure or complete required or desired daily activities.

RELATED FACTORS

Physical deconditioning
Sedentary lifestyle
Immobility
Imbalance between oxygen supply and demand

DEFINING CHARACTERISTICS

Subjective

Fatigue, generalized weakness
Exertional discomfort, dyspnea

Objective

Abnormal heart rate or blood pressure response to activity
ECG change [e.g., arrhythmia, conduction abnormality, ischemia]

FUNCTIONAL LEVEL CLASSIFICATION³

Level I: Walk, regular pace, on level indefinitely; climb one flight or more, but more short of breath than normal
Level II: Walk one city block [or] 500 ft on level; climb one flight slowly without stopping
Level III: Walk no more than 50 ft on level without stopping; unable to climb one flight of stairs without stopping
Level IV: Dyspnea and fatigue at rest

Sample Clinical Applications: Anemias, angina, aortic stenosis, bronchitis, emphysema, cancers, diabetes mellitus, dysmenorrhea, heart failure, HIV/AIDS, labor/preterm labor, leukemias, mitral stenosis, obesity, pain, pericarditis, peripheral vascular disease, rheumatic fever, thrombocytopenia, tuberculosis, uterine bleeding

Information that appears in brackets has been added by the authors to clarify and enhance the use of the nursing diagnoses.

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Activity Tolerance: Physiological response to energy-consuming movements with daily activities

Energy Conservation: Personal actions to manage energy for initiating and sustaining activity

Endurance: Capacity to sustain activity

Psychomotor Energy: Personal drive and energy to maintain activities of daily living, nutrition, and personal safety

Client Will (Include Specific Time Frame)

- Identify negative factors affecting activity tolerance and eliminate or reduce their effects when possible.
- Use identified techniques to enhance activity tolerance.
- Participate in necessary/desired activities.
- Report measurable increase in activity tolerance.
- Demonstrate a decrease in physiological signs of intolerance (e.g., pulse, respirations, and blood pressure remain within client's usual range).

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Activity Therapy: Prescription of and assistance with specific physical, cognitive, social, and spiritual activities to increase the range, frequency, or duration of an individual's (or group's) activity

Energy Management: Regulating energy use to treat or prevent fatigue and optimize function

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

NURSING PRIORITY NO. 1 To identify causative/precipitating factors:

- Note presence of acute or chronic illness, such as heart failure, pulmonary disorders, hypothyroidism, diabetes mellitus, AIDS, anemias, cancers, acute and chronic pain, etc. *Many factors cause or contribute to fatigue, but the term "activity intolerance" implies that the client cannot endure or adapt to increased energy or oxygen demands caused by an activity.*^{1,8,9}
- Assess cardiopulmonary response to physical activity by measuring vital signs, noting heart rate and regularity, respiratory rate and work of breathing, and blood pressure before, during, and after activity. Note progression or accelerating degree of fatigue. *Dramatic changes in heart rate and rhythm, changes in usual blood pressure, and progressively worsening fatigue result from imbalance of oxygen supply and demand. These changes are potentially greater in the frail, elderly population.*^{1,3,10,11}
-  Note treatment-related factors such as side effects and interactions of medications. *Can affect nature and degree of activity intolerance.*
-  Determine if client is receiving medications such as vasodilators, diuretics, or beta blockers. *Orthostatic hypotension can occur with activity because of medication effects (vasodilation), fluid shifts (diuresis), or compromised cardiac pumping function.*¹⁵
- Note client reports of difficulty accomplishing tasks or desired activities. Evaluate current limitations or degree of deficit in light of usual status and what the client perceives causes, exacerbates, and helps the problem. *Provides comparative baseline, influences choice of interventions, and may reveal causes that the client is unaware of affecting energy, such as sleep deprivation, smoking, poor diet, depression, or lack of support.*^{2,10,11}

- Ascertain ability to sit, stand, and move about as desired. Note degree of assistance necessary and/or use of assistive equipment. *Helps to differentiate between problems relating to movement and problems with oxygen supply and demand characterized by fatigue and weakness.*^{2,8,9,11}
- Identify activity needs versus desires (e.g., client barely able to walk up stairs but states would like to play racquetball). *Assists caregiver in dealing with reality of situation as well as the feasibility of goals client wants to achieve when developing activity plan.*
- Assess emotional or psychological factors affecting the current situation. *Stress and/or depression may be exacerbating the effects of an illness, or depression may be the result of therapy and/or limitations.*

NURSING PRIORITY NO. 2 To assist client to deal with contributing factors and manage activities within individual limits:

- Monitor vital signs before and during activity, watching for changes in blood pressure, heart and respiratory rate, and post-activity vital sign response. *Vital signs may change during activity (including higher or lower pulse or blood pressure) and should return to baseline within 5 to 7 min after activity if response to activity is normal.*¹
- Observe respiratory rate, noting breathing pattern, breath sounds, skin color, and mental status. *Pallor and/or cyanosis, presence of respiratory distress, or confusion may be indicative of need for oxygen during activities, especially if respiratory infection or compromise is present.*
- Plan care with rest periods between activities *to reduce fatigue.*
- Assist with self-care activities. Adjust activities or reduce intensity level, or discontinue activities that cause undesired physiological changes. *Prevents overexertion.*
- Increase exercise/activity levels gradually; encourage stopping to rest for 3 minutes during a 10-minute walk, or sitting down instead of standing to brush hair. *Methods of conserving energy.*
- Encourage expression of feelings contributing to or resulting from condition. Provide positive atmosphere while acknowledging difficulty of the situation for the client. *Helps to minimize frustration, rechannel energy.*
- Involve client/significant others (SOs) in planning of activities as much as possible. *May give client opportunity to perform desired or essential activities during periods of peak energy.*
- Assist with activities and provide and monitor client's use of assistive devices. *Enables client to maintain mobility while protecting from injury.*
- Promote comfort measures and provide for relief of pain *to enhance client's ability and desire to participate in activities.*^{9,11} (Refer to NDs acute Pain, chronic Pain.)
-  Provide referral to collaborative disciplines, such as an exercise physiologist, psychological counseling/therapy, occupational/physical therapy, and recreation/leisure specialists. *May be needed to develop individually appropriate therapeutic regimens.*
-  Prepare for/assist with and monitor effects of exercise-capacity testing. *May be performed to determine degree of oxygen desaturation and/or hypoxemia that occurs with exertion or to optimize titration of supplemental oxygen when used.*^{5,8}
-  Implement graded exercise or rehabilitation program under direct medical supervision. *Gradual increase in activity avoids excessive myocardial workload and associated oxygen demand and has been shown to exert positive health benefits, even in those with chronic diseases. One intervention review found that for people with mild to moderate systolic heart failure, there was neither a reduction nor an increase in the risk of death with exercise. However, following exercise training, there was a reduction in hospital admissions due to systolic heart failure.*⁴
-  Administer supplemental oxygen, medications, prepare for surgery, and other treatments, as indicated. *Type of therapy or medication is dependent on the underlying condition and might include medications (e.g., antiarrhythmics, bronchodilators) or surgery (e.g., stents or coronary artery bypass graft) to improve myocardial perfusion and systemic circulation. Other treatments might include iron preparations or blood transfusion to treat severe anemia or use of oxygen and bronchodilators to improve respiratory function.*^{6,7,12,14}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review expectations of client/SOs/providers and explore conflicts or differences. *Help to establish goals and to reach agreement for the most effective plan.*
- Assist or direct client/SOs to plan for progressive increase of activity level, aiming for maximal activity within the client's ability. *Promote improved or more normal activity level, stamina, and conditioning.*
-  Instruct client/SOs in monitoring response to activity and in recognizing signs/symptoms that indicate need to alter activity level. *Assist in self-management of condition and in understanding of reportable problems. Research studies continue to confirm that regular physical activity not only reduces the risk of many adverse outcomes, but it also provides health benefits.*^{8,9,13,16}
- Give client information that provides evidence of daily or weekly progress to sustain motivation.
- Assist client to learn and demonstrate appropriate safety measures, such as using assistive devices correctly, wearing glasses, and having a companion when walking to prevent injuries.
- Provide information about proper nutrition to meet metabolic and energy needs, obtaining or maintaining normal body weight. *Energy is improved when nutrients are sufficient to meet metabolic demands.*^{1,16}
- Encourage client to use relaxation techniques, such as visualization or guided imagery, as appropriate. *Useful in maintaining positive attitude and enhancing sense of well-being.*
- Encourage participation in self-care, recreation, or social activities and hobbies appropriate for situation. (Refer to ND decreased Diversional Activity Engagement.)
-  Monitor laboratory values (such as for anemia) and pulse oximetry to identify areas of concern that may require further assessment or intervention.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Level of activity as noted in Functional Level Classification.
- Causative or precipitating factors.
- Client reports of difficulty or change.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Modifications to plan of care.
- Attainment or progress toward desired outcome(s).

Discharge Planning

- Referrals to other resources.
- Long-term needs and who is responsible for actions.

risk for Activity Intolerance

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/Pulmonary Response (00094) [**Diagnostic Division:** Activity/Rest], Submitted 1982, revised 2013, 2017

DEFINITION: Susceptible to experiencing insufficient physiological or psychological energy to endure or complete required or desired daily activities, which may compromise health.

RISK FACTORS

Imbalance between oxygen supply/demand

Immobility, physical deconditioning; sedentary lifestyle

Inexperience with an activity

At Risk Population: History of previous activity intolerance

Associated Condition: Circulatory or respiratory condition

Sample Clinical Applications: Anemias, angina, aortic stenosis, bronchitis, emphysema, dysmenorrhea, heart failure, HIV/AIDS, labor/preterm labor, leukemias, mitral stenosis, obesity, pain, pericarditis, peripheral vascular disease, rheumatic fever, thrombocytopenia, tuberculosis, uterine bleeding

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Endurance: Capacity to sustain activity

Energy Conservation: Personal actions to manage energy for initiating and sustaining activity

Psychomotor Energy: Personal drive and energy to maintain activities of daily living, nutrition, and personal safety

Client Will (Include Specific Time Frame)

- Verbalize understanding of potential loss of ability in relation to existing condition.
- Participate in conditioning or rehabilitation program to enhance ability to perform.
- Identify alternative ways to maintain desired activity level (e.g., if weather is bad, walking in a shopping mall could be an option).
- Identify conditions or symptoms that require medical reevaluation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Energy Management: Regulating energy use to treat or prevent fatigue and optimize function

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

NURSING PRIORITY NO. 1 To assess factors affecting current situation:

-  Note presence of medical diagnosis and/or therapeutic regimens (e.g., AIDS, chronic obstructive pulmonary disease, cancer, heart failure or other cardiac problems, anemia, multiple medications or treatment modalities, extensive surgical interventions, musculoskeletal trauma, neurological disorders). *These have potential for interfering with client's ability to perform at a desired level of activity. Note: Many factors cause or contribute to fatigue, but activity intolerance implies that the individual cannot endure or adapt to increased energy or oxygen demands caused by an activity.*¹
- Ask client/significant other (SO) about usual level of energy *to identify potential problems and/or client's/SO's perception of client's energy and ability to perform needed or desired activities.*
- Identify factors (e.g., age, functional decline, malnutrition, painful conditions, breathing problems, vision or hearing impairments; need for mobility assistance; client resistive to efforts; unsuitable climate or weather conditions; unsafe areas to exercise) *that could block or affect desired level of activity.*
-  Determine current activity level and physical condition with observation, exercise capacity testing, use of functional level classification system (e.g., Gordon's), as appropriate. *Provides baseline for comparison and opportunity to track changes.*

NURSING PRIORITY NO. 2 To develop/investigate alternative ways to remain active within the limits of the disabling condition/situation:

-  Implement physical therapy or exercise program in conjunction with the client and other team members, such as a physical and/or occupational therapist, exercise or rehabilitation physiologist. *Collaborative program with short- and long-term achievable goals enhances likelihood of success and may motivate client to adopt a lifestyle of physical exercise for enhancement of health.*²
-  Promote or implement progressive conditioning program and support inclusion in exercise or activity groups *to prevent or limit effects of deconditioning. Instruct client in energy-conserving activities and benefits of alternating activity and rest periods while continuing activities. Note: studies continue to support the positive effects of exercise training on exercise [activity] tolerance.*^{6,7}
- Instruct client in proper performance of unfamiliar activities and/or alternate ways of doing familiar activities *to learn methods of conserving energy and promote safety in performing activities.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Discuss with client/SO relationship of illness or debilitating condition to inability to perform desired activity(ies). *Understanding these relationships can help with acceptance of limitations or reveal opportunity for changes of practical value.*^{1,5}
- Provide information regarding factors such as smoking when one has cardiac or respiratory problems, weight management issues, or lack of motivation or interest in exercise. *Education is essential in promoting client awareness of lifestyle behaviors that can negatively affect health and may encourage client to address issues impacting ability to be active and healthy.*^{3,4}
- Assist client/SO with planning for changes that may become necessary (e.g., shifting of family responsibilities, use of supplemental oxygen or medications to improve client's ability to participate in desired activities). *Anticipatory guidance facilitates adaptation if symptoms occur.*^{3,4} (Refer to ND Activity Intolerance.)

- Identify and discuss symptoms for which client needs to seek medical assistance or evaluation, *providing for timely intervention*.³
-  Refer to appropriate sources for assistance (e.g., medical specialists, smoking cessation, dietary counseling, psychological counseling) and/or assistive equipment, as needed, *to sustain or improve activity level and to promote client safety*.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified and potential risk factors for individual.
- Current level of activity tolerance and blocks to activity.

Planning

- Treatment options, including physical therapy or exercise program, other assistive therapies and devices.
- Lifestyle changes that are planned, who is to be responsible for each action, monitoring methods.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modification of plan of care.

Discharge Planning

- Referrals for medical assistance and evaluation.

ineffective Activity Planning

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00199) [Diagnostic Division: Activity/Rest], Submitted 2008, revised 2017

DEFINITION: Inability to prepare for a set of actions fixed in time and under certain conditions.

RELATED FACTORS

Unrealistic perception of event [or] personal abilities
 Insufficient social support
 Insufficient information-processing ability
 Pattern of procrastination; flight behavior when faced with proposed solution
 Hedonism

DEFINING CHARACTERISTICS

Subjective

Worried/excessive anxiety/fear about a task to be undertaken

Objective

Pattern of failure, or procrastination
 Insufficient resources (e.g., financial, social, knowledge)
 Absence of plan; insufficient organizational skills
 Unmet goals for chosen activity

Sample Clinical Applications: Depression, bipolar disorder, learning disabilities or dyslexia, chronic conditions (e.g., fibromyalgia, fatigue syndrome)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Motivation: Inner urge that moves or promotes an individual to positive action(s)

Social Support: Reliable assistance from others

Client Will (Include Specific Time Frame)

- Acknowledge difficulty with follow-through of activity plan.
- Identify negative factors affecting ability to plan activities.
- Willingly prepare to develop own plan for activity.
- Report lessened anxiety and fear toward planning.
- Be aware of and make plan to deal with procrastination.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

Values Clarification: Assisting another to clarify her/his own values in order to facilitate effective decision making

Support System Enhancement: Facilitation of support to patient by family, friends, and community

NURSING PRIORITY NO. 1 To identify causative/precipitating factors:

- Determine individual problems with planning and follow through with activity plan. *Identifies individual difficulties, such as anxiety regarding what kind of activity to choose, lack of resources, lack of confidence in own ability.*¹
-  Perform complete physical examination. *May have underlying problems, such as allergies, hypertension, asthma, chronic pain, that contribute to fatigue and difficulty undertaking task.*²
- Review medication regimen. *Side effects may contribute to fatigue, affecting client's desire to get involved in any activity.*²
-  Assess mental status; use Beck's Depression Scale as indicated. *Anxieties and depression can interfere with client's ability and desire to be active.*⁵
- Identify client's personal values and perception of self, including strengths and weaknesses. *Provides information that will be helpful in planning care and choosing goals for this individual.*¹
- Determine client's need to be in control, fear of dependency on others (although may need assistance from others), belief he or she cannot do the task. *Indicative of external locus of control, where client sees others as having the control and ability.*¹
-  Identify cultural or religious issues that may affect how individual deals with issues of life. *Often person learns strict ideas in family of origin, such as rituals of Catholicism or the demands of prayers for Muslims, that affect how they see their ability to make choices or manage own life.*¹
- Discuss awareness of procrastination, need for perfection, fear of failure. *Although client may not acknowledge it as a problem, this may be a factor in difficulty in planning for, choosing, and following through with activities that might be enjoyed.*^{3,8,9}
- Assess client's ability to process information. *Low self-esteem, anxiety, and possibly difficulty with thinking may interfere with perceptions.*⁴
- Discuss possibility that client is motivated by pleasure to avoid pain (hedonism). *Individual may seek activities that bring pleasure to avoid painful experiences and not realize he or she is using this to keep from completing tasks.*^{4,7}
- Note availability and use of resources. *Client may have difficulty if family and friends are not supportive and other resources are not readily available.*¹

NURSING PRIORITY NO. 2 To assist client to recognize and deal with individual factors that do or could interfere with activities and begin to plan appropriate activities:

- Encourage expression of feelings contributing to or resulting from situation. Maintain a positive atmosphere without seeming overly cheerful. *Helps client to begin to be aware of frustration and redirect energy into productive actions.*⁵
- Discuss client's perception of self as worthless and not deserving of success and happiness. *This belief is common among individuals who struggle with feelings of low self-esteem/self-confidence. They believe that anything they do is bound to fail, and feelings of anxiety and worry contribute to failure. Procrastinating and postponing the task results in failure. Sometimes the underlying feelings are those of wanting to be perfect, and the task may not be perfect if it is finished.*^{4,8}
- Gently confront ambivalent, angry, or depressed feelings. *Client may react negatively and withdraw if these feelings are not dealt with in a sensitive manner.*¹
- Help client learn how to reframe negative thoughts about self into a positive view of what is happening. *Reframing turns a negative thought into something positive to change how it affects the individual.*¹
- Involve client/significant others (SOs) in planning an activity. *Having the support of the family and nurse will help promote success.*¹
- Direct client to start with one desired or needed activity and to break it down into specific steps. *Makes activity more manageable, and as each step is accomplished, individual feels more confident about ability to finish the task.*¹

- Encourage client to recognize procrastinating behaviors and make a decision to change. *Procrastination is a learned behavior, possibly in the family of origin, and serves many purposes for the individual. It can be changed but requires motivation and strong desire.*^{3,8,9}
- Accompany client to activity of own choosing, encouraging participation together, if appropriate. *Support from caregiver may enable client to begin participating and gain confidence.*^{1,9}
- Assist client to develop skills of relaxation, imagery or visualization, and mindfulness. *Using these techniques can help the client learn to overcome stress and be able to manage life's difficulties more effectively.*^{2,6}
- Assist client to investigate the idea that seeking pleasure (hedonism) is interfering with motivation to accomplish goals. *Some philosophers believe that pleasure is the only good for a person, and the individual does not see other aspects of life, interfering with accomplishments.*⁷

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

-  Assist client to identify life goals and priorities. *Often individual has not thought about the possibility of these ideas and, when asked to do this, begins to think he or she can accomplish some goals.*¹
- Review treatment goals and expectations of client and SOs. *Helps to clarify what has been discussed and decisions that have been made and provides an opportunity to change goals as needed.*¹
- Discuss progress in learning to relax and deal productively with anxieties and fears. *As client sees that progress is being made, feelings of worthwhileness will be enhanced and individual will be encouraged to continue working toward goals.*^{2,3}
-  Identify community resources such as social services, senior center, or classes to provide support and options for activities and change.
-  Refer for cognitive therapy. *This structured therapy can help the individuals identify, evaluate, and modify underlying assumptions and dysfunctional beliefs they may have and begin the process of change. Learning to set own schedule with reminders can also help client to get tasks done in a timely manner.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Specific problems exhibited by client.
- Causative or precipitating factors.
- Client reports of difficulty making and following through with plans.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).

Discharge Planning

- Referrals to other resources.
- Long-term needs and who is responsible for actions.

risk for ineffective Activity Planning

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (0026) [Diagnostic Division: Activity/Rest], Submitted 2010; Revised 2013

DEFINITION: Susceptible to an inability to prepare for a set of actions fixed in time and under certain conditions, which may compromise health.

RISK FACTORS

Unrealistic perception of event or personal abilities
 Insufficient social support
 Insufficient information-processing ability
 Flight behavior when faced with proposed solution
 Pattern of procrastination
 Hedonism

Sample Clinical Applications: Depression, bipolar disorder, learning disabilities/dyslexia, chronic conditions (e.g., fibromyalgia, fatigue, multiple sclerosis)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Motivation: Inner urge that motivates or prompts an individual to positive action(s)

Decision-Making: Ability to make judgments and choose between two or more alternatives

Social Support: Reliable assistance from others

Client Will (Include Specific Time Frame)

- Express awareness of negative factors or actions that can interfere with planning.
- Establish mindfulness and relaxation activities to lessen anxiety.
- Develop a plan, including the time frame, for a task to be completed.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Self-Responsibility Facilitation: Encourage a patient to assume more responsibility for own behavior

Self-Modification Assistance: Reinforce self-directed change initiated by the patient to achieve personally important goals

Mutual Goal Setting: Collaborate with patient to identify and prioritize care goals, then develop a plan for achieving those goals

NURSING PRIORITY NO. 1 To identify causative/precipitating factors related to risk:

- Determine circumstances of client's situation that may impact participating in selective activities. *Identifies areas for client to begin to change behavior.*
- Note client's ability to process information. *Compromised mental ability, low self-esteem, and anxiety can interfere with dealing with planning of activities of life.*¹⁵
- Review health history and medications. *Underlying physical or emotional factors, such as fatigue, stress, or medication side effects, can affect ability to engage in tasks.*^{3,11,18}
- Evaluate mental status, using Beck's Depression Scale or other inventories as indicated. *Depression, anxiety, and/or mental illness can potentially interfere with client's ability to plan desired activities.*¹⁶
- Discuss religious/cultural and personal values and perception of self, including view of strengths and weaknesses. *These factors affect every aspect of client's life, including how he/she views ability to make choices or manage life.*^{9,15}
- Ascertain need for control, fear of dependency on others, or belief they will not be able to do the task. *Although client may need assistance, he/she may have external locus of control and see others as having control and the ability to do things the client is not able to do.*¹⁷
- Investigate client's awareness of procrastination, need for perfection, or fear of failure. *These issues may be interfering with client's choosing to manage planning of life activities.*⁸
- Discuss issue of avoiding pain by seeking pleasure (hedonism). *People sometimes avoid pain by choosing activities that provide pleasure but don't get needed tasks accomplished.*^{7,8,9}
- Note availability and use of resources and social support. *Lack of resources or insufficient support limit client's ability to engage in activities.*

NURSING PRIORITY NO. 2 To assist client to recognize and deal with risk factors that interfere with appropriate activities:

- Encourage recognition of feelings associated with issues that prevent client from planning desired activities. *Awareness of frustration and/or anxiety will help client redirect energy into productive activities.*^{5,10}
- Help client to reframe negative thoughts about self into a positive view of what he/she is able to achieve. *The belief that individuals are worthless and not deserving of success and happiness is prevalent among many people who are anxious, leading to the belief that anything tried is doomed to failure.*^{2,5,6,14}
- Encourage client to recognize procrastinating behaviors and make a decision to change. *Often this learned behavior comes from the family of origin. A decision to change may require therapy to change the ingrained habit.*^{5,11,13}
- Develop a plan with the client to deal with activities in small steps. *Learning to do this will help client to feel more organized and successful in completing the desired task.*^{4,5,12}
- Encourage client to engage in activity of choice with a friend, family member. *Support may encourage client to pursue activity and be successful at completion.*¹
- Investigate with the client the possibility that seeking pleasure (hedonism) may interfere with achieving life goals. *Individual may believe that pleasure is the only good and avoid tasks or activities viewed as not fun or pleasurable, thereby interfering with accomplishments.*⁷

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

- 🏠 Identify life goals and priorities. *If the individual has never thought about setting goals, he or she may begin to think about the possibility of being successful.*¹²
- Discuss use of relaxation techniques and mindfulness to deal with anxieties and stressors. *Enables client to deal with life's difficulties more effectively, helping client to view self as worthwhile and encouraging continued work toward goals.*^{3,6}

- Identify community resources, such as social services, senior center, or classes. *Provides an opportunity to be involved in different activities and be successful in trying new activities.*
- Refer for cognitive therapy as indicated. *May help client to deal with basic assumptions and dysfunctional beliefs in order to become successful.*^{5,13}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors identified.
- Client concerns or difficulty making and following through with plan.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward outcomes.
- Client's plan for the future.

Discharge Planning

- Referrals to other resources.
- Long-term need and who is responsible for actions.

Acute Substance Withdrawal Syndrome

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00258) [**Diagnostic Division:** Safety], Approved 2016

DEFINITION: Serious multifactorial sequelae following abrupt cessation of an addictive compound

RELATED FACTORS

Developed dependence to alcohol or other addictive substances
Heavy use of an addictive substance over time
Sudden cessation of an addictive substance
Malnutrition

DEFINING CHARACTERISTICS

Subjective

Nausea

Objective

Acute confusion
Anxiety
Disturbed sleep pattern
Risk for electrolyte imbalance
Risk for injury

At Risk Population: History of previous withdrawal symptoms

Older adults

Associated Condition: Comorbid mental disorder

Comorbid serious physical illness

Sample Clinical Applications: Alcohol intoxication, drug overdose

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Substance Withdrawal Severity: Severity of signs and symptoms of withdrawal from addictive drugs, tobacco, alcohol

Alcohol [or] Drug Abuse Cessation Behavior: Personal actions to eliminate alcohol [or] drug use that poses a threat to health

Substance Addiction Consequences: Severity in change in health status and social functioning due to substance addiction

Client Will (Include Specific Time Frame)

- Be free of adverse reactions to withdrawal, e.g., stable vital signs, alert and oriented, no cardiac dysrhythmias, electrolyte imbalance, hallucinations, or seizures.
- Commit to cessation of substance(s) used.
- Engage in behaviors/lifestyle changes to eliminate substance use.
- Use available personal, professional, and community resources.
- Manage own activities of daily living including work/school schedule.
- Engage in appropriate social interactions.

(continues on page 42)

Acute Substance Withdrawal Syndrome (continued)

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Substance Use Treatment: Alcohol Withdrawal: Care of patient experiencing sudden cessation of alcohol consumption

Substance Use Treatment: Drug Withdrawal: Care of patient experiencing drug detoxification

Substance Use Treatment: Care of patient and family members demonstrating dysfunction as a result of substance abuse or dependence

NURSING PRIORITY NO. 1 To determine degree of impairment/compromise:

- Identify comorbidities—medical conditions/psychiatric disorders and currently prescribed medications. *Underlying cardiovascular disease is compounded by withdrawal; chronic lung diseases are common, affecting oxygenation, chronic infections may be present as well as traumatic injuries, suggesting additional testing, monitoring, and potential treatment needs.*
-  Determine if naloxone (Narcan) administered, how many doses, and time of last dose. *Used to reverse opioid overdose but duration of action of some opioids may exceed that of Narcan, requiring repeat doses.*
-  Review toxicology results of urine and blood. *To determine substances used, necessary interventions, and potential complications. Note: Symptoms and timing of occurrence depend on type of substance(s) used and last dose.*
- Assess level of consciousness, ability to speak, and response to commands. *Speech may be garbled, confused, or slurred. Response to commands may reveal inability to concentrate, impaired judgment, or muscle coordination deficits.*
- Determine stage of alcohol withdrawal syndrome (AWS) using Clinical Institute Withdrawal Assessment for Alcohol-Revised (CIWA-AR) tool. *AWS usually begins 3 to 36 hours after last drink. Helps determine appropriate care setting and specific interventions.¹ Note: In presence of substantial language barrier, absence of reliable history, an alternate tool such as Prediction of Alcohol Withdrawal Severity Scale (PAWSS) may be more appropriate.²*
- Observe for behavioral responses such as hyperactivity, disorientation, confusion, sleeplessness, irritability. *Hyperactivity related to CNS disturbances may escalate rapidly. Sleep deprivation may aggravate disorientation or confusion. Progression of symptoms may indicate impending hallucinations or delirium tremens (DTs) in alcohol withdrawal.⁴*
- Auscultate breath sounds noting adventitious sounds such as rhonchi, wheezes, crackles. *Client is at risk for atelectasis related to hypoventilation and pneumonia.*
-  Review chest x-ray, arterial blood gas (ABG), or pulse oximetry. *Respiratory compromise common, e.g., right lower lobe pneumonia common in alcohol-debilitated clients and is often due to chronic aspiration.*
- Measure weight and compare to usual weight and norms for age and body size. Note skin turgor, status of mucous membranes, muscle tone/wasting, presence of edema. *Substance abuse is often associated with malnutrition.*
-  Review serum nutritional studies, e.g., albumin, transferrin, prealbumin, iron, liver function, electrolytes, hemoglobin, hematocrit. *Substance users are often malnourished, impacting organ function, energy/endurance level, immune status, general well-being.*

NURSING PRIORITY NO. 2 To facilitate safe withdrawal from substance:

-  Consult with medical toxicologist or regional poison control center as needed. *Useful resources for diagnosis and management of acute/critically ill clients, especially those with multi-substance use.³*

- Provide environmental safety as indicated, e.g., bed in low position, call device within reach, doors full open or closed position, padded side rails, family member or sitter at bedside as appropriate. *Reduces risk of injury in presence of distorted sense of reality.*
- Monitor vital signs (VS) and level of consciousness (LOC) frequently during acute withdrawal. *VS and LOC can be labile based on specific substance(s) and length of time since last used. For example, hypertension frequently occurs in acute withdrawal phase but may quickly progress to hypotension.*
- Elevate head of bed. *Decreases potential for aspiration and lowers diaphragm, enhancing lung expansion.*
- Monitor respiratory rate, depth, and pattern. Note periods of apnea or Cheyne-Stokes respirations. *Toxicity levels may change rapidly, e.g., hyperventilation common during acute alcohol withdrawal phase, or marked respiratory depression can occur because of central nervous system depressant effects of substance used.*
-  Administer supplemental oxygen, as needed. *Hypoxia may occur with respiratory depression and chronic anemia.*
- Monitor body temperature. *Elevation may occur because of sympathetic stimulation, dehydration, and/or infection, causing vasodilation and compromising venous return and cardiac output.*
- Record intake/output, 24-hour fluid balance; skin turgor, status of mucous membranes. *Preexisting dehydration, nausea/vomiting, diuresis, and diaphoresis may compromise cardiovascular function as well as renal perfusion, impacting drug clearance.*
-  Administer fluid/electrolytes as indicated. *Depending on substances used, client is susceptible to excessive fluid losses and electrolyte imbalances, especially potassium and magnesium that can result in life-threatening dysrhythmias. Magnesium sulfate also beneficial in reducing tremors and seizure activity.^{3,5}*
- Reorient frequently to person, place, time, and surrounding environment. *May have calming effect and limit misinterpretation of external stimuli.*
- Encourage client to verbalize anxiety. Explain substance withdrawal increases anxiety and uneasiness. *Anxiety may be physiologically or environmentally caused, and client may be unable to identify and/or accept what is happening. Note: Individuals with alcohol use disorders often also have posttraumatic stress disorder (PTSD).⁶*
- Monitor for suicidal tendencies. *May need to use emergency commitments or legal hold for client's safety once medically stable.*
-  Provide symptom management as indicated. *Medications for nausea/vomiting, anxiety, trembling/"shakes," insomnia, seizure activity promote comfort and facilitate recovery.³*
-   Administer medications treating specific substance(s) used. *For example, beta-adrenergic blockers may speed up the alcohol withdrawal process but are not useful in preventing seizures or DTs,^{3,4} and methadone is used to assist opioid withdrawal.⁷ Note: There are no Food and Drug Administration (FDA)-approved medications for treating cannabis, cocaine, or methamphetamine substance use disorders (SUDs), and medication-assisted treatments (MATs) are rarely used to treat adolescent alcohol use.⁹*
-  Administer thiamine, vitamins C and B complex as indicated. *Vitamin deficiency, especially thiamine, is associated with ataxia, loss of eye movement and pupillary response, palpitations, postural hypotension, and exertional dyspnea.³*

NURSING PRIORITY NO. 3 To promote long-term sobriety:

- Develop trusting relationship, project an accepting attitude about substance use. *Provides client a sense of humanness, helping to decrease paranoia and distrust. (Client will be able to detect biased or condescending attitude of caregivers, negatively impacting relationship.)*
- Determine understanding of current situation. *Provides information about degree of denial, acceptance of personal responsibility, and commitment to change.*
- Arrange "intervention" or confrontation in controlled setting when client sufficiently recovered from withdrawal to address addiction issues. *Client more likely to contract for treatment while still hurting and experiencing fear and anxiety from last substance use episode.*
- Confront use of defensive behaviors—denial, projection, and rationalization. *Helps client accept the reality of the problems as they exist.*

- Identify individual triggers for substance use (e.g., exhaustion, loneliness/isolation, depression) and client's plans for living without drugs/alcohol. *Provides opportunity to discuss substance tension-reducing strategies and to develop and refine plan.*
- Use crisis intervention techniques to initiate behavior changes. *Calming effect enables client to be receptive to care and therapeutic interventions.*
- Instruct in use of relaxation skills, guided imagery, and visualization techniques. *Helps client relax and develop new ways to deal with stress and to problem-solve.*
- Facilitate visit by a group member/possible sponsor as appropriate, such as Alcoholics Anonymous (AA), Narcotics Anonymous (NA), Crystal Methamphetamine Anonymous (CMA), Smart Recovery. *Puts client in direct contact with support system necessary for managing sobriety and drug-free life.*
-  Administer antipsychotic medications as necessary. *May be indicated for prolonged or profound psychosis following lysergic acid diethylamide (LSD) or phencyclidine (PCP) intoxication.*
-  Engage entire family in multidimensional family therapy as indicated. *Program developed for adolescents with SUDs and their families to address the various influences on client's substance use by improving family functioning and collaboration with other systems, such as school and juvenile justice.*⁸

NURSING PRIORITY NO. 4 To promote optimal wellness (Teaching/Discharge Considerations):

- Review effects of substance(s) used—physical, psychological, social. *Information needed for client to make informed decisions and commit to therapeutic regimen.*
- Discuss potential for reemergence of withdrawal symptoms in stimulant abuse as early as 3 months or as late as 9 to 12 months after discontinuing use. *Early recognition of recurrence of withdrawal symptoms provides for timely intervention.*
- Review specific aftercare needs, e.g., PCP user should drink cranberry juice and continue use of ascorbic acid; alcohol abuser with liver damage should refrain from medications, anesthetics, or use household cleaning products that are detoxified in the liver. *Promotes individualized care related to specific situation.*
- Encourage balanced diet, adequate rest, exercise such as walking, biofeedback, deep meditative techniques. *These activities help restore natural biochemical balance, aid detoxification, and manage stress, anxiety.*
-  Review long-term therapeutic regimen/medication-assisted treatment (MAT). *Medications such as methadone for opioid use, and Antabuse for alcohol use, may be prescribed to help maintain sobriety and reduce risk of relapse.*
- Identify community/social assistance resources, e.g., housing, food pantry, senior center/feeding station, transportation, medical care. *Provides for basic human needs, enhances coping abilities, reduces sense of isolation, and decreases risk of relapse.*
-  Refer for vocational counseling/alternative schooling program as appropriate. *Provides opportunity to learn skills and obtain employment to promote independence and enhance self-esteem.*
-  Encourage continued involvement in peer group therapy, individual/family counseling, drug recovery education programs. *Provides follow-up support to maintain sobriety.*
-  Monitor results of periodic drug screening as appropriate. *Important to identify return to substance use or change to another drug.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings including general health status, comorbidities, signs/stage of withdrawal.
- Substance(s) used, dose, frequency, last dose.
- Results of laboratory tests/diagnostic studies.
- Effects of substance use life and relationships.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.
- Plan for sobriety.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.
- Plan for monitoring sobriety.

Acute Substance Withdrawal Syndrome, risk for

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00259) [**Diagnostic Division:** Safety], Approved 2016

DEFINITION: Susceptible to serious multifactorial sequelae following abrupt cessation of an addictive compound, which may compromise health

RISK FACTORS

Developed dependence to alcohol or other addictive substance
Heavy use of an addictive substance over time
Sudden cessation of an addictive substance
Malnutrition

At Risk Population: History of previous withdrawal symptoms; older adults

Associated Condition: Comorbid mental disorder or serious physical illness

Sample Clinical Applications:

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Substance Withdrawal Severity: Severity of signs and symptoms of withdrawal from addictive drugs, tobacco, alcohol

(continues on page 46)

Acute Substance Withdrawal Syndrome, risk for (continued)

Alcohol [or] Drug Abuse Cessation Behavior: Personal actions to eliminate alcohol [or] drug use that poses a threat to health

Substance Addiction Consequences: Severity in change in health status and social functioning due to substance addiction

Client Will (Include Specific Time Frame)

- Be free of adverse reactions to withdrawal, e.g., stable vital signs, alert and oriented, no cardiac dysrhythmias, electrolyte imbalance, hallucinations, or seizures.
- Commit to cessation of substance(s) used.
- Engage in behaviors/lifestyle changes to eliminate substance use.
- Use available personal, professional, and community resources.
- Manage own activities of daily living including work/school schedule.
- Engage in appropriate social interactions.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Substance Use Treatment: Alcohol Withdrawal: Care of patient experiencing sudden cessation of alcohol consumption

Substance Use Treatment: Drug Withdrawal: Care of patient experiencing drug detoxification

Substance Use Treatment: Care of patient and family members demonstrating dysfunction as a result of substance abuse or dependence

NURSING PRIORITY NO. 1 To determine degree of impairment/compromise:

- Identify comorbidities—medical conditions/psychiatric disorders and currently prescribed medications. *Underlying cardiovascular disease is compounded by withdrawal; chronic lung diseases are common, affecting oxygenation; chronic infections may be present, as well as traumatic injuries, suggesting additional testing, monitoring, and potential treatment needs.*
-  Determine if naloxone (Narcan) administered, how many doses, and time of last dose. *Used to reverse opioid overdose but duration of action of some opioids may exceed that of Narcan, requiring repeat doses.*
-  Review toxicology results of urine and blood. *To determine substances used, necessary interventions, and potential complications. Note: Symptoms and timing of occurrence depend on type of substance(s) used and last dose.*
- Monitor for signs relative to other substances used. *Symptoms and timing of withdrawal depend on type of substance used and last dose, e.g., flu-like symptoms for heroin within 12 hours, opiates within 8–12 hours; anxiety and/or seizures for benzodiazepines within 1–4 days.⁷*
- Observe for behavioral responses such as hyperactivity, disorientation, confusion, sleeplessness, irritability. *Hyperactivity related to CNS disturbances may escalate rapidly. Sleep deprivation may aggravate disorientation or confusion. Progression of symptoms may indicate impending hallucinations or delirium tremens (DTs) in alcohol withdrawal.²*
- Auscultate breathe sounds noting adventitious sounds such as rhonchi, wheezes, crackles. *Client is at risk for atelectasis related to hypoventilation and pneumonia.*
- Measure weight and compare to usual weight and norms for age and body size. Note skin turgor, status of mucous membranes, muscle tone/wasting, presence of edema. *Substance abuse is often associated with malnutrition.*

NURSING PRIORITY NO. 2 To facilitate safe withdrawal from substance:

- Provide environmental safety as indicated, e.g., bed in low position, call device within reach, doors full open or closed position, situated close to nursing station as appropriate. *Reduces risk of injury in presence of distorted sense of reality.*
- Monitor vital signs (VS) and level of consciousness (LOC) frequently during acute withdrawal. *VS and LOC can be labile based on specific substance(s) and length of time since last used. For example, hypertension frequently occurs in acute withdrawal phase but may quickly progress to hypotension.*
- Monitor respiratory rate, depth, and pattern. *Toxicity levels may change rapidly, e.g., hyperventilation common during acute alcohol withdrawal phase or marked respiratory depression can occur because of central nervous system depressant effects of substance used.*
- Encouraging client to verbalize anxiety. *Anxiety may be physiologically or environmentally caused, and client may be unable to identify and/or accept what is happening. Note: Individuals with alcohol use disorders often also have posttraumatic stress disorder (PTSD).³*
-  Provide symptom management as indicated. *Medications for nausea/vomiting, anxiety, trembling/“shakes,” insomnia, seizure activity promote comfort and facilitate recovery.¹*
-   Administer medications treating specific substance(s) used. *For example, beta-adrenergic blockers may speed up the alcohol withdrawal process but are not useful in preventing seizures or DTs,^{1,2} and methadone is used to assist opioid withdrawal.⁴ Note: There are no FDA-approved medications for treating cannabis, cocaine, or methamphetamine SUDs, and medication-assisted treatments (MAT) are rarely used to treat adolescent alcohol use.⁶*
-  Administer thiamine, vitamins C and B complex as indicated. *Vitamin deficiency, especially thiamine, is associated with ataxia, loss of eye movement and pupillary response, palpitations, postural hypotension, and exertional dyspnea.¹*

NURSING PRIORITY NO. 3 To promote long-term sobriety:

- Develop trusting relationship, project an accepting attitude about substance use. *Provides client a sense of humanness, helping to decrease paranoia and distrust.*
- Arrange “intervention” or confrontation in controlled setting when client sufficiently recovered from withdrawal to address addiction issues. *Client more likely to contract for treatment while still hurting and experiencing fear and anxiety from last substance use episode.*
- Confront use of defensive behaviors—denial, projection, and rationalization. *Helps client accept the reality of the problems as they exist.*
- Identify individual triggers for substance use (e.g., loneliness/isolation, depression) and client’s plans for living without drugs/alcohol. *Provides opportunity to discuss substance tension-reducing strategies and to develop and refine plan.*
- Instruct in use of relaxation skills, guided imagery, and visualization techniques. *Helps client relax and develop new ways to deal with stress and to problem-solve.*
- Facilitate visit by a group member/possible sponsor as appropriate, such as Alcoholics Anonymous (AA), Narcotics Anonymous (NA), Crystal Methamphetamine Anonymous (CMA), Smart Recovery. *Puts client in direct contact with support system necessary for managing sobriety and drug-free life.*
-  Administer antipsychotic medications as necessary. *May be indicated for prolonged or profound psychosis following lysergic acid diethylamide (LSD) or phencyclidine (PCP) intoxication.*
-  Engage entire family in multidimensional family therapy as indicated. *Program developed for adolescents with SUDs and their families to address the various influences on client’s substance use by improving family functioning and collaboration with other systems, such as school and juvenile justice.⁵*

NURSING PRIORITY NO. 4 To promote optimal wellness (Teaching/Discharge Considerations):

- Review effects of substance(s) used—physical, psychological, social. *Information needed for client to make informed decisions and commit to therapeutic regimen.*

- Discuss potential for reemergence of withdrawal symptoms in stimulant abuse as early as 3 months or as late as 9 to 12 months after discontinuing use. *Early recognition of recurrence of withdrawal symptoms provides for timely intervention.*
- Review specific aftercare needs, e.g., alcohol abuser with liver damage should refrain from medications, anesthetics, or using household cleaning products that are detoxified in the liver. *Promotes individualized care related to specific situation.*
- Encourage balanced diet, adequate rest, exercise such as walking, biofeedback, deep meditative techniques. *These activities help restore natural biochemical balance, aid detoxification, and manage stress, anxiety.*
-  Review long-term therapeutic regimen/medication-assisted treatment (MAT). *Medications such as methadone for opioid use, and Antabuse for alcohol use, may be prescribed to help maintain sobriety and reduce risk of relapse.*
- Identify community/social assistance resources, e.g., housing, food pantry, senior center/feeding station, transportation, medical care. *Provides for basic human needs, enhances coping abilities, reduces sense of isolation, and decreases risk of relapse.*
-  Refer for vocational counseling/alternative schooling program as appropriate. *Provides opportunity to learn skills and obtain employment to promote independence and enhance self-esteem.*
-  Encourage continued involvement in peer group therapy, individual/family counseling, drug recovery education programs. *Provides follow-up support to maintain sobriety.*
-  Monitor results of periodic drug screening as appropriate. *Important to identify return to substance use or change to another drug.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings including general health status, comorbidities, signs/stage of withdrawal.
- Substance(s) used, dose, frequency, last dose.
- Results of laboratory tests/diagnostic studies.
- Effects of substance use life and relationships.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.
- Plan for sobriety.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.
- Plan for monitoring sobriety.

decreased intracranial Adaptive Capacity

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00049) [Diagnostic Division: Circulation], Submitted 1994

DEFINITION: Compromise in intracranial fluid dynamic mechanisms that normally compensate for increases in intracranial volumes, resulting in repeated disproportionate increases in intracranial pressure (ICP) in response to a variety of noxious and non-noxious stimuli.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Objective

Baseline intracranial pressure (ICP) ≥ 10 mmHg

Disproportionate increase in intracranial pressure (ICP) following stimulus

Elevated tidal wave intracranial pressure (P_2 ICP) waveform

Repeated increase in intracranial pressure (ICP) of ≥ 10 mmHg for ≥ 5 min following external stimuli

Volume-pressure response test variation (volume: pressure ratio 2, pressure-volume index < 10)

Wide-amplitude ICP waveform

Associated Condition: Brain injury; decrease in cerebral perfusion ≤ 50 – 60 mmHg; sustained increase in intracranial pressure (ICP) of 10 – 15 mmHg; systemic hypotension with intracranial hypertension

Sample Clinical Applications: Traumatic brain injury (TBI), cerebral edema, stroke, cranial tumors/hematomas, hydrocephalus

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Tissue Perfusion: Cerebral: Adequacy of blood flow through the cerebral vasculature to maintain brain function

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Client Will (Include Specific Time Frame)

- Demonstrate stable ICP as evidenced by normalization of pressure waveforms and response to stimuli.
- Display improved neurological signs.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Cerebral Edema Management: Limitation of secondary cerebral injury resulting from swelling of brain tissue

Cerebral Perfusion Promotion: Promotion of adequate perfusion and limitation of complications for a patient experiencing or at risk for inadequate cerebral perfusion

Intracranial Pressure (ICP) Monitoring: Measurement and interpretation of patient data to regulate intracranial pressure

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Determine factors related to individual situation (e.g., trauma such as fall, motor vehicle crash, gunshot wound, infection such as meningitis or encephalitis; brain tumor) and potential for increased ICP. *Deterioration in neurological signs/symptoms or failure to improve after initial insult may reflect decreased adaptive capacity.*
-  Review results of diagnostic imaging (e.g., cerebral computed tomography [CT] scans) to note location, type, and severity of intracranial injury. *CT scan is sensitive to acute hemorrhage or skull fractures and aids in evaluating mass effect and midline shift, obliteration of the basal cisterns, or evidence of herniation.*⁶
-  Monitor for change in ICP (e.g., worsening neurological signs or variations in ICP monitor waveform and pressure) and corresponding event (e.g., coughing, suctioning, position change, noise such as monitor alarms, family visit). *ICP monitoring may be done in a critically ill client with a Glasgow Coma Scale (GCS) score of 8 or less. The ICP offers data that supplement the neurological examination, and can be crucial in a client whose examination findings are affected by sedatives, paralytics, or other factors. Elevated pressure can be caused by the injury, environmental stimuli, or treatment modalities. Note: More advanced technologies are being used in some neurotrauma intensive care units to monitor electroencephalograph and bispectral index readings at the bedside to evaluate brain function while the client is in induced coma sedation with agents such as pentobarbital or propofol (Diprivan).*^{2,3,6,14}

NURSING PRIORITY NO. 2 To note degree of impairment:

-  Evaluate level of consciousness using GCS. *GCS remains the gold standard for objectively assessing individuals with TBIs. It assesses eye opening (e.g., awake, opens only to painful movement, keeps eyes closed), position or movement (e.g., spontaneous, purposeful, posturing), pupils (size, shape, equality, light reactivity), and consciousness or mental status (e.g., comatose, responds to pain, awake or confused). Low numbers (e.g., <8) are typically seen in clients with severe head injury and impaired cerebral perfusion requiring critical care interventions.*^{2,3,6,9}
- Note purposeful and nonpurposeful motor response (e.g., posturing), comparing right and left sides. *Posturing and abnormal flexion of extremities usually indicate diffuse cortical damage. Absence of spontaneous movement on one side indicates damage to the motor tracts in the opposite cerebral hemisphere.*¹
- Test for presence or absence of reflexes (e.g., blink, cough, gag, Babinski's reflex) and nuchal rigidity. *Helps identify location of injury (e.g., loss of blink reflex suggests damage to the pons and medulla, absence of cough and gag reflexes reflects damage to medulla, presence of Babinski's reflex indicates injury along pyramidal pathways in the brain).*¹
- Monitor vital signs and cardiac rhythm before, during, and after activity. *Helps determine parameters for "safe" activity. Mean arterial blood pressure should be maintained above 90 mmHg to maintain cerebral perfusion pressure (CCP) greater than 70 mmHg, which reflects adequate blood supply to the brain. Fever in brain injury can be associated with injury to the hypothalamus or bleeding, systemic infection (e.g., pneumonia), or drugs. Hyperthermia exacerbates cerebral ischemia. Irregular respiration patterns can suggest location of cerebral insult. Cardiac dysrhythmias can be due to brainstem injury and stimulation of the sympathetic nervous system. Bradycardia may occur with high ICP.*^{2,3,6}
-  Monitor pulse oximetry or arterial blood gases, particularly pH, CO₂, and Pao₂. *A PaCO₂ level of 30 to 35 mmHg maintains cerebral blood flow and adequate cerebral oxygenation, while a Pao₂ of less than 65 mmHg may cause cerebral vascular dilation and further tissue damage.*^{2,3,12}
-  Monitor urine output and serum sodium. *Posttraumatic neuroendocrine dysfunction can result in a hyponatremic or hypernatremic state. When hyponatremia exists, cerebral edema or syndrome of inappropriate antidiuretic hormone can occur, requiring correction with fluid restriction and hypertonic IV solution. Hypernatremia can occur because of injury to the hypothalamus or pituitary stalk, causing diabetes insipidus, resulting in huge urine losses, or can be the result of excessive diuresis due to use of mannitol or furosemide administered to reduce cerebral edema.*³

NURSING PRIORITY NO. 3 To minimize/correct causative factors/maximize perfusion:

-  Perform periodic assessments of the client's level of consciousness and/or neurological status, blood pressure, breath sounds, temperature, amount of respiratory secretions, central venous pressure, heart rate and rhythm, fluid balance, nutritional status, and serial laboratory values, as with any critically ill client.
- Perform interventions specific to client with increased ICP:
 -  Elevate head of bed as individually appropriate. *Optimal head of bed position is determined by both ICP and coronary perfusion pressure measurements—that is, which degree of elevation lowers ICP while maintaining adequate cerebral blood flow. Studies show that in most cases, an elevation of 30 degrees significantly decreases ICP while maintaining cerebral blood flow.*^{6,7}
 - Maintain head and neck in neutral position, supporting with small towel rolls or pillows to maximize venous return. *Note: Lateral and rotational neck flexion has been shown to be the most consistent trigger of sustained increases in ICP.*^{3,4}
 - Avoid causing hip flexion of 90 degrees or more. *Hip flexion may trap venous blood in the intra-abdominal space, increasing abdominal and intrathoracic pressure and reducing venous outflow from the head, increasing cerebral pressure.*⁵
 - Limit or prevent activities such as coughing, vomiting, and straining at stool and avoid or restrict use of restraints. *These factors often increase intrathoracic/abdominal pressures or agitation and markedly increase ICP.*¹
 -   Suction with caution and only when needed. Pass catheter just beyond end of endotracheal tube without touching tracheal wall or carina. Administer lidocaine intratracheally if indicated to reduce cough reflex. *Note: Studies have reported significant increase in ICP and decrease in CCP during suctioning in ventilated clients with brain injury, especially if they are not well sedated.*^{3,15}
 -   Hyperoxygenate before suctioning as appropriate to minimize hypoxia. *Note: Studies show that in most clients, hyperventilation is not necessary; however, therapeutic hyperventilation (PaCO₂ of 30 to 35 mm) may be used for a short period of time in acute neurological deterioration to reduce intracranial hypertension while other methods of ICP control are initiated.*^{3,7,8,11}
- Investigate increased restlessness to determine causative factors and initiate corrective measures as indicated: Decrease extraneous stimuli and provide comfort measures (e.g., quiet environment, soft voice, tapes of familiar voices played through earphones, back massage, gentle touch as tolerated) to reduce central nervous system stimulation and promote relaxation.⁴
- Limit painful procedures (e.g., venipunctures, redundant neurological evaluations) to those that are absolutely necessary in order to minimize preventable elevations in ICP.³
- Provide rest periods between care activities and limit duration of procedures. Lower lighting and noise levels and schedule and limit activities to provide a restful environment and limit spikes in ICP associated with noxious stimuli.³
- Encourage family/significant others to talk to client. *Familiar voices appear to have a relaxing effect on many comatose individuals (thereby reducing ICP).*¹
-  Administer and restrict fluid intake as necessary, and administer IV fluids via pump or control device to maintain intravascular volume sufficient to maintain cerebral perfusion while preventing inadvertent vascular overload, cerebral edema, and increased ICP.⁶
- Weigh as indicated. Calculate fluid balance every shift/daily to determine fluid needs, maintain hydration, and prevent fluid overload.¹
-   Monitor and manage body temperature. Regulate environmental temperature and bed linens and use cooling blanket as indicated to decrease metabolic and oxygen needs when fever is present or when therapeutic hypothermia therapy is used. *Lowering the body temperature has been shown to lower ICP and improve outcomes for recovery.*^{3,6,13}
- Provide appropriate safety measures/initiate treatment for seizures to prevent injury and increase of ICP or hypoxia.
-  Administer supplemental oxygen as indicated to prevent cerebral ischemia.

-  Administer medications (e.g., antihypertensives, diuretics, analgesics, sedatives, antipyretics, vasopressors, antiseizure drugs, neuromuscular blocking agents, corticosteroids) as appropriate *to maintain cerebral homeostasis and manage symptoms associated with neurological injury. Note: Controversy continues concerning the use of steroids in the setting of TBI as a neuroprotective strategy. Review of five key randomized control trials (RCTs) consistently showed that corticosteroids do not confer significant benefit in the TBI population.*¹²
-  Administer enteral or parenteral nutrition *to achieve positive nitrogen balance, reducing effects of post-brain injury metabolic and catabolic states, which can lead to complications such as immunosuppression, infection, poor wound healing, loss of body mass, and multiple organ dysfunction. Studies have shown that parenteral nutritional support can be given to these clients without worsening cerebral edema.*¹⁰
-  Prepare client for surgery as indicated (e.g., evacuation of hematoma or space-occupying lesion) *to reduce ICP and enhance circulation.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Discuss with caregivers specific situations (e.g., if client choking or experiencing pain, needing to be repositioned, constipated, blocked urinary flow) and review appropriate interventions *to prevent or limit episodic increases in ICP.*
- Identify signs/symptoms suggesting increased ICP (in client at risk without an ICP monitor), such as restlessness and deterioration in neurological responses. Review appropriate interventions.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Neurological findings, noting right and left sides separately (e.g., pupils, motor response, reflexes, restlessness, nuchal rigidity); GCS.
- Response to activities and events (e.g., changes in pressure waveforms or vital signs).
- Presence and characteristics of seizure activity.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Future needs, plan for meeting them, and determining who is responsible for actions.
- Referrals as identified.

risk for Adverse Reaction to Iodinated Contrast Media

Taxonomy II: Safety/Protection—Class 5 Defensive Processes (00218) [**Diagnostic Division:** Safety], Approved 2010, revised 2013; 2017

DEFINITION: Susceptible to noxious or unintended reaction associated with the use of iodinated contrast media that can occur within seven days after contrast agent injection, which may compromise health.

RISK FACTORS

Dehydration

Generalized weakness

Anxiety

At Risk Population: Extremes of age

History of allergy; history of previous adverse effect from iodinated contrast media

Associated Condition: Chronic illness, unconsciousness

Contrast media precipitates adverse event; concurrent use of pharmaceutical agents

Fragile vein

Sample Clinical Applications: Any condition requiring the use of contrast media for diagnosis or treatment

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Allergic Response: Systemic: Severity of systemic hypersensitive immune response to a specific environmental (exogenous) antigen

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Experience no adverse reaction from iodinated contrast media.
- Verbalize understanding of individual risks and responsibilities to avoid exposure.
- Recognize need for/seek assistance to limit allergic response/complications.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Allergy Management: Identification, treatment, and prevention of allergic responses to food, medications, insect bites, contrast material, blood, and other substances

NURSING PRIORITY NO. 1 To identify causative/precipitating factors related to risk:

- Identify the client at risk for adverse reaction prior to procedures. *A history of allergies; asthma; diabetes; renal insufficiency, including solitary kidney with elevated creatinine; thyroid dysfunction; hypertension; heart failure; current or recent use of nephrotoxic medications; or reaction to previous iodinated contrast media (ICM) administration places individual at increased risk.*^{1,2}
- Ascertain type of reaction client experienced when there is a history of past reaction. *There are two types of reactions, both of which could change decisions about using ICM for diagnostic purposes. (1) Idiosyncratic reaction typically begins within 20 minutes of ICM injection. The symptoms are similar to anaphylactic reactions and can be mild (e.g., cough, itching, nasal congestion), moderate (e.g., dyspnea, wheezing), or severe (e.g., respiratory distress, arrhythmias such as bradycardia, seizures, shock, cardiopulmonary arrest). (2) Nonidiosyncratic reaction includes bradycardia, hypotension, and vasovagal reactions; neuropathy; extravasation; sensations of warmth; a metallic taste in the mouth; nausea and vomiting; and delayed reactions.*^{1,3}

NURSING PRIORITY NO. 2 To assist client/caregiver to reduce or correct individual risk factors:

-  Administer infusions using the “6 rights” system (right client, right medication, right route, right dose, right time, right documentation) to prevent client from receiving improper contrast agent or dosage. *Note: Clients undergoing more than one procedure at a time (such as cardiac angiography and angioplasty) receive a higher dose and are at greater risk for renal insufficiency reactions.*
-  Perform imaging tests that do not require contrast media where possible when client is at high risk for reaction.
-  Administer intravenous fluids as appropriate to reduce incidence of contrast-induced nephropathy by supporting intravascular volume, diluting contrast media, and promoting its elimination.^{4,5}
-  Administer medications (e.g., methylprednisilone [Deltasone], Benadryl) before, during, and after injection or procedures to reduce risk or severity of reaction.³
- Observe intravenous injection site frequently to ascertain that no extravasation of contrast solution is occurring.
- Halt infusion immediately to prevent tissue damage from contrast agent if client reports site discomfort or redness or swelling is noted.
-  Monitor results of lab studies (e.g., creatinine clearance) to ascertain status of kidney function.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

-  Instruct client regarding signs and symptoms that should be reported to physician after procedures. *Weight gain, shortness of breath, decreased urination, or new or worsening edema could indicate renal insufficiency. Any delayed signs of reaction should be reported to physician immediately for possible intervention.*
- Instruct client/care provider about puncture sites and to report redness, soreness, or pain to reduce risk of complications associated with extravasation.
- Encourage client use of medical alert bracelet/necklace where indicated to alert healthcare providers of prior reaction to contrast media.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual risk factors identified.
- Client concerns or difficulty making and following through with plan.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward outcomes.

Discharge Planning

- Referrals to other resources.
- Long-term need and who is responsible for actions.

ineffective Airway Clearance

Taxonomy II: Safety—Class 2 Physical Injury (00031) [**Diagnostic Division:** Respiration], Submitted 1980; Revised 1996, 1998, 2017

DEFINITION: Inability to clear secretions or obstructions from the respiratory tract to maintain a clear airway.

RELATED FACTORS

Excessive mucus, retained secretions
 Foreign body in airway
 Smoking, exposure to smoke; secondhand smoking

DEFINING CHARACTERISTICS**Subjective**

Dyspnea

Objective

Diminished breath sounds; adventitious breath sounds [rales, crackles, rhonchi, wheezes]
 Ineffective or absence of cough; excessive sputum
 Alteration in respiratory rate or pattern
 Difficulty verbalizing
 Wide-eyed look; restlessness
 Orthopnea
 Cyanosis

Associated Condition: Airway spasm, allergic airway, asthma, chronic obstructive pulmonary disease, exudate in alveoli; hyperplasia of bronchial walls; infection; neuromuscular impairment; presence of artificial airway

Sample Clinical Applications: COPD, pneumonia, influenza, acute respiratory distress syndrome (ARDS), cancer of lung, cancer of head and neck, congestive heart failure (CHF), cystic fibrosis, neuromuscular diseases such as cerebral palsy; spinal cord injury, inhalation injuries

(continues on page 56)

ineffective Airway Clearance (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Respiratory Status: Airway Patency: Open, clear tracheobronchial passages for air exchange

Risk Control: Aspiration: Personal actions to understand and prevent the passage of fluid and solid particles into the lung

Cognition: Ability to execute complex mental processes

Client Will (Include Specific Time Frame)

- Maintain airway patency.
- Expectorate or clear secretions readily.
- Demonstrate absence or reduction of congestion with breath sounds clear, respirations noiseless, and improved oxygen exchange (e.g., absence of cyanosis, arterial blood gas [ABG] results within client norms).
- Verbalize understanding of cause(s) and therapeutic management regimen.
- Demonstrate behaviors to improve or maintain clear airway.
- Identify potential complications and how to initiate appropriate preventive or corrective actions.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Airway Management: Facilitation of patency of air passages

Respiratory Monitoring: Collection and analysis of patient data to ensure airway patency and adequate gas exchange

Cough Enhancement: Promotion of deep inhalation by the patient with subsequent generation of high intrathoracic pressures and compression of underlying lung parenchyma for the forceful expulsion of air

NURSING PRIORITY NO. 1 To maintain adequate, patent airway:

- Identify client populations at risk. *Persons with impaired ciliary function (e.g., cystic fibrosis, lung transplant recipients); those with excessive or abnormal mucus production (e.g., asthma, emphysema, pneumonia, dehydration, bronchiectasis, mechanical ventilation); those with impaired cough function (e.g., neuromuscular diseases, such as muscular dystrophy, multiple sclerosis and other neuromotor conditions, such as cerebral palsy, spinal cord injury); those with swallowing abnormalities (e.g., poststroke, seizures, head/neck cancer, coma/sedation, tracheostomy, facial burns/trauma/surgery); those who are immobile (e.g., sedated individual, frail elderly, developmentally delayed, institutionalized client with multiple high-risk conditions); and infants/children (e.g., feeding intolerance, abdominal distention, emotional stressors that may compromise airway) are all at risk for problems with maintenance of open airways.*^{1,2}
- Assess level of consciousness/cognition and ability to protect own airway. *This information is essential for identifying potential for airway problems, providing baseline level of care needed, and influencing choice of interventions.*
- Evaluate respiratory rate/depth and breath sounds. *Tachypnea is usually present to some degree and may be pronounced during respiratory stress. Respirations may be shallow. Some degree of bronchospasm is present with obstruction in airways and may/may not be manifested in adventitious breath sounds, such as scattered moist crackles (bronchitis), faint sounds with expiratory wheezes (emphysema), or absent breath sounds (severe asthma).*²

- Position head appropriate for age and condition/disorder. *Repositioning head may, at times, be all that is needed to open or maintain open airway in at-rest or compromised individual, such as one with sleep apnea.*
- ∞ Insert oral airway, using correct size for adult or child, when indicated. Have appropriate emergency equipment at bedside (such as tracheostomy equipment, ambu-bag, suction apparatus) to restore or maintain an effective airway.^{3,4}
- Evaluate amount and type of secretions being produced. *Excessive and/or sticky mucus can completely obstruct or make it difficult to maintain effective airways, especially if client has impaired cough function, is very young or elderly, is developmentally delayed, has restrictive or obstructive lung disease, or is mechanically ventilated.*^{2,5}
- Note ability to, and effectiveness of, cough. *Cough function may be absent, weak, or ineffective in diseases and conditions such as extremes in age (e.g., premature infant or elderly), cerebral palsy, muscular dystrophy, spinal cord injury, brain injury, postsurgery, and/or mechanical ventilation due to mechanisms affecting muscles of throat, chest, and lungs.*^{5,6}
- ∞ Suction (nasal, tracheal, oral), when indicated, using correct-size catheter and suction timing for child or adult to clear airway when secretions are blocking airways, client is unable to clear airway by coughing, cough is ineffective, infant is unable to take oral feedings because of secretions, or ventilated client is showing desaturation of oxygen by oximetry or ABGs.^{2,5,7}
- Assist with or prepare for appropriate testing (e.g., pulmonary function test or sleep studies) to identify causative or precipitating factors.
- Assist with procedures (e.g., bronchoscopy, tracheostomy) to clear or maintain open airway.
- Keep environment free of smoke, dust, and feather pillows according to individual situation. *Remove precipitants of allergic types of respiratory reactions that can trigger/exacerbate acute episode.*³

NURSING PRIORITY NO. 2 To mobilize secretions:

- Elevate head of the bed or change position, as needed. *Elevation or upright position facilitates respiratory function by use of gravity; however, the client in severe distress will seek position of comfort.*³
- Position appropriately (e.g., head of bed elevated, client on side, rather than supine) and discourage use of oil-based products around nose to prevent vomiting with aspiration into lungs. (Refer to NDs risk for Aspiration, impaired Swallowing.)
- Exercise diligence in providing oral hygiene, removing substances, and keeping oral mucosa hydrated. *Airways can be obstructed by substances such as blood or thickened secretions. These can be managed by strict attention to good oral hygiene, especially in the client who is unable to provide that for self. Note: Instances of inspissated (thickened, dense, dehydrated) secretions as the cause of death have been reported.*²
- Encourage and instruct in deep-breathing and directed-coughing exercises; teach (presurgically) and reinforce (postsurgically) breathing and coughing while splinting incision to maximize cough effort, lung expansion, and drainage and to reduce impairment associated with pain.
- Mobilize client as soon as possible. *Reduces risk or effects of atelectasis, enhancing lung expansion and drainage of different lung segments.*⁵
- Administer analgesics, as indicated. *Analgesics may be needed to improve cough effort when pain is inhibiting. Note: Overmedication, especially with opioids, can depress respirations and cough effort.*
- Administer medications (e.g., expectorants, anti-inflammatory agents, bronchodilators, mucolytic agents), as indicated, to relax smooth respiratory musculature, reduce airway edema, and mobilize secretions.⁸
- Increase fluid intake to at least 2,000 mL/day within cardiac tolerance (may require IV in acutely ill, hospitalized client). Encourage or provide warm versus cold liquids, as appropriate. *Warm hydration can help liquefy viscous secretions and improve secretion clearance. Note: Individuals with compromised cardiac function may develop symptoms of CHF (crackles, edema, weight gain).*^{4,5}
- Provide ultrasonic nebulizer or room humidifier, as needed, to deliver supplemental humidification, helping to reduce viscosity of secretions.

-  Assist with use of respiratory devices and treatments (e.g., intermittent positive-pressure breathing [IPPB], incentive spirometer [IS], positive expiratory pressure mask, mechanical ventilation, airway clearance vest/oscillatory airway device [flutter], assisted and directed cough techniques). *Various therapies/modalities may be required to maintain adequate airways and improve respiratory function and gas exchange depending on the cause for airway impairment. For example, an evidence-based review supports the notion that in individuals with neuromuscular conditions, cough may be made more effective by using manual assistance or positive-pressure insufflation devices. However, in clients with COPD, these same devices can be detrimental, causing decreased peak expiratory flow. (Refer to NDs ineffective Breathing Pattern, impaired Gas Exchange, impaired spontaneous Ventilation.)*^{3,12}
-  Perform or assist client in learning airway clearance techniques, particularly when airway congestion is a chronic or long-term condition. *Numerous techniques may be used, including (but not limited to) postural drainage and percussion, flutter devices, high-frequency chest compression with an inflatable vest, intrapulmonary percussive ventilation (IPV), and active cycle of breathing technique, as indicated. Many of these techniques are the result of research in treatments of cystic fibrosis and muscular dystrophy as well as other chronic lung diseases. NOTE: Studies show that while these modalities yield short-term improvements in airway clearance, more studies are needed to measure long-term and clinically important endpoints like quality of life or rates of exacerbations.*^{1,12,13}

NURSING PRIORITY NO. 3 To assess changes, note complications:

- Auscultate breath sounds, noting changes in air movement *to ascertain current status and effects of treatments to clear airways.*
- Monitor vital signs, noting blood pressure or pulse changes. Observe for increased respiratory rate, restlessness or anxiety, and use of accessory muscles for breathing, *suggesting advancing respiratory distress.*
-  Monitor and document serial chest radiographs, ABGs, pulse oximetry readings. *Identifies baseline status, influences interventions, and monitors progress of condition and/or treatment response.*
- Evaluate changes in sleep pattern, noting insomnia or daytime somnolence. *May be evidence of nighttime airway incompetence or sleep apnea. (Refer to NDs Insomnia, Sleep Deprivation)*
-  Document response to drug therapy and/or development of adverse reactions or side effects with antimicrobial agents, steroids, expectorants, and bronchodilators. *Pharmacological therapy is used to prevent and control symptoms, reduce severity of exacerbations, and improve health status. The choice of medications depends on availability of the medication, the client's decision making about medication regimen, and response to any given medication.*¹⁰
- Observe for signs/symptoms of infection (e.g., increased dyspnea, onset of fever, increase in sputum volume, change in color or character) *to identify infectious process and promote timely intervention.*¹⁰
-  Obtain sputum specimen, preferably before antimicrobial therapy is initiated, *to point to effective antimicrobial agent. Note: The presence of purulent sputum during an exacerbation of symptoms is a sufficient indication for starting antibiotic therapy, but a sputum culture and antibiogram (antibiotic sensitivity) may be done if the illness is not responding to the initial antibiotic.*¹⁰

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Assess client's/caregiver's knowledge of contributing causes, treatment plan, specific medications, and therapeutic procedures *to determine educational needs.*
- Provide information about the necessity of raising and expectorating secretions versus swallowing them *to note changes in color and amount in the event that medical intervention may be needed to prevent or treat infection.*
- Identify signs/symptoms to be reported to primary care provider. *Prompt evaluation and intervention are required to prevent/treat infection.*
- Demonstrate or assist client/significant other (SO) in performing specific airway clearance techniques (e.g., forced expiratory breathing [also called "huffing"] or respiratory muscle strength training, use of vest, chest percussion), if indicated.^{1,9,11}

- Review breathing exercises, effective coughing techniques, and use of adjunct devices (e.g., IPPB or IS) in pre-operative teaching *to facilitate postoperative recovery and reduce risk of pneumonia.*
-  Instruct client/SO/caregiver in use of inhalers and other respiratory drugs. Include expected effects and information regarding possible side effects and interactions of respiratory drugs with other medications, over-the-counter medications, and herbals. Discuss symptoms requiring medical follow-up. *Client is often taking multiple medications that have similar side effects and potential for interactions. It is important to understand the difference between nuisance side effects (e.g., fast heartbeat after albuterol inhaler) and adverse effects (e.g., chest pain, hallucinations, or uncontrolled cardiac arrhythmia).*⁸
- Encourage and provide opportunities for rest; limit activities to level of respiratory tolerance. *Prevents or diminishes fatigue associated with underlying condition or efforts to clear airways.*
-  Urge reduction or cessation of smoking. *Smoking is known to increase production of mucus and to paralyze (or cause loss of) cilia needed to move secretions to clear airway and improve lung function.*¹⁰
-  Refer to appropriate support groups (e.g., smoking-cessation clinic, COPD exercise group, weight reduction, American Lung Association, Cystic Fibrosis Foundation, Muscular Dystrophy Association).
-  Refer for/instruct in use of nocturnal continuous positive airway pressure (CPAP) therapy for treatment of sleep apnea. (Refer to NDs Insomnia, Sleep Deprivation.)

DOCUMENTATION FOCUS

Assessment/Reassessment

- Related factors for individual client.
- Breath sounds, presence and character of secretions, use of accessory muscles for breathing.
- Character of cough and sputum.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for Allergy Reaction

Taxonomy II: Safety/Protection—Class 5 Defensive Processes (00217) [Diagnostic Division: Safety], Submitted 1988; revised 2013, 2017

DEFINITION: Susceptible to an exaggerated immune response or reaction to substances, which may compromise health.

RISK FACTORS

Exposure to allergen

Exposure to environmental allergen

Exposure to toxic chemical

At Risk Population: History of food allergy; history of insect sting allergy; repeated exposure to allergen-producing environmental substance

Sample Clinical Applications: Asthma, conjunctivitis; eczema and other allergic skin rashes; food allergies and intolerances; hay fever; hives; insect stings

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Allergic Response: Localized: Severity of localized hypersensitive immune response to a specific environmental (exogenous) antigen

Allergic Response: Systemic: Severity of systemic hypersensitive immune response to a specific environmental (exogenous) antigen

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Be free of signs of hypersensitive response.
- Verbalize understanding of individual risks and responsibilities in avoiding exposure.
- Identify signs/symptoms requiring prompt response.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Allergy Management: Identification, treatment, and prevention of allergic responses to food, medications, insect bites, contrast material, blood, and other substances

NURSING PRIORITY NO. 1 To identify causative/precipitating factors related to risk:

-  Question client regarding known allergies upon admission to healthcare facility. *Basic safety information to help healthcare providers prevent/prepare for safe environment for client while providing care.*
- Ascertain type of allergy and usual symptoms if client reports history of allergies (e.g., seasonal rhinitis [“hay-fever”], allergic dermatitis, conjunctivitis, environmental asthma, environmental substances [e.g., mold, dust, pet dander], insect sting reactions, food intolerance, immunodeficiency such as Addison’s disease, drug or transfusion reaction. *Allergies can manifest as local reactions (as may occur in skin rashes) or be systemic. Responses are many and variable. Client/caregiver may be aware of some allergies, but not all of them. It is also possible that client is having a first time allergic reaction to a substance and not know what substance caused the reaction.*⁵
- Obtain written list of drug allergies upon first contact with client. *Helps prevent adverse drug events (ADEs) while client is in facility care and aids in differentiating side effects from allergic responses. May also help improve client’s understanding of reportable symptoms.*¹
- Discuss possibility of latex allergy when entering facility care, especially when procedures are anticipated (e.g., laboratory, emergency department, operating room, wound care management, one-day surgery, dental) so that proper precautions can be taken by healthcare providers. *Note: The most severe reactions tend to occur with latex proteins contacting internal tissues during invasive procedures and when they touch mucous membranes of the mouth, vagina, urethra, or rectum.*² (Refer to NDs Latex Allergy Reaction and risk for Latex Reaction for related interventions.)
-  Note client’s age. *Although allergies can occur at any time in client’s lifespan, there are some that can start early in life. These include food allergies (e.g., peanuts) and respiratory ailments (e.g., asthma). Note: In 2015, 8.4% of young children in the United States had asthma. Higher numbers were listed for adolescents and young adults (9.8% in persons aged 11 to 21). In 2015, it was reported that allergies affect as many as 30% percent of adults and 40% of children in the United States.*^{3,5}
-  Perform challenge or patch test, if appropriate, to identify specific allergens in client with known type IV hypersensitivity. *Note: Emergency department diagnosis and management depend on the history and physical examination.*
-  Note response to allergen-specific IgE antibody tests where available. *Performed to measure the quantity of IgE antibodies in serum after exposure to specific antigens and has generally replaced skin tests and provocation tests, which are inconvenient, often painful, and/or hazardous to the client. Note: These tests are useful in nonemergent evaluations.*⁴

NURSING PRIORITY NO. 2 To take measures to avoid exposure and reduce/limit allergic response:

- Discuss client’s current symptoms, noting reports of rash, hives, itching; teary eyes, localized swelling (e.g., of lips) or diarrhea, nausea, and feeling of faintness. Try to ascertain if client/care provider associates these symptoms with certain food, substances, or environmental factors (triggers). *May help isolate cause for a reaction. Baseline for determining where the client is along a continuum of symptoms, so that appropriate treatments can be initiated.*⁵
- Provide allergen-free environment (e.g., clean, dust-free room, use of air filters to reduce mold and pollens in air, etc.) to reduce client exposure to allergens.
-  Collaborate with all healthcare providers to administer medications and perform procedures with client’s allergies in mind. Perform challenge or patch test, if appropriate.
- Encourage client to wear medical ID bracelet/necklace to alert providers to condition if client is unresponsive or unable to relay information for any reason.
-  Refer to physician/allergy specialists as indicated for interventions related to specific allergy conditions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

-  Instruct in/review with client and care provider(s) ways to prevent or limit client exposures. *May need or desire information regarding ways to reduce allergens at home, school, or work; may desire information regarding potential exposures when traveling, or how to manage food allergies when eating in restaurants.*⁵

- Instruct in signs of reaction and emergency treatment needs. *Allergic reactions range from skin irritation to anaphylaxis. Reaction may be gradual but progressive, affecting multiple body systems, or may be sudden, requiring lifesaving treatment. Allergy can result in chronic illness, disability, career loss, hardship, and death.*
- Emphasize the critical importance of taking immediate action for moderate to severe hypersensitivity reactions *to limit life-threatening symptoms.*
- Demonstrate equipment and injection procedure, and recommend client carry auto-injectable epinephrine *to provide timely emergency treatment, as needed.*
- Emphasize necessity of informing all new care providers of allergies *to reduce preventable exposures.*
- Provide audiovisual resources and assistance numbers for emergencies. *When allergy is suspected or the potential for allergy exists, protection must begin with identification and removal of possible sources.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors identified.
- Client concerns or difficulty making and following through with plan.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward outcomes.

Discharge Planning

- Referrals to other resources.
- Long-term need and who is responsible for actions.

Anxiety [Specify Level]

mild, moderate, severe, panic **Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00146)** [Diagnostic Division: Ego Integrity], Submitted 1973; Revised 1982, 1998, 2017

DEFINITION: Vague uneasy feeling of discomfort or dread accompanied by an autonomic response (the source is often nonspecific or unknown to the individual); a feeling of apprehension caused by anticipation of danger. It is an alerting sign that warns of impending danger and enables the individual to take measures to deal with that threat.

RELATED FACTORS

Conflict about life goals; value conflict
 Interpersonal transmission or contagion
 Stressors
 Substance misuse/[abuse]
 Threat of death [perceived or actual]
 Threat to current status
 Unmet needs

At Risk Population: Exposure to toxin; family history of anxiety, heredity; major change; maturational or situational crisis

DEFINING CHARACTERISTICS**Subjective**

Behavioral: Worried about change in life event; insomnia

Affective: Regretful; rattled; distress; apprehensiveness; nervousness, uncertainty; fear; feeling of inadequacy; worried; helplessness

Cognitive: Fear; forgetfulness; awareness of physiological symptoms

Sympathetic: Dry mouth; heart palpitations; weakness; anorexia; diarrhea

Parasympathetic: Tingling in extremities; nausea; abdominal pain; diarrhea; urinary frequency, hesitancy, urgency; faintness; fatigue; alteration in sleep pattern

Objective

Behavioral: Poor eye contact; glancing about; scanning behavior; hypervigilance; extraneous movement; fidgeting; restlessness; decrease in productivity

Affective: Increase in wariness; self-focus; irritability; jitteriness; overexcitement; anguish

Cognitive: Preoccupation; alteration in attention, concentration; diminished ability to learn or problem solve; rumination; tendency to blame others; blocking of thoughts; confusion; decrease in perceptual field

Physiological: Voice quivering; trembling; tremor; increase in tension; facial tension; increase in perspiration

Sympathetic: Cardiovascular excitation; facial flushing; superficial vasoconstriction; increase in heart or respiratory rate; increase in blood pressure; alteration in respiratory pattern; pupil dilation; twitching; brisk reflexes

Parasympathetic: Decrease in blood pressure or heart rate

Sample Clinical Applications: Major life changes or events, hospital admissions, surgery, cancer, hyperthyroidism, drug intoxication or abuse, mental health disorders

(continues on page 64)

Anxiety [Specify Level] (continued)**DESIRED OUTCOMES/EVALUATION CRITERIA****Sample NOC linkages:**

Anxiety Level: Severity of manifested apprehension, tension, or uneasiness arising from an unidentifiable source

Anxiety Self-Control: Personal actions to eliminate or reduce feelings of apprehension, tension, or uneasiness from an unidentifiable source

Coping: Personal actions to manage stressors that tax an individual's resources

Client Will (Include Specific Time Frame)

- Verbalize awareness of feelings of anxiety.
- Appear relaxed and report anxiety is reduced to a manageable level.
- Identify healthy ways to deal with and express anxiety.
- Demonstrate problem-solving skills.
- Use resources and support systems effectively.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Anxiety Reduction: Minimizing apprehension, dread, foreboding, or uneasiness related to an unidentified source or anticipated danger

Calming Technique: Reducing anxiety in patient experiencing acute distress

Dementia Management: Provision of a modified environment for the patient who is experiencing a chronic confusional state

NURSING PRIORITY NO. 1 To assess level of anxiety:

- Review familial and physiological factors, such as genetic depressive factors and psychiatric illness, active medical conditions (e.g., thyroid problems, metabolic imbalances, cardiopulmonary disease, anemia, dysrhythmias), and recent or ongoing stressors (e.g., family member illness or death, spousal conflict or abuse, loss of job). *These factors can cause or exacerbate anxiety and anxiety disorders.*^{6,12,13}
-  Determine current prescribed medication regimen and recent drug history of prescribed or over-the-counter (OTC) medications (e.g., steroids, thyroid preparations, weight-loss pills, caffeine). *Can heighten feelings or sense of anxiety.*^{12,13}
- Identify client's perception of the threat represented by the situation. *Distorted perceptions of the situation may magnify feelings. Understanding client's point of view promotes a more accurate plan of care.*¹
-  Note cultural factors that may influence anxiety. *Individual responses are influenced by the cultural values and beliefs and culturally learned patterns of family of origin.*³
- Monitor physical responses (e.g., palpitations, rapid pulse, repetitive movements, pacing). *Changes in vital signs may suggest degree of anxiety client is experiencing or reflect the impact of physiological factors such as endocrine imbalances and medication effect.*⁶
- Observe behavior indicative of anxiety, *which can be a clue to the client's level of anxiety:*
- **Mild**
Alert, more aware of environment, attention focused on environment and immediate events.
Restless, irritable, wakeful, reports of insomnia.
Motivated to deal with existing problems in this state.

- **Moderate**

Perception narrower, concentration increased, able to ignore distractions in dealing with problem(s).

Voice quivers or changes pitch.

Trembling, increased pulse or respirations.

- **Severe**

Range of perception is reduced, anxiety interferes with effective functioning.

Preoccupied with feelings of discomfort or sense of impending doom.

Increased pulse or respirations with reports of dizziness, tingling sensations, headache, etc.

- **Panic**

Ability to concentrate is disrupted, behavior is disintegrated, client distorts the situation and does not have realistic perceptions of what is happening.

May be experiencing terror or confusion or be unable to speak or move (paralyzed with fear).

- Note own feelings of anxiety or uneasiness. *Feelings of anxiety are circular, and those in contact with the client may find themselves feeling more anxious.*²
- Note use of drugs (including alcohol and other drugs), insomnia or excessive sleeping, and limited or avoidance of interactions with others, *which may be behavioral indicators of use of drugs to deal with problems or may indicate withdrawal from drugs or substances.*⁴
-  Review results of diagnostic tests (e.g., drug screens, cardiac testing, complete blood count, chemistry panel), *which can point to physiological sources of anxiety.*
- Review coping skills used in past. *Can determine those that might be helpful in current circumstances.*⁵

NURSING PRIORITY NO. 2 To assist client to identify feelings and begin to deal with problems:

- Establish a therapeutic relationship, conveying empathy and unconditional positive regard. *Enables client to become comfortable and to begin looking at feelings and dealing with situation.*²
- Be available to client for listening and talking. *Establishes rapport, promotes expression of feelings, and helps client/significant other look at realities of the illness or treatment without confronting issues they are not ready to deal with.*²
- Encourage client to acknowledge and to express feelings—for example, crying (sadness), laughing (fear, denial), or swearing (fear, anger)—using active-listening, reflection techniques. *Often, acknowledging feelings enables client to accept and deal more appropriately with situation, thus relieving anxiety.*⁷
- Assist client to develop self-awareness of verbal and nonverbal behaviors. *Becoming aware helps client to control these behaviors and begin to deal with issues that are causing anxiety.*⁸
- Clarify meaning of feelings or actions by providing feedback and checking meaning with the client. *Validates meaning and ensures accuracy of communication.*⁹
- Acknowledge anxiety or fear. Do not deny or reassure client that everything will be all right. *Validates reality of feelings. False reassurances may be interpreted as lack of understanding or dishonesty, further isolating client.*²
- Be aware of defense mechanisms being used (e.g., denial, regression). *Use of defense mechanisms may be a helpful coping mechanism initially. However, continued use of such mechanisms diverts the energy that the client needs for healing, thus delaying the client from focusing and dealing with the actual problem.*⁵
- Identify coping skills the individual is using currently, such as anger, daydreaming, forgetfulness, eating, smoking, or lack of problem solving. *These may be useful for the moment but may eventually interfere with resolution of current situation.*⁵
- Provide accurate information about the situation. *Helps client to identify what is reality based and provides opportunity for client to feel reassured.*¹³
-  Respond truthfully, avoid bribing, and provide physical contact (e.g., hugging, rocking) when client is a child. *Soothes fears and provides assurance. Children need to recognize that their feelings are not different from those of others.*⁴

NURSING PRIORITY NO. 3 To provide measures to comfort and aid client to handle problematic situations:

-  Provide comfort measures (e.g., calm or quiet environment, soft music, warm bath, back rub, Therapeutic Touch). *Aids in meeting basic human need, decreasing sense of isolation, and assisting client to feel less anxious. Therapeutic Touch requires the nurse to have specific knowledge and experience to use the hands to correct energy field disturbances by redirecting human energies to help or heal.*^{2,10}
-  Modify procedures as necessary (e.g., substitute oral for intramuscular medications, combine blood draws or use fingerstick method). *Limits degree of stress and avoids overwhelming child or anxious adult.*¹
-  Manage environmental factors, such as harsh lighting, high traffic flow, excessive noise. *May be confusing or stressful to older individuals. Managing these factors can lessen anxiety, especially when client is in strange and unusual circumstances.*¹
- Discuss the use of music and accommodate client's preferences. *Promotes calming atmosphere, helping to alleviate anxiety.*²
- Accept client as is. *The client may need to be where he or she is at this point in time, such as in denial after receiving the diagnosis of a terminal illness.*²
- Allow the behavior to belong to the client; do not respond personally. *Reacting personally can escalate the situation, promoting a nontherapeutic situation and increasing anxiety.*
- Assist client to use anxiety for coping with the situation if helpful. *Moderate anxiety heightens awareness and can help client to focus on dealing with problems.*⁸
- Encourage awareness of negative self-talk and discuss replacing with positive statements, such as using "can" instead of "can't," etc. *Negative self-talk promotes feelings of anxiety and self-doubt. Becoming aware and replacing these thoughts can enhance sense of self-worth and reduce anxiety.*⁸

PANIC STATE

-  Stay with client, maintaining a calm, confident manner. *Presence communicates caring and helps client to regain control and sense of calm.*
- Speak in brief statements using simple words. *Client is not able to comprehend complex information at this time.*
- Provide for nonthreatening, consistent environment or atmosphere. Minimize stimuli and monitor visitors and interactions with others. *Lessens effect of transmission of anxious feelings.*
- Set limits on inappropriate behavior and help client to develop acceptable ways of dealing with anxiety.
- Provide safe controls and environment until client regains control. *Behavior may result in damage or injury that client will regret when control is regained, diminishing sense of self-worth.*
- Gradually increase activities and involvement with others as anxiety is decreased. *Promotes sense of normalcy, helps control feelings of anxiety.*
-  Use cognitive therapy to focus on and correct faulty catastrophic interpretations of physical symptoms. *For example, thoughts of dying increase anxiety and feelings of panic. Controlling these thoughts allows client to look at situation more realistically and begin to deal appropriately with what is happening.*
-  Administer anti-anxiety agents or sedatives, as ordered. *Appropriate medication can be helpful in enabling the client to regain control.*¹³

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Assist client to identify and deal with precipitating factors and learn new methods of coping with disabling anxiety. *Lessens possibility of repeat episodes.*⁸
- Review happenings, thoughts, and feelings preceding the anxiety attack. *Identifies factors that led to onset of attack, promoting opportunity to prevent recurrences.*¹

- Identify actions and activities the client has previously used to cope successfully when feeling nervous or anxious. *Realizing that individual already has coping skills that can be applied in current and future situations can empower client.*¹
- List helpful resources and people, including available hotline or crisis managers. *Provides ongoing and timely support.*¹
-  Encourage client to develop a regular exercise or activity program. *May be helpful in reducing level of anxiety by relieving tension and has been shown to raise endorphin levels to enhance sense of well-being.*¹
- Assist in developing skills (e.g., awareness of negative thoughts, saying “Stop” and substituting a positive thought). *Eliminating negative self-talk can lead to feelings of positive self-esteem. (Note: Mild phobias seem to respond better to behavioral therapy.)*⁹
- Review such strategies as role-playing, use of visualizations to practice anticipated events, and prayer or meditation. *These activities can help the client practice behaviors in a safe and supportive environment, enabling individual to manage anxiety-provoking situations.*⁹
-  Review medication regimen and possible interactions, especially with OTC drugs, alcohol, and herbal products. *Enhances understanding of reason for medication and can avoid untoward or harmful reactions from incompatible drugs.*^{11,13}
-  Discuss appropriate drug substitutions or changes in dosage or time of dose. *Ensures proper dosage and avoids untoward side effects. This is especially important in the elderly, who are particularly susceptible to multidrug complications.*¹¹
-  Refer to physician for drug management program or alteration of prescription regimen. *Drugs that often cause symptoms of anxiety include aminophylline, anticholinergics, dopamine, levodopa, salicylates, and steroids. Monitoring provides opportunity to correct possible undesirable effects of these drugs.*¹¹
-  Refer to individual and/or group therapy, as appropriate. *May be useful to help client deal with chronic anxiety states.*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Level of anxiety and precipitating or aggravating factors.
- Description of feelings (expressed and displayed).
- Awareness or ability to recognize and express feelings.
- Related substance use, if present.

Planning

- Treatment plan and individual responsibility for specific activities.
- Teaching plan.

Implementation/Evaluation

- Client involvement and response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Referrals and follow-up plan.
- Specific referrals made.

risk for Aspiration

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00039) [Diagnostic Division: Respiration], Submitted 1988; Revised 2013, 2017

DEFINITION: Susceptible to entry of gastrointestinal secretions, oropharyngeal secretions, solids or fluids into the tracheobronchial passages, which may compromise health.

RISK FACTORS

Barrier to elevating upper body
Decrease in gastrointestinal motility
Ineffective cough
Insufficient knowledge of modifiable factors

Associated Condition: Decrease in level of consciousness; oral, facial, or neck surgery or trauma; treatment regimen

Depressed gag reflex; impaired ability to swallow; incompetent lower esophageal sphincter; increase in gastric residual or intragastric pressure; delayed gastric emptying
Presence of oral/nasal tube; enteral feedings

Sample Clinical Applications: Facial, jaw, neck surgery; vomiting, bulimia nervosa, presence of nasogastric tube, enteral feedings; brain injury, spinal cord injury

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Risk Control: Aspiration: Personal actions to understand and prevent the passage of fluid and solid particles into the lung

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Respiratory Status: Airway Patency: Open, clear tracheobronchial passages for air exchange

Client/Caregiver Will (Include Specific Time Frame)

- Experience no aspiration as evidenced by noiseless respirations; clear breath sounds; clear, odorless secretions.
- Identify causative or risk factors.
- Demonstrate techniques to prevent and/or correct aspiration.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Aspiration Precautions: Prevention or minimization of risk factors in the patient at risk for aspiration

Artificial Airway Management: Maintenance of endotracheal and tracheostomy tubes and prevention of complications associated with their use

Postanesthesia Care: Monitoring and management of the patient who has recently undergone general or regional anesthesia

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify at-risk client according to condition/disease process as listed in Risk Factors to determine when more active observation and/or interventions may be required.
-  Assess for age-related risk factors potentiating risk of aspiration (e.g., premature infant, elderly infirm). *Aspiration pneumonia is more common in extremely young or old individuals, and it commonly occurs in those with chronically impaired airway defense mechanisms, including gag reflex, coughing, ciliary movement, and immune mechanisms that aid in removing material from the lower airways.*^{4,13}
-  Note level of consciousness or awareness of surroundings and cognitive impairment. *Aspiration is common in comatose clients owing to inability to cough or swallow adequately and/or presence of artificial airway, mechanical ventilation, and tube feedings.*^{1,13}
-  Evaluate neuromuscular dysfunction, if present, noting muscle groups involved, degree of impairment, and whether acute or of a progressive nature (e.g., stroke, cerebral palsy, Parkinson's disease, progressive supranuclear palsy, similar disabling brain diseases; Guillain-Barré syndrome, amyotrophic lateral sclerosis, psychiatric client following electric shock therapy). *May result in temporary or chronic, progressive impairment of protective muscle functions.*^{7,11}
- Assess client's ability to swallow and cough; note quality of voice. *Although aspiration during swallowing is best detected by procedures such as video fluoroscopy, clinical observations are important. Sudden respiratory symptoms (such as severe coughing and cyanosis or wet phlegmy voice quality) are indicative of potential aspiration. Also, individuals with impaired or absent cough reflexes (such as may occur after a stroke, in Parkinson's disease, or during sedation) are at high risk for "silent" aspiration.*^{4,9}
- Observe for neck and facial edema; e.g., client with head or neck surgery or a tracheal or bronchial injury (upper torso burns, inhalation or chemical injury). *Problems with swallowing and maintenance of airways can be expected in this client, and the potential is high for aspiration and aspiration pneumonia.*
-  Assess amount and consistency of respiratory secretions and rate and depth of respirations. *Helps differentiate the potential cause for risk of aspiration. The major pathophysiological dysfunction is the inability of the epiglottis and true vocal cords to move to close the trachea (e.g., changes in the structures themselves or because messages to the brain are absent, decreased, or impaired). Problems with coughing (clearing airways) and swallowing (pooling of saliva, liquids) increase risk of aspiration and respiratory complications.*²⁻⁴
- Auscultate lung sounds periodically (especially in client who is coughing frequently or not coughing at all; client with artificial airways, endotracheal and tracheostomy tubes; ventilator client being tube-fed, immediately following extubation), and observe chest radiographs to determine decreased breath sounds, rales, or dullness to percussion that could indicate presence of aspirated food or secretions and "silent aspiration" leading to aspiration pneumonia. *Note: Aspiration is the most common route of entry for both community- and hospital-acquired pneumonia.*⁵
-  Evaluate for/note presence of gastrointestinal (GI) pathology and motility disorders. *Nausea with vomiting (associated with metabolic disorders, following surgery, or with certain medications) and gastroesophageal reflux disease can cause inhalation of gastric contents.*^{3,6}

-  Note administration of enteral feedings, which may be initiated when oral nutrition is not possible, such as in head injury, stroke, or other neurological disorders, head and neck surgery, esophageal obstruction, and discontinuous GI tract. *Potential exists for regurgitation and aspiration with the use of small or larger bore nasogastric feeding tubes, even with proper tube placement, necessitating the need for clients at high risk for aspiration associated with nasogastroenteral feedings to be evaluated for enteral feedings into the jejunum.*⁷
- Ascertain lifestyle habits (e.g., chronic use of alcohol and drugs, alcohol intoxication, tobacco, other central nervous system-suppressant drugs). *Can affect awareness as well as impair gag and swallow mechanisms.*⁵
-   Assist with and review diagnostic studies (e.g., video-fluoroscopy, fiber-optic endoscopy) that may be done to assess for presence and degree of impairment. *Note: One recent retrospective study of 2,000 clients evaluated by video-fluoroscopy revealed that of those who aspirated, 55% had no protective cough reflex (silent aspiration).*^{9,11}

NURSING PRIORITY NO. 2 To assist in correcting factors that can lead to aspiration:

-   Place client in proper position for age and condition or disease affecting airways. *Adult and child should be upright for meals to decrease likelihood of drainage into trachea and to reduce reflux and improve gastric emptying.*^{2,4} *Prone position may provide shorter gastric emptying time and decreased incidence of regurgitation and subsequent aspiration in premature infants.*⁸
- Encourage client to cough, as able, to clear secretions. *May simply need to be reminded or encouraged to cough (such as might occur in elderly person with delayed gag reflex or in postoperative, sedated client).*²
- Provide close monitoring for use of oxygen masks in clients at risk for vomiting. Refrain from using oxygen mask for comatose individuals.
- Keep wire cutters or scissors with client at all times when jaws are wired or banded to facilitate clearing airway in emergencies.
- Assist with oral care, postural drainage, and other respiratory therapies to remove or mobilize thickened secretions that may interfere with swallowing and block airway.⁶
-  In client requiring suctioning to manage secretions:^{6,9,10}
Maintain operational suction equipment at bedside or chairside.

Suction (oral cavity, nose, and endotracheal/tracheostomy tube) as needed, using correct size of catheter and timing for adult or child to clear secretions in client with more frequent or congested-sounding cough; presence of coarse rhonchi and expiratory wheezing (audible with or without auscultation); visible secretions; increased peak pressures during volume-cycled ventilation; indication from client that suctioning is necessary; suspected aspiration of gastric or upper airway secretions; or otherwise unexplained increases in shortness of breath, respiratory rate, or heart rate.

Avoid triggering gag mechanism when performing suction or mouth care.

Avoid keeping client supine or flat when on mechanical ventilation (especially when also receiving enteral feedings). *Supine positioning and enteral feeding have been shown to be independent risk factors for the development of aspiration pneumonia.*

-  For a verified swallowing problem:^{3–5,11}

Provide a rest period prior to feeding time. *Rested person may have less difficulty with swallowing.*

Elevate client to highest or best possible position for eating and drinking.

Feed slowly and instruct client to take small bites and to chew thoroughly.

Vary placement of food in client's mouth according to type of deficit (e.g., place food in right side of mouth if facial weakness present on left side). Use semisolid or soft foods that stick together and form a bolus (e.g., casseroles, puddings, stews), which aids swallowing effort by improving client's ability to manipulate food with the tongue.

Avoid pureed foods and mucus-producing foods (milk).

Determine food and liquid viscosity best tolerated by client. Add thickening agent to liquids, as appropriate. *Some individuals may swallow thickened liquids better than thin liquids.*

Offer very warm or very cold liquids *to activate temperature receptors in the mouth that help to stimulate swallowing.*

Avoid washing solids down with liquids *to prevent bolus of food pushing down too rapidly, increasing risk of aspiration.*

-  Provide oral medications in elixir form or crushed, if appropriate. Have client self-medicate when possible. Time medications to coincide with meals when possible.
-  Refer to physician and/or speech language pathologist, as appropriate, *for medical and surgical interventions or for specific exercises to strengthen muscles and techniques to enhance swallowing.*
-  When feeding tube is in place:^{4,12,13}

Note radiograph and/or measurement of aspirate pH following placement of feeding tube *to verify correct position.*

Ask client about feeling of fullness and/or measure residuals just prior to feeding and several hours after feeding, when appropriate, *to prevent overfeeding.*

Elevate head of bed 30 degrees during and for at least 30 minutes after bolus feedings.

-  Determine best position for infant/child (e.g., with the head of bed elevated 30 degrees and infant propped on right side after feeding). *Upper airway patency is facilitated by upright position, and turning to right side decreases likelihood of drainage into trachea.*
-  Provide oral medications in elixir form or crushed, if appropriate.
-  Minimize use of sedatives/hypnotics when possible. *Agents can impair coughing and swallowing.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review individual risk or potentiating factors with client/care provider.
-  Provide information about the effects of aspiration on the lungs. *Severe coughing and cyanosis (associated with eating or drinking) and voice change after swallowing indicate onset of respiratory symptoms associated with aspiration and require intervention for actual presence of aspiration.*^{4,12}
- Instruct in safety concerns when feeding orally or tube feeding. (Refer to ND impaired Swallowing.)
- Train client to suction self or train family members in suction techniques (especially if client has constant or copious oral secretions) *to enhance safety/self-sufficiency.*
- Instruct individual/family member to avoid or limit activities after eating that increase intra-abdominal pressure (straining, strenuous exercise, tight or constrictive clothing). *May slow digestion or increase risk of regurgitation.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings and conditions that could lead to problems of aspiration.
- Verification of tube placement, observations of physical findings.

Planning

- Interventions to prevent aspiration or reduce risk factors and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Foods and fluids client handles with ease or difficulty.
- Amount and frequency of intake.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.

risk for impaired Attachment

Taxonomy II: Role Relationships—Class 2 Family Relationships (00058) [Diagnostic Division: Social Interaction],
Submitted as Risk for Impaired Parent/Infant/Child Attachment 1994; Revised 2008, 2013, 2017

DEFINITION: Susceptible to disruption of the interactive process between parent/significant other and child that fosters the development of a protective and nurturing reciprocal relationship.

RISK FACTORS

Inability of parent to meet personal needs

Anxiety

Child's illness prevents effective initiation of parental contact

Disorganized infant behavior; parental conflict resulting from disorganized infant behavior

Parent-child separation; [physical barrier (e.g., infant in isolette); insufficient privacy]

Substance misuse/[abuse]

At Risk Population: Premature infant

[Difficult pregnancy and/or birth]

[Uncertainty of paternity; conception as a result of rape/sexual abuse]

[Parents who themselves experienced impaired attachment]

Sample Clinical Applications: Prematurity, genetic or congenital conditions, autism, attention deficit disorder, developmental delay (parent or child), substance abuse (parent), bipolar disorder (parent)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Parent-Infant Attachment: Parent and infant behaviors that demonstrate an enduring affectionate bond

Parenting Performance: Parental actions to provide a child a nurturing and constructive physical, emotional, and social environment

Child Development: [specify age group]: Milestones of physical, cognitive, and psychosocial progression by [specify] months/years of age

Parent Will (Include Specific Time Frame)

- Identify and prioritize family strengths and needs.
- Exhibit nurturing and protective behaviors toward child.
- Identify and use resources to meet needs of family members.
- Demonstrate techniques to enhance behavioral organization of the infant/child.
- Engage in mutually satisfying interactions with child.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Attachment Promotion: Facilitating the development of an affective, enduring relationship between infant and parent

Family Integration Promotion: Facilitation of the growth of individuals or families who are adding an infant to the family unit

Parenting Promotion: Providing parenting information, support, and coordination of comprehensive services to high-risk families

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Interview parents, noting their perception of situation and individual concerns. *Identifies problem areas and strengths to formulate appropriate plans to change situation that is currently creating problems for the parents.*⁸
- Assess parent/child interactions. *Identifies relationships, communication skills, and feelings about one another. The way in which a parent responds to a child and how the child responds to the parent largely determines how the child develops. Identifying the way in which the family responds to one another is crucial in determining the need for and type of interventions required.*⁸
- Ascertain availability and use of resources to include extended family, support groups, and finances. *Lack of support from or presence of extended family, lack of involvement in groups (e.g., church) or specific resources (e.g., La Leche League), and financial stresses can affect family negatively, interfering with ability to deal effectively with parenting responsibilities. Parents need support from both inside and outside the family.*^{9,12}
- Determine emotional and behavioral problems of the child. *Attachment-disordered children are unable to give and receive love and affection, defy parental rules and authority, and are physically and emotionally abusive, creating ongoing stress and turmoil in the family and in future relationships.*¹²
- Evaluate parents' ability to provide protective environment and to participate in reciprocal relationship. *Parents may be immature, may be substance abusers, or may be mentally ill and unable or unwilling to assume the task of parenting. The ways in which the parent responds to the child are critical to the child's development, and interventions need to be directed at helping the parents to deal with their own issues and learn positive parenting skills.*^{1,7}
-  Note attachment behaviors between parent and child(ren), recognizing cultural background. *For example, lack of eye contact and touching may indicate bonding problems. Behaviors such as eye-to-eye contact, use of en face position, and talking to the infant in a high-pitched voice are indicative of attachment behaviors in American culture but may not be practiced in another culture. Failure to bond effectively is thought to affect subsequent parent-child interaction.*^{4,5}

- Assess parenting skill level, considering intellectual, emotional, and physical strengths and limitations. *Identifies areas of need for further education, skill training, and factors that might interfere with ability to assimilate new information.*^{1,2}

NURSING PRIORITY NO. 2 To enhance behavioral organization of infant/child:

- Identify infant's strengths and vulnerabilities. *Each child is born with his or her own temperament that affects interactions with caregivers, and when these are known, actions can be taken to assist parents/caregivers to parent appropriately.*^{2,7,11}
- Educate parents regarding child growth and development, where indicated, addressing parental perceptions. *Parents often have misconceptions about the abilities of their children, and providing correct information clarifies expectations and is more realistic.*⁶
- Assist parents in modifying the environment. *The environment can be changed to provide appropriate stimulation (e.g., to diminish stimulation before bedtime, to simplify when the environment is too complex to handle, to provide life space where the child can play unrestricted, resulting in freedom for the child to meet his or her needs).*^{2,7} (Refer to ND readiness for enhanced organized Infant Behavior.)
-  Model caregiving techniques that best support behavioral organization, such as attachment parenting. *Recognizing that the child deserves to have his or her needs taken seriously and responding to those needs in a loving fashion promotes trust, and children learn to model their behavior after what they have seen the parents do.*^{9,11}
- Respond consistently with nurturance to infant/child. *Babies come wired with an ability to signal their needs by crying, and when parents respond to these signals, they develop a sensitivity that in turn develops parental intuition, providing infants with gratification of their needs and trust in their environment.*¹⁰

NURSING PRIORITY NO. 3 To enhance best functioning of parents:

- Develop a therapeutic nurse-client relationship. Provide a consistently warm, nurturant, and nonjudgmental environment. *Parents are often surprised to find that a tiny infant can cause so many changes in their lives and need help to adjust to this new experience. The warm, caring relationship of the nurse can help with this adjustment and provide the information and empathy they need at this time.*¹
- Assist parents in identifying and prioritizing family strengths and needs. *Promotes positive attitude by looking at what they already do well and using those skills to address needs.*²
- Support and guide parents in process of assessing resources. *Outside support is important at this time, and making sure that parents receive the help they need will help them in this adjustment period.*¹²
- Involve parents in activities with the infant/child that they can accomplish successfully. *Parent participation (mentoring and modeling) in activities such as those recommended in Baby Gymboree Play and Music® creative play, and baby yoga can enable the parents to get to know their child and themselves, enhancing their confidence and self-concept.*¹²
- Recognize and provide positive feedback for nurturant and protective parenting behaviors. *Using "I" messages to let parents know their behaviors are effective reinforces continuation of desired behaviors and promotes feelings of confidence in their abilities.*^{2,12}

NURSING PRIORITY NO. 4 To support parent/child attachment during separation:

- Provide parents with telephone contact as appropriate. *Knowing there is someone they can call if they have problems provides a sense of security.*³
-  Establish a routine time for daily phone calls or initiate calls as indicated when child is hospitalized. *Provides sense of consistency and control; allows for planning of other activities so parents can maintain contact and get information on a regular basis.*¹
-  Minimize number of professionals on team with whom parents must have contact. *Parents begin to know the individuals they are dealing with on a regular basis, fostering trust in these relationships and providing opportunities for modeling and learning.*³

- Invite parents to use resources, such as the Ronald McDonald House, or provide a listing of a variety of local accommodations and restaurants. *When child is hospitalized out of town, parents need to have a place to stay so they can have ready access to the hospital and be able to rest and refresh from time to time.*³
- Arrange for parents to receive photos and progress reports from the child. *Provides information and comfort as the child progresses, allowing the parents to continue to have hope for a positive resolution.*³
- Suggest parents use cell phone with FaceTime, if available, or provide a photo and/or audiotape of themselves when separated for the child. *Provides a connection during the separation, sustaining attachment between parent and child.*¹
- Consider use of a contract with parents. *Clearly communicating expectations of both family and staff serves as a reminder of what each person has committed to and serves as a tool to evaluate whether expectations are being maintained.*³
- Suggest parents keep a journal of infant/child progress. *Serves as a reminder of the progress that is being made, especially when they become discouraged and believe infant/child is “never” going to be better.*³
- 🏠 Provide “homelike” environment for situations requiring supervision of visits. *An environment that is comfortable supports the family as they work toward resolving conflicts and promotes a sense of hopefulness, enabling them to experience success when family is involved with a legal situation.*¹²

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

- 🏠🚫 Refer to addiction counseling or treatment, individual counseling, or family therapies as indicated. *May need additional assistance when situation is complicated by drug abuse (including alcohol), mental illness, disruptions in caregiving, or parents who are burned out with caring for child with attachment or other difficulties.*^{12,13}
- Identify services for transportation, financial resources, housing, etc. *Assistance with these needs can help families focus on therapeutic regimen and on issues of parenting to improve family dynamics.*⁹
- 🤝 Develop support systems appropriate to situation (e.g., extended family, friends, social worker). *Depending on individual situation, support from extended family, friends, social worker, or therapist can assist family to deal with attachment disorders.*¹⁰
- Explore community resources (e.g., church affiliations, volunteer groups, day/respite care). *Church affiliations, volunteer groups, day or respite care can help parents who are overwhelmed with care of a child with attachment or other disorder.*¹²

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified behaviors of both parents and child.
- Specific risk factors, individual perceptions and concerns.
- Interactions between parent and child.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Parents’/child’s responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible.
- Plan for home visits to support parents and to ensure infant/child safety and well-being.
- Specific referrals made.

Autonomic Dysreflexia

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00009) [Diagnostic Division: Circulation], Submitted 1988, 2017

DEFINITION: Life-threatening, uninhibited sympathetic response of the nervous system to a noxious stimulus after a spinal cord injury (SCI) at the 7th vertebra (T7) or above.

RELATED FACTORS**Gastrointestinal Stimuli:**

Constipation, difficult passage of feces, fecal impaction
Digital stimulation, suppositories, enemas

Integumentary Stimuli:

Cutaneous stimulation, skin irritation

Musculoskeletal-Neurological Stimuli:

Irritating or painful stimuli below level of injury
Pressure over bony prominence or genitalia
Range of motion exercises
Spasm

Regulatory-Situational Stimuli:

Constricting clothing
Environmental temperature fluctuations
Positioning

Reproductive-Urological Stimuli:

Bladder spasm or distention
Sexual intercourse [excitation]
Instrumentation [e.g., catheter insertion, obstruction; irrigation]

Other:

Insufficient [client] or caregiver knowledge of disease process

At Risk Population: Ejaculation; menstruation; extremes of temperature

DEFINING CHARACTERISTICS

Subjective

Diffuse pain in different areas of the head

Paresthesia, chilling, blurred vision, chest pain, metallic taste in mouth, nasal congestion

Objective

Paroxysmal hypertension [sudden periodic elevated blood pressure with systolic pressure >140 mmHg and diastolic >90 mmHg]

Bradycardia or tachycardia

Diaphoresis above the injury, red blotches on skin above injury, pallor below injury

Horner's syndrome [contraction of the pupil, partial ptosis of the eyelid, enophthalmos, and sometimes loss of sweating over the affected side of the face]; conjunctival congestion

Pilomotor reflex

Associated Condition:

Bowel distention; esophageal reflux disease; gastric ulcer; gastrointestinal system pathology; gallstones; hemorrhoids

Deep vein thrombosis; pulmonary emboli

Fractures; heterotopic bone

Ovarian cyst; pregnancy; labor and delivery period

Pharmaceutical agent; substance withdrawal

Renal calculi, urinary catheterization; cystitis, urinary tract infection, detrusor sphincter dyssynergia; epididymitis

Surgical procedure; wound; sunburn

Sample Clinical Applications: Spinal cord injury

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Neurological Status: Autonomic: Ability of the autonomic nervous system to coordinate visceral and homeostatic function

Knowledge: Disease Process: Extent of understanding conveyed about a specific disease process and potential complications

Client/Caregiver Will (Include Specific Time Frame)

- Identify specific precipitating factors.
- Recognize signs and symptoms of syndrome.
- Demonstrate corrective techniques.

Client Will

Experience no episodes of dysreflexia or seek medical intervention in a timely manner.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Dysreflexia Management: Prevention and elimination of stimuli that cause hyperactive reflexes and inappropriate autonomic responses in a patient with a cervical or high thoracic cord lesion

Urinary Elimination Management [or] Bowel Management: Maintenance of an optimum urinary elimination pattern/establishment and maintenance of a regular pattern of bowel elimination

Anxiety Reduction: Minimizing apprehension, dread, foreboding, or uneasiness related to an unidentified source or anticipated danger

NURSING PRIORITY NO. 1 To assess for precipitating factors:

-    Note phase and specifics of injury. *Autonomic dysreflexia (AD) occurs in about 29% of persons with complete tetraplegia (quadraplegia). AD does not occur in the acute phase of SPI. However, some studies have identified factors that may point toward a client's likelihood of developing AD, and perhaps early in recovery. These include higher level of injury (cervical versus thoracic involvement) and more complete lesions.*^{1-3,6-9}
- Assess for bladder distention, presence of bladder spasms or stones, or acute urinary tract infection. *The most common stimulus for AD is bladder irritation or overstretch associated with urinary retention or infection, blocked catheter, overfilled collection bag, or noncompliance with intermittent catheterization.*
- Evaluate for bowel distention, fecal impaction, or problems with bowel management program. *Bowel irritation or overstretch is associated with constipation or impaction; digital stimulation, suppository, or enema use during bowel program; hemorrhoids or fissures; and/or infection of gastrointestinal tract, such as might occur with ulcers or appendicitis.*
- Observe skin and tissue pressure areas, especially following prolonged sitting. *Skin and tissue irritants include direct pressure (e.g., object in chair or shoe, leg straps, abdominal support, orthotics), wounds (e.g., bruise, abrasion, lacerations, pressure ulcer), ingrown toenail, tight clothing, or sunburn or other burn.*
- Inquire about sexual activity and/or determine if reproductive issues are involved. *Overstimulation or vibration, sexual intercourse and ejaculation, scrotal compression, menstrual cramps, and/or pregnancy (especially labor and delivery) are known precipitants.*
- Inform client/care providers of additional precipitators during course of care. *Client is prone to physical conditions or treatments (e.g., intolerance to temperature extremes; deep vein thrombosis; kidney stones; fractures or other trauma; surgical, dental, diagnostic procedures), any of which can precipitate AD.*
- Note environmental temperature for extremes/drafts, which can precipitate episode.

NURSING PRIORITY NO. 2 To provide for early detection and immediate intervention:

-  Investigate associated complaints/syndrome of symptoms (e.g., severe pounding headache, [blood pressure may be >200/100 mmHg], chest pain, irregular heart rate or dysrhythmias, blurred vision, nausea, facial flushing, metallic taste, severe anxiety; minimal symptoms or expressed complaints in presence of significantly elevated blood pressure—silent AD]). *Body's reaction to misinterpreted sensations from below the injury site, resulting in an autonomic reflex, can cause blood vessels to constrict and increase blood pressure. This is a potentially life-threatening condition, requiring immediate and correct action.*^{1-3,5}
-  Note onset of crying, irritability, or somnolence in infant or child who may present with nonspecific symptoms and may not be able to verbalize discomfort.^{1,6}
-   Locate and attempt to eliminate causative stimulus, moving in a stepwise fashion: *Cause can be anything that would normally cause pain or discomfort below level of injury.*¹⁻⁵
Assess for bladder distention: *Note: The two most common inciting stimuli are bladder and bowel distention, respectively, commonly a blocked urinary catheter.*³
Empty bladder by voiding or catheterization, applying local anesthetic ointment (if indicated/per facility procedure to prevent exacerbation of AD by procedure).
Ascertain that urine is free-flowing if Foley or suprapubic catheter is in place, empty drainage bag, straighten tubing if kinked, and lower drainage bag if it is higher than bladder.
Irrigate gently or change catheter, if it is not draining freely.
- Note color, character, and odor of urine; obtain specimen for culture as indicated (*acute urinary infection can cause AD*).³
- Check for distended bowel (*if urinary problem is not causing AD*). Note: Fecal impaction is the second most common cause of AD.³
Perform digital stimulation, checking for constipation or impacted stool. (If symptoms first appear while performing digital stimulation, stop procedure.)

Apply local anesthetic ointment to rectum; remove impaction after symptoms subside *to remove causative problem without causing additional symptoms.*

- Check for skin pressure or irritation (*if bowel problem is not causing AD*):
Perform a pressure release if sitting.
Check for tight clothing, straps, and belts.
Note whether pressure sore has developed or changed.
Observe for bruising and signs of infection.
Check for ingrown toenail, other injury to skin or tissue (e.g., burns, sunburn), or fractured bones.
- Check for other possible causes (*if skin pressure is not causing AD*):
Menstrual cramps, sexual activity, or labor and delivery.
Abdominal conditions (e.g., colitis, ulcer).
Environmental temperature extremes.
-  Take steps to reduce blood pressure, thereby *reducing potential for stroke (primary concern)*:¹⁻⁶
Elevate head of bed immediately or place in sitting position with legs hanging down. *Lowers blood pressure by pooling of blood in legs and decreases intracranial pressure caused by vasodilation in the brain, thus reducing headache.*³
Loosen any clothing or restrictive devices. *Lowers blood pressure by pooling of blood in abdomen and lower extremities.*
Monitor vital signs frequently during acute episode. *Blood pressure may fluctuate quickly due to impaired autonomic regulation. Continue to monitor blood pressure at intervals during procedures to remove cause of AD and after acute episodic symptoms subside to evaluate effectiveness of interventions and antihypertensives.*
-  Administer medications, as indicated. *If an episode is particularly severe, or persists after removal of suspected cause, antihypertensive medications with rapid onset and short duration (e.g., nifedipine, nitrates, mecamylamine diazoxide, phenoxybenzamine) may be used to block excessive autonomic nerve transmission, normalize heart rate, and reduce hypertension.*^{1,4}
-   Know contraindications and cautions associated with antihypertensive medications; adjust dosage of antihypertensive medications carefully for child, elderly person, individual with known heart disease, male client using sildenafil for sexual activity, and pregnant woman. *Prevents complications, including unknown reactions in a child or systemic hypotension or seizure activity.*⁴ *Note: Use of nitrate-containing medications is an absolute contraindication to sildenafil use because of the possibility of a fatal response.*^{1,3}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-   Discuss with client/caregivers warning signs of AD, as listed previously. Be aware of client's communication abilities. *AD can occur at any age from infant to very old, and the individual may not be able to verbalize a pounding headache, which is often the first symptom during onset of AD. Note: abnormal blood pressure readings may be more difficult to identify in child, unless baseline readings are known. AD management is typically initiated when the systolic BP is elevated 15 mmHg over baseline in a child and 15 to 20 mmHg over baseline for an adolescent.*^{1,7}
- Ascertain that client/caregivers understand ways to avoid onset or treat syndrome as noted previously. Provide information card and instruct and periodically reinforce teaching, as needed, regarding:^{1,2,5,6}
 - Maintaining indwelling catheter by keeping tubing free of kinks, keeping bag empty and situated below bladder level, and checking daily for deposits (bladder grit) inside catheter.
 - Performing intermittent catheterization as often as necessary *to prevent overfilling or distention.*
 - Monitoring for adequate spontaneous voiding, noting frequency and amount.
 - Maintaining a regular and effective bowel evacuation program.
 - Performing routine skin assessments.
 - Monitoring all systems for signs of infection and reporting promptly *for timely medical treatment.*
 - Scheduling routine medical evaluations.

-   Instruct family member/caregiver in client's "normal" blood pressure range and proper blood pressure monitoring and plan for monitoring hypertension during acute episodes. *A spinal cord–injured client's (both adult and child) baseline blood pressure is lower than that of a noninjured person. Blood pressure 20 to 40 mmHg higher than reference range may be a sign of AD in an adult.*⁶
-  Review proper use and administration of medications, when used. *Client may have medication(s) both for emergent situations and/or prevention of AD, and if so, he or she should receive medication instructions, as well as symptoms to report for immediate or emergent care, when blood pressure is not responsive.*^{1,6}
-  Refer for or advise treatment of sexual and reproductive concerns, as indicated. *Client requires information and monitoring regarding sexual issues that can precipitate AD, including vibration to achieve orgasm, use of erectile dysfunction medication, and labor and delivery.*^{3,7}
- Recommend wearing medical alert bracelet or necklace and carrying information card about signs/symptoms of AD and usual methods of treatment. *Provides vital information in emergency.*
-  Assist client/family in identifying emergency referrals (e.g., physician, rehabilitation nurse/home-care supervisor). Place telephone number(s) in prominent place or program numbers into client's/caregiver's cell phone.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, noting previous episodes, precipitating factors, and individual signs/symptoms.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions and actions performed, understanding of teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.

risk for Autonomic Dysreflexia

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00010) [Diagnostic Division: Circulation], Submitted 1988; Revised 2000, 2013, 2017

DEFINITION: Susceptible to life-threatening, uninhibited response of the sympathetic nervous system post-spinal shock, in an individual with a spinal cord injury or lesion at T6 or above (has been demonstrated in clients with injuries at T7 and T8), which may compromise health.

RISK FACTORS

Gastrointestinal Stimuli

Constipation, difficult passage of feces, fecal impaction
Digital stimulation, suppositories, enemas

Integumentary Stimuli

Cutaneous stimulation, skin irritation

Musculoskeletal-Neurological Stimuli

Irritating or painful stimuli below level of injury
Pressure over bony prominence or genitalia
Range of motion exercises
Spasm

Regulatory-Situational Stimuli

Constricting clothing
Environmental temperature fluctuations
Positioning

Reproductive-Urological Stimuli

Bladder spasm or distention
Sexual intercourse [excitation]
Instrumentation [e.g., catheter insertion, obstruction; irrigation]

Other

Insufficient [client] or caregiver knowledge of disease process

At Risk Population: Ejaculation; menstruation; extremes of temperature

Associated Condition:

Bowel distention; esophageal reflux disease; gastric ulcer; gastrointestinal system pathology; gallstones; hemorrhoids
Deep vein thrombosis; pulmonary emboli
Fractures; heterotopic bone
Ovarian cyst; pregnancy; labor and delivery period
Pharmaceutical agent; substance withdrawal
Renal calculi, urinary catheterization; cystitis, urinary tract infection, detrusor sphincter dyssynergia; epididymitis
Surgical procedure; wound; sunburn

Sample Clinical Applications: Spinal cord injury

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Knowledge: Disease Process: Extent of understanding conveyed about a specific disease process and potential complications

(continues on page 82)

risk for AUTONOMIC DYSREFLEXIA (continued)

Caregiver Home Care Readiness: Preparedness of a caregiver to assume responsibility for the health care of a family member in the home

Client/Caregiver Will (Include Specific Time Frame)

- Identify risk factors present.
- Demonstrate preventive or corrective techniques.
- Be free of episodes of dysreflexia.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Dysreflexia Management: Prevention and elimination of stimuli that cause hyperactive reflexes and inappropriate autonomic responses in a patient with a cervical or high thoracic cord lesion

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

Medication Management: Facilitation of safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To assess risk factors present:

- Monitor for potential precipitating factors, including urological (e.g., bladder distention, acute urinary tract infection, kidney stones), gastrointestinal (e.g., bowel overdistention, hemorrhoids, digital stimulation), cutaneous (e.g., pressure ulcers, extreme external temperatures, dressing changes), reproductive (e.g., sexual activity, menstruation, pregnancy/delivery), and miscellaneous (e.g., pulmonary emboli, drug reaction, deep vein thrombosis). (Refer to ND Autonomic Dysreflexia for a more complete listing of precipitating factors, if indicated.)^{1,2,5,6}

NURSING PRIORITY NO. 2 To prevent occurrence:

-  Monitor vital signs routinely, noting changes in blood pressure, heart rate, and temperature, especially during times of physical stress *to identify trends and intervene in a timely manner*.^{1,2} *Note: The baseline blood pressure in spinal cord-injured clients (adult and child) is lower than in the general population; therefore, an elevation of 20 to 40 mmHg above baseline may be indicative of autonomic dysreflexia (AD).*^{5,6}
-  Instruct all caregivers in regularly timed elimination and safe bowel and bladder or catheter care, as well as in interventions for long-term prevention of skin stress or breakdown (e.g., appropriate padding for skin and tissues, proper positioning with frequent pressure-relief actions, routine foot and toenail care) *to reduce risk of AD episode*. *Note: The two most common inciting stimuli are bladder and bowel distention, respectively; commonly a blocked urinary catheter.*^{1,3,4,6}
- Instruct client/caregivers in additional preventive interventions (e.g., temperature control; preventing pressure ulcers, blisters, ingrown toenails; checking frequently for tight clothes or leg straps; sunburn and other burn prevention).^{1,4-6}
-  Administer antihypertensive medications, as indicated. *At-risk client may be placed on routine “maintenance dose,” such as when noxious stimuli cannot be removed (e.g., presence of chronic sacral pressure ulcer, fracture, acute postoperative pain).*¹
- Refer to ND Autonomic Dysreflexia.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review warning signs of AD with client/caregiver (e.g., sudden, severe pounding headache; flushed, red face; increased blood pressure/acute hypertension; nasal congestion; anxiety; blurred vision; metallic taste in mouth; sweating and/or flushing above the level of SCI; goose bumps; bradycardia, cardiac irregularities). *AD can develop rapidly (in minutes), thus requires quick intervention.*

-  Be aware of client's communication abilities. *AD can occur at any age, from infant to very old, and the individual may not be able to verbalize a pounding headache, which is often the first symptom during onset of AD.*¹
- Ascertain that client/caregiver understands ways to avoid onset of syndrome. Provide information card and instruct and periodically reinforce teaching, as needed, regarding the following:¹⁻⁶
 - Keeping indwelling catheter free of kinks, keeping bag empty and situated below bladder level, and checking daily for deposits (bladder grit) inside catheter,
 - Catheterizing as often as necessary *to prevent overfilling*,
 - Monitoring voiding patterns for adequate frequency and amount,
 - Performing regular bowel evacuation program,
 - Performing routine skin assessments, and
 - Monitoring all systems for signs/symptoms of infection and reporting promptly *for timely medical treatment*.
- Instruct family member/caregiver in proper blood pressure monitoring.
-  Review use and administration of medications, when used. *Some clients are on medications routinely, and if so, they should receive instructions for routine administration, as well as symptoms to report for immediate or emergent care, when blood pressure is not responsive.*^{1,5}
- Emphasize importance of regularly scheduled medical evaluations *to monitor status and identify developing problems*.
- Recommend wearing a medical alert bracelet or necklace with information card about signs/symptoms of AD and usual methods of treatment. *Provides vital information in emergencies*.
-  Assist client/family in identifying emergency referrals (e.g., physician, rehabilitation nurse, or home-care supervisor). Place telephone number(s) in prominent place or program into client's/caregiver's cell phone.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors.
- Previous episodes, precipitating factors, and individual signs/symptoms.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions and actions performed, understanding of teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.

disorganized infant Behavior

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00116) [**Diagnostic Division:** Neurosensory], Submitted 1994; Revised 1998, 2017

DEFINITION: Disintegration of the physiological and neurobehavioral systems of functioning.

RELATED FACTORS

Caregiver cue misreading
Environmental overstimulation; inadequate physical environment
Feeding intolerance

DEFINING CHARACTERISTICS

Objective

Attention-interaction system: Impaired response to sensory stimuli [e.g., difficult to soothe, unable to sustain alert status]

Motor system:

Alteration in primitive reflexes; exaggerated startle response; fidgeting
Finger splay; fisting; hands to face; hyperextension of extremities
Impaired motor tone; tremor, twitching; uncoordinated movements

Physiological:

Abnormal skin color [e.g., pale, dusky]; oxygen desaturation
Arrhythmia; bradycardia; tachycardia
Feeding intolerances
Time-out signals [e.g., gaze, hiccup, sigh, slack jaw, tongue thrust]

Regulatory problems: Inability to inhibit startle reflex; irritability

State-organization system:

Active-awake; quiet-awake
Diffuse alpha electroencephalogram (EEG) activity with eyes closed; state-oscillation
Irritable crying

At Risk Population: Low postconceptual age; prematurity; prenatal exposure to teratogen

Associated Condition: Congenital or genetic disorders; infant illness; immature neurological functioning; impaired infant motor functioning; invasive procedure; infant oral impairment

Sample Clinical Applications: Prematurity, congenital or genetic disorders, meconium aspiration, respiratory distress syndrome, small for gestational age

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Preterm Infant Organization: Extrauterine integration of physiological and behavioral function by the infant born 24 to 37 (term) weeks gestation

Infant Will (Include Specific Time Frame)

- Exhibit organized behaviors promoting achievement of optimal potential for growth and development as evidenced by modulation of physiological, motor, state, and attentional-interactive functioning.

Sample NOC linkages:

Child Development [specify age 1, 2 months]: Milestones of physical, cognitive, and psychosocial progression by [specify] months of age

Parent/Caregiver Will

- Recognize cues reflecting infant's stress threshold and current status.
- Identify appropriate responses (including environmental modifications) to infant's cues.
- Engage in responses to promote infant adaptation and development.
- Verbalize readiness to assume caregiving independently.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Environmental Management: Manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being

Developmental Enhancement: Infant: Facilitating optimal physical, cognitive, social, and emotional growth of child under 1 year of age

Infant Care: Newborn: Provision of care to the infant during the transition from birth to extrauterine life and subsequent period of stabilization

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine infant's chronological and developmental age; note length of gestation. *These factors (prematurity, infant maturity, and stages of development) help to determine plan of care.*^{1,2}
- Observe for cues suggesting presence of situations that may result in pain or discomfort. *Some behavior that appears to be disorganized may be caused by a pain source that, once identified, may be alleviated.*¹
- Determine adequacy of physiological support. *Identifies areas of additional need.*¹
- Evaluate level and appropriateness of environmental stimuli. *Infant behavior is affected by a wide range of stimuli. Careful assessment narrows focus of concerns.*²
- Ascertain parents' understanding of infant's needs and abilities. *Identifies knowledge base and areas of learning needed.*²⁻⁴
- Listen to parents' concerns about their capabilities to meet infant's needs. *Active listening can reassure parents, pinpoint areas to be addressed, and provide an opportunity to correct misconceptions.*^{2,3}

NURSING PRIORITY NO. 2 To assist parents in providing coregulation to the infant:

- Provide a calm, nurturant, physical, and emotional environment. *Provides optimal infant comfort. Models behavior for parent(s) and optimizes learning.*^{2,3}
-  Encourage parents to hold infant, including skin-to-skin contact as appropriate. *Touch enhances parent-infant bonding and provides means of calming.*³ *Research suggests skin-to-skin contact or kangaroo care may have a positive effect on infant development by enhancing neurophysiological organization and an indirect effect by improving parental mood, perceptions, and interactive behavior.*⁶
- Model gentle handling of baby and appropriate responses to infant behavior. *Provides cues to parent.*³
- Support and encourage parents to be with infant and participate actively in all aspects of care. *Situation may seem overwhelming to new parents. Emotional and physical support enhances coping. Parents who are able to help in the care of their infant express lower levels of helplessness and powerlessness.*^{1,2}
- Encourage parents to refrain from social interaction during feedings as appropriate. *Infant may have difficulty/lack necessary energy to manage feeding and social stimulation simultaneously.*⁵

-  Provide positive feedback for progressive parental involvement in caregiving process. *Transfer of care from staff to parents progresses along a continuum as parents' confidence level increases and they are able to take on more complex care activities.*⁷
- Discuss infant growth and development, pointing out current status and progressive expectations as appropriate. *Augments parent knowledge of coregulation.*²
- Incorporate the parents' observations and suggestions into plan of care. *Demonstrates valuing of parents' input and encourages continued involvement.*^{2,4}

NURSING PRIORITY NO. 3 To deliver care within the infant's stress threshold:

-  Provide a consistent caregiver. *Facilitates recognition of infant cues or changes in behavior. Communication is optimized if family is familiar with caregiver.*²
- Identify infant's individual self-regulatory behaviors (e.g., sucking, mouthing; grasp, hand-to-mouth, face behaviors; foot clasp, brace; limb flexion, trunk tuck; boundary seeking).
- Support hands to mouth and face; offer pacifier or nonnutritive sucking at the breast with gavage feedings. *Provides opportunities for infant to self-regulate.*^{2,5}
- Avoid aversive oral stimulation, such as routine oral suctioning; suction endotracheal tube only when clinically indicated. *Maximizes infant comfort, preventing undue/noxious stimulation.*^{1,2}
- Use Oxyhood large enough to cover the infant's chest so arms will be inside the hood. *Allows for hand-to-mouth self-calming activities during this therapy.*²
- Provide opportunities for infant to grasp. *Helps with development of motor function skills and can have a calming effect.*^{2,5}
- Provide boundaries or containment during all activities. Use swaddling, nesting, bunting, and caregiver's hands as indicated. *Enhances infant's feelings of security and safeness. Avoids startle reflex and accompanying distress.*^{2,3}
- Allow adequate time and opportunities to hold infant. Handle infant very gently; move infant smoothly, slowly, and keep contained, avoiding sudden or abrupt movements. *Provides comfort to infant and models behavior to parent(s).*³
- Maintain normal alignment, position infant with limbs softly flexed and shoulders and hips adducted slightly. Use appropriate-sized diapers. *Avoids unnecessary discomfort.*²
- Evaluate chest for adequate expansion, placing rolls under trunk if prone position is indicated. *Provides for ease of respirations.*²
- Avoid restraints, including at IV sites. If an IV board is necessary, secure to limb positioned in normal alignment. *Optimizes comfort and movement.*^{1,2}
- Provide a pressure-eliminating mattress, water bed, or gel pillow for infant who does not tolerate frequent position changes. *Minimizes tissue pressure and risk of tissue injury.*²
- Visually assess color, respirations, activity, and invasive lines without disturbing infant. Assess with "hands on" every 4 hr as indicated and prn. *Allows for undisturbed rest and quiet periods.*^{2,3}
- Group care activities, schedule time for rest, and organize sleep and wake states to maximize tolerance of infant. Defer routine care when infant is in quiet sleep. *Gives infant a sense of routine and also provides for undisturbed rest and longer periods of quiet.*^{2,3,5}
- Provide care with baby in side-lying position. Begin by talking softly to the baby and then placing hands in a containing hold on baby, allowing baby to prepare. Proceed with least invasive manipulations first. *Gradual build from comforting touch, to nursing care, to invasive interventions decreases overall stress of infant. Shortens perception of "being bothered" time and facilitates a more rapid calming phase.*³
- Respond promptly to infant's agitation or restlessness. Provide "time-out" when infant shows early cues of overstimulation. Comfort and support the infant after stressful interventions. *Decreases stress for both infant and family. Facilitates calming phase.*³
- Remain at infant's bedside for several minutes after procedures and caregiving to monitor infant's response and provide necessary support. *Allows for more rapid intervention(s) if infant becomes overstressed.*³
-  Administer analgesics as individually appropriate. *Maintains optimal comfort.*¹⁻⁴

NURSING PRIORITY NO. 4 To modify the environment to provide appropriate stimulation:

-  Introduce stimulation as a single mode and assess individual tolerance.

Light/Vision

- Reduce lighting perceived by infant; introduce diurnal lighting (and activity) when infant achieves physiological stability. (Daylight levels of 20 to 30 candles and night-light levels of less than 10 candles are suggested.) Change light levels gradually to allow infant time to adjust. *Lowering light levels reduces visual stimulation and provides a comforting environment. Diurnal lighting allows the stable infant to begin perception of day and night cycles and to establish circadian rhythms.*¹
- Protect the infant's eyes from bright illumination during examinations and procedures, as well as from indirect sources, such as neighboring phototherapy treatments. *Prevents retinal damage and reduces visual stressors.*²
-  Deliver phototherapy (when required) with Biliblanket devices if available. *Alleviates need for eye patches to protect vision.*²
- Provide a caregiver's face (preferably a parent's) as visual stimulus when infant shows readiness (awake, attentive). *Begins process of visual recognition.*¹
- Evaluate/readjust placement of pictures, stuffed animal, etc., within infant's immediate environment. *Promotes state maintenance and smooth transition, allowing infant to look away easily when visual stimuli become stressful.*⁵

Sound

- Identify sources of noise in environment and eliminate/reduce to minimize auditory stimulus, reduce startle response in infant, and provide a comforting environment.²
 Speak in a low voice.
 Reduce volume on alarms and telephones to safe but not excessive volume.
 Pad metal trash can lids.
 Open paper packages such as IV tubing and suction catheters slowly and at a distance from bedside.
 Conduct rounds or report away from bedside.
 Place soft, thick fabric such as blanket rolls and toys near infant's head to absorb sound.
 Keep all incubator portholes closed, closing with two hands to avoid loud snap with closure and associated startle response.
- Refrain from playing musical toys or tape players inside incubator. *Even very soft sounds echo in an enclosed space. What an adult may find soothing is likely to overstimulate an infant.*^{2,3}
- Avoid placing items on top of incubator; if necessary to do so, pad surface well. *Contact with the external parts of the incubator causes reverberation inside the chamber.*
- Conduct regular decibel (dB) checks of interior noise level in incubator (recommended not to exceed 60 dB). *Verifies that decibel levels are within acceptable range.*²
- Provide auditory stimulation to console and support infant before and through handling or to reinforce restfulness. *Provides modeling of behavior for family and increased comfort for infant.*³

Olfactory

- Be cautious in exposing infant to strong odors (e.g., alcohol, Betadine, perfumes). *Olfactory capability of the infant is very sensitive.*¹
- Place a cloth or gauze pad scented with milk near the infant's face during gavage feeding. *Enhances association of milk with act of feeding and gastric fullness.*²
- Invite parents to leave near infant a handkerchief that they have scented by wearing close to their body. *Strengthens infant recognition of parents.*²

Vestibular

- Move and handle the infant slowly and gently. Do not restrict spontaneous movement. *Maintains comfort while encouraging motor function skill.*²
- Provide vestibular stimulation to console, stabilize breathing/heart rate, or enhance growth. Use a water bed (with or without oscillation); a motorized, moving bed or cradle; or rocking in the arms of a caregiver.

Gustatory

- Dip pacifier in milk and offer to infant for sucking and tasting during gavage feeding. *Further enhances feeding recognition with touch and taste cues.*²

Tactile

- Maintain skin integrity and monitor closely. Limit frequency of invasive procedures. *Decreases chance of infections. Decreases infant discomfort.*¹
- Minimize use of chemicals on skin (e.g., alcohol, povidone-iodine, solvents) and remove afterward with warm water. *Chemical compounds remove the natural protective mechanisms of skin, and infants are often very sensitive to integumentary injury.*¹
- Limit use of tape and adhesives directly on skin. Use DuoDerm under tape. *Helps prevent dermal injury and allergic reactions.*¹
- Touch infant with a firm, containing touch; avoid light stroking. Provide a sheepskin or soft linen. *Note: Tactile experience is the primary sensory mode of the infant. Light stroking can cause tickle sensations that are irritating rather than pleasurable. Firm touch is reassuring.*²
- Encourage frequent parental holding of infant (including skin-to-skin). Supplement activity with extended family, staff, volunteers. *For family members, touch enhances bonding. If family is not readily available, infant needs regular skin-to-skin contact from caregivers for comfort and reassurance.*³

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Evaluate home environment to identify appropriate modifications. *Helps the family identify needs and begin to mentally prepare for infant homecoming.*³
- 🤝 Identify community resources (e.g., early stimulation program, qualified childcare facilities or respite care, visiting nurse, home-care support, specialty organizations). *Begins process of resource utilization.*²⁻⁴
- 🔍 Determine sources for equipment and therapy needs. *Facilitates transition to at-home care.*³
- 🤝 Refer to support or therapy groups as indicated. *Provides role models, facilitates adjustment to new roles and responsibilities, and enhances coping.*^{2,3}
- 📞 Provide contact number, as appropriate (e.g., primary nurse). *Supports adjustment to home setting and enhances problem solving.*³
- Refer to additional NDs such as risk for impaired Attachment, risk for caregiver Role Strain, compromised/disabled/readiness for enhanced family Coping, risk for delayed Development.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Findings, including infant's cues of stress, self-regulation, and readiness for stimulation; chronological and developmental age.
- Parent's concerns, level of knowledge.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Infant's responses to interventions and actions performed.
- Parents' participation and response to interactions and teaching.
- Attainment or progress toward desired outcome(s).
- Modifications of plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

readiness for enhanced organized infant Behavior

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00117) [**Diagnostic Division:** Neurosensory], Submitted 1994; Revised 2013

DEFINITION: A pattern of modulation of the physiological and behavioral systems of functioning, which can be strengthened.

DEFINING CHARACTERISTICS

Objective

Parent expresses desire to enhance cue recognition

Parent expresses desire to enhance recognition of infant's self-regulatory behaviors

Parent expresses desire to enhance environmental conditions

Sample Clinical Applications: Prematurity, congenital or genetic disorders, meconium aspiration, respiratory distress syndrome, small for gestational age

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Preterm Infant Organization: Extrauterine integration of physiological and behavioral function by the infant born 24 to 37 (term) weeks gestation

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Infant Will (Include Specific Time Frame)

- Modulate physiological and behavioral systems of functioning.
- Achieve higher levels of integration in response to environmental stimuli.

Sample **NOC** linkages:

Child Development: [specify age group 1 or 2 months]: Milestones of physical, cognitive, and psychosocial progression by [specify] months of age

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Parent/Caregiver Will (Include Specific Time Frame)

- Identify cues reflecting infant's stress threshold and current status.
- Develop or modify responses (including environment) to promote infant adaptation and development.

(continues on page 90)

readiness for enhanced organized infant Behavior (continued)**ACTIONS/INTERVENTIONS****Sample NIC linkages:**

Developmental Enhancement: Infant: Facilitating optimal physical, cognitive, social, and emotional growth of child under 1 year of age

Environmental Management: Manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being

NURSING PRIORITY NO. 1 To assess infant status and parental skill level:

- Determine infant's chronological and developmental age; note length of gestation. *These factors (prematurity, infant maturity, and stages of development) help to determine plan of care.*^{1,2,5}
- Identify infant's individual self-regulatory behaviors: suck, mouth; grasp, hand-to-mouth, face behaviors; foot clasp, brace; limb flexion, trunk tuck; boundary seeking. *Assessing the infant's own regulatory coping tools alerts family and caregiver when infant is entering a stress cycle and helps determine if the infant needs assistance coping. This knowledge also helps in development of a care plan if situation warrants.*^{1,2,4}
- Observe for cues suggesting presence of situations that may result in pain/discomfort. *Some behavior that appears to be disorganized may be caused by a pain source that, once identified, may be alleviated.*¹
- Evaluate level and appropriateness of environmental stimuli. *Infant behavior is affected by a wide range of stimuli. Careful assessment narrows focus of concerns.*²
- Ascertain parents' understanding of infant's needs and abilities. *Identifies knowledge base and areas of additional learning need.*²⁻⁴
- Listen, or Active-listen, to parents' perceptions of their capabilities to promote infant's development. *When parents feel their thoughts and concerns are heard, they will feel reassured that they will be able to handle the situation.*^{2,3}

NURSING PRIORITY NO. 2 To assist parents to enhance infant's integration:

- Provide positive feedback for parental involvement in caregiving process. Transfer of care from staff to parents progresses along a continuum as parents' confidence level increases and they are able to take on more responsibility.⁷
-  Discuss use of skin-to-skin contact (kangaroo care [KC]) as appropriate. *Research suggests KC may have a positive effect on infant development by enhancing neurophysiological organization and an indirect effect by improving parental mood, perceptions, and interactive behavior.*⁶
- Review infant growth and development, pointing out current status and progressive expectations. *Increases parental knowledge base and level of confidence.*²⁻⁴
- Identify cues reflecting infant stress. *Attention to cues allows for early intervention in case of problem development.*²⁻⁴
- Discuss possible modifications of environmental stimuli, handling, activity schedule, sleep, and pain control needs based on infant's behavioral cues. *Stimulation that is properly timed and appropriate in complexity and intensity allows the infant to maintain a stable balance of his/her subsystems and enhances development.*⁵
-  Discuss parents' perceptions of needs and provide recommendations for modifications of environmental stimuli, activity schedule, sleep, and pain control needs. *While care provided is satisfactory, some modifications may enhance infant's integration and development.*^{1,4}

-  Incorporate parents' observations and suggestions into plan of care. *Demonstrates value of and regard for parents' input and enhances sense of ability to deal with situation.*^{2,4}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Learning Considerations):

-   Identify community resources (e.g., visiting nurse, home-care support, childcare). *Begins process of resource utilization.*²⁻⁴
-  Refer to support group or individual role model *to facilitate ongoing adjustment to new roles and responsibilities and problem solving.*^{2,3}
- Refer to additional NDs, for example, readiness for enhanced family Coping.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings, including infant's self-regulation and readiness for stimulation; chronological and developmental age.
- Parents' concerns, level of knowledge.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Infant's responses to interventions and actions performed.
- Parents' participation and response to interactions/teaching.
- Attainment or progress toward desired outcome(s).
- Modifications of plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for disorganized infant Behavior

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00115) [**Diagnostic Division:** Neurosensory], Submitted 1994; Revised 2013, 2017

DEFINITION: Susceptible to disintegration in the pattern of modulation of the physiological and behavioral systems of functioning, which may compromise health.

RISK FACTORS

Caregiver cue misreading; insufficient caregiver knowledge of behavioral cues
Environmental overstimulation, or insufficient environmental sensory stimulation; sensory deprivation
Feeding intolerance; infant malnutrition
Inadequate physical environment; insufficient containment within environment
Pain

At Risk Population: Low postconceptual age; prematurity; prenatal exposure to teratogen

Associated Condition: Congenital or genetic disorders; infant illness; immature neurological functioning; impaired infant motor functioning; invasive procedure; infant oral impairment

Sample Clinical Applications: Prematurity, congenital or genetic disorders, meconium aspiration, respiratory distress syndrome, small for gestational age

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Preterm Infant Organization: Extrauterine integration of physiological and behavioral function by the infant born 24 to 37 (term) weeks gestation

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Infant Will (Include specific time frame)

- Exhibit organized behaviors promoting achievement of optimal potential for growth and development as evidenced by modulation of physiological, motor, state, and attentional-interactive functioning.

Sample **NOC** linkages:

Child Development: [specify age group 1 or 2 months]: Milestones of physical, cognitive, and psychosocial progression by [specify] months of age

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Parent/Caregiver Will (Include specific time frame)

- Identify cues reflecting infant's stress threshold and current status.
- Develop or modify responses (including environment) to promote infant adaptation and development.

ACTIONS/INTERVENTIONS AND DOCUMENTATION FOCUS

Refer to ND disorganized infant Behavior for Actions/Interventions and Documentation Focus.

risk for Bleeding

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00206) [**Diagnostic Division:** Circulation], Submitted 2008; Revised 2013, 2017

DEFINITION: Susceptible to a decrease in blood volume, which may compromise health.

RISK FACTORS

Insufficient knowledge of bleeding precautions

At Risk Population: History of falls

Associated Condition: Aneurysm; disseminated intravascular coagulopathy; inherent coagulopathy

Gastrointestinal condition [e.g., ulcer, polyps, varices]; impaired liver function [e.g., cirrhosis]

Postpartum complications [e.g., uterine atony, retained placenta]; pregnancy complication [e.g., placenta previa/abruption]

Treatment regimen [e.g., surgery, medications, administration of platelet-deficient blood products, chemotherapy]; circumcision

Sample Clinical Applications: Trauma, brain injury, femur fracture, aortic aneurysm, esophageal varices, pancreatitis, sickle cell anemia, surgery; use of anticoagulants

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Blood Loss Severity: Severity of signs and symptoms of internal or external hemorrhage

Blood Coagulation: Extent to which blood clots within normal period of time

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Be free of signs of active bleeding, such as hemoptysis, hematuria, or hematemesis, or excessive blood loss as evidenced by stable vital signs, skin and mucous membranes free of pallor, usual mentation, and urinary output.
- Display laboratory results for clotting times and factors within normal range for individual.
- Identify individual risks and engage in appropriate behaviors or lifestyle changes to prevent or reduce frequency of bleeding episodes.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Bleeding Precautions: Reduction of stimuli that may induce bleeding or hemorrhage in at-risk patients

Bleeding Reduction: Limitation of the loss of blood volume during an episode of bleeding

NURSING PRIORITY NO. 1 To assess risk factors:

- Assess client risk. Note possible medical diagnoses or disease processes that may lead to bleeding such as known or suspected major trauma, coagulopathies, gastric ulcers, liver disorders, pregnancy-related complications, malignancies, gram-negative sepsis, etc.
- Note type of injury(ies) present when client presents with trauma. *The pattern and extent of injury and bleeding may or may not be readily determined. For example, unbroken skin can hide a significant injury where a large amount of blood is lost within soft tissues or a crush injury resulting in interruption of the integrity of the pelvic ring can cause life-threatening bleeding from three sources (arterial, venous, and bone edge).*^{1,10,11}

- Determine presence of hereditary factors, such as hereditary hemorrhagic telangiectasia, hemophilia, or other factor deficiencies; thrombocytopenia. *Hereditary bleeding or clotting disorders predispose client to bleeding complications, either spontaneous bleeding, such as nosebleeds and acute and chronic digestive tract bleeding,² or failure to clot in a timely manner.¹*
- Obtain detailed history if a familial bleeding disorder is suspected. *Specialized testing may be needed and/or referral to hematologist.¹*
- ∞ Note client's gender. *While bleeding disorders are common in both men and women, women are affected more due to the increased risk of blood loss related to menstrual cycle and child delivery procedures.^{1,3}*
- Note pregnancy-related factors, as indicated. *Many factors can occur, including overdistention of the uterus—pregnant with multiples, prolonged or rapid labor, lacerations occurring during vaginal delivery, or retained placenta that can place mother at risk for postpartum bleeding.*
- 📋 Evaluate client's medication regimen. *Use of medications, such as NSAIDs, anticoagulants, corticosteroids, and certain herbals (e.g., ginkgo biloba), predispose client to bleeding.⁴*

NURSING PRIORITY NO. 2 To evaluate for potential bleeding:

- + Monitor perineum and fundal height in postpartum client and wounds, dressings, and tubes in client with trauma, surgery, or other invasive procedures *to identify active blood loss. Note: Hemorrhage may occur because of inability to achieve hemostasis in the setting of injury or may result from the development of a coagulopathy.² Excessive bleeding may be defined by the individual client's physician or the facility's written policy—such as saturating two perineal pads per hour or more than 200 mL/chest tube drainage in 4 hr.⁵*
- Evaluate and mark boundaries of soft tissues in enclosed structures such as a leg or abdomen *to document expanding bruise or hematomas. Helps in identifying bleeding that may be occurring in a closed space, which renders client susceptible to complications, such as compartment syndrome or hypovolemia; permits earlier intervention.*
- 📊 Assess vital signs, including blood pressure, pulse (may be elevated initially), and respirations. Measure blood pressure lying, sitting, and standing *as indicated to evaluate for orthostatic hypotension. Note: Vital signs do not necessarily reflect the quantity of hemorrhage accurately! Fit, young patients may lose 40% of their blood volume before the systolic blood pressure drops below 100 mmHg, whereas the elderly may become hypotensive with volume loss of as little as 10%. Monitor invasive hemodynamic parameters when present (e.g., central venous pressure) to determine if intravascular fluid deficit exists. Note: Client could lose up to 2 L of blood into chest, abdomen, or pelvis before hypotension signals the presence of a problem.⁶ The American College of Surgeons Advanced Trauma Life Support lists four classes of hemorrhage, with class I involving up to 15% blood volume loss and little change in vital signs and class IV involving blood loss greater than 40% of circulating volume and requiring aggressive resuscitation to prevent death.⁷*
- 📋 Hematest all secretions and excretions for occult blood *to more accurately determine possible source of bleeding when blood loss is occurring.*
- Note client report of pain in specific areas and whether pain is increasing, diffuse, or localized. *Can help identify bleeding into tissues, organs, or body cavities.*
- Assess skin color and moisture, urinary output, and level of consciousness or mentation. *Changes in these signs may be indicative of blood loss affecting systemic circulation or local organ function such as kidneys or brain.*
- 📋 Review laboratory data (e.g., complete blood count, including hemoglobin [Hb], platelet numbers, and function; and other coagulation factors, which may be known by number—factor I, factor II, etc., or by name—prothrombin time, partial thromboplastin time, fibrinogen, etc.) *to evaluate bleeding risk. Note: Generally, laboratory values are not helpful in acute hemorrhage because values do not change from normal until redistribution of interstitial fluid into the blood plasma occurs after 8 to 12 hours. The common problem in life-threatening acute anemia is a sudden reduction in the oxygen-carrying capacity of the blood. Depending on the etiology, this may occur with or without reduction in the intravascular volume. It is generally accepted that an acute drop in hemoglobin to a level of 7 to 8 g/dL is symptomatic.^{8,12,13} Note: When one or more clotting factors are missing, produced in too small a quantity, or not functioning correctly, excessive bleeding can*

occur. Loss of factors may be due to acute blood loss, transfusion of factor-deficient blood, presence of inherited bleeding disorders, drugs that alter factors (e.g., warfarin, steroids, contraceptives, NSAIDs), or medical conditions affecting organs, such as cirrhosis of the liver.⁹

-  Prepare client for, or assist with, diagnostic studies, such as x-rays, computed tomography or magnetic resonance imaging scans, ultrasound, or colonoscopy, to determine presence of injuries or disorders that could cause internal bleeding (e.g., ectopic pregnancy, damaged spleen following vehicle crash, epidural hemorrhage 2 days after a fall, reports of rectal bleeding).

NURSING PRIORITY NO. 3 To prevent bleeding/correct potential causes of excessive blood loss:

-  Apply direct pressure and ice to bleeding site, insert nasal packing, or perform fundal massage as appropriate.
- Restrict activity and encourage bedrest or chairrest until bleeding abates.
- Maintain patency of vascular access *for fluid administration or blood replacement as indicated.*
-  Assist with treatment of underlying conditions causing or contributing to blood loss, such as medical treatment of systemic infections or balloon tamponade of esophageal varices prior to sclerotherapy; proton pump inhibitor medications or antibiotics for gastric ulcer; and surgery for internal abdominal trauma or retained placenta. *Treatment of underlying conditions may prevent or halt bleeding complications.*
- Provide special intervention for an at-risk client (e.g., individual with bone marrow suppression, chemotherapy, uremia) *to prevent bleeding associated with tissue injury:*

Monitor closely for overt bleeding.

Observe for diffuse oozing from tubes, wounds, and orifices with no observable clotting *to identify excessive bleeding and/or possible coagulopathy. Note: Client with certain conditions, such as obstetric complications, gram-negative sepsis, or massive trauma, may be predisposed to develop consumptive coagulopathy or disseminated intravascular coagulation, a potentially lethal phenomenon characterized by simultaneous clotting and continual bleeding.*²

Maintain pressure or pressure dressings as indicated for a longer period of time. *May be required to stop bleeding, such as pressure dressings over arterial puncture site or surgical dressings.*

 Hematest secretions and excretions for occult blood *for early identification of internal bleeding.*

Protect client from trauma such as falls, accidental or intentional blows, or lacerations *that could cause bleeding.*

Use soft toothbrush or toothettes for oral care *to reduce risk of injury to oral mucosa.*

-  Collaborate in evaluating need for replacing blood loss or specific components and be prepared for emergency interventions. *Institution or physician may have specific guidelines for transfusion, such as platelet count less than 20,000/mcL or Hg less than 7 g/dL, in addition to the client's clinical status.*
-  Be prepared to administer hemostatic agents, such as desmopressin, *which promotes clotting and may stop bleeding by increasing coagulation factor VIII and the von Willebrand factor,* or medications to prevent bleeding, such as proton pump inhibitors *to reduce the risk of gastrointestinal bleeding and need for replacement transfusion.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide information to client/family about hereditary or familial problems that predispose to bleeding complications.
- Instruct at-risk client and family regarding:
Specific signs of bleeding requiring healthcare provider notification, such as active bright bleeding anywhere, prolonged epistaxis or trauma in client with known factor bleeding tendencies, black tarry stools, weakness, vertigo, syncope, etc.
-  The need to inform healthcare providers when taking aspirin and other anticoagulants (e.g., Lovenox, Coumadin, Plavix, Xeralto, Eliquis), especially when elective surgery or other invasive procedure is planned. *These agents will most likely be withheld for a period of time prior to elective procedures to reduce potential for excessive blood loss.*

-  Importance of periodic review of client's medication regimen *to identify medications that might cause or exacerbate bleeding problems. Note: Some prescriptions, over-the-counter medications, and herbals (e.g., vitamin E, ginkgo, ginger, garlic, fish oils) promote bleeding.*⁵
 -  Necessity of regular medical and laboratory follow-up when on Coumadin (warfarin), *to determine needed dosage changes or client management issues requiring monitoring and/or modification.*
- Dietary measures to improve blood clotting, such as foods rich in vitamin K.
- The need to avoid alcohol in diagnosed liver disorders or seek treatment for alcoholism in presence of alcoholic varices.
- Techniques for postpartum client to check her own fundus and perform fundal massage as indicated and to contact physician for postdischarge bleeding that is bright red or dark red with large clots. *May prevent blood loss complications, especially if client is discharged early from hospital.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual factors that may potentiate blood loss—type of injuries, obstetrical complications, etc.
- Baseline vital signs, mentation, urinary output, and subsequent assessments.
- Results of laboratory tests or diagnostic procedures.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for actions to be taken.
- Community resources or support for chronic problems.
- Specific referrals made.

risk for unstable Blood Glucose Level

Taxonomy II: Nutrition—Class 4 Metabolism (00179) [**Diagnostic Division:** Food/Fluid], Approved 2006; Revised 2013, 2017

DEFINITION: Susceptible to variation in serum levels of glucose from the normal range, which may compromise health.

RISK FACTORS

Average daily physical activity is less than recommended for gender and age

Does not accept diagnosis; insufficient knowledge of diabetes management

Excessive stress

Insufficient diabetes management or nonadherence to diabetes management plan; inadequate blood glucose monitoring; ineffective medication management

Insufficient dietary intake; excessive weight gain or loss

At Risk Population: Alteration in mental status; compromised health status; delay in cognitive development; rapid growth period

Associated Condition: Pregnancy

Sample Clinical Applications: Diabetes mellitus, diabetic ketoacidosis, hypoglycemia, gestational diabetes, corticosteroid use, total parenteral nutrition (TPN)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Diabetes Management: Extent of understanding conveyed about diabetes, its treatment, and the prevention of complications

Diabetes Self-Management: Personal actions to manage diabetes mellitus, its treatment, and to prevent complications

Blood Glucose Level: Extent to which glucose levels in plasma and urine are maintained in normal range

Client/caregiver Will (Include Specific Time Frame)

- Acknowledge factors that may lead to unstable glucose.
- Verbalize understanding of body and energy needs.
- Verbalize plan for modifying factors to prevent or minimize shifts in glucose level.
- Maintain glucose in satisfactory range.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Hyperglycemia Management: Preventing and treating above-normal blood glucose levels

Teaching: Disease Process: Assisting the patient to understand information related to a specific disease process

Teaching: Prescribed Medication: Preparing a patient to safely take prescribed medications and monitor for their effects

NURSING PRIORITY NO. 1 To assess risk/contributing factors:

- Determine individual factors as listed in Risk Factors. *Client or family history of diabetes, known diabetic with poor glucose control, eating disorders (e.g., morbid obesity), poor exercise habits, and failure to recognize changes in glucose needs or control due to adolescent growth spurts or pregnancy can result in problems with glucose stability.*
- Ascertain client's/significant other's (SO's) knowledge and understanding of condition and treatment needs.
- Identify individual perceptions and expectations of treatment regimen.
-   Note influence of cultural, ethnic origin, socioeconomic, or religious factors impacting diabetes recognition and care, including how person with diabetes is viewed by family and community; the seeking and receiving of health care, management of factors such as dietary practices, weight, blood pressure, and lipids; and expectations of outcomes. *These factors influence client's ability to manage condition and must be considered when planning care. Numerous U.S. studies in recent years have not shown consensus on whether or not diabetes manifestations and complications disproportionately affect African Americans and Hispanics compared with non-Hispanic white adults. Some studies show differences in individuals receiving treatment for hyperlipidemia or albuminuria, control of glucose and hypertension, and preventive self-care. Some ethnic groups use folk medicine and popular remedies such as bitter food and herbs to reduce blood sugar; others may practice fasting or prayer. However, because food patterns are learned in family context and have highly symbolic associations, food choices and preparation may be the most difficult aspects of diabetes management.*⁹⁻¹¹
-  Determine client's awareness and ability to be responsible for dealing with situation. *Age, developmental level, and current health status affect client's ability to provide for own safety.*
- Assess client family/SO support of client. *Client may need assistance with lifestyle changes (e.g., food preparation, consumption, timing of intake and/or exercise, administration of medications).*
- Note availability and use of resources.

NURSING PRIORITY NO. 2 To assist client to develop preventative strategies to avoid glucose instability:

-   Ascertain whether client and SO(s) are certain they are obtaining accurate readings on glucose-monitoring device and are adept at using device. *In addition to checking blood glucose more frequently when it is unstable, it is wise to ascertain that equipment is functioning properly and being used correctly. All available devices will provide accurate readings if properly used and maintained and routinely calibrated. However, there are many other factors that may affect the accuracy of numbers, such as size of blood drop with finger-sticking, forgetting a bolus from insulin pump, and injecting insulin into lumpy subcutaneous site. Note: Although expensive and not yet widely used because of lagging FDA approval (as of 2015), technology advances include a real-time continuous blood glucose monitoring system for detecting blood glucose trends, as well as a warning system for extreme highs and lows.*^{1,13,14}
- Provide information on balancing food intake, antidiabetic agents, and energy expenditure.
-   Review medical necessity for regularly scheduled lab screening and monitoring tests for diabetes. *Screening tests may include fasting plasma glucose or oral glucose tolerance tests. In the known or sick diabetic, tests can include fasting, daily (or numerous times in a day) finger-stick glucose levels. Also, in diabetics, regular testing of hemoglobin (Hgb)A_{1c} and the estimated average glucose help determine glucose control over time (few months). At present, there is no consensus for a hard and fast number; some guidelines state that "HgbA_{1c} level of 6.5%" is diagnostic for a diabetes diagnosis, while others indicate that a level of "less than 7%" is a reasonable goal for many, but not all patients and should be based on individualized assessment of risk for complications.*^{12,13}
- Discuss home glucose monitoring according to individual parameters (e.g., six times per day for normal day and more frequently during times of stress) *to identify and manage glucose fluctuations.*

- Identify common situations that could contribute to client's glucose instability on daily, occasional, or crisis basis. *Multiple factors can be in play at any time, such as missing meals, an adolescent growth spurt, or infection or other illness.*
- Review client's diet, especially carbohydrate intake. *Glucose balance is determined by the amount of carbohydrates consumed, which should be determined in needed grams/day.*²
- 🏠 Encourage client to read labels and choose carbohydrates described as having a low glycemic index (GI) and foods with adequate protein, higher fiber, and low fat content. *These foods produce a slower rise in blood glucose and more stable release of insulin. Note: For most people with diabetes, the first tool for managing blood glucose is some form of carbohydrate counting. Because the type of carbohydrate also affects glucose, using the GI may be helpful in "fine-tuning" blood glucose management.*³
- 💉 Discuss how client's antidiabetic medication(s) work. *Drugs and combinations of drugs work in varying ways with different blood glucose control and side effects. Understanding drug actions can help client avoid or reduce risk of potential for hypoglycemic reactions.*⁴

For client receiving insulin:

- 💉 Emphasize importance of checking expiration dates of medication, inspecting insulin for cloudiness if it is normally clear, and monitoring proper storage and preparation (when mixing is required). *Affects insulin absorbability and effectiveness.*¹
- Review type(s) of insulin used (e.g., rapid, short, intermediate, long-acting, combinations, premixed) and delivery method (e.g., subcutaneous, intramuscular injection; prefilled pen; pump). Note time when short-acting and long-acting insulins are administered. Remind client that only short-acting insulin is used in pump. *Affects timing of effects and provides clues to potential timing of glucose instability.*^{1,5}
- Check injection sites periodically. *Insulin absorption can vary from day to day in healthy sites and is less absorbable in lumpy sites.*
- ∞ Ascertain that all injections are being given. *Children, teenagers, and elderly clients may forget injections or be unable to self-inject; they may need reminders and supervision.*¹

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Review individual risk factors and provide information to assist client in efforts to avoid complications, such as caused by chronic hyperglycemia and acute hypoglycemia. *Note: Hyperglycemia is most commonly caused by alterations in nutrition needs, inactivity, or inadequate use of antidiabetic medications. Hypoglycemia is the most common complication of antidiabetic therapy, stress, and exercise.*^{1,6-8}
- Emphasize consequences of actions and choices—both immediate and long term.
- Engage client/family/caregiver in formulating a plan to manage blood glucose level, incorporating lifestyle, age, developmental level, physical and psychological ability to manage condition.
- 🗣️ Consult with dietitian about specific dietary needs based on individual situation (e.g., growth spurt, pregnancy, change in activity level following injury).
- Encourage client to develop a system for self-monitoring to provide a sense of control and enable client to follow own progress and assist with making choices.
- 🗣️ Refer to appropriate community resources, diabetic educator, and/or support groups as needed for lifestyle modification, medical management, referral for insulin pump or glucose monitor, financial assistance for supplies, etc.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings related to individual situation, risk factors, current caloric intake, and dietary pattern; prescription medication use; monitoring of condition.
- Client's/caregiver's understanding of individual risks and potential complications.
- Results of laboratory tests and finger-stick testing.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term plans for ongoing needs, monitoring and management of condition, and who is responsible for actions to be taken.
- Sources for equipment and supplies.
- Specific referrals made.

risk for unstable Blood Pressure

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/pulmonary Responses Physical Injury (00267) [**Diagnostic Division:** Circulation], Approved 2016

DEFINITION: Susceptible to fluctuating forces of blood flowing through arterial vessels, which may compromise health.

RISK FACTORS

Inconsistency with medication regimen

Orthostasis

Associated Condition: Adverse effects of cocaine, or nonsteroidal anti-inflammatory drugs (NSAIDs), or steroids

Cardiac dysrhythmia; rapid absorption and distribution of antiarrhythmia agent or vasodilator agents

Cushing syndrome; hormonal change; hyperparathyroidism; hyper- or hypothyroidism

Electrolyte imbalance; fluid retention; fluid shifts; hyperosmolar solutions

Increased intracranial pressure

Sympathetic responses

Use of antidepressant agents

This nursing diagnosis encompasses assessments and nursing interventions found in many other nursing diagnoses. For specific related information, refer to NDs, decreased intracranial Adaptive Capacity; risk for Allergy Reaction; Autonomic Dysreflexia, risk for Bleeding; risk for decreased Cardiac Output; risk for Electrolyte Imbalance; deficient Knowledge; risk for Electrolyte Imbalance; deficient Fluid Volume; excess Fluid Volume; Hyperthermia; risk for Infection; risk for Shock

Sample Clinical Applications: Adrenal crisis, primary aldosteronism, anemia; brain injury; burns; cardiogenic shock; cerebrovascular accident (CVA/stroke); pregnancy; childbirth/delivery; diabetic ketoacidosis; dialysis; drug overdose; acute kidney injury; eating disorders (anorexia/bulimia); sepsis/septicemia; shock (various types); spinal cord injury; surgery; trauma

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Cardiac Pump Effectiveness: Adequacy of blood volume ejected from the left ventricle to support systemic perfusion pressure

Symptom Control: Personal actions to minimize perceived adverse changes in physical and emotional functioning

Client/Caregiver Will

- Maintain blood pressure within acceptable limits
- Experience no cardiovascular or systemic complications
- Verbalize understanding of condition, therapeutic regimen, and preventive measures
- Initiate necessary lifestyle/behavioral changes

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Hypertension Management: Preventing and treating blood pressure levels higher than normal

Hypotension Management: Preventing and treating blood pressure levels lower than normal

Medication Management: Facilitating safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To identify contributing risk factors:

- Identify presence of associated conditions, for example, (1) cardiac dysfunction [including myocardial infarction, dysrhythmias, heart failure, cardiomyopathy]; (2) brain injury [including traumatic injury, stroke]; (3) fluid imbalances [either deficit or excess] and electrolyte imbalances; (4) endocrine disorders [e.g., primary aldosteronism, adrenal gland tumors, thyroid issues]; (5) acute or chronic renal disease; (6) trauma [causing damage to central and autonomic systems, including spinal cord injury]; (7) fever [such as accompanies infections/sepsis]; (8) substance use/abuse/overdose [e.g., caffeine, cocaine, other drugs of abuse]; (9) great physical/emotional stress [e.g., traumas causing anxiety, fear/panic]; (10) pregnancy; and (11) allergic reactions *that can cause or exacerbate blood pressure instability*.^{1,3}
- Review current medication regimen. *Use of certain medications such as dysrhythmia agents, vasodilators, antihypertensives, diuretics, tricyclic antidepressants, medications for Parkinson's disease can have direct effect on blood pressure.*^{1,3}
- ∞ Determine how client takes medications, whether assistance is provided and by whom. *Blood pressure fluctuations can occur (1) in client who is not taking blood pressure medications as prescribed (e.g., older client living alone who doesn't understand or chooses not to follow directions and takes less or more than prescribed dose); or (2) client is taking medications as prescribed, but failing to report adverse side effects (e.g., blood pressure too low on current dose of amlodipine); (3) caregiver not involved with client medications, does not understand dosing instructions, inadvertently gives incorrect doses, or makes decisions for client (e.g., "my husband doesn't like the way that medication makes him feel, so we stopped the blood pressure medication"); (4) client/caregiver receives inadequate teaching.*⁴
- ∞ Note client age, general health, developmental and cognitive status. *These factors affect client's abilities to manage own symptoms, or respond to emergent conditions affecting blood pressure.*
- 📋 Ascertain client's current and ongoing blood pressure measurements, noting trends and sudden changes. *Note: A recent (2015) systematic review and meta-analysis of multiple studies suggest that greater systolic blood pressure variance measured early from ischemic stroke or intracerebral hemorrhage onset is associated with poor longer-term functional outcome.*²
- Measure blood pressure to determine risk for hypertension or hypotension, using the appropriate size and type of equipment, proper position (e.g., seated, legs uncrossed, feet flat on floor), and free of contributing factors such as consumption of caffeine, recent administration of influential medications, agitation). Be aware of numbers that are currently used to identify normal ranges of blood pressure. *Incorrect readings may result in inappropriate or lack of needed treatment.*
- Note client reports of headaches, blurred vision, chest pain, weakness or numbness in arms, legs, or face *which may indicate that blood pressure is elevated (although high blood pressure often fails to produce any noticeable symptoms until damage to the blood vessels result in serious conditions, or blood pressure rise is sudden.*¹
- Observe for (or assess client/SO reports) sudden high blood pressure. *This condition usually occurs in a small percentage of people with high blood pressure. This can include young adults, including a high number of African American men, and individuals experiencing collagen vascular disorders, kidney issues, or pregnancy.*³
- Note client reports of dizziness or fainting, blurred vision, nausea, shortness of breath, thirst *which may indicate that blood pressure is fluctuating downward.*³
- Note whether client has potential causes for low blood pressure or hypotension. *The reason (1) may not be pathological (e.g., client reports typical blood pressure lower depending on time of day, or with medication effect; chronic kidney disease) or (2) may be indicative of pathological associated conditions (e.g., heart attack, blood loss, allergic response).*

NURSING PRIORITY NO. 2 To assist client/caregiver to reduce risk:

- Refer for and collaborate in treatment/management of underlying condition(s) *that can restore hemodynamic stability or reduce risk of blood pressure fluctuations.*
- Monitor blood pressure as indicated and evaluate trends. Correlate client's symptoms with potential or identified cause for blood pressure instability.

- Address personal factors (e.g., age and developmental level, social and cultural influences, life experiences, cognitive/emotional/psychological impairment *that require modifications in healthcare management, teaching, and follow-up*).
- Discuss with client/SO those risk factors that are modifiable (e.g., taking medications as prescribed, avoiding substance misuse/[abuse]).
- Recommend changing position from supine to standing slowly and in stages, avoiding standing motionless or for long periods of time, or sitting with legs crossed *to enhance safety and reduce gravitational blood pooling in the lower extremities*.
- Identify available support systems, as needed. *Client or caregiver may need community resources (e.g., home healthcare services, assistance with medication setup/administration, supervision or day care for frail elderly or child).*
- Emphasize importance of regular and long-term medical follow-up appointments *for monitoring blood pressure and disease/condition trends and to provide for early intervention to reduce risk of complications*.
- Refer to appropriate NDs (as listed above) for related interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- Determine most urgent need from client's/caregiver's and healthcare provider's viewpoints, *which may differ and require adjustments in teaching plan*.
- Teach home monitoring of blood pressure, where indicated, and obtain return demonstration of ability to take blood pressure (and medications) accurately.
- Recommend client keep diary of pressure readings taken at different times of the day and noting any associated symptoms. *Provides opportunity to follow trends and identify contributing factors such as medication effect*.
- Instruct client/SO in healthy eating and adequate fluid intake. *For example, obesity is a risk factor for hypertension and dehydration is a risk for hypotension. Furthermore, sodium intake can influence blood pressure in hyper- and hypotension*.
- Instruct client/SO in lifestyle modifications based on identified risks. *Exercise program, smoking cessation, stress management techniques, substance use programs not only reduce risk of blood pressure issues but also enhance general well-being*.
- Elicit client's knowledge of reportable blood pressure measurements and symptoms and who to report to. *Provides opportunity for timely intervention*.
- Review specifics and rationale for components of treatment plan. Ask client/SO if he or she has questions and/or if he or she is willing to adhere to plan. *Helps to identify areas of concern and need for further instruction/interventions*.
- Refer to specific NDs (as listed above) for related Teaching/Discharge considerations.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline and subsequent blood pressure measurements
- Medications
- Individual risk factors

Planning

- Plan of care and who is involved in planning
- Teaching plan

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed
- Status and disposition at discharge
- Attainment or progress toward desired outcome(s)
- Modifications to plan of care

Discharge Planning

- Discharge considerations and who will be responsible for carrying out individual actions
- Long-term needs and available resources
- Specific referrals made

disturbed Body Image

Taxonomy II: Self-Perception—Class 3 Body Image (00118) [Diagnostic Division: Ego Integrity]. Approved 1973; Revised 1998, 2017

DEFINITION: Confusion in [and/or dissatisfaction with] mental picture of one's physical self.

RELATED FACTORS

Alteration in self-perception

Cultural or spiritual incongruence

[Significance of body part or functioning with regard to age, gender, developmental level, or basic human needs]

DEFINING CHARACTERISTICS

Subjective

Alteration in view of one's body; perceptions that reflect an altered view of one's body appearance

Depersonalization of body part or loss by use of impersonal pronouns

Emphasis on remaining strengths

Fear of reaction by others

Focus on past strength, function, or appearance

Negative feeling about body

Personalization of body part/loss by name

Objective

Absence of body part; alteration in body structure or function

Avoids looking at or touching one's body

Behavior of acknowledging or monitoring one's body

Change in ability to estimate spatial relationship of body to environment

Change in lifestyle, social involvement

Extension of body boundary [e.g., includes external object]

Heightened achievement

Hiding or overexposure of body part

Nonverbal response to actual or perceived change in body

Preoccupation with change or loss; refusal to verify change

At Risk Population: Developmental transition

Associated Condition: Alteration in body or cognitive functioning; illness; impaired psychosocial functioning; injury; surgical procedure; trauma, treatment regimen

Trauma to nonfunctioning body part

Sample Clinical Applications: Eating disorders (anorexia/bulimia nervosa), traumatic injuries, amputation, ostomies, aging process, arthritis, pregnancy, chronic renal failure, renal dialysis, burns

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Body Image: Perception of own appearance and body functions

Self-Esteem: Personal judgment of self-worth

Adaptation to Physical Disability: Personal actions to adapt to a significant functional challenge due to a physical disability

Client Will (Include Specific Time Frames)

- Verbalize acceptance of self in situation (e.g., chronic progressive disease, amputee, decreased independence, weight as is, effects of therapeutic regimen).
- Verbalize relief of anxiety and adaptation to altered body image.
- Verbalize understanding of body changes.
- Recognize and incorporate body image change into self-concept in accurate manner without negating self-esteem.
- Seek information and actively pursue growth.
- Acknowledge self as an individual who has responsibility for self.
- Use adaptive devices or prosthesis appropriately.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Body Image Enhancement: Improving a patient's conscious and unconscious perceptions and attitudes toward his/her body

Developmental Enhancement: Adolescent: Facilitating optimal physical, cognitive, social, and emotional growth of individuals during the transition from childhood to adulthood

Self-Esteem Enhancement: Assisting a patient to increase his or her personal judgment of self-worth

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Discuss pathophysiology present or situation affecting the individual and refer to additional NDs, as appropriate. For example, when alteration in body image is related to neurological deficit (e.g., stroke), refer to ND Unilateral Neglect; for presence of severe, ongoing pain, refer to ND chronic Pain; or for loss of sexual desire/ability, refer to ND Sexual Dysfunction.
- Determine whether condition is permanent with no hope for resolution. (May be associated with other NDs such as Self-Esteem [specify] or risk for impaired Attachment when child is affected.) *Identifies appropriate interventions based on reality of situation and need to plan for long- or short-term prognosis. Note: There is always something that can be done to enhance acceptance, and it is important to hold out the possibility of living a good life with the disability.*¹
- Assess the mental and physical influence of illness or condition on the client's emotional state (e.g., diseases of the endocrine system, use of steroid therapy). *Some diseases or conditions can have a profound effect on one's emotions and need to be considered in the evaluation and treatment of the individual's behavior and reaction to the current situation.*^{1,9}

- Evaluate level of client's knowledge of and anxiety related to situation. Observe emotional changes. *Provides information about starting point for providing information about illness. Emotional changes may indicate level of anxiety and need for intervention to lower anxiety before learning can take place.*¹
- Recognize behavior indicative of overt preoccupation with body and its processes. *May interfere with ability to engage in therapy and indicate need to provide interventions to deal with concern before beginning therapy.*^{2,3}
- Assume all individuals are sensitive to changes in appearance, but avoid stereotyping. *Not all individuals react to body changes in the same way, and it is important to determine how this person is reacting to changes.*^{2,3}
- Have client describe self, noting what is positive and what is negative. Be aware of how client believes others see self. *Identifies self-image and whether there is a discrepancy between own view, how client's view is affected by social media, or how client believes others see him or her, which may have an effect on how client perceives changes that have occurred.*^{3,4}
- ∞ Discuss meaning of loss or change to client. *A small (seemingly trivial) loss may have a big impact (such as the use of a urinary catheter or enema for bowel continence). A change in function (such as immobility) may be more difficult for some to deal with than a change in appearance. Permanent facial scarring of child may be difficult for parents to accept.*¹
- ∞ Use developmentally appropriate communication techniques for determining exact expression of body image in child (e.g., puppet play or constructive dialogue for toddler). *Developmental capacity must guide interaction to gain accurate information.*
- Note signs of grieving or indicators of severe or prolonged depression. *May require evaluation of need for counseling or medications.*³
- 🌐 Determine ethnic background and cultural or religious perceptions and considerations. *Understanding how these factors affect the individual in this situation and how they may influence how individual deals with what has happened is necessary to develop appropriate interventions.*⁵
- Identify social aspects of illness or disease. *Sexually transmitted infections, sterility, or chronic conditions (e.g., vitiligo, multiple sclerosis) may affect how client views self and functions in social settings and how others view the client.*^{2,8}
- Observe interaction of client with significant others (SOs). *Distortions in body image may be unconsciously reinforced by family members, or secondary gain issues may interfere with progress.*^{2,8}

NURSING PRIORITY NO. 2 To determine coping abilities and skills:

- Assess client's current level of adaptation and progress. *Client may have already adapted somewhat, and information provides starting point for developing plan of care.*²
- Listen to client's comments and note responses to the situation. *Different situations are upsetting to different people, depending on individual coping skills, severity of the perceived changes in body image, and past experiences with similar illnesses/conditions.*^{2-4,8}
- 📄 Note withdrawn behavior and the use of denial. *May be normal response to situation or may be indicative of mental illness (e.g., depression, schizophrenia).*⁶ (Refer to ND ineffective Denial.)
- 🧴 Note dependence on prescription medications or use of addictive substances/alcohol. *May reflect dysfunctional coping as client turns to use of these substances to avoid dealing with changes that are occurring to body or ability to function in his or her accustomed manner.*⁶
- Identify previously used coping strategies and effectiveness. *Familiar coping strategies can be used to begin adaptation to current situation.*²
- 🤝 Determine individual/family/community resources. *Can provide efficient assistance and support to enable the client to adapt to changing circumstances.*

NURSING PRIORITY NO. 3 To assist client and SO(s) to deal with/accept issues of self-concept related to body image:

- Establish a therapeutic nurse-client relationship. *Conveys an attitude of caring and develops a sense of trust in which client can discuss concerns and find answers to issues confronting him or her in new situation.*^{4,8}

- Visit client frequently and acknowledge the individual as someone who is worthwhile. *Provides opportunities for listening to concerns and questions to promote dealing positively with individual situation and change in body image.*¹
- Assist in correcting underlying problems when possible. *Promotes optimal healing and adaptation to individual situation (i.e., amputation, presence of colostomy, mastectomy, impotence).*¹
- Provide assistance with self-care needs or measures, as necessary, while promoting individual abilities and independence. *Client may need support to achieve the goal of independence and positive return to managing own life.*
- Work with client's self-concept without moral judgments regarding client's efforts or progress (e.g., "You should be progressing faster; you're weak, lazy, not trying hard enough"). *Such statements diminish self-esteem and are counterproductive to progress. Positive reinforcement encourages client to continue efforts and strive for improvement.*^{2,8}
- Discuss concerns about fear of mutilation, prognosis, and rejection when client is facing surgery or potentially poor outcome of procedure or illness. *Addresses realities and provides emotional support to enable client to be ready to deal with whatever the outcome may be.*¹
- Acknowledge and accept feelings of dependency, grief, and hostility. *Conveys a message of understanding.*¹
- Encourage verbalization of and role-play anticipated conflicts to enhance handling of potential situations. *Provides an opportunity to imagine and practice how different situations can be dealt with, thus promoting confidence.*⁴
- Encourage client and SO(s) to communicate feelings to each other and discuss situation openly. *Enhances relationship, improving sense of self-worth and sense of support.*²
- Alert staff to be cognizant of own facial expressions and other nonverbal behaviors. *Important to convey acceptance and not revulsion, especially when the client's appearance is affected. Clients are very sensitive to reactions of those around them, and negative reactions will affect self-esteem and may retard adaptation to situation.*¹
- Encourage family members to treat client normally and not as an invalid. *Helps client return to own routine and begin to gain confidence in ability to manage own life.*¹
- Encourage client to look at and touch affected body part to begin to incorporate changes into body image. *Acceptance will enhance self-esteem and enable client to move forward in a positive manner.*^{1,7}
- Allow client to use denial without participating (e.g., client may at first refuse to look at a colostomy; the nurse says, "I am going to change your colostomy now" and proceeds with the task). *Provides individual time to adapt to situation.*⁴
- Set limits on maladaptive behavior; assist client to identify positive behaviors. *Self-esteem will be damaged if client is allowed to continue behaviors that are destructive or not helpful, and adaptation to new image will be delayed.*^{4,10}
- Provide accurate information, as desired or requested. Reinforce previously given information. *Accurate knowledge helps client make better decisions for the future.*⁴
-  Discuss the availability of prosthetics, reconstructive surgery, and physical and occupational therapy or other referrals, as dictated by individual situation. *Provides hope that situation is not impossible and the future does not look so bleak.*^{1,7,8}
- Help client to select and creatively use clothing or makeup to minimize body changes and enhance appearance.¹
- Discuss reasons for infectious isolation and procedures when used, and make time to sit down and talk or listen to client while in the room. *Promotes understanding and decreases sense of isolation and loneliness.*¹

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Begin counseling or other therapies (e.g., biofeedback or relaxation techniques) as soon as possible. *Provides early and ongoing sources of support to promote rehabilitation in a timely manner.*¹
- Provide information at client's level of acceptance and in small segments. *Allows for easier assimilation.*^{1,2,7}

- Clarify misconceptions and reinforce explanations given by other health team members. *Ensures client is hearing factual information to make the best decisions for own situation.*^{1,2,7}
- Include client in decision-making process and problem-solving activities. *Promotes adherence to decisions and plans that are made.*¹
- Assist client to incorporate therapeutic regimen into activities of daily living (e.g., specific exercises, housework activities). *Promotes continuation of program by helping client see that progress can be made within own daily activities.*¹
- Identify and plan for alterations to home and work environment or activities when necessary. *Accommodates individual needs and supports independence.*¹
- Assist client in learning strategies for dealing with feelings and venting emotions. *Helps individual move toward healing and optimal recuperation.*^{1,2}
- Offer positive reinforcement for efforts made (e.g., wearing makeup, using prosthetic device). *Client needs to hear that what he or she is doing is helping.*^{1,9}
-  Refer to appropriate support groups. *May need additional help to adjust to new situation and life changes.*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Observations, presence of maladaptive behaviors, emotional changes, stage of grieving, level of independence.
- Physical wounds, dressings; use of life support-type machine (e.g., ventilator, dialysis machine).
- Meaning of loss or change to client.
- Support systems available (e.g., SOs, friends, groups).

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications of plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions.
- Specific referrals made (e.g., rehabilitation center, community resources).

ineffective Breastfeeding

Taxonomy II: Nutrition—Class 1 Ingestion (00104) [**Diagnostic Division:** Food/Fluid], Approved 1988; Revised 2010, 2013, 2017

DEFINITION: Difficulty feeding milk from the breasts, which may compromise nutritional status of the infant/child.

RELATED FACTORS

Insufficient parental knowledge regarding importance of breastfeeding or breastfeeding techniques
 Insufficient opportunity for suckling at the breast; inadequate milk supply; delayed stage II lactogenesis
 Poor infant sucking reflex
 Supplemental feedings with artificial nipple; pacifier use
 Maternal anxiety or ambivalence, fatigue, pain, obesity
 Interrupted breastfeeding
 Maternal breast anomaly
 Insufficient family support

DEFINING CHARACTERISTICS

Subjective

Sore nipples persisting beyond the first week of breastfeeding
 Insufficient emptying of each breast per feeding
 Perceived inadequate milk supply

Objective

Infant inability to latch on to maternal breast correctly; unsustained suckling at the breast
 Infant arching or crying at the breast; resisting latching on to breast
 Infant crying within the first hour after breastfeeding; fussing within 1 hour of breastfeeding; unresponsive to other comfort measures
 Insufficient signs of oxytocin release
 Inadequate infant stooling
 Insufficient infant weight gain; sustained infant weight loss
At Risk Population: Prematurity; previous breast surgery; previous history of breastfeeding failure; short maternity leave
Associated Condition: Oropharyngeal defect [e.g., cleft palate/lip; ankyloglossia (tongue-tied)]
Sample Clinical Applications: Prematurity, cleft lip/palate, ankyloglossia, Down's syndrome, child abuse or neglect, failure to thrive, diseases/infections of the breast

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Breastfeeding: Extent of understanding conveyed about lactation and nourishment of infant through breastfeeding

Breastfeeding Establishment: Maternal [or] Infant: Maternal establishment of proper attachment of an infant to and sucking from the breast for nourishment during the first 3 weeks of breastfeeding/ infant attachment to and sucking from the mother's breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Maintenance: Continuation of breastfeeding from establishment to weaning for nourishment of an infant/toddler

(continues on page 110)

ineffective Breastfeeding (continued)

Client Will (Include Specific Time Frame)

- Verbalize understanding of causative or contributing factors.
- Demonstrate techniques to enhance breastfeeding experience.
- Assume responsibility for effective breastfeeding.
- Achieve mutually satisfactory breastfeeding regimen with infant content after feedings, gaining weight appropriately, and output within normal range.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

Support Group: Use of a group environment to provide emotional support and health-related information for members

NURSING PRIORITY NO. 1 To identify maternal causative/contributing factors:

- Assess client knowledge about breastfeeding and extent of instruction previously received. *Provides baseline information for identifying needs and developing plan of care.*^{1,7}
-  Identify cultural expectations and conflicts about breastfeeding and beliefs or practices *Various differences are possible regarding lactation, let-down techniques, and maternal food preferences.*
-  Note incorrect myths/misunderstandings especially in teenage mothers, *who are more likely to have limited knowledge and more concerns about body image issues.*
- Encourage discussion of current and previous breastfeeding experience(s). *Identifies current needs and problems encountered to develop a plan of care.*⁵
- Note previous unsatisfactory experience (including self or others). *Often unsolved problems and stories told by others may cause doubt about chance for success.*¹
- Perform physical assessment, noting appearance of breasts and nipples, marked asymmetry of breasts, obvious inverted or flat nipples, and minimal or no breast enlargement during pregnancy. *Identifies existing problems that may interfere with successful breastfeeding experience and provides opportunity to correct them when possible.*^{1,7}
-  Determine whether lactation failure is primary (i.e., maternal prolactin deficiency/serum prolactin levels, inadequate mammary gland tissue, breast surgery that has damaged the nipple, areola enervation, pituitary disorders) or secondary (i.e., sore nipples, severe engorgement, plugged milk ducts, mastitis, inhibition of letdown reflex, maternal/infant separation with disruption of feedings). *Primary failure may be irremediable, and alternate plans may need to be made. Secondary failure can be remedied so breastfeeding efforts can be successful.*⁵ *Note: Overweight women and obese women are 2.5 times and 3.6 times, respectively, less successful in initiating breastfeeding than the general population.*⁹
- Note history of pregnancy, labor, and delivery (vaginal or cesarean section); other recent or current surgery; preexisting medical problems (e.g., diabetes mellitus, seizure disorder, cardiac diseases, presence of disabilities); or if client is adoptive mother. *While some conditions may preclude breastfeeding and alternate plans need to be made, others will need specific plans for monitoring and treatment to ensure successful breastfeeding.*⁵
- Identify maternal support systems and presence and response of significant other (SO), extended family, and friends. *Infant's father and maternal grandmother (in addition to caring healthcare providers) are important factors in whether breastfeeding is successful.*⁸ *Having sufficient support enhances opportunity for a successful breastfeeding experience. Negative attitudes and comments interfere with efforts and may cause client to abandon attempt to breastfeed.*⁵

- Ascertain mother's age, number of children at home, and need to return to work or school. *These factors may have a detrimental effect on desire to breastfeed. Immaturity may influence mother to avoid breastfeeding, believing that it will be inconvenient, or may cause her to be insensitive to the infant's needs. The stress of the responsibility of other children or the need to return to work can affect the ability to manage effective breastfeeding; mother will need support and information to be successful.*⁶
- Determine maternal feelings (e.g., fear, anxiety, ambivalence, depression). *Indicators of underlying emotional state that may suggest need for intervention and referral.*¹
-  Ascertain cultural expectations or conflicts about breastfeeding and beliefs and practices regarding lactation, letdown techniques, and maternal food preferences. *Understanding impact of culture and idiosyncrasies of specific feeding practices is important to determine the effect on infant feeding. The practice may be different but not inferior. For example, in many cultures, such as Mexican American, Navajo, and Vietnamese, colostrum is not offered to the newborn. Intervention is only necessary if the practice/belief is harmful to the infant.*^{1,3,8}
-  Note incorrect myths or misunderstandings, especially in teenage mothers who are more likely to have limited knowledge and more concerns about body image issues.⁸

NURSING PRIORITY NO. 2 To assess infant causative/contributing factors:

-  Determine suckling problems or infant anomaly (e.g., cleft lip/palate). *These factors indicate need for interventions directed at correcting individual situation. Conditions such as cleft palate need evaluation for correction and individualized instruction in holding infant upright and using special nipple or feeding device, such as a Haberman feeder.*^{1,2} *Note: One study indicated that about one-half of mothers in the study were unable to breastfeed infants with cleft lip and/or palate.*¹⁴
- Note prematurity. *Degree of prematurity will dictate type of interventions needed to deal with situation. Infant may be put to breast if sufficiently developed or mother may pump breast and the breast milk given via gavage. If infant breastfeeds, mother should pump afterward because the premature infant's suck cannot empty breast.*²
- Encourage mother to keep a log of intake and output. Review feeding schedule to note increased demand for feeding (at least eight times/day, taking both breasts at each feeding for more than 15 min on each side) or use of supplements with artificial nipple. *Provides opportunity to evaluate infant's growth, determine whether sufficient nourishment is provided, and make adjustments as needed.*²
- Evaluate baby latching and note observable signs of inadequate infant intake. *Inadequate latching, baby latching onto mother's nipples with sustained suckling but minimal audible swallowing noted, infant arching and crying at the breasts with resistance to latching on, decreased urinary output/frequency of stools, and inadequate weight gain all indicate need for evaluation and intervention.*^{1,7}
- Determine whether baby is content after feeding or exhibits fussiness and crying within the first hour after breastfeeding. *Suggests unsatisfactory breastfeeding process.*¹
- Note any correlation between maternal ingestion of certain foods and "colicky" response of infant. *Some foods may seem to result in reaction by the infant, and identification and elimination may correct the problem.*²

NURSING PRIORITY NO. 3 To assist mother to develop skills of successful breastfeeding:

- Provide emotional support to mother. Use one-to-one instruction with each feeding during hospital stay/clinic visit. *New mothers say they would like more support, encouragement, and practical information, especially when they are discharged early. Contact during each feeding provides the opportunity to develop nurse-client relationship in which these goals can be attained.*¹ *Note: Adoptive mothers choosing to breastfeed will require more supportive instruction from a lactation consultant to assist with induced lactation techniques.*⁸
-  Encourage skin-to-skin or kangaroo care, especially for the premature infant. *Studies show that early skin-to-skin mother-infant contact is correlated with exclusive breastfeeding while in the hospital.*^{16,21}
- Inform mother how to assess and correct a latch if needed. Demonstrate asymmetric latch by aiming infant's lower lip as far from base of the nipple as possible and then bringing infant's chin and lower jaw in contact with breast while mouth is wide open and before upper lip touches breast. *This position allows infant to use both tongue and jaw more effectively to obtain milk from the breast.*^{17,21}

- Discuss early infant feeding cues (e.g., rooting, lip smacking, sucking fingers or hand) versus the late cue of crying. *New mothers may not be aware that these behaviors indicate hunger and may not respond appropriately. Early recognition of infant hunger promotes timely and more rewarding feeding experience for infant and mother.*^{1,8}
- Recommend avoidance or overuse of supplemental bottle feedings and pacifiers (unless specifically indicated). *These can lessen infant's desire to breastfeed. The shape of the mouth and lips and the sucking mechanism are different for breast and bottle, and the infant may be confused by the difference, causing interference in the breastfeeding process and increasing risk of early weaning. Note: Adoptive mothers may not develop a full breast milk supply, necessitating supplemental feedings.*^{1,8}
- Restrict use of nipple shields (i.e., only temporarily to help draw the nipple out) and then place baby directly on nipple. *These have been found to contribute to lactation failures. Shields prevent the infant's mouth from coming into contact with the mother's nipple, which is necessary for continued release of prolactin (promoting milk production) and can interfere with or prevent establishment of adequate milk supply. However, temporary use of shield may be beneficial in the presence of severe nipple cracking. Hand pumps can also help draw a flat nipple out before latching.*⁶
- Discuss and demonstrate breastfeeding aids (e.g., infant sling, nursing footstool, or pillows) and suggest using a variety of nursing positions to find the most comfortable ones for mother and infant. *Positions particularly helpful for "plus-sized" women or those with large breasts include the "football" hold, with infant's head to mother's breast and body curved around behind her; or lying down to nurse.*¹⁰
-  Encourage frequent rest periods, sharing household and childcare duties. *The new mother may feel overwhelmed with taking care of infant and carrying out other household duties; having assistance can limit fatigue and facilitate relaxation at feeding times.*⁶ *Note: Research suggests a correlation between psychological stress and development of breast disease (e.g., breast pain, milk stasis, mastitis) leading to early weaning.*¹⁹
- Suggest abstinence or restriction of tobacco, caffeine, alcohol, drugs, and excess sugar, as appropriate. *May affect milk production/letdown reflex and can be passed on to the infant.*¹
- Promote early management of breastfeeding problems. *Dealing with problems in a timely manner will promote successful breastfeeding.*^{1,7}

For example:

Engorgement: Wear supportive bra; apply heat or cool applications to the breasts and massage from chest wall down to nipple; soothe "fussy baby" before latching on the breast and properly position baby on breast/nipple; alternate the side on which baby starts nursing; nurse round the clock or pump with piston-type electric breast pump with bilateral collection chambers at least 8 to 12 times/day; and avoid using bottle, pacifier, or supplements.¹³

 **Sore nipples:** Wear 100% cotton fabrics, do not use soap/alcohol/drying agents on nipples, and avoid use of nipple shields or nursing pads that contain plastic; cleanse and pat dry with a clean cloth; apply thin layer of highly purified anhydrous (HPA) lanolin on nipple. *Note: This cream is edible and does not need to be removed before breastfeeding.*^{12,18} Administer a mild pain reliever as appropriate. Infant should latch on least sore side or begin with hand expression to establish letdown reflex, properly position infant on breast and nipple, and use a variety of nursing positions. Break suction after breastfeeding is complete.

Clogged ducts: Use larger bra or extender to avoid pressure on site; use moist or dry heat and gently massage from above plug down to nipple; nurse infant, hand express, or pump after massage; and nurse more often on affected side.

Inhibited letdown: Use relaxation techniques before nursing (e.g., maintain quiet atmosphere, massage, apply heat to breasts, have beverage available, assume position of comfort, place infant on mother's chest, skin-to-skin). Encourage mother to relax and enjoy her baby.

 **Mastitis:** Promote bedrest (with infant) for several days; administer antibiotics; provide warm, moist heat before and during nursing; and empty breasts completely, continuing to nurse baby at least 8 to 12 times/day, or pumping breasts for 24 hours, and then resuming breastfeeding as appropriate.

-  Demonstrate use of hand expression, hand pump, and electric piston-type breast pump with bilateral collection chamber when necessary to maintain or increase milk supply. *Note: Studies indicate that mothers taught*

hands-on pumping increased the mean daily volume of milk by 48%.²⁰ The need to use a pump to store milk for feedings while the mother is away (i.e., going back to work or simply to allow time away from the infant) demands some degree of proficiency in the use of the pump.¹

NURSING PRIORITY NO. 4 To condition infant to breastfeed:

- Scent breast pad with breast milk and leave in bed with infant along with mother's photograph when separated from mother for medical purposes (e.g., prematurity).
- Increase skin-to-skin contact (kangaroo care).
- Provide practice times at breast for infant to "lick and learn."
- Express small amounts of milk into baby's mouth.
- Have mother pump breast after feeding to enhance milk production.
- Use supplemental nutrition system cautiously when necessary.
-  Identify special interventions for feeding in presence of cleft lip/palate.

These measures promote optimal interaction between mother and infant and provide adequate nourishment for the infant, enhancing successful breastfeeding.^{1,21}

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-   Schedule follow-up visits with healthcare provider 24 to 48 hours after hospital discharge and 2 weeks after birth. *Provides opportunity to evaluate milk intake and breastfeeding process and adequacy of home situation and to answer mother's questions.²*
- Recommend monitoring number of infant's wet and soiled diapers. *Stools should be yellow in color and infant should have at least six wet diapers a day to determine that infant is receiving sufficient intake.⁶*
- Weigh infant at least every third day initially as indicated and record. *Provides record of appropriate weight gain verifying adequacy of nutritional intake or indicates need for evaluation of insufficient weight gain.¹ Note: Most infants lose 5% to 7% of their birth weight in the first few days of life.¹²*
-  Educate father/SO about benefits of breastfeeding and how to manage common lactation challenges. *Enlisting support of father/SO is associated with higher ratio of successful breastfeeding at 6 months.¹¹*
- Discuss with spouse/SO mother's need for rest, relaxation, and time together with spouse and with other children as appropriate. *Promotes understanding of mother's needs and cooperation with incorporation of new member into family. Spouse and children feel included when they have time alone with mother and are more willing to allow mother time with infant and for herself.⁴*
- Instruct in use of relaxation techniques. *Facilitates release of oxytocin improving milk removal.²¹*
-  Promote peer and cultural group counseling for teen mothers. *Provides positive role model that teen can relate to and feel comfortable with discussing concerns and feelings.⁸*
- Discuss importance of adequate nutrition and fluid intake, prenatal vitamins, or other vitamin or mineral supplements, such as vitamin C, as indicated. *During lactation, there is an increased need for energy, and supplementation of protein, minerals, and vitamins is necessary to provide nourishment for the infant and to protect mother's stores, along with extra fluid intake. Alternating different types of fluid, water, juices, decaffeinated tea, and milk can help mother promote sufficient intake. Beer and wine are not recommended for increasing lactation.⁴*
- Address specific problems (e.g., suckling problems, prematurity, anomalies). *Individualized planning can enhance mother's understanding and ability to manage situation.^{1,7}*
- Discuss timing of introduction of solid foods and importance of delaying until infant is at least 4 months, preferably 6 months old. *American Academy of Pediatrics and the World Health Organization recommend delaying solids until at least 6 months. If supplementation is necessary, infant can be finger fed, spoon fed, cup fed, or syringe fed.^{10,15}*
- Inform mother that the return of menses varies in nursing mothers and usually averages 3 to 36 weeks with ovulation returning in 17 to 28 weeks. *Return of menstruation does not affect breastfeeding, and breastfeeding is not a reliable method of birth control.¹*

-  Refer to support groups (e.g., La Leche League, parenting support groups, stress reduction, or other community resources as indicated). *Provides information and visible support for ensuring an effective outcome.*⁵
- Provide bibliotherapy and appropriate Web sites for further information. *Additional resources to assist mother and family to learn and apply new skills.*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified assessment factors, both maternal and infant (e.g., is engorgement present, is infant demonstrating adequate weight gain without supplementation).

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Mother's/infant's responses to interventions, teaching, and actions performed.
- Changes in infant's weight and output.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Referrals that have been made and mother's choice of participation.

interrupted Breastfeeding

Taxonomy II: Nutrition—Class 1 Ingestion (00105) [**Diagnostic Division:** Food/Fluid], Approved 1992; Revised 2013; 2017

DEFINITION: Break in the continuity of providing milk from the breasts, which may compromise breast-feeding success and/or nutritional status of the infant/child.

RELATED FACTORS

Maternal employment
Maternal/infant separation
Need to abruptly wean infant

DEFINING CHARACTERISTICS

Subjective

Nonexclusive breastfeeding

At Risk Population: Hospitalization of child; prematurity

Associated Condition: Contraindications to breastfeeding; infant or maternal illness

Sample Clinical Applications: Prematurity, postpartum depression, conditions requiring hospitalization of infant or mother, occasionally maternal medication or drug use

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Breastfeeding: Extent of understanding conveyed about lactation and nourishment of an infant through breastfeeding

Breastfeeding Maintenance: Continuation of breastfeeding from establishment to weaning for nourishment of an infant/toddler

Parent-Infant Attachment: Parent and infant behaviors that demonstrate an enduring affectionate bond

Client Will (Include Specific Time Frame)

- Identify and demonstrate techniques to sustain lactation until breastfeeding is reinitiated.
- Achieve mutually satisfactory feeding regimen with infant content after feedings and gaining weight appropriately.
- Achieve weaning and cessation of lactation, if desired or necessary.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

Coping Enhancement: Assisting a patient to adapt to perceived stressors, changes, or threats that interfere with meeting life demands and roles

Bottle Feeding: Preparation and administration of fluids to an infant via a bottle

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Assess client knowledge and perceptions about breastfeeding and extent of instruction that has been given. *Provides baseline information to develop plan of care for individual situation.*^{1,8}
- ∞ Note myths or misunderstandings, especially in some cultures, and in teenage mothers, *who are more likely to have limited knowledge and concerns about body image issues.*⁹

- Encourage discussion of current and previous breastfeeding experience(s). *Useful for determining efforts needed to continue breastfeeding, if desired, while circumstances interrupting process are resolved, if possible.*²
-  Ascertain cultural expectations or conflicts. *The dominant culture in America has sexualized women's breasts, and mother may be embarrassed by breastfeeding or father/partner may not want mother to breast-feed. Mother may believe her independence will be curtailed by breastfeeding. Studies have shown that in the United States, breastfeeding rates vary not only by race and ethnicity but also by geographic location. For example, the rate of breastfeeding among African American mothers in the Southeast has lagged behind other areas in the country. Other cultures, such as Arab American, may believe that modernization means giving up breastfeeding.*^{1,3,19}
- Determine support systems available to mother/family. *Infant's father and maternal grandmother (in addition to caring healthcare providers) are important factors in whether breastfeeding is successful and sustained.*⁹
-  Identify factors necessitating interruption or, occasionally, cessation of breastfeeding (e.g., maternal illness, drug use) or desire or need to wean infant. *In general, infants with chronic diseases benefit from breastfeeding, and only a few maternal infections (e.g., HIV, active/untreated tuberculosis for initial 2 weeks of multidrug therapy, active herpes simplex of the breasts, development of chickenpox within 5 days prior to delivery or 2 days after delivery) are hazardous to breastfeeding infants. In addition, use of antiretroviral medications, chemotherapy agents, or maternal substance abuse usually requires weaning of infant. Exposure to radiation therapy requires interruption of breastfeeding for length of time radioactivity is known to be present in breast milk and is therefore dependent on agent used. Note: Mother can "pump and dump" her breastmilk to maintain supply and continue to breastfeed after her condition has resolved (e.g., chicken pox).*^{1,8–11,18}
- Determine maternal responsibilities, routines, and scheduled activities. *Caretaking of siblings, employment in or out of the home, and work or school schedules of family members may affect ability to visit hospitalized infant when this is the reason for mother/infant separation.*^{6,7}

NURSING PRIORITY NO. 2 To assist mother to maintain breastfeeding, as desired:

- Provide information, as needed, regarding need or decision to interrupt breastfeeding.
- Give emotional support to mother and support her decision regarding cessation or continuation of breastfeeding. *Many women are ambivalent about breastfeeding, and providing information about the pros and cons of both breastfeeding and bottle-feeding, along with support for the mother's/couple's decision, will promote a positive experience.*^{1,8}
-  Promote peer counseling for teen mothers. *Provides positive role model teen can relate to and feel comfortable with discussing concerns and feelings.*⁹
- Educate father/significant other (SO) about the benefits of breastfeeding and how to manage common lactation challenges. *Enlisting support of father/SO is associated with higher ratio of successful breastfeeding at 6 months.*¹²
- Discuss and demonstrate use of breastfeeding aids (e.g., infant sling, nursing footstool or pillows, hand expression, manual and/or electric piston-type breast pump). *Enhances comfort and relaxation for breastfeeding. When circumstances dictate that mother and infant are separated for a time, whether due to illness, prematurity, or returning to work or school, the milk supply can be maintained by use of the pump. Storing the milk for future use enables the infant to continue to receive the value of breast milk. Learning the correct technique is important for successful use of the pump.*^{1,4,13,15}
- Review techniques for storage and use of expressed breast milk. *Provides safety and optimal nutrition, promoting continuation of the breastfeeding process.*¹
- Determine if a routine visiting schedule or advance warning can be provided. *When infant remains in the hospital or when working mother continues to nurse, it helps to make preparations so that infant will be hungry and ready to feed when the mother arrives. A sleepy baby can be gently played with to arouse him or her; clothing can be loosened or diaper changed, exposing infant to room air; or if infant is hungry and upset, a calm voice and gentle rocking can calm the infant and prepare him or her to nurse.*¹

- Provide privacy and calm surroundings when mother breastfeeds in hospital or work setting. *Note: Federal law 2010 requires an employer to provide a place and reasonable break time for an employee to express her breast milk for her baby for 1 year after birth.*²⁰
- Problem-solve return-to-work or school issues or periodic infant care requiring bottle or supplemental feeding.^{14,15}
- Recommend using expressed breast milk instead of formula or at least partial breastfeeding for as long as mother and child are satisfied. *Prevents temporary interruption in breastfeeding, decreasing the risk of premature weaning.*^{13,15}

NURSING PRIORITY NO. 3 To promote successful infant feeding:

- Recommend or provide for infant sucking on a regular basis, especially if gavage feedings are part of the therapeutic regimen. *Reinforces that feeding time is pleasurable and enhances digestion.*¹
- Explain anticipated changes in feeding needs and frequency. *Growth spurts require increased intake or more feedings by infant.*¹³
- Discuss proper use and choice of supplemental nutrition and alternate feeding methods (e.g., bottle or syringe, finger feeding, cup feeding, or supplemental nursing system feeding). *If infant is not receiving sufficient nourishment, whether by mother's choice to reduce number of feedings (e.g., returning to work) or necessity (e.g., specific maternal illness, medication use), other means for supplementing intake must be taken, and mother needs to be given information regarding method chosen.*¹
- Review safety precautions when bottle-feeding is necessary/chosen. *Identifying importance of proper flow of formula from nipple, frequency of burping, holding bottle instead of propping, techniques of formula preparation, and sterilization techniques are necessary for successful bottle-feeding.*¹

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Encourage mother to obtain adequate rest, maintain fluid and nutritional intake, continue to take her prenatal vitamins, and schedule breast pumping every 3 hours while awake, as indicated. *Sustains adequate milk production and enhances breastfeeding process when mother and infant are separated for any reason.*^{1,8}
- Suggest abstinence or restriction of tobacco, caffeine, alcohol, drugs, and excess sugar, as appropriate, when breastfeeding is reinitiated. *These substances may affect milk production/letdown reflex and can be passed on to the infant.*¹
- Identify other means of nurturing and strengthening infant attachment, such as skin-to-skin or kangaroo care. *Activities that provide comfort, consolation, and play activities help mother become comfortable with handling the infant, thus enhancing relationship.*^{7,15}
-  Refer to support groups (e.g., La Leche League, Lact-Aid) or community resources (e.g., public health nurse; lactation specialist; Women, Infants, and Children [WIC] program; and electric pump rental programs). *Additional support may provide assistance, supplies, and education to promote a successful outcome. WIC and other federal programs support breastfeeding through education and enhanced nutritional intake.*^{5,15}
- Promote use of bibliotherapy and appropriate Web sites. *Provides additional sources of information.*⁵
- Discuss timing of introduction of solid foods and importance of delaying until infant is at least 4 months, preferably 6 months, old if possible. *American Academy of Pediatrics and the World Health Organization recommend delaying solids until at least 6 months. If supplementation is necessary, infant can be finger fed, spoon fed, cup fed, or syringe fed.*^{13,21}

NURSING PRIORITY NO. 5 To assist mother in weaning process, when desired:

-  Discuss reducing frequency of daily feedings or breast pumping by once every 2 to 3 days. *Preferred method of weaning, if circumstance permits, to reduce problems associated with engorgement.*^{16,17}
- Encourage wearing a snug, well-fitting bra, but refrain from binding breasts *because of increased risk of clogged milk ducts and inflammation.*^{15,16}

- Recommend expressing some milk from breasts regularly each day over a 1- to 3-week period, if necessary, *to reduce discomfort associated with engorgement until milk production decreases*.^{16,17}
- Suggest holding infant differently during bottle-feeding or interactions or having another family member give infant's bottle feeding *to prevent infant rooting for mother's breast and limit stimulation of her nipples*.
-  Discuss use of ibuprofen or acetaminophen *for discomfort during weaning process*.⁸
- Suggest use of ice packs to breast tissue (not nipples) for 15 to 20 min at least four times a day *to help reduce swelling during sudden weaning*.¹⁷

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline findings maternal/infant factors, including mother's milk supply, infant nourishment.
- Reason for interruption or cessation of breastfeeding.
- Number of wet and soiled diapers daily, log of intake and output, as appropriate, and periodic weight.

Planning

- Method of feeding chosen.
- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Maternal response to interventions, teaching, and actions performed.
- Infant's response to feeding and method.
- Whether infant appears satisfied or still seems to be hungry.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Referrals, plan for follow-up, and who is responsible.
- Specific referrals made.

readiness for enhanced Breastfeeding

Taxonomy II: Nutrition—Class 1 Ingestion (00106) [Diagnostic Division: Food/Fluid], Approved 1990; Revised 2010, 2013, 2017

DEFINITION: A pattern of feeding milk from the breasts to an infant or child, which may be strengthened.

DEFINING CHARACTERISTICS

Subjective

Mother expresses desire to enhance ability to exclusively breastfeed

Mother expresses desire to provide breast milk for child's nutritional needs

Sample Clinical Applications: Wellness diagnosis associated with pre-/postnatal client

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Breastfeeding Establishment: Infant: Infant attachment to and sucking from the mother's breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Establishment: Maternal: Maternal establishment of proper attachment of an infant to and sucking from the breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Maintenance: Continuation of breastfeeding from establishment to weaning for nourishment of an infant/toddler

Client Will (Include Specific Time Frame)

- Verbalize understanding of breastfeeding techniques, good latch, and lactogenesis.
- Demonstrate effective techniques for breastfeeding.
- Demonstrate family involvement and support.
- Attend classes, read appropriate materials, or access resources as necessary.
- Verbalize understanding of the benefits of human milk.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

Teaching: Infant Nutrition (specify months): Instruction on nutrition and feeding practices during the first year of life

NURSING PRIORITY NO. 1 To determine individual learning needs:

- Assess mother's desires/plan for feeding infant. *Provides information for developing plan of care.*¹
- Assess mother's knowledge and previous experience with breastfeeding. *Accurate knowledge and previous experience can lead to a positive breastfeeding experience.*¹
-  Note cultural and societal influences regarding infant feeding (breastfeeding/bottle-feeding), lactation process, letdown techniques, and maternal food preferences. *In Western cultures, the breast has taken on a sexual connotation, and some mothers may be embarrassed to breastfeed. While breastfeeding may be accepted, in some cultures, certain beliefs may affect specific feeding practices (e.g., in Mexican American, Navajo, Filipino, and Vietnamese cultures, colostrum is not offered to the newborn; breastfeeding begins only after the milk flow is established).*³
-  Note myths or misunderstandings, especially in teenage mothers who are more likely to have limited knowledge and concerns about body image issues.⁶
- Monitor effectiveness of current breastfeeding efforts. *Determining the actions client is taking provides information about measures that may enhance efforts to be successful in endeavor.*¹
- Determine support systems available to mother/family. *Presence of adequate support can provide encouragement to mother who may be feeling nervous and unsure about new role.*^{1,6}

NURSING PRIORITY NO. 2 To promote effective breastfeeding behaviors:

- Initiate breastfeeding within first hour after birth. *The time of the first feeding is determined by the infant's physiological and behavioral cues. Throughout the first 2 hours after birth, the infant is usually alert and ready to nurse. Early feedings are of great benefit to mother and infant because oxytocin release is stimulated, helping to expel the placenta and prevent excessive maternal blood loss; the infant receives the immunological protection of colostrum; peristalsis is stimulated; lactation is accelerated; and maternal-infant bonding is enhanced.*²
-  Encourage skin-to-skin contact. Place infant on mother's stomach, skin-to-skin after delivery. *Many full-term infants are alert and capable of latching onto mother's breast without assistance.*⁹ *Studies show that early skin-to-skin mother-infant contact is correlated with exclusive breastfeeding while in the hospital.*¹⁰
- Demonstrate asymmetric latch aiming infant's lower lip as far from base of the nipple as possible, then bringing infant's chin and lower jaw in contact with breast while mouth is wide open and before upper lip touches breast. *This position allows infant to use both tongue and jaw more effectively to obtain milk from the breast.*⁹
- Demonstrate how to support and position infant and use of aids (e.g., infant sling, nursing footstool, or pillows). *The mother should be made as comfortable as possible and given specific instructions for positioning self and baby depending on the type of birth (e.g., cesarean section or vaginal).*^{1,5}
- Observe mother's return demonstration/teach back. *Provides practice and the opportunity to correct misunderstandings and add additional information to promote optimal experience for breastfeeding.*¹
- Keep infant with mother for unrestricted breastfeeding duration and frequency. *Rooming-in offers opportunity for spontaneous encounters for the family to practice handling skills and increase confidence in own ability. It also encourages feeding in response to cues from the baby and increases bonding.*¹
- Discuss early infant feeding cues (e.g., rooting, lip smacking, sucking fingers or hand) versus the late cue of crying. *Early recognition of infant hunger promotes timely and more rewarding feeding experience for infant and mother. NOTE: For healthy infants, discourage use of pacifiers and artificial nipples in first month of life to avoid "nipple confusion" and to establish mother's milk supply.*⁶
- Encourage mother to follow a well-balanced diet containing an extra 500 calories/day, continue her prenatal vitamins, and drink at least 2,000 to 3,000 mL of fluid/day. *There is an increased need for maternal energy, protein, minerals, and vitamins, as well as increased fluid intake, during lactation to restore what the mother loses in secreting milk to provide adequate nutrients for the nourishment of the infant and to protect the mother's own stores.*⁴
- Provide information, as needed, in support of breastfeeding. *Having adequate information about the nutritional, psychological, immunological advantages, contraindications, and disadvantages of breastfeeding helps*

the parents to make a decision that is best for the family. Many mothers indicate that if they had had adequate information, they would have chosen to breastfeed.¹

-  Promote peer counseling for teen mothers. Provides positive role model teen can relate to and feel comfortable with discussing concerns and feelings.⁶

NURSING PRIORITY NO. 3 To enhance optimum wellness (Teaching/Discharge Considerations):

-  Provide for follow-up contact or home visit 48 hours after discharge; repeat visit as necessary. Provides opportunity to assess adequacy of home situation and breastfeeding efforts as well as support and assistance with problem solving, if needed.¹
- Recommend monitoring number of infant's wet diapers (at least six wet diapers in 24 hours suggests adequate hydration) and soiled diapers (breastfed baby's stool will be yellow in color). Often mothers who are breastfeeding worry about whether infant is getting adequate nutrition because they cannot measure the amount of milk being received, and having this information can allay these fears.¹
- Encourage mother and other family members to express feelings and concerns, and active-listen to determine nature of concerns. Identifying the concerns of the parents promotes problem solving and alleviation of worries and fears. When individuals do not express these concerns, they can become frustrated, which can interfere with successful breastfeeding.¹
-  Educate father/significant other (SO) about benefits of breastfeeding and how to manage common lactation challenges. Enlisting support of father/SO is associated with higher ratio of successful breastfeeding at 6 months.⁸
- Review techniques for expression and storage of breast milk to help sustain breastfeeding activity. Having this information enables the mother to successfully manage continuation of breastfeeding while engaging in activities outside the home for specified periods of time.¹
- Explain changes in feeding needs and frequency. Growth spurts require increased intake or more feedings by infant.⁵
- Review normal nursing behaviors of older breastfeeding infants/toddlers.⁵
- Discuss importance of delaying introduction of solid foods until infant is at least 4 months, preferably 6 months old. Note: American Academy of Pediatrics and the World Health Organization recommend delaying solids until at least 6 months.^{5,11}
- Recommend avoidance of specific medications or substances (e.g., estrogen-containing contraceptives, bromocriptine, nicotine, alcohol) known to decrease milk supply. Note: Small amounts of alcohol have not been shown to be detrimental.^{6,7}
-  Emphasize importance of client notifying healthcare providers, dentists, and pharmacists of breastfeeding status.
- Problem-solve return-to-work issues or periodic infant care requiring bottle or supplemental feeding. Enables mothers who need or desire to return to work (for economic or personal reasons) or who simply want to attend activities without the infant to deal with these issues, thus allowing more freedom while maintaining adequate breastfeeding.¹
- Recommend using expressed breast milk instead of formula or at least partial breastfeeding for as long as mother and child are satisfied.⁶
-  Refer to support groups, such as La Leche League, as indicated. Provide mother with phone number of support person or group, prior to leaving hospital. While the father or SO is the most important support person in Western society, family support systems may be lacking information about other support systems/groups.¹
- Refer to ND ineffective Breastfeeding for more specific information, as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified assessment factors (maternal and infant).
- Number of daily wet and soiled diapers and periodic weight.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Mother's response to interventions, teaching plan, and actions performed.
- Effectiveness of infant's efforts to feed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, referrals made, and who is responsible for follow-up actions.

insufficient Breast Milk Production

Taxonomy II: Nutrition—Class 1 Ingestion (00216) [**Diagnostic Division:** Food/Fluid], Approved 2010; Revised 2017

DEFINITION: Inadequate supply of maternal breast milk to support nutritional state of an infant or child.

RELATED FACTORS

Mother

Insufficient fluid volume
Smoking; alcohol consumption
Malnutrition
Treatment regimen [e.g., medication side effects—contraceptives, diuretics]

Infant

Ineffective latching on to breast, sucking reflex
Insufficient opportunity for suckling at the breast or suckling time at breast
Rejection of breast

DEFINING CHARACTERISTICS

Objective

Mother

Absence of milk production with nipple stimulation
Breast milk expressed is less than prescribed volume for infant
Delay in milk production

Infant

Frequently seeks to suckle at breast; prolonged breastfeeding time
Suckling time at breast appears unsatisfactory; frequently crying
Refuses to suckle at breast; unsustained suckling at breast
Voids small amounts of concentrated urine;
Weight gain <500 g in a month

Associated Condition: Pregnancy

Sample Clinical Applications: Conditions resulting in dehydration, such as fluid volume depletion, hemorrhage; malnutrition; premature infant with inability to suck vigorously, or mother not pumping to promote supply; adolescent mother; use/abuse of substances and/or certain medications.

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Breastfeeding: Extent of understanding conveyed about lactation and nourishment of an infant through breastfeeding

Breastfeeding Establishment: Maternal: Maternal establishment of proper attachment of an infant to and sucking from the breast for nourishment during the first 3 weeks of breastfeeding

Breastfeeding Maintenance: Continuation of breastfeeding from establishment to weaning for nourishment of infant/toddler

Client Will [Include Specific Time Frame]

- Develop plan to correct/change contributing factors.
- Engage in techniques to enhance milk production.
- Achieve mutually satisfactory breastfeeding pattern with infant content after feedings and gaining weight appropriately.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

NURSING PRIORITY NO. 1 To identify maternal causative or contributing factors:

- Assess mother's knowledge about breastfeeding and extent of instruction that has been provided. Determine previous breastfeeding experience. *Lack of knowledge, unresolved problems, or stories told by others may cause client to doubt abilities and chances for success.*^{8,13}
-  Identify cultural expectations and conflicts about breastfeeding and beliefs or practices regarding lactation, letdown techniques, and maternal food preferences. *Understanding the impact of culture and idiosyncrasies of specific feeding practices is important to determine the effect on infant breastfeeding success.*^{8,11,14}
-  Note incorrect myths/misunderstandings, especially in teenage mothers. *Adolescents are more likely to have limited knowledge, difficulty managing time demands of school/work, concerns about body image issues, and feel overwhelmed.*^{8,14}

- Identify maternal support systems and presence/response of significant others (SOs)/extended family. *Negative attitudes and comments interfere with efforts and may cause client to prematurely abandon attempt to breastfeed.*¹⁴
- Determine use of supplemental feedings for infant. *Unless medically indicated, routine supplementation increases risk for decrease in mother's milk supply.*¹⁴
- Perform physical examination, noting appearance of breasts and nipples, marked asymmetry of breasts, obvious inverted or flat nipples, minimal or no breast enlargement during pregnancy. *Inadequate mammary gland tissue, breast surgery that has damaged the nipple, areola enervation results in irremediable primary lactation failure.*^{9,13}
-  Assess for other causes of primary lactation failure. *Maternal prolactin deficiency/serum prolactin levels, pituitary or thyroid disorders, and anemia may be corrected with medication.*^{4,9}
- Review lifestyle for common causes of secondary lactation failure. *Smoking, caffeine/alcohol use, lack of adequate healthy food; birth control pills containing estrogen, becoming pregnant again; medications (e.g., antihistamines, decongestants, diuretics), stress, and fatigue are known to inhibit milk production.*^{1,4,9}
- Determine desire/motivation to breastfeed. *Increasing milk supply can be intense, requiring commitment to therapeutic regimen and possible lifestyle changes.*

NURSING PRIORITY NO. 2 To identify infant causative or contributing factors:

- Observe infant at breast to evaluate latching-on skill and presence of suck/swallow difficulties. *Poor latching-on, lack of audible swallowing/gulp are associated with inadequate intake. The infant gets substantial amounts of milk when drinking with an open—pause—close type of suck.³ (Open—pause—close is one suck; the pause described here is not a pause between sucks but rather when swallowing occurs.)*
- Observe signs of inadequate infant intake. *Infant arching and crying at the breast with resistance to latching-on, decreased urinary output/frequency of stools, and inadequate weight gain indicate need for further evaluation and intervention.*^{11,13}
- Review feeding schedule—frequency, length of feeding, and taking one or both breasts at each feeding. *Provides information regarding whether sufficient nutrition is being provided.*¹⁰

NURSING PRIORITY NO. 3 To increase mother's milk supply:

- Instruct on how to differentiate between perceived and actual insufficient milk supply. *Normal breastfeeding frequencies, suckling times, and amounts vary not only between mothers, but also based on infant's needs/moods. Milk production is likely to be a reflection of the infant's appetite rather than the mother's ability to produce milk.*^{4,5}
- Provide emotional support to mother. Use one-to-one instruction with each feeding during hospital stay, clinic, or home visit. *Increases likelihood of continuation of breastfeeding efforts and achievement of goals.*^{11,14}
- Refer adoptive mothers choosing to breastfeed to a lactation consultant. *Adoptive mothers choosing to breastfeed will require more supportive instruction from a professional consultant to assist with induced lactation techniques.*¹⁴
- Inform mother how to assess and correct a latch if needed. Demonstrate asymmetric latch, aiming infant's lower lip as far from base of the nipple as possible and then bringing infant's chin and lower jaw in contact with breast while mouth is wide open and before upper lip touches breast. *Correct latching-on is the most effective way to stimulate milk supply.*^{2,9}
- Encourage unrestricted frequency and duration of breastfeeding. *Provides stimulation of breast tissue and may increase milk supply naturally.*⁹
- Recommend reducing or stopping supplemental feedings if used. *Gradual tapering off of supplementation can increase frequency/duration of infant's breastfeeding stimulating maternal milk production.*^{9,14}
- Demonstrate breast massage technique. *Improves oxytocin release and milk removal to increase milk supply naturally.*^{9,14} Also, gently massaging breast while infant feeds from it can improve the release of higher-calorie hindmilk from the milk glands.^{1,9}

- Use breast pump 8 to 12 times a day. *Expressing with a hospital-grade, double (automatic) pump is ideal for stimulation/reestablishing milk supply.*^{1,9}
- Recommend mother adjust the electric pump to her maximum comfortable vacuum. *Enhances milk flow rate and milk yield and minimizes occurrence of tissue damage.*⁹
- Suggest using a breast pump or hand expression after infant finishes breastfeeding. *Continued breast stimulation cues the mother's body that more milk is needed, increasing supply.*⁷
- Encourage use of relaxation techniques during hand or mechanical expression. *Facilitates oxytocin release to improve milk removal.*⁹
- Monitor increased filling of breasts in response to nursing and/or pumping to help evaluate effectiveness of interventions.
- Discuss appropriate/safe use of herbal supplements. *Herbs such as sage, parsley, oregano, peppermint, jasmine, and yarrow may have a negative effect on milk supply if taken in large quantities. A number of herbs have been used for centuries to stimulate milk production, with fenugreek (*Trigonella foenum-graecum*) being the most commonly recommended herbal galactagogue to facilitate lactation.*^{4,9}
-  Discuss possible use of prescribed medications (galactagogues) to increase milk production. *Domperidone (Motilium) is approved by the American Academy of Pediatrics for use in breastfeeding mothers and has fewer side effects. Metoclopramide (Reglan) has been shown to increase milk supply anywhere from 72% to 110% depending on how many weeks the mother is postpartum.*^{1,6,9}

NURSING PRIORITY NO. 4 To promote optimal success and satisfaction of breastfeeding process for mother and infant:

- Encourage frequent rest periods, sharing household and childcare tasks. *Having assistance can limit fatigue (known to impact milk production) and facilitate relaxation at feeding time.*¹²
- Discuss with spouse/SO mother's requirement for rest, relaxation, and time together with family members. *Enhances understanding of mother's needs, and family members feel included and more willing to support breastfeeding activity/treatment plan.*¹¹
-  Arrange dietary consult to review nutritional needs and vitamin/mineral supplements, such as vitamin C, as indicated. *During lactation, there is an increased need for energy requiring supplementation of protein, vitamins, and minerals to provide nourishment for the infant.*¹¹
- Emphasize importance of adequate fluid intake. *Alternating types of fluids (e.g., water, juice, decaffeinated tea/coffee, milk) enhances intake promoting milk production. Note: Beer and wine are not recommended for increasing lactation.*¹¹
-  Encourage peer counseling for teen mothers. *Provides positive role model that teen can relate to and feel comfortable with discussing concerns and feelings.*¹⁴
- Recommend monitoring number of infant's wet and soiled diapers. *Stools should be yellow in color and infant should have at least six wet diapers a day to determine that infant is receiving sufficient intake.*¹²
- Weigh infant every 3 days, or as directed by primary provider/lactation consultant, and record. *Monitors weight gain verifying adequacy of intake or need for additional interventions.*¹¹
- Identify products/programs for cessation of smoking. *Smoking can interfere with the release of oxytocin, which stimulates the letdown reflex, and can negatively affect milk production.*^{4,9,11}
-  Refer to support groups (e.g., La Leche League International, parenting support groups, stress management class, or other community resources, as indicated). *Provides information and ongoing support increasing likelihood of successful breastfeeding.*⁹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified maternal assessment factors—hydration level, medication use, lifestyle choices.
- Cultural factors, support systems.
- Findings of breast examination.

- Infant assessment factors—latching-on technique, hydration level/number of wet diapers, weight gain/loss.
- Use of supplemental feedings.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Individual teaching plan.

Implementation/Evaluation

- Mother's/infant's responses to interventions, teaching, and actions performed.
- Change in infant's weight.
- Attainment or progress toward desired outcomes.
- Modification to plan of care.

Discharge Planning

- Specific referrals made.

ineffective Breathing Pattern

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/Pulmonary Responses (00032) [Diagnostic Division: Respiration], Approved 1980; Revised 1996, 1998, 2010, 2017

DEFINITION: Inspiration and/or expiration that does not provide adequate ventilation.

RELATED FACTORS

Anxiety; [panic attacks]
 Body position that inhibits lung expansion; obesity
 Fatigue; respiratory muscle fatigue
 Hyperventilation
 Pain

DEFINING CHARACTERISTICS

Subjective

Dyspnea
Orthopnea

Objective

Abnormal breathing pattern
Altered chest excursion; [paradoxical breathing patterns]
Bradypnea; tachypnea
Decrease in inspiratory or expiratory pressure
Decrease in minute ventilation or vital capacity
Use of accessory muscles to breath; use of three-point position
Increase in anterior-posterior chest diameter
Prolonged expiration phases; pursed-lip breathing
Nasal flaring; [grunting]

Associated Condition: Bony or chest wall deformity; hypoventilation syndrome; musculoskeletal, neurological or neuromuscular impairment; neurological immaturity; spinal cord injury

Sample Clinical Applications: COPD, emphysema, asthma, pneumonia, chest trauma or surgery, SCI, Guillain-Barré syndrome, traumatic brain injury, cystic fibrosis, drug or alcohol toxicity

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Respiratory Status: Ventilation: Movement of air in and out of the lungs

Fatigue Level: Severity of observed or reported prolonged generalized fatigue

Anxiety Level: Severity of manifested apprehension, tension, or uneasiness arising from an unidentifiable source

Client Will (Include Specific Time Frame)

- Establish a normal, effective respiratory pattern.
- Be free of cyanosis and other signs/symptoms of hypoxia with arterial blood gases (ABGs) within client's normal/acceptable range.
- Verbalize awareness of causative factors and initiate needed lifestyle changes.
- Demonstrate appropriate coping behaviors.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Ventilation Assistance: Promotion of an optimal spontaneous breathing pattern that maximizes oxygen and carbon dioxide exchange in the lungs

Airway Management: Facilitation of patency of air passages

Respiratory Monitoring: Collection and analysis of patient data to ensure airway patency and adequate gas exchange

NURSING PRIORITY NO. 1 To identify etiology/precipitating factors:

-  Identify age and ethnic group of client who may be at increased risk. *Respiratory ailments in general are increased in infants and children with neuromuscular disorders, the frail elderly, and persons living in*

highly polluted environments.^{1,2} Smoking (and potential for smoking-related disorders) is prevalent among such groups as Appalachians, African Americans, Chinese men, Latinos, and Arabs. Studies have linked air pollution to heart disease, asthma, and other diseases. Communities of color are especially vulnerable as they tend to live in areas (such as close to freeways or high traffic areas) with high levels of air toxins.^{3,4} People most at risk for infectious pneumonias include the very young and frail elderly; those suffering from chronic respiratory or circulatory problems; and those with compromised immune systems from congenital deficiencies, AIDS, cancers, and cancer therapies.^{2,5}

- Ascertain if client has history of underlying respiratory disorder or if this is a new condition with potential for breathing problems or exacerbation of preexisting problems (e.g., asthma, other acute upper respiratory infection, lung cancer, neuromuscular disorders, heart disease, sepsis, burns, acute chest or brain trauma). *Important in pointing to cause for current breathing problems.*⁶
- Assess for pregnancy, other abdominal distention, and muscle guarding. *Distended abdomen and muscle tension can impede diaphragmatic excursion and reduce lung expansion.*
- Note current symptoms and how they relate to past history. *Assessing current illness, including history of (1) onset and duration of symptoms; (2) how they are similar to or different from past symptoms; (3) precipitating, relieving, and exacerbating factors; and (4) exposures (e.g., environmental toxins, alcohol or other drugs, source of infection) may help in selecting the correct diagnosis.*
- Note emotional state. *Gasping, crying, anxiety, irritability, struggling, look of fear, report of tingling lips or fingers, withdrawal, and self-focus are responses often associated with respiratory distress. Emotional changes can accompany a condition or precipitate or aggravate ineffective breathing patterns.*⁵⁻⁹
- Evaluate client's respiratory status:

∞ Note rate and depth of respirations, counting for 1 full minute, if rate is irregular. *Rate may be faster or slower than usual. In infants and younger children, rate increases dramatically relative to anxiety, crying, fever, or disease. Depth may be difficult to evaluate but is usually described as shallow, normal, or deep.*^{5,7,8}

Note client's reports and perceptions of breathing ease. *Client may report a range of symptoms (e.g., air hunger, shortness of breath with speaking, activity, or at rest) and demonstrate a wide range of signs (e.g., tachypnea, gasping, wheezing, coughing).*

∞ Observe characteristics of breathing pattern. *May note use of accessory muscles for breathing, sternal retractions (infants and young children), nasal flaring, or pursed-lip breathing. Client may change position in effort to breathe easier. Irregular patterns may be pathological (e.g., prolonged expiration, periods of apnea, obvious agonal breathing) with pronounced alterations in conditions such as severe asthma attack, brainstem damage, or impending respiratory failure.*⁵⁻⁷

Auscultate and percuss chest, describing presence, absence, and character of breath sounds. *Air should be moving freely through air passages (differs from ineffective airway clearance), but ventilatory effort may be insufficient to bring in enough oxygen or to exchange sufficient amounts of carbon dioxide, such as might occur in asthma or congenital heart disease. Abnormal breath sounds are indicative of numerous problems (e.g., obstruction by foreign object, hypoventilation such as might occur with chest or spinal cord injuries, atelectasis, or presence of secretions, improper endotracheal [ET] tube placement, collapsed lung) and must be evaluated and reported for further intervention.*^{5,8,9}

Observe chest size, shape, and symmetry of movement. *Changes in movement of chest wall (such as might occur with chest trauma, chest wall deformities) can impair breathing patterns.*

∞ Note color of skin and mucous membranes. *If pallor, dusky, and/or cyanosis are present, supplemental oxygen and/or other interventions may be required. (Refer to ND Impaired Gas Exchange.)*

Note presence and character of cough. *Cough function may be weak or ineffective in conditions such as extremes in age (e.g., premature infant or elderly); in diseases (e.g., cerebral palsy, muscular dystrophy, SCI, brain injury); after surgery; and/or in mechanical ventilation due to mechanisms affecting muscles of throat, chest, and lungs. Cough that is persistent and constant can interfere with breathing (such as can occur with asthma, acute bronchitis, cystic fibrosis, croup, whooping cough).*^{1,6-10} (Refer to ND Ineffective Airway Clearance.)

- Assess client's awareness and cognition. *Affects ability to manage own airway and cooperate with interventions such as controlling breathing and managing secretions.*^{2,8,9}
-  Assist with and monitor results of diagnostic testing (e.g., pulmonary or cardiac function studies, neuromuscular evaluation, sleep studies) *to diagnose presence and severity of lung diseases and degree of respiratory compromise.*
-  Review chest radiographs and laboratory data (e.g., ABGs, pulse oximetry at rest and activity *to determine degree of oxygenation, CO₂ retention*) and pulmonary function studies (such as spirometry) *to determine effectiveness of inhalation and exhalation.*⁹

NURSING PRIORITY NO. 2 To provide for relief of causative factors, promoting ease of breathing:⁶⁻¹¹

-  Assist in treatment of underlying conditions, administering medications and therapies as ordered.
- Suction airway to clear secretions as needed. (Refer to ND ineffective Airway Clearance for additional interventions.)
- Maintain emergency equipment in readily accessible location and include age- and size-appropriate airway, ET, and tracheostomy tubes (e.g., infant, child, adolescent, adult).
-  Administer oxygen (by cannula, mask, mechanical ventilation) at lowest concentration needed (per ABGs, pulse oximetry) *for underlying pulmonary condition and current respiratory problem.*¹¹⁻¹³ (Refer to ND impaired Gas Exchange for additional interventions.)
- Elevate head of bed or have client sit up in chair; support with pillows *to prevent slumping and promote rest, or place in position of comfort, as appropriate, to promote maximal inspiration.*
- Reposition client frequently *to enhance respiratory effort and ventilation of all lung segments, especially if immobility is a factor.*
-  Encourage early ambulation using assistive devices, as individually indicated. Involve client in program of exercise training *to prevent onset or reduce severity of respiratory complications and to improve respiratory muscle strength.*¹¹
- Direct client in breathing efforts as needed. Encourage slower and deeper respirations and use of the pursed-lip technique, *to assist client in "taking control" of the situation, especially when condition is associated with anxiety and air hunger.*
-  Coach client in effective coughing techniques. Place in appropriate position for clearing airways. Splint rib cage and surgical incisions as appropriate. Medicate for pain, as indicated. *Promotes more effective breathing and airway management, especially when client is guarding, as might occur with chest, rib cage, or abdominal injuries or surgeries.* (Refer to NDs acute Pain; chronic Pain for additional interventions.)
-  Provide and assist with use of respiratory therapy adjuncts.
- Maintain calm attitude while working with client/significant others (SOs). Provide quiet environment, instruct and reinforce client in the use of relaxation techniques, and administer anti-anxiety medications as indicated *to reduce intensity of anxiety and deal with fear that may be present.* (Refer to NDs Fear; Anxiety for additional interventions.)
-  Avoid overfeeding, such as might occur with young infant or client on tube feedings. *Abdominal distention can interfere with breathing as well as increase the risk of aspiration.*
-  Ascertain that client possesses and properly operates continuous positive airway pressure machine *when obstructive sleep apnea is causing breathing problems.*
-  Maintain emergency equipment in readily accessible location and include age/size-appropriate ET/tracheostomy tubes (e.g., infant, child, adolescent, adult) *when ventilatory support might be needed.*
-  Assist with bronchoscopy or chest tube insertion as indicated.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review with client/SO the type of respiratory condition, treatments, rehabilitation measures, and quality-of-life issues. *Many conditions with impaired breathing are associated with chronic conditions that require life-time management by client and healthcare providers.*

- Instruct and reinforce breathing retraining. *Education may include many measures, such as conscious control of breathing rate, effective use of accessory muscles, breathing exercises (diaphragmatic, abdominal breathing, inspiratory resistive, pursed-lip), and assistive devices such as rocking bed.*⁶
- Discuss relationship of smoking to respiratory function. Emphasize importance of smoking cessation and a smoke-free environment.
- Encourage client/SO(s) to develop a plan for smoking cessation. Provide appropriate referrals.
-  Encourage self-assessment and symptom management:^{6–11}
Use of equipment to identify respiratory decompensation, such as peak flow meter.
Appropriate use of oxygen (dosage, route, safety factors).
 Medication regimen, including actions, side effects, and potential interactions of medications, over-the-counter drugs, vitamins, and herbal supplements.
-  Home treatments such as metered-dose inhalers, compressor, nebulizer, and chest physiotherapies.
Dietary patterns and needs; access to foods and nutrients supportive of health and breathing.
Management of personal environment, including stress reduction, rest and sleep, social events, travel, and recreation issues.
Avoidance of known irritants, allergens, and sick persons.
 Immunizations against influenza and pneumonia.
Early intervention when respiratory symptoms occur and what symptoms require reporting to medical providers or seeking emergency care.
- Discuss benefits of exercise for endurance, muscle strengthening, and flexibility training *to improve general health and respiratory muscle function.*
-  Refer to physical therapy and pulmonary rehabilitation programs and resources as indicated.^{11,12}
- Review energy conservation techniques (e.g., sitting instead of standing to wash dishes, pacing activities, taking short rest periods between activities) *to limit fatigue and improve endurance.*
- Review environmental factors (e.g., exposure to dust, high pollen counts, severe weather, perfumes, animal dander, household chemicals, fumes, secondhand smoke; insufficient home support for safe care) *that may require avoidance/modification of lifestyle or environment to limit impact on client's breathing.*^{12–14}
-  Reinforce instruction in proper use and safety concerns for home oxygen therapy and/or use of respirator or diaphragmatic stimulator, rocking bed, or apnea monitor, when used. *Protects client's safety, especially when used in the very young or fragile elderly or when a cognitive or neuromuscular impairment is present.*
- Discuss impact of respiratory condition on occupational performance, as well as work environment issues that affect client.
-  Provide referrals as indicated by individual situation. *May include a wide variety of services and providers, including support groups, a comprehensive rehabilitation program, occupational nurse, oxygen and durable medical equipment companies for supplies, home health services, occupational and physical therapy, transportation, assisted or alternate living facilities, local and national Lung Association chapters, and Web sites for educational materials.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Relevant history of problem.
- Respiratory pattern, breath sounds, use of accessory muscles.
- Laboratory values.
- Use of respiratory supports, ventilator settings, etc.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, actions performed, and treatment regimen.
- Mastery of skills, level of independence.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, including appropriate referrals and action taken, available resources.
- Specific referrals provided.

decreased Cardiac Output

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/Pulmonary Responses (00029) [Diagnostic Division: Circulation], Approved 1979; Revised 1996, 2000, 2017

DEFINITION: Inadequate blood pumped by the heart to meet the metabolic demands of the body.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Subjective

Altered Heart Rate/Rhythm: Heart palpitations

Altered Preload: Fatigue, weight gain

Altered Afterload: Dyspnea; [feeling breathless]

Altered Contractility: Orthopnea; paroxysmal nocturnal dyspnea [PND]

Behavioral/Emotional: Anxiety

(continues on page 132)

decreased Cardiac Output (continued)

Objective

Altered Heart Rate/Rhythm: Bradycardia; tachycardia; electrocardiogram (ECG) changes [e.g., arrhythmia, conduction abnormality, ischemia]

Altered Preload: Jugular vein distention; edema; weight gain; increase or decrease in central venous pressure (CVP); increase or decrease in pulmonary artery wedge pressure (PAWP); heart murmur

Altered Afterload: Clammy skin; abnormal skin color; prolonged capillary refill; decreased peripheral pulses; alteration in blood pressure; increase or decrease in systemic vascular resistance (SVR); increase or decrease in pulmonary vascular resistance (PVR); oliguria

Altered Contractility: Adventitious breath sounds; coughing; decrease in cardiac index; decrease in ejection fraction; decrease in stroke volume index (SVI) or left ventricular stroke work index (LVSWI); presence of S₃ or S₄ sounds [gallop rhythm]

Behavioral/Emotional: Restlessness

Associated Condition: Alteration in heart rate or rhythm; alteration in preload; alteration in afterload; alteration in stroke volume; alteration in contractility

Sample Clinical Applications: Myocardial infarction (MI), congestive heart failure, valvular heart disease, dysrhythmias, cardiomyopathy, cardiac contusions/trauma, pericarditis, ventricular aneurysm

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Cardiac Pump Effectiveness: Adequacy of blood volume ejected from the left ventricle to support systemic perfusion pressure

Circulation Status: Unobstructed, unidirectional blood flow at an appropriate pressure through large vessels of the systemic and pulmonary circuits

Energy Conservation: Personal actions to manage energy for initiating and sustaining activity

Client Will (Include Specific Time Frame)

- Display hemodynamic stability (e.g., blood pressure, cardiac output, urinary output, peripheral pulses).
- Report or demonstrate decreased episodes of dyspnea, angina, and dysrhythmias.
- Demonstrate an increase in activity tolerance.
- Verbalize knowledge of the disease process, individual risk factors, and treatment plan.
- Participate in activities that reduce the workload of the heart (e.g., stress management or therapeutic medication regimen program, weight reduction, balanced activity/rest plan, proper use of supplemental oxygen, cessation of smoking).
- Identify signs of cardiac decompensation, alter activities, and seek help appropriately.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Hemodynamic Regulation: Optimization of heart rate, preload, afterload, and contractility

Cardiac Care: Limitation of complications resulting from an imbalance between myocardial oxygen supply and demand for a patient with symptoms of impaired cardiac function

Circulatory Care: Mechanical Assist Devices: Temporary support of the circulation through the use of mechanical devices or pumps

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Review clients at risk as noted in Related Factors and Defining Characteristics. *In addition to individuals obviously at risk with known cardiac problems, there is a potential for cardiac output problems in persons with trauma; hemorrhage; alcohol and other drug intoxication, withdrawal, chronic use, or overdose; pregnant women with hypertensive states; individuals with chronic renal failure; individuals with brainstem trauma or spinal cord injury at T8 or above.*
-  Note age, gender, and ethnic-related cardiovascular considerations, e.g., *in infants, failure to thrive with poor ability to suck and feed can be an indication of heart problems.¹ Contractile force is naturally decreased in the elderly with reduced ability to raise cardiac output in response to increased demand. Also, arteries are stiffer, veins are more dilated, and heart valves are less competent, often resulting in systemic hypertension and blood pooling.^{3,18} In 2013, the overall prevalence of heart failure (HF) was reported to range from 1% to 12% based on available data from the United States and Europe. In 2017, the American Heart Association estimated the annual incidence of heart failure in persons older than 65 to be 21/1000.^{4,19} When in the supine position, pregnant women incur decreased vascular return during the second and third trimesters, potentially compromising cardiac output.² Generally, higher-risk populations include African Americans, Hispanics, Native Americans, and recent immigrants from developing nations, Russia, and the former Soviet republics. The higher prevalence of heart failure in African Americans, Hispanics, and Native Americans is directly related to the higher incidence and prevalence of hypertension and diabetes.⁵*
-  Review diagnostic studies, including, but not limited to, chest radiograph, cardiac stress testing, ECG, echocardiogram, cardiac output and ventricular ejection studies, and heart scan or catheterization. *For example, ECG may show previous or evolving MI, left ventricular hypertrophy, and valvular stenosis. Doppler flow echocardiogram showing an ejection fraction (EF) less than 40% is indicative of systolic dysfunction, but many clients with clinical diagnosis of heart failure have a normal EF. Although cardiac output can be high in certain types of heart failure, a client with severe HF will have decreased cardiac output (less than 4 L/m) owing either to an increased hemodynamic burden or to a reduction in oxygen delivery to the myocardium, resulting in impaired contraction. Additional cardiac studies (e.g., radionuclide scans or catheterization) may be indicated to assess left ventricular function, valvular function, and coronary circulation. Chest radiography may show enlarged heart, pulmonary infiltrates.^{6-8,12,13}*
-  Review laboratory data, including, but not limited to, complete blood count, electrolytes, arterial blood gases (ABGs), and cardiac biomarkers (e.g., creatine kinase and its subclasses, troponins, myoglobin, and LDH); lactate; brain natriuretic peptide; kidney, thyroid, and liver function studies; and cultures (e.g., blood, wound, secretions), bleeding, and coagulation studies *to identify imbalances, disease processes, and effects of interventions.^{6,12}*

NURSING PRIORITY NO. 2 To assess degree of debilitation:

- Assess for signs of poor ventricular function or impending cardiac failure and shock:^{2,3,7-12}
 Client reports or demonstrates extreme fatigue, intolerance for activity, sudden or progressive weight gain, swelling of extremities, and progressive shortness of breath.
 Client reports chest pain. *May indicate evolving heart attack; can also accompany congestive heart failure. Chest pain may be atypical in women experiencing an MI and is often atypical in the elderly owing to altered pain perception.*
 Mental status changes. *Confusion, agitation, decreased cognition, and coma may occur due to decreased brain perfusion.*
 Changes in heart rate or rhythm: Tachycardia at rest, bradycardia, atrial fibrillation, or multiple dysrhythmias may be noted. *Heart irritability is common, reflecting conduction defects and/or ischemia.*
 Heart sounds may be distant, with irregular rhythms; murmurs—systolic (*valvular stenosis and shunting*) and diastolic (*aortic or pulmonary insufficiency*) or gallop rhythm (S₃, S₄) noted *when heart failure is present and ventricles are stiff.*

Peripheral pulses may be weak and thready, reflecting hypotension, vasoconstriction, shunting, and venous congestion.

∞ Changes in skin color, moisture, temperature, and capillary refill time. Pallor or cyanosis; cool, moist skin; and slow capillary refill time may be present because of peripheral vasoconstriction and decreased oxygen saturation. Note: Children with chronic heart failure and adults with chronic obstructive pulmonary disease often show clubbing of fingertips.

Blood pressure changes. Hypertension may be chronic or blood pressure elevated initially in client with impending cardiogenic, hypovolemic, or septic shock. Later, as cardiac output decreases, profound hypotension can be present, often with narrowed pulse pressure.

Breath sounds may reveal bilateral crackles and wheezing associated with congestion. Respiratory distress and failure often occur as shock progresses.

Edema with neck vein distention is often present, and pitting edema is noted in extremities and dependent portions of body because of impaired venous return. Other veins in trunk and extremities can be prominent owing to venous congestion.

∞ Urinary output may be decreased or absent, reflecting poor perfusion of kidneys. Note: Output less than 30 mL/hr (adult) or less than 10 mL/hr (child) indicates inadequate renal perfusion.

NURSING PRIORITY NO. 3 To minimize/correct causative factors, maximize cardiac output:

Acute/severe phase^{7-10,12,15}

-  Keep client on bedrest or chairrest in position of comfort. Decreases oxygen consumption and demand, reducing myocardial workload and risk of decomposition. Note: In congestive state, client may be placed in semi-Fowler's or high Fowler's position to reduce preload and ventricular filling. A supine position may be needed to increase venous return and promote diuresis. May raise legs 20 to 30 degrees in shock situation (Trendelenburg position); however, current studies to support the use of the Trendelenburg position during shock do not reveal any beneficial or sustained changes in systolic blood pressure or cardiac output.¹⁸
-  Administer supplemental oxygen, as indicated (by cannula, mask, endotracheal or tracheostomy tube with mechanical ventilation), to improve cardiac function by increasing available oxygen and reducing oxygen consumption. Note: A critically ill client may be on ventilator to support cardiopulmonary function.¹²
-  Monitor vital signs frequently to evaluate response to treatments and activities. Perform periodic hemodynamic measurements, as indicated (e.g., arterial, CVP, PAWP, left atrial pressure; cardiac output and cardiac index, oxygen saturation). These measurements (via central line monitoring) are commonly used in the critically ill to provide continuous, accurate assessment of cardiac function and response to inotropic and vasoactive medications that affect cardiac contractility and systemic circulation (preload and afterload). Note: A multicenter research study evaluating the clinical effectiveness of clinical management guided by a pulmonary artery catheter in adult intensive care patients (N = 1,041) found no clear evidence that management guided by a pulmonary catheter was either beneficial or harmful.^{15,17}
- Monitor cardiac rhythm continuously to note changes and evaluate effectiveness of medications and devices (e.g., implanted pacemaker/defibrillator).
-  Administer or restrict fluids, as indicated. Replacement of blood and large amounts of IV fluids may be needed if low output state is due to hypovolemia. Use infusion pumps for IVs to monitor IV rates closely to prevent bolus or exacerbation of fluid overload.
- Assess hourly or periodic urinary output and daily weight, noting 24-hour total fluid balance to evaluate kidney function and effects of interventions, as well as to allow for timely alterations in therapeutic regimen.
-  Administer medications as indicated (e.g., inotropic drugs to maintain systemic perfusion and preserve end-organ performance, antiarrhythmics to improve cardiac output; diuretics to reduce congestion by improving urinary output; vasopressors and/or dilators as indicated to manage systemic effects of vasoconstriction and low cardiac output; pain medications and anti-anxiety agents to reduce oxygen demand and myocardial workload; anticoagulants to improve blood flow and prevent thromboemboli). Note: Randomized clinical trials demonstrate consistent mortality benefit from angiotensin-converting enzyme inhibitors (ACEIs), angiotensin

receptor blockers (ARBs); direct-acting vasodilators, beta blockers, and aldosterone antagonists. Additionally, some data show benefits from two new classes of drugs: ARB/neprilysin inhibitor and sinus node modulator.⁷

- Note reports of anorexia or nausea and limit or withhold oral intake as indicated. Symptoms may be systemic reaction to low cardiac output, visceral congestion, or reaction to medications or pain.
-  Assist with preparations for and monitor response to support procedures or devices as indicated (e.g., cardioversion, pacemaker, angioplasty and stent placement, coronary artery bypass graft or valve replacement, intra-aortic balloon pump, left ventricular assist device [LVAD]; total artificial heart [TAH], transplantation). Any number of interventions may be required to correct a condition causing heart failure or to support a failing heart during recovery from myocardial infarction, while awaiting transplantation, or for long-term management of chronic heart failure. Note: The application of LVAD during reperfusion procedures causes reduction of the left ventricular preload, increases regional myocardial blood flow and lactate extraction, and improves general cardiac function.^{6,7}
- Promote rest periods in bed or chair with upper body elevated, as indicated, to reduce catecholamine-induced stress response and cardiac workload.^{11,15}
Decrease stimuli, providing quiet environment.
Schedule activities and assessments to maximize sleep periods.
Assist with or perform self-care activities for client.
Avoid the use of restraints whenever possible, especially if client is confused.
-  Use sedation and analgesics, as indicated, with caution to achieve desired rest state without compromising hemodynamic responses.

Postacute/Chronic Phase^{6,7,11}

- Provide for adequate rest, positioning client for maximum comfort.
- Encourage changing positions slowly, dangling legs before standing to reduce risk of orthostatic hypotension.
- Increase activity levels gradually as permitted by individual condition, noting vital sign response to activity.
-  Administer medications, as appropriate, and monitor cardiac responses.
- Encourage relaxation techniques to reduce anxiety and muscle tension.
-  Refer for nutritional needs assessment and management to provide for supportive nutrition while meeting diet restrictions (e.g., IV nutrition or total parenteral nutrition, sodium-restricted or other type of diet with frequent small feedings).
- Monitor intake/output and calculate 24-hour fluid balance. Provide or restrict fluids, as indicated, to maximize cardiac output and improve tissue perfusion.¹⁵

NURSING PRIORITY NO. 4 To enhance safety/prevent complications:^{2,14,15}

-  Wash hands before and after client contact, maintain aseptic technique during invasive procedures, and provide site care, as indicated, to prevent hospital-acquired infection. (Refer to ND risk for Infection for additional interventions.)
-  Provide antipyretics and fever control actions as indicated. Adjust ambient environmental temperature to maintain body temperature in near-normal range.
- Maintain patency of invasive intravascular monitoring and infusion lines and tape connections to prevent exsanguination or air embolus.
- Minimize activities that can elicit Valsalva response (e.g., rectal straining, vomiting, spasmodic coughing with suctioning, prolonged breath-holding during pushing stage of labor) and encourage client to breathe deeply in and out during activities that increase risk of Valsalva effect. Valsalva response to breath-holding causes increased intrathoracic pressure, reducing cardiac output and blood pressure.¹⁴
-  Avoid prolonged sitting position for all clients and supine position for sleep or exercise for gravid clients (second and third trimesters) to maximize vascular return.^{2,15}
- Elevate legs when in sitting position and edematous extremities when at rest. Apply antiembolic hose or sequential compression devices when indicated, being sure they are individually fitted and appropriately applied. Limits venous stasis, improves venous return, and reduces risk of thrombophlebitis. (Refer to ND ineffective peripheral Tissue Perfusion for additional interventions.)

- Provide skin care, a special bed or mattress (e.g., air, water, gel, foam), and assist with frequent position changes *to prevent the development of pressure ulcers.*
- Provide psychological support *to reduce anxiety and its adverse effects on cardiac function:*
Maintain calm attitude and limit stressful stimuli.
Provide and encourage use of relaxation techniques, such as massage therapy, soothing music, or quiet activities.
Promote visits from family/significant others *to provide positive social interaction.*
Provide information about testing procedures and client participation.
Explain limitations imposed by condition and dietary and fluid restrictions.
Share information about positive signs of improvement.

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):^{11,16}

-  Provide information to clients/caregivers on individual condition, therapies, and expected outcomes. Use various forms of teaching according to client needs, desires, and learning style.
-  Direct client and/or caregivers to resources for emergency assistance, financial help, durable medical supplies, and psychosocial support and respite, especially when client has impaired functional capabilities or requires supporting equipment (e.g., pacemaker, LVAD, or 24-hour oxygen).
-  Emphasize importance of regular medical follow-up care *to monitor client's condition and response to treatment and provide the most effective care.*
- Educate client/caregivers about drug regimen, including indications, dose and dosing schedules, potential adverse side effects, or drug/drug interactions. *Client is often on multiple medications, which can be difficult to manage, thus increasing potential that medications can be missed or incorrectly used.*
- Emphasize reporting of adverse and nuisance side effects of medications *so that adjustments can be made in dosing or another class of medication considered.*
-  Discuss significant signs/symptoms that need to be reported to healthcare provider, such as *unrelieved or increased chest pain, dyspnea, fever, swelling of ankles, and sudden unexplained cough; these are all "danger signs" that require immediate evaluation and possible change of usual therapies.*
- Provide instruction for home monitoring of weight, pulse, and blood pressure, as appropriate, *to detect change and allow for timely intervention.*
-  Recommend annual flu shot, and pneumonia vaccination (when needed).
-  Discuss individual's particular risk factors (e.g., smoking, stress, obesity, recent MI) and specific resources for assistance (e.g., written information sheets, direction to helpful Web sites, formalized rehabilitation programs, home interventions) for management of identified factors for:
Smoking cessation
Stress management techniques
Energy conservation techniques
Nutrition education regarding specific needs (e.g., to improve general health status, reduce or gain weight, lower cholesterol levels, manage sodium)
Exercise and activity plan
- Refer to NDs Activity Intolerance, decreased Diversional Activity Engagement, ineffective Coping, ineffective Breathing Pattern, compromised family Coping, deficient/excess Fluid Volume, imbalanced Nutrition: less than body requirements, Overweight, acute/chronic Pain, risk for decreased cardiac Tissue Perfusion, ineffective peripheral Tissue Perfusion, Sexual Dysfunction, as indicated.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline and subsequent findings and individual hemodynamic parameters, heart and breath sounds, ECG pattern, presence and strength of peripheral pulses, skin and tissue status, renal output, and mentation.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Status and disposition at discharge.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge considerations and who will be responsible for carrying out individual actions.
- Long-term needs.
- Specific referrals made.

risk for decreased Cardiac Output

Taxonomy II: Activity/Rest—Class 4 Cardiovascular/Pulmonary Responses (00240) [Diagnostic Division: Circulation], Approved 2013; Revised 2017

DEFINITION: Susceptible to inadequate blood pumped by the heart to meet the metabolic demands of the body, which may compromise health.

RISK FACTORS

To Be Developed

Associated Condition: Alteration in heart rate or rhythm; alteration in preload; alteration in afterload; alteration in stroke volume; alteration in contractility

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Cardiac Pump Effectiveness: Adequacy of blood volume ejected from the left ventricle to support systemic perfusion pressure

Circulation Status: Unobstructed, unidirectional blood flow at an appropriate pressure through large vessels of the systemic and pulmonary circuits

Energy Conservation: Personal actions to manage energy for initiating and sustaining activity

Client Will (Include Specific Time Frame)

- Display hemodynamic stability (e.g., blood pressure, cardiac output, urinary output, peripheral pulses).
- Verbalize knowledge of the disease process and individual risk factors.
- Participate in activities that reduce risk factors (e.g., stress management or therapeutic medication regimen program, weight reduction, balanced activity/rest plan, proper use of supplemental oxygen, cessation of smoking).

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Cardiac Risk Management: Prevention of an acute episode of impaired cardiac function by minimizing contributing events and risk factors

Hemodynamic Regulation: Optimization of heart rate, preload, afterload, and contractility

NURSING PRIORITY NO. 1 To identify client at risk:

- Identify client at risk: *In addition to an individual obviously at risk because of known cardiac problems, there is a potential for cardiac output issues in others (e.g., person with traumatic injuries and hemorrhage; brain-stem trauma; spinal cord injury at T8 or above; alcohol and other drug intoxication, substance withdrawal or overdose; pregnant woman with hypertensive states; individual with chronic renal failure).*
-  Note age, gender, and ethnic-related cardiovascular considerations. For example, in infants, failure to thrive with poor ability to suck and feed can be indications of heart problems;¹ contractile force is naturally decreased in the elderly with reduced ability to increase cardiac output in response to increased demand;² when in the supine position, pregnant women incur decreased vascular return during the second and third trimesters, potentially compromising cardiac output;³ and generally, higher-risk populations include African Americans, Hispanics, Native Americans, and recent immigrants from developing nations, Russia, and the former Soviet republics.^{4,5}

- Assess for signs of poor ventricular function or impending cardiac failure:^{2,6,7,9,10}
 Note reports of extreme fatigue, intolerance for activity, sudden or progressive weight gain, swelling of extremities, and progressive shortness of breath.
 Evaluate reports of chest pain. *May indicate evolving heart attack; can also accompany congestive heart failure.*
 Observe for mental status changes. *Confusion, agitation, and altered cognition may occur due to decreased brain perfusion.*
 Note changes in heart rate or rhythm: *Heart irritability is common, reflecting conduction defects and/or ischemia.*
 Assess heart sounds. *May become distant, with irregular rhythms; murmurs.*
 Palpate peripheral pulses, *which may become weak and thready.*
 Observe skin, noting color, moisture, temperature, and capillary refill time. *Pallor or cyanosis; cool, moist skin; and slow capillary refill time can occur with peripheral vasoconstriction and decreased oxygen saturation.*
 Evaluate blood pressure changes. *Client may have chronic hypertension. Blood pressure can be elevated initially, followed by hypotension in client with impending cardiogenic, hypovolemic, or septic shock.*
 Auscultate breath sounds. *Bilateral crackles and wheezing can occur associated with congestion.*
 Check for dependent or generalized edema with neck vein distention, *which can occur because of impaired venous return.*
 Observe for changes in urinary output, *which may be decreased or be caused by dehydration, hypovolemia, or poor perfusion of kidneys.*
-  Review laboratory data, including, but not limited to, complete blood count, electrolytes, arterial blood gases, cardiac biomarkers (e.g., creatine kinase and its subclasses, troponins, myoglobin, LDH); lactate; brain natriuretic peptide; kidney, thyroid, and liver function studies; cultures (e.g., blood, wound, secretions); bleeding and coagulation studies, *to identify client at risk and promote early intervention, if indicated.*^{6,7}
- Refer to ND decreased Cardiac Output for additional assessments and interventions as indicated.

NURSING PRIORITY NO. 2 To minimize risk factors, maximize cardiac output:^{6-8,10}

- Provide for adequate rest.
- Increase activity levels gradually as permitted by individual condition, noting vital sign response to activity.
-  Administer medications, as appropriate, and monitor cardiac responses.
- Encourage relaxation techniques *to reduce anxiety and muscle tension.*
- Elevate legs when in sitting position and edematous extremities when at rest. Apply antiembolic hose or sequential compression devices when indicated, ensuring they are individually fitted and appropriately applied. *Limits venous stasis, improves venous return, and reduces risk of thrombophlebitis.*
-  Avoid prolonged sitting position for all clients and supine position for sleep or exercise for gravid clients (second and third trimesters) *to maximize vascular return.*^{2,3}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):⁶⁻⁸

-  Discuss individual's particular risk factors (e.g., smoking, stress, obesity, recent myocardial infarction) and specific resources for assistance (e.g., written information sheets, direction to helpful Web sites, formalized rehabilitation programs, home interventions) for management of identified risk factors.
- Provide information to clients/caregivers on individual condition, therapies, and expected outcomes.
-  Educate client/caregivers about drug regimen, including indications, dose and dosing schedules, potential adverse side effects, or drug/drug interactions.
- Provide instruction for home monitoring of weight, pulse, and blood pressure, as appropriate.
- Discuss significant signs/symptoms that need to be reported to healthcare provider, such as unrelieved or increased chest pain, dyspnea, fever, swelling of ankles, and sudden unexplained cough.

-  Emphasize importance of regular medical follow-up care *to monitor client's condition and provide early intervention when indicated to prevent complications.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline and subsequent findings and individual hemodynamic parameters, heart and breath sounds, ECG pattern, presence and strength of peripheral pulses, skin and tissue status, renal output, and mentation.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Status and disposition at discharge.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge considerations and who will be responsible for carrying out individual actions.
- Long-term needs.
- Specific referrals made.

ineffective Childbearing Process

Taxonomy II: Sexuality—Class 3 Reproduction (00221) [**Diagnostic Division:** Sexuality]. Approved 2010; Revised 2017

DEFINITION: Inability to prepare for and/or maintain a healthy pregnancy, childbirth process, and care of the newborn for ensuring well-being.

RELATED FACTORS

Inadequate maternal nutrition; inconsistent prenatal health visits; insufficient prenatal care
 Insufficient knowledge of childbearing process; unrealistic birth plan
 Insufficient parental role model or support system
 Maternal powerlessness, or low maternal confidence; psychological distress
 Domestic violence; substance misuse/[abuse]

DEFINING CHARACTERISTICS

Subjective

During Pregnancy

Inadequate prenatal care and lifestyle [e.g., nutrition, elimination, sleep, exercise, personal hygiene]
 Ineffective management of unpleasant symptoms in pregnancy
 Unrealistic birth plan

During Labor and Delivery

Inadequate lifestyle for stage of labor

After Birth

Inadequate postpartum lifestyle

Objective

During Pregnancy

Inadequate prenatal care or lifestyle
 Insufficient access of support system
 Insufficient respect for unborn baby; inadequate preparation of newborn care items or home environment

During Labor and Delivery

Inappropriate response to onset of labor; decrease in proactivity during labor and delivery
 Insufficient attachment behavior
 Insufficient access of support system

After Birth

Insufficient attachment behavior; inadequate baby care techniques
 Inappropriate baby feeding techniques; inappropriate breast care
 Unsafe environment for an infant
 Insufficient access of support system

Associated Condition: Unplanned or unwanted pregnancy

Sample Clinical Applications: First, second, and third trimester of pregnancy; labor and delivery, postpartum, newborn

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Prenatal Health Behavior: Personal actions to promote a healthy pregnancy and a healthy newborn

Maternal Status: Antepartum/Intrapartum/Postpartum [specify]: Extent to which maternal well-being is within normal limits from conception to the onset of labor/from onset of labor to delivery/from delivery of placenta to completion of involution

(continues on page 142)

ineffective Childbearing Process (continued)

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Client Will (Include Specific Time Frame)

- Demonstrate healthy pregnancy free of preventable complications.
- Engage in activities to prepare for birth process and care of newborn.
- Experience complication-free labor and childbirth.
- Verbalize understanding of care requirements to promote health of self and infant.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Childbirth Preparation: Providing information and support to facilitate childbirth and to enhance the ability of an individual to develop and perform the parental role

Prenatal Care: Provision of healthcare during the course of pregnancy

Attachment Promotion: Facilitating the development of an effective, enduring relationship between infant and parent

NURSING PRIORITY NO. 1 To determine causative factors and individual needs:

During Pregnancy

-  Determine maternal health/nutritional status, usual pregravid weight, and dietary pattern. *Research studies have found a positive correlation between pregravid maternal obesity and increased perinatal morbidity rates (e.g., hypertension and gestational diabetes) associated with preterm births and macrosomia.*¹⁶
-  Note use of alcohol/other drugs, nicotine. *Maternal pregnancy complications and negative effects on the developing fetus are increased with the use of tobacco, alcohol, and illicit drugs. Smoking negatively affects placental circulation; even smoking fewer than 10 cigarettes/day is associated with an increased risk of fetal death, damage in utero, abruptio placenta, placenta previa, and low birth weights.*^{4,8,13–15,20} *Note: Prescription medications may also be dangerous to the fetus, requiring a risk/benefit analysis for therapeutic choices and appropriate dosage.*¹²
- Evaluate current knowledge regarding physiological and psychological changes associated with pregnancy. *Provides information to assist in identifying needs and creating individual plan of care.*^{2,3}
- Identify involvement/response of child's father to pregnancy. *Helps clarify whether or not father is likely to be supportive or has the potential of posing a threat to the safety and well-being of mother/fetus.*¹⁹
- Determine family stressors, economic situation/financial needs, and availability/use of resources to identify necessary referrals. *Impact of pregnancy on family with limited resources can create added stress and result in limited prenatal care and preparation for newborn.*^{1,2}
-  Verify environmental well-being and safety of client/family. *Women experiencing intimate partner violence both prior to and/or during pregnancy are at higher risk for multiple poor maternal and infant health outcomes.*^{18,19}
-  Determine cultural expectations/beliefs about childbearing, self-care, and so on. Identify who provides support/instruction within the client's culture (e.g., grandmother/other family member, cuerandero/doula, other cultural healer). Work with support person(s) as desired by client, using an interpreter as needed. *Helps ensure quality and continuity of care because support person(s) can reinforce information provided.*^{1,2,4}
- Ascertain client's commitments to work, family, and self; roles/responsibilities within family unit; and use of supportive resources. *Helps in setting realistic priorities to assist client in making adjustments, such as*

changing work hours, shifting of household chores, curtailing some outside commitments.^{12,17} *Note: Initially, even if the pregnancy is planned, the expectant mother may feel ambivalence toward the pregnancy because of personal or professional goals, financial concerns, and/or possible role changes.*^{1,2}

-  Determine client's/couple's perception of fetus as a separate entity and extent of preparations being made for this infant. *Absence of activities such as choosing a name or nicknaming the baby in utero and home preparations indicate lack of completion of psychological tasks of pregnancy. Note: Cultural or familial beliefs may limit visible preparations out of concern that bad outcome might result.*²

During Labor and Delivery

- Ascertain client's understanding and expectations of the labor process and who will participate/provide support.
-   Determine presence/appropriateness of birth plan developed by client/couple and any associated cultural expectations/preferences. *Identifies areas to address to ensure that choices made are amenable to the specific care setting, reflect reality of client/fetal status, and accommodate individual wishes. Note: Some cultures or personal values may limit male involvement in the delivery process, necessitating the identification of other support person(s).*^{1,6,10}

After Birth

- Determine plan for discharge after delivery and home-care support/needs. *Important to facilitate discharge and ensure client/infant needs will be met.*³
- Appraise level of parent's understanding of physiological needs and adaptation to extrauterine life associated with maintenance of body temperature, nutrition, respiratory needs, and bowel and bladder functioning. *Identifies areas of concern/need requiring development of teaching plan and/or demonstration of care activities.*^{3,12}
- Assess mother's strengths and needs, noting age, relationship status, and reactions of family members. *Identifies potential risk factors that influence the client's/couple's ability to assume role of parenthood. For example, an adolescent still formulating goals and identity may have difficulty accepting the infant as a person. The single parent who lacks support systems may have difficulty assuming sole responsibility for parenting.*^{1,6}
- Ascertain nature of emotional and physical parenting that client/couple received during their childhood. *Parenting role is learned, and individuals use their own parents as role models. Those who experienced a negative upbringing or poor parenting may require additional support to meet the challenges of effective parenting.*

NURSING PRIORITY NO. 2 To promote optimal maternal well-being:

During Pregnancy

- Emphasize importance of maternal well-being including discussion of nutrition, regular moderate exercise, comfort measures, rest, and sexual activity. *Fetal well-being is directly related to maternal health, especially during the first trimester, when developing organ systems are most vulnerable to injury from environmental or hereditary factors:*

 Review nutrition requirements and optimal prenatal weight gain to support maternal-fetal needs. *Dietary focus should be on balanced nutrients and calories to produce appropriate weight gain and to supply vitamins and minerals for healthy fetus. Inadequate prenatal weight gain and/or below normal prepregnancy weight increases the risk of intrauterine growth retardation in the fetus and delivery of a low-birth-weight infant.*^{8,12}

Encourage moderate exercise such as walking, or non-weight-bearing activities (e.g., swimming, bicycling) in accordance with client's physical condition and cultural beliefs. *Nonendurance antepartal exercise tends to shorten labor, increases likelihood of a spontaneous vaginal delivery, and decreases need for oxytocin augmentation.*^{4,5} *In some cultures, inactivity may be viewed as a protection for the mother.*^{1,6}

Recommend a consistent sleep and rest schedule (e.g., 1- to 2-hour daytime nap and 8 hours of sleep each night) in a dark, comfortable room. *Provides rest to meet metabolic needs associated with growth of maternal and fetal tissues.*¹²

-  Provide necessary referrals (e.g., dietitian, social services, supplemental nutrition assistance programs including the Women, Infants, and Children [WIC] program) as indicated. *May need additional assistance with*

*nutritional choices and may have budget or financial constraints. Supplemental federal/state food programs help promote optimal maternal, fetal, and infant nutrition.*¹²

-  Encourage participation in a smoking-cessation program and alcohol/drug abstinence as appropriate. *Reduces risk of premature birth, stillbirth, low birth weight, congenital defects, drug withdrawal of newborn, and fetal alcohol syndrome.*¹⁴
-  Explain psychological reactions, including ambivalence, introspection, stress reactions, and emotional lability, as being characteristic of pregnancy. *Helps client/couple understand mood swings and may provide opportunity for partner to offer support and affection at these times.*⁴ *Note: However, the stressors associated with pregnancy may lead to abuse/exacerbate existing abusive behavior.*^{18,19}
- Discuss personal situation and options, providing information about resources available to client. *Partner may be upset about an unplanned pregnancy, financial concern regarding supporting the child, or even jealousy that attention is shifting to the unborn child, creating safety issues for client/family.*¹⁹
- Identify reportable potential danger signals of pregnancy, such as bleeding, cramping, acute abdominal pain, backache, edema, visual disturbances, headaches, and pelvic pressure. *Helps client distinguish normal from abnormal findings, thus assisting her in seeking timely, appropriate healthcare.*¹² (Refer to ND risk for disturbed Maternal-Fetal Dyad for additional interventions.)

During Labor and Delivery

- Monitor labor progress and maternal and fetal well-being per protocol. Provide continuous intrapartal professional support/doula. *Fear of abandonment can intensify as labor progresses. The client may experience increased anxiety and/or loss of control when left unattended. Doulas can provide client with emotional, physical, and informational support as an adjunct to primary nurse.*^{2,8}
- Identify client's support person/coach and ascertain that the individual is providing support the client requires. *Coach may be client's husband/significant other (SO) or doula, and he or she needs to include physical and emotional support for the mother and aid in initiation of bonding with the neonate.*⁴

After Birth

- Promote sleep and rest. *Reduces metabolic rate and allows energy and oxygen to be used for healing process.*¹²
- Ascertain client's perception of labor and delivery, length of labor, and client's fatigue level. *There is a correlation between length of labor and the ability of some clients to assume responsibility for self-care/infant care tasks and activities.*
- Assess client's readiness for learning. Assist client in identifying needs. *The postpartum period provides an opportunity to foster maternal growth, maturation, and competence. However, the client needs time to move from "taking-in" to a "taking-hold" phase, in which her receptiveness and readiness are heightened and she is emotionally and physically ready for learning new information to facilitate mastery of her new role.*⁴
- Provide information about self-care, including perineal care and hygiene; physiological changes, including normal progression of lochial flow; need for sleep and rest; importance of progressive postpartum exercise program; and role changes. *Helps prevent infection, fosters healing and recuperation, and contributes to positive adaptation to physical and emotional changes, enhancing feelings of general well-being.*¹²
- Review nipple and breast care, special dietary needs for lactating mother, factors that facilitate or interfere with successful breastfeeding, use of breast pump and appropriate suppliers, and proper storage of expressed milk. *Prevents nipple cracking and soreness, enhancing comfort, facilitates role of breastfeeding mother, and helps ensure adequate milk supply.*⁸
- Discuss normal psychological changes and needs associated with the postpartal period. *Client's emotional state may be somewhat labile at this time and often is influenced by physical well-being. Anticipating such changes may reduce the stress associated with this transition period that necessitates learning new roles and taking on new responsibilities.*^{4,8,12}
- Discuss sexuality needs and plans for contraception. Provide information about available methods, including advantages/disadvantages. *Client/couple may need clarification regarding available contraception methods and the fact that pregnancy could occur even prior to the 4- to 6-week postpartum visit.*⁸

-  Reinforce importance of postpartum examination by healthcare provider and interim follow-up as appropriate. *Follow-up visit is necessary to evaluate recovery of reproductive organs, healing of episiotomy/laceration repair, general well-being, and adaptation to life changes.*¹²

NURSING PRIORITY NO. 3 To promote appropriate participation in childbearing process:

During Pregnancy

-  Develop nurse-client relationship, maintaining an open attitude toward beliefs of client/couple. *Acceptance is important to developing and maintaining relationship and supporting independence.*²
-  Explain office visit routine and rationale for ongoing screening and close monitoring (e.g., urine testing, blood pressure monitoring, weight, fetal growth). Emphasize importance of keeping regular appointments. *Reinforces relationship between health assessment and positive outcomes for mother and baby.*¹²
- Suggest father/siblings attend office visits and listen to fetal heart tones as appropriate. *Promotes a sense of involvement and helps make baby a reality for family members.*
- Provide anticipatory guidance regarding health habits/lifestyle and employment concerns:
Review physical changes to be expected during each trimester. *Questions will continue to arise as new changes occur; regardless of whether changes are anticipated or unexpected, and knowledge of normal variations can be reassuring. Also prepares client/couple for managing common discomforts associated with pregnancy.*^{4,12}
- Discuss signs/symptoms requiring evaluation by primary provider during prenatal period (e.g., excessive vomiting, fever, unresolved illness of any kind, decreased fetal movement). *Allows for timely intervention.*¹²
- Identify anticipatory adaptations for SO/family necessitated by pregnancy. *Family members will need to be flexible in adjusting own roles and responsibilities in order to assist client to meet her needs related to the demands of pregnancy, both expected and unplanned, such as prolonged nausea, fatigue, and emotional lability.*¹²
-  Provide information about potential teratogens, such as alcohol, nicotine, illicit drugs, the STORCH group of viruses (syphilis, toxoplasmosis, other, rubella, cytomegalovirus, herpes simplex), and HIV. *Helps client make informed decisions/choices about behaviors/environment that can promote healthy offspring. Note: Research supports the attribution of a wide range of negative effects in the neonate from alcohol and recreational drug use and smoking.*^{4,8,13–15}
-  Provide information about need for additional laboratory studies and diagnostic tests or procedure(s). Review risks and potential side effects. *Aids in making informed decisions and choosing treatment options.*^{8,12}
- Discuss signs of labor onset; how to distinguish between false and true labor, when to notify healthcare provider, and when to leave for birth center/hospital as appropriate; and stages of labor and delivery. *Helps ensure timely arrival and enhances coping with labor/delivery process.*¹²
- Determine anticipated infant feeding plan. Discuss physiology and benefits of breastfeeding. *Breastfeeding provides a protective effect against respiratory illnesses, ear infections, gastrointestinal diseases, and allergies, including asthma, eczema, and atopic dermatitis.*⁹
- Encourage attendance at prenatal and childbirth classes. Provide information about father/sibling or grandparent participation in classes and delivery if client desires. *Knowledge gained helps reduce fear of unknown and increases confidence that client/couple can manage the preparation for the birth of their child. Helps family members to realize they are an integral part of the pregnancy and delivery.*^{11,12}

During Labor and Delivery

- Support use of positive coping mechanisms. *Enhances feelings of competence and fosters self-esteem.*¹²
- Demonstrate behaviors and techniques (e.g., breathing, focused imagery, music, other distractions; aromatherapy; abdominal effleurage, back or leg rubs, sacral pressure, repositioning, back rest; oral care, linen changes, shower/tub use) that partner can use to assist with pain control and relaxation. *Enhances feeling of well-being. May block pain impulses within the cerebral cortex through conditioned responses and cutaneous stimulation, facilitating progression of normal labor.*⁴

-  Discuss available analgesics, appropriate timing, usual responses and side effects (client and fetal), and duration of analgesia effect in light of current situation. *Allows client to make informed choices about means of pain control and can allay client's fears and anxieties about medication use. Note: If conservative measures are not effective and increasing muscle tension impedes progress of labor, judicious use of medication can enhance relaxation, shorten labor, limit fatigue, and prevent complications.*⁴
-  Honor client's decision about the use or nonuse of medication in a nonjudgmental manner. Continue encouragement for efforts and use of relaxation techniques. *Enhances client's sense of control and may prevent or reduce need for medication. Note: Continued support may be needed to help reduce feelings of failure in the client/couple who may have anticipated an unmedicated birth and did not follow through with that plan.*¹²

After Birth

- Monitor and document the client's/couple's interactions with infant. *Presence of bonding/acquaintance behaviors (e.g., making eye contact, using high-pitched voice and en face [face-to-face] position as culturally appropriate, calling infant by name, holding infant closely) are indicators of beginning the attachment process.*^{2,12}
- Initiate early breast or oral feeding according to facility protocol and client preference. *Initiating feeding for breastfed infants usually occurs in the delivery room; otherwise, 5 to 15 mL of sterile water may be offered in the nursery to assess effectiveness of sucking, swallowing, gag reflexes, and patency of esophagus. If aspirated, sterile water is easily absorbed by pulmonary tissues.*^{7,9}
- Provide for unlimited participation of father and siblings. *Ascertain whether siblings attended orientation program. Facilitates family development and ongoing process of acquaintance/attachment and helps family members feel more comfortable caring for newborn.*

NURSING PRIORITY NO. 4 To promote optimal well-being of newborn (Teaching/Discharge Considerations):

-  Provide information about newborn interactional capabilities, states of consciousness, and means of stimulating cognitive development. *Helps parents recognize and respond to infant cues during interactional process and fosters optimal interaction, attachment behaviors, and cognitive development in infant. The state of consciousness can be divided into the sleep and the wake states, involving separate predictable behavioral characteristics.*¹²
- Note father's/partner's response to birth and to parenting role. *Client's ability to adapt positively to parenting may be strongly influenced by partner's reaction.*
- Discuss normal variations and characteristics of infant, such as caput succedaneum, cephalohematoma, pseudo-menstruation, breast enlargement, physiological jaundice, and milia. *Helps parents recognize normal variations and may reduce anxiety.*^{4,12}
- Demonstrate/supervise infant care activities related to feeding and holding; bathing, diapering, and clothing; care of umbilical cord stump; and care of circumcised male infant. *Promotes understanding of principles and techniques of newborn care, fosters parents' skills as caregivers, and enhances self-confidence.*^{3,12}
- Note frequency, amount, and length of feeding. Encourage demand feedings instead of scheduled feedings. Note frequency, amount, and appearance of regurgitation. *Hunger and length of time between feedings vary from feeding to feeding, and excessive regurgitation increases replacement needs.*^{7,9}
- Evaluate neonate and maternal satisfaction following feedings. *Provides opportunity to answer client questions, offer encouragement for efforts, identify needs, and problem-solve situations.*^{7,9}
- Discuss physiological needs and adaptation to extrauterine life, including maintenance of body temperature, nutritional requirements, respiratory needs, and bowel and bladder functioning. *Enhances parents' ability to provide for neonates' well-being.*^{3,12}
-  Emphasize newborn's need for follow-up laboratory tests, regular evaluations by healthcare provider, and timely immunizations. *Ongoing evaluation is important for monitoring growth and achievement of development milestones. Immunizations are necessary to protect the infant from childhood diseases and associated serious complications.*¹²

- Identify manifestations of illness and infection and when to contact healthcare provider. Demonstrate proper technique for taking temperature, administering oral medication, or providing other care activities for infant as required. *Early recognition of illness and prompt use of healthcare facilitate timely treatment and positive outcomes.*¹²
-  Provide oral and written/pictorial information and reliable Web sites about infant care and development, feeding, and safety issues. Offer appropriate resources in client's dominant language reflecting cultural beliefs. *Maximizes learning, providing opportunity to review information as needed to engage in new caretaking role, identify necessary supplies/safety needs, and prepare for feeding method of choice.*^{8,12}
-  Refer breastfeeding client to lactation consultant/support group (e.g., La Leche League, Lact-Aid) as appropriate. *Provides ongoing support to promote a successful breastfeeding outcome.*^{7,9}
-  Discuss available community support groups/parenting class as indicated. *Increases parents' knowledge of child rearing and child development and provides a supportive atmosphere while parents incorporate new roles.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, general health, previous pregnancy experience, any safety concerns.
- Knowledge of pre/postpartum needs and newborn care.
- Cultural beliefs and expectations.
- Specific birth plan and individuals to be involved in delivery.
- Arrangement for postpartum period and preparation for newborn.

Planning

- Plan of care and who is involved in planning.
- Individual teaching plans for pregnancy, labor/delivery, postpartum self-care, and infant care.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

readiness for enhanced Childbearing Process

Taxonomy II: Sexuality—Class 3 Reproduction (00208) [Diagnostic Division: Sexuality]. Approved 2008; Revised 2013

DEFINITION: A pattern of preparing for and maintaining a healthy pregnancy, childbirth process, and care of the newborn for ensuring well-being, which can be strengthened.

DEFINING CHARACTERISTICS

During Pregnancy

Subjective

Expresses desire to enhance prenatal lifestyle [e.g., nutrition, elimination, sleep, exercise, personal hygiene]
 Expresses desire to enhance knowledge of childbearing process
 Expresses desire to enhance management of unpleasant pregnancy symptoms
 Expresses desire to enhance preparation for newborn

During Labor and Delivery

Subjective

Expresses desire to enhance lifestyle appropriate for stage of labor
 Expresses desire to enhance proactivity during labor and delivery

After Birth

Subjective

Expresses desire to enhance attachment behavior, baby care/feeding techniques, environmental safety for the baby
 Expresses desire to enhance postpartum lifestyle, breast care
 Expresses desire to enhance use of support system

Sample Clinical Applications: First, second, and third trimesters of pregnancy; labor and delivery; postpartum; newborn

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Pregnancy: Extent of understanding conveyed about promotion of a healthy pregnancy and prevention of complications

Knowledge: Labor & Delivery: Extent of understanding conveyed about labor and vaginal delivery

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Client Will (Include Specific Time Frame)

- Demonstrate healthy pregnancy free of preventable complications.
- Engage in activities to prepare for birth process and care of newborn.
- Experience complication-free labor and childbirth.
- Display culturally appropriate bonding behaviors.
- Verbalize understanding of care requirements to promote health of self and infant.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Childbirth Preparation: Providing information and support to facilitate childbirth and to enhance the ability of an individual to develop and perform the parental role

Postpartal Care: Providing care to a woman during the 6-week time period beginning immediately after birth

Parent Education: Infant: Instruction on nurturing and physical care needed during the first year of life

NURSING PRIORITY NO. 1 To determine individual needs:

During Pregnancy

-  Evaluate current knowledge and cultural beliefs regarding normal physiological and psychological changes of pregnancy, as well as beliefs about activities, self-care, and so on. *Provides information to assist in identifying needs and creating individual plan of care.*^{2,3}
- Determine degree of motivation for learning. *Client may have difficulty learning unless the need for it is clear.*³
-  Identify who provides support/instruction within the client's culture (e.g., grandmother, other family member, curandero or doula, other cultural healer). Work with support person(s) when possible, using interpreter as needed. *Helps ensure quality and continuity of care because support person(s) may be more successful than the healthcare provider in communicating information.*^{1,2,4}
- Determine client's commitments to work, family, community, and self; roles and responsibilities within family unit; and use of supportive resources. *Helps in setting realistic priorities to assist client in making adjustments, such as changing work hours, shifting of household chores and responsibilities, prioritizing and curtailing some outside commitments, etc.*^{12,17}
- Evaluate the client's/couple's response to pregnancy, individual and family stressors, and cultural implications of pregnancy and childbirth. *The client's/couple's ability to adapt positively depends on support systems, cultural beliefs, resources, and effective coping mechanisms developed in dealing with past stressors. Initially, even if the pregnancy is planned, the expectant mother may feel ambivalent toward the pregnancy because of personal or professional goals, financial concerns, and possible role changes that a child will necessitate.*^{1,2}
-  Determine client's/couple's perception of fetus as a separate entity and extent of preparations being made for this infant. *Activities such as choosing a name or nicknaming the baby in utero and home preparations indicate completion of psychological tasks of pregnancy. Note: Cultural or familial beliefs may limit visible preparations out of concern that bad outcome may result.*²
- Assess economic situation and financial needs. Note use of available resources. *Impact of pregnancy on family with limited resources can create added stress and result in limited prenatal care and preparation for newborn.*
- Determine usual pregravid weight and dietary patterns. *Research studies have found a positive correlation between pregravid maternal obesity and increased perinatal morbidity rates (e.g., hypertension and gestational diabetes) associated with preterm births and macrosomia.*¹⁶

During Labor and Delivery

- Ascertain client's understanding and expectations of the labor process. *The client's/couple's coping skills are most challenged during the active and transition phases as contractions become increasingly intense. Lack of knowledge, misconceptions, or unrealistic expectations can have a negative impact on coping abilities.*
-  Review birth plan developed by client/partner. Note cultural expectations/preferences. *Verifies that choices made are amenable to the specific care setting, accommodate individual wishes, and reflect client/fetal status. Note: Some cultures or personal values may limit male involvement in the delivery process, necessitating the identification of other support person(s).*^{1,6,10}

After Birth

- Determine plan for discharge after delivery and home care support and needs. *Early planning can facilitate discharge and help ensure that client/infant needs will be met.*³
- Ascertain client's perception of labor and delivery, length of labor, and client's fatigue level. *There is a correlation between length of labor and the ability of some clients to assume responsibility for self-care/infant care tasks and activities.*
-  Assess mother's strengths and needs, noting age, marital status or relationship, presence and reaction of siblings and other family, available sources of support, and cultural background. *Identifies potential risk factors and sources of support, which influence the client's/couple's ability to assume role of parenthood. For example, the adolescent may still be formulating goals and an identity. She may have difficulty accepting the infant as a person and coping with full-time parenting responsibility. The single parent who lacks support systems may have difficulty assuming sole responsibility for parenting. Cultures in which the extended family members live together may provide more emotional and physical support, facilitating adoption of the new role.*^{1,6}
- Appraise level of parents' understanding of infant's physiological needs and adaptation to extrauterine life associated with maintenance of body temperature, nutrition, respiratory needs, and bowel and bladder functioning. *Identifies areas of concern/need, which could require additional information and/or demonstration of care activities.*^{3,12}
- Evaluate nature of emotional and physical parenting that client/couple received during their childhood. *Parenting role is learned, and individuals use their own parents as role models. Those who experienced a negative upbringing or poor parenting may require additional support to meet the challenges of effective parenting.*
- Note father's/partner's response to birth and to parenting role. *Client's ability to adapt positively to parenting may be strongly influenced by the father's/partner's reaction.*
- Assess client's readiness and motivation for learning. Assist client/couple in identifying needs. *The postpartal period provides an opportunity to foster maternal growth, maturation, and competence. However, the client needs time to move from a "taking-in" to a "taking-hold" phase, in which her receptiveness and readiness are heightened and she is emotionally and physically ready for learning new information to facilitate mastery of her new role.*⁴

NURSING PRIORITY NO. 2 To promote maximum participation in childbearing process:

During Pregnancy

- Maintain open attitude toward beliefs of client/couple. *Acceptance is important to developing and maintaining relationship and supporting independence.*²
-  Explain office visit routine and rationale for ongoing screening and close monitoring (e.g., urine testing, blood pressure monitoring, weight, fetal growth). Emphasize importance of keeping regular appointments. *Reinforces relationship between health assessment and positive outcome for mother/baby.*¹²
- Suggest father/siblings attend prenatal office visits and listen to fetal heart tones as appropriate. *Promotes a sense of involvement and helps make baby a reality for family members.*
-  Provide information about need for additional laboratory studies and diagnostic tests or procedure(s). Review risks and potential side effects. *Aids in making informed decisions.*^{8,12}
-  Discuss any medications that may be needed to control or treat medical conditions. *Helpful in choosing treatment options because need must be weighed against possible harmful effects on the fetus.*¹²

- Provide anticipatory guidance, including discussion of nutrition, regular moderate exercise, comfort measures, rest, employment, breast care, sexual activity, and health habits and lifestyle. *Information encourages acceptance of responsibility and promotes self-care:*

Review nutrition requirements and optimal prenatal weight gain to support maternal-fetal needs. *Dietary focus should be on balanced nutrients and calories to produce appropriate weight gain and to supply adequate vitamins and minerals for healthy fetus. Inadequate prenatal weight gain and/or below normal prepregnancy weight increases the risk of intrauterine growth restriction in the fetus and delivery of a low-birth-weight infant.*^{8,12}

 Encourage moderate exercise such as walking or non-weight-bearing activities (e.g., swimming, bicycling) in accordance with client's physical condition and cultural beliefs. *Nonendurance, antepartal exercise regimens tend to shorten labor; increase likelihood of a spontaneous vaginal delivery, and decrease need for oxytocin augmentation.*^{4,5} *In some cultures, inactivity may be viewed as a protection for mother/child.*^{1,6}

Recommend a consistent sleep and rest schedule (e.g., 1- to 2-hour daytime nap and 8 hours of sleep each night) in a dark, cool room. *Provides rest to meet metabolic needs associated with growth of maternal/fetal tissues.*¹²

Identify anticipatory adaptations for significant other (SO)/family necessitated by pregnancy. *Family members will need to be flexible in adjusting own roles and responsibilities in order to assist client to meet her needs related to the demands of pregnancy, both expected and unplanned, such as prolonged nausea, fatigue, and emotional lability.*¹²

 Provide or reinforce information about potential teratogens, such as alcohol, nicotine, illicit drugs, the STORCH group of viruses (syphilis, toxoplasmosis, other, rubella, cytomegalovirus, herpes simplex), and HIV. *Helps client make informed decisions and choices about behaviors and environment that can promote healthy offspring. Note: Research supports the fact that alcohol and recreational drug use can lead to a wide range of negative effects in the neonate. Smoking negatively affects placental circulation; even smoking fewer than 10 cigarettes per day is associated with an increased risk of fetal death, damage in utero, abruptio placentae, placenta previa, and low birth weight.*^{4,8,13–15}

- Use various methods for learning, including pictures, to discuss fetal development. *Visualization enhances reality of child and strengthens learning process.*⁴
- Discuss signs of labor onset; how to distinguish between false and true labor, when to notify healthcare provider, and when to leave for hospital or birth center; and stages of labor and delivery. *Helps client to recognize onset of labor, to ensure timely arrival, and to cope with labor and delivery process.*¹²
-  Review signs/symptoms requiring evaluation by primary provider during prenatal period (e.g., excessive vomiting, fever, unresolved illness of any kind, decreased fetal movement). *Allows for timely intervention.*¹²

During Labor and Delivery

- Identify client's support person/coach and ascertain that the individual is providing support that client requires. *Coach may be client's husband/SO or doula, and support can take the form of physical and emotional support for the mother and aid in initiation of bonding with the neonate.*⁴
- Demonstrate or review behaviors and techniques (e.g., breathing, focused imagery, music, other distraction; aromatherapy; abdominal effleurage, back and leg rubs, sacral pressure, repositioning, back rest; oral and perineal care, linen changes; shower or hot tub use) partner can use to assist with pain control and relaxation. *Enhances feeling of well-being. May block pain impulses within the cerebral cortex through conditioned responses and cutaneous stimulation, facilitating progression of normal labor.*⁴
-  Discuss available analgesics, usual responses and side effects (client and fetal), and duration of analgesic effect in light of current situation. *Allows client to make informed choice about means of pain control and can allay client's fears or anxieties about medication use. Note: If conservative measures are not effective and increasing muscle tension impedes progress of labor, judicious use of medication can enhance relaxation, shorten labor, limit fatigue, and prevent complications.*⁴
- Support client's decision about the use or nonuse of medication in a nonjudgmental manner. Continue encouragement for efforts and use of relaxation techniques. *Enhances client sense of control and may prevent or*

*decrease need for medication. Note: Continued support may be needed to help reduce feelings of failure in the client/couple who may have anticipated an unmedicated birth and did not follow through with that plan.*¹²

After Birth

- Initiate early breastfeeding or oral feeding according to hospital protocol. *Initial feeding for breastfed infants usually occurs in the delivery room. Otherwise, 5 to 15 mL of sterile water may be offered in the nursery to assess effectiveness of sucking, swallowing, gag reflexes, and patency of esophagus. If aspirated, sterile water is easily absorbed by pulmonary tissues.*^{7,9}
- Note frequency and amount and length of feedings. Encourage demand feedings instead of “scheduled” feedings. *Hunger and length of time between feedings vary from feeding to feeding.*^{7,9} Note frequency, amount, and appearance of regurgitation. *Excessive regurgitation increases feeding needs.*
- Evaluate neonate/maternal satisfaction following feedings. *Provides opportunity to answer client questions, offer encouragement for efforts, identify needs, and problem-solve solutions.*^{7,9}
- Demonstrate and supervise infant care activities related to feeding and holding; bathing, diapering, and clothing; care of circumcised male infant; and care of umbilical cord stump. Provide written and pictorial information for parents to refer to after discharge. *Promotes understanding of principles and techniques of newborn care and fosters parents’ skills as caregivers.*^{3,12}
- Provide information about newborn interactional capabilities, states of consciousness, and means of stimulating cognitive development. *Helps parents recognize and respond to infant cues during interactional process and fosters optimal interaction, attachment behaviors, and cognitive development in infant. The state of consciousness can be divided into the sleep and the wake states, involving separate and predictable behavioral characteristics.*¹²
- Promote sleep and rest. *Reduces metabolic rate and allows nutrition and oxygen to be used for healing process rather than for energy needs.*¹²
- Provide for unlimited participation for father and siblings. Ascertain whether siblings attended an orientation program. *Facilitates family development and ongoing process of acquaintance and attachment. Helps family members feel comfortable caring for newborn.*
- Monitor and document the client’s/couple’s interactions with infant. Note presence of bonding (acquaintance) behaviors (e.g., making eye contact, using high-pitched voice and en face [face-to-face] position as culturally appropriate, calling infant by name, holding infant closely).^{2,12}

NURSING PRIORITY NO. 3 To enhance optimal well-being:

During Pregnancy

- Emphasize importance of maternal well-being. *Fetal well-being is directly related to maternal well-being, especially during the first trimester, when developing organ systems are most vulnerable to injury from environmental or hereditary factors.*
- Review physical changes to be expected during each trimester. *Questions will continue to arise as new changes occur, regardless of whether changes are expected or unexpected, and knowledge of “what’s normal” can be reassuring. Also prepares client/couple for managing common discomforts associated with pregnancy.*^{4,12}
- Explain psychological reactions, including ambivalence, introspection, stress reactions, and emotional lability, as being characteristic of pregnancy. *Helps client/couple understand mood swings and may provide opportunities for partner to offer support/affection at these times.*⁴
-  Provide necessary referrals (e.g., dietitian, social services, Supplemental Nutrition Assistance Program (SNAP) or the Women, Infants, and Children [WIC] food program) as indicated. *May need additional assistance with nutritional choices and may have budget or financial constraints. Supplemental federally funded food program helps promote optimal maternal, fetal, and infant nutrition.*¹²
-  Identify reportable danger signals of pregnancy, such as bleeding, cramping, acute abdominal pain, backache, edema, visual disturbance, headaches, and pelvic pressure. *Helps client to distinguish normal from abnormal findings, thus assisting her in seeking timely, appropriate healthcare.*¹²

- Encourage attendance at prenatal and childbirth classes. Provide information about father/sibling or grandparent participation in classes and delivery as client desires. *Knowledge gained helps reduce fear of unknown and increases confidence that couple can manage the preparation for the birth of their child. Helps family members to realize they are an integral part of the pregnancy and delivery.*^{11,12}
- Provide list of appropriate reading materials for client, couple, and siblings regarding adjusting to newborn. *Information helps individual realistically analyze changes in family structure, roles, and behaviors.*³

During Labor and Delivery

- Monitor labor progress and maternal and fetal well-being per protocol. Provide continuous intrapartal professional support or a doula. *Fear of abandonment can intensify as labor progresses. The client may experience increased anxiety and/or loss of control when left unattended. Doulas can provide client with emotional, physical, and informational support as an adjunct to primary nurse.*^{2,8}
- Reinforce use of positive coping mechanisms. *Enhances feelings of competence and fosters self-esteem.*¹²

After Birth

- Provide information about self-care, including perineal care and hygiene; physiological changes, including normal progression of lochial discharge; need for sleep and rest; importance of progressive postpartal exercise program; and role changes. *Helps prevent infection, fosters healing and recuperation, and contributes to positive adaptation to physical and emotional changes enhancing feelings of general well-being.*¹²
- Review normal psychological changes and needs associated with the postpartal period. *Client's emotional state may be somewhat labile at this time and often is influenced by physical well-being. Anticipating such changes may reduce the stress associated with this transition period that necessitates learning new roles and taking on new responsibilities.*^{4,8,12}
- Discuss sexuality needs and plans for contraception. Provide information about available methods, including advantages and disadvantages. *Couple may need clarification regarding available contraceptive methods and the fact that pregnancy could occur even prior to the 4- to 6-week postpartum visit.*⁸
-  Reinforce importance of postpartal examination by healthcare provider and interim follow-up as appropriate. *Follow-up visit is necessary to evaluate recovery of reproductive organs, healing of episiotomy or laceration repair, general well-being, and adaptation to life changes.*¹²
- Provide oral and written information about infant care and development, feeding, and safety issues. Offer appropriate references. Elicit cultural beliefs. *Helps prepare for new caretaking role, acquiring necessary items of furniture, clothing, and supplies; helps prepare for breastfeeding and/or bottle feeding.*^{8,12}
- Discuss physiology and benefits of breastfeeding, nipple and breast care, special dietary needs, factors that facilitate or interfere with successful breastfeeding, and use of breast pump and appropriate suppliers. *Helps ensure adequate milk supply, prevents nipple cracking and soreness, facilitates comfort, and establishes role of breastfeeding mother.*⁸
-  Refer client to support groups (e.g., La Leche League International, Lact-Aid) or a lactation consultant. *Provides ongoing help to promote a successful breastfeeding outcome.*^{7,9}
-  Identify available community resources as indicated (e.g., WIC program). *WIC and other federal programs support well-being through client education and enhanced nutritional intake for infant.*¹²
- Discuss normal variations and characteristics of infant, such as caput succedaneum, cephalohematoma, pseudo-menstruation, breast enlargement, physiological jaundice, and milia. *Helps parents to recognize normal variations and may reduce anxiety.*^{4,12}
-  Emphasize newborn's need for follow-up evaluation by healthcare provider and timely immunizations. *Ongoing evaluation is important for monitoring growth and development. Immunizations are necessary to protect the infant from childhood diseases with associated serious complications.*¹²
-  Identify manifestations of illness and infection and when a healthcare provider should be contacted. Demonstrate proper technique for taking temperature, administering oral medications, or providing other care activities as required. *Early recognition of illness and prompt use of healthcare facilitate treatment and positive outcome.*¹²
-  Refer client/couple to community postpartal parent groups. *Increases parents' knowledge of child rearing and child development and provides supportive atmosphere while parents incorporate new roles.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, general health, previous pregnancy experience.
- Cultural beliefs and expectations.
- Specific birth plan and individuals to be involved in delivery.
- Arrangements for postpartal recovery period.
- Response to newborn.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

risk for ineffective Childbearing Process

Taxonomy II: Sexuality—Class 3 Reproduction (00227) [**Diagnostic Division:** Sexuality]. Approved 2010; Revised 2013, 2017

DEFINITION: Susceptible to an inability to prepare for and/or maintain a healthy pregnancy, childbirth process, and care of the newborn for ensuring well-being.

RISK FACTORS

Insufficient knowledge of childbearing process; unrealistic birth plan

Inconsistent prenatal health visits; insufficient prenatal care

Inadequate maternal nutrition

Insufficient parental role model/cognitive readiness for parenting

Substance misuse/[abuse]; domestic violence

Insufficient support system

Low maternal confidence; maternal powerlessness or psychological distress

Associated Condition: Unplanned or unwanted pregnancy

Sample Clinical Applications: First, second, and third trimester of pregnancy; labor and delivery, postpartum, newborn

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Prenatal Health Behavior: Personal actions to promote a healthy pregnancy and a healthy newborn

Maternal Status: Antepartum/Intrapartum/Postpartum [specify]: Extent to which maternal well-being is within normal limits from conception to the onset of labor/from onset of labor to delivery/from delivery of placenta to completion of involution

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Client Will (Include Specific Time Frame)

- Acknowledge and address individual risk factors.
- Demonstrate healthy pregnancy free of preventable complications.
- Engage in activities to prepare for birth process and care of newborn.
- Experience complication-free labor and childbirth.
- Verbalize understanding of care requirements to promote health of self and infant.

Refer to ND ineffective Childbearing Process for Interventions and Documentation Focus.

impaired Comfort

Taxonomy II: Comfort—Class 1 Physical Comfort/Class 2 Environmental Comfort/Class 3 Social Comfort (00214)
[Diagnostic Division: Pain/Discomfort], Approved 2008; Revised 2010, 2017

DEFINITION: Perceived lack of ease, relief and transcendence in physical, psychospiritual, environmental, cultural, and/or social dimensions.

RELATED FACTORS

Insufficient environmental or situational control
Insufficient privacy
Noxious environmental stimuli
Insufficient resources (e.g., financial, social, knowledge)

DEFINING CHARACTERISTICS

Subjective

Distressing symptoms; feeling of hunger, discomfort; itching; feeling cold, warm
Alteration in sleep pattern, inability to relax
Anxiety, fear; uneasy in situation

Objective

Restlessness; irritability; sighing; moaning; crying
Associated Condition: Illness-related symptoms; treatment regimen
Sample Clinical Applications: Presence of chronic physical or psychological conditions

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Symptom Control: Personal actions to minimize perceived adverse changes in physical and emotional functioning

Comfort Status: Overall physical, psychospiritual, sociocultural, and environmental ease and safety of an individual

Quality of Life: Extent of positive perception of current life circumstances

Client Will (Include Specific Time Frame)

Engage in behaviors or lifestyle changes to increase level of ease.
Verbalize sense of comfort and contentment.
Participate in desirable and realistic health-seeking behaviors.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Environmental Management: Comfort: Manipulation of the patient's surroundings for promotion of optimal comfort

Relaxation Therapy: Use of techniques to encourage and elicit relaxation for the purpose of decreasing undesirable signs and symptoms such as pain, muscle tension, or anxiety

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

NURSING PRIORITY NO. 1 To assess etiology/precipitating contributory factors:

- Determine the type of discomfort client is experiencing, such as physical pain; feeling of discontent; lack of ease with self, environment, or sociocultural settings; or inability to rise above one's problems or pain (lack of transcendence). Have client rate total comfort using a 0–10 scale, with 10 being as comfortable as possible, or a “general comfort” questionnaire using a Likert-type scale. *A comfort scale is similar to a pain rating scale and can help client identify focus of discomfort (e.g., physical, emotional, social, etc.).*^{1,5,10}
-  Note cultural or religious beliefs and values that impact perceptions and expectations of comfort.
- Ascertain locus of control. *Presence of external locus of control may hamper efforts to achieve sense of peace or contentment.*
- Discuss concerns with client and active-listen to identify underlying issues (e.g., physical and/or emotional stressors; external factors such as environmental surroundings, social interactions) that could impact client's ability to control own well-being. *Helps to determine client's specific needs and ability to change own situation.*
- Establish context(s) in which lack of comfort is realized: physical—pertaining to bodily sensations; psychospiritual—pertaining to internal awareness of self and meaning in one's life, relationship to a higher order or being; environmental—pertaining to external surroundings, conditions, and influences; sociocultural—pertaining to interpersonal, family, and societal relationships.¹

Physical

- Determine how client is managing pain and pain components. *Lack of control may be related to other issues or emotions such as fear, loneliness, anxiety, noxious stimuli, and anger.*¹
- Ascertain what has been tried or is required for comfort or rest (e.g., head of bed up or down, music on or off, white noise, rocking motion, certain person or thing; ability to express and/or manage conflicts).²

Psychospiritual

- Determine how psychological and spiritual indicators overlap (e.g., meaningfulness, faith, identity, self-esteem) for client.¹
- Ascertain if client/significant other (SO) desires support regarding spiritual enrichment, including prayer, meditation, or access to spiritual counselor of choice.³

Environmental

- Determine that client's environment respects privacy and provides natural lighting and readily accessible view to outdoors—*an aspect that can be manipulated to enhance comfort.*^{1,3}

Sociocultural

- Ascertain meaning of comfort in context of interpersonal, family, and cultural values and societal relationships.^{4,10}
- Validate client/SO understanding of client's situation and ongoing methods of managing condition, as appropriate and/or desired by client. *Considers client/family needs in this area and shows appreciation for their desires.*⁴

NURSING PRIORITY NO. 2 To assist client to alleviate discomfort:

- Review knowledge base and note coping skills that have been used previously to change behavior and promote well-being. *Brings these to client's awareness and promotes use in current situation.*⁸
- Acknowledge client's strengths in present situation and build on those strengths in planning for future.

Physical

-  Collaborate in treating and managing medical conditions involving oxygenation, elimination, mobility, cognitive abilities, electrolyte balance, thermoregulation, and hydration, *to promote physical stability.*^{2,5,6}
- Work with client to prevent pain, nausea, itching, thirst, and other physical discomforts.
-  Review medications or treatment regimen *to determine possible changes or options to reduce side effects.*
-  Suggest parent be present during procedures *to comfort child.*
-  Provide age-appropriate comfort measures (e.g., back rub, change of position, cuddling, use of heat or cold) *to provide nonpharmacological pain management.*

-  Discuss interventions and activities to promote ease, such as Therapeutic Touch, massage, healing touch, biofeedback, self-hypnosis, guided imagery, breathing exercises, play therapy, and humor, *to promote relaxation and refocus attention. Note: In recent years, a number of studies have documented emotional and physical health benefits that come from touch. This research is suggesting that touch is truly fundamental to human communication, bonding, and health.*^{9,11}
-  Assist client to use and modify medication regimen *to make best use of pharmacological pain or symptom management.*
- Assist client/SO(s) to develop plan for activity and exercise within individual ability emphasizing necessity of allowing sufficient time to finish activities.
- Maintain open and flexible visitation with client's desired persons.
- Encourage and plan care to allow individually adequate rest periods *to prevent fatigue.* Schedule activities for periods when client has the most energy *to maximize participation.*
- Discuss routines to promote restful sleep.

Psychospiritual

- Interact with client in therapeutic manner. *The nurse could be the most important comfort intervention for meeting client's needs. For example, assuring client that nausea can be treated successfully with both pharmacological and nonpharmacological methods may be more effective than simply administering antiemetic without reassurance and comforting presence.*⁷
- Encourage verbalization of feelings and make time for listening and interacting.
- Identify ways (e.g., meditation, sharing oneself with others, being out in nature or garden, other spiritual activities) to achieve connectedness or harmony with self, others, nature, and/or a higher power.
- Establish realistic activity goals with client. *Enhances commitment to promoting optimal outcomes.*
- Involve client/SO(s) in schedule planning and decisions about timing and spacing of treatments *to promote relaxation and reduce sense of boredom.*
- Encourage client to do whatever possible (e.g., self-care, sit up in chair, walk). *Enhances self-esteem and independence.*
- Use distraction with music, chatting, texting with family/friends, watching TV or videos, or playing computer games *to limit dwelling on negatives and to transcend unpleasant sensations and situations.*
- Encourage client to make use of beneficial coping behaviors and develop assertiveness skills, prioritizing goals and activities. *Promotes sense of control and improves self-esteem.*
- Offer or identify opportunities for client to participate in experiences that enhance control and independence.

Environmental

- Provide quiet environment and calm activities.
- Provide for periodic changes in the personal surroundings when client is confined. Use the individual's input in creating the changes (e.g., seasonal bulletin boards, color changes, rearranging furniture, pictures).
- Suggest activities, such as bird feeders or baths for bird-watching, a garden in a window box or terrarium, or a fishbowl or aquarium, *to stimulate observation as well as involvement and participation in an activity.*

Sociocultural

-  Encourage age-appropriate diversional activities (e.g., TV, radio, computer games, playtime, socialization or outings with others).
- Avoid overstimulation or understimulation (cognitive and sensory).
-  Make appropriate referrals to available support groups, hobby clubs, and service organizations.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide information about condition, health risk factors, or concerns in desired format (e.g., pictures, TV programs, articles, handouts, audio/visual materials; classes, group discussions, Internet Web sites, other databases) as appropriate. *Use of multiple modalities enhances acquisition and retention of information and gives client choices for accessing and applying information.*

Physical

- Promote overall health measures (e.g., nutrition, adequate fluid intake, appropriate vitamin or iron supplementation).
-  Discuss potential complications and possible need for medical follow-up or alternative therapies. *Timely recognition and intervention can promote wellness.*
- Assist client/SO(s) to identify and acquire necessary equipment (e.g., lifts, commode chair, safety grab bars, personal hygiene supplies) to meet individual needs.

Psychospiritual

-  Collaborate with others when client expresses interest in lessons, counseling, coaching, and/or mentoring *to meet or enhance emotional and spiritual comfort.*
- Encourage client's contributions toward meeting realistic goals.
- Recommend client take time to be introspective in the search for contentment or transcendence.

Environmental

-   Create a compassionate supportive and therapeutic environment incorporating client's cultural, age, and developmental factors.
- Correct environmental hazards that could influence safety and negatively affect comfort.
- Arrange for home visit and evaluation as needed.
- Discuss long-term plan for taking care of environmental needs.

Sociocultural

-  Advocate for growth-promoting environment in conflict situations and consider issues from client/family and cultural perspective.
-  Identify resources or referrals (e.g., knowledge and skills, financial resources and assistance; personal or psychological support group; social activities).

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including client's description of current status or situation, and factors impacting sense of comfort.
- Pertinent cultural or religious beliefs and values.
- Medication use and nonpharmacological measures.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

readiness for enhanced Comfort

Taxonomy II: Comfort—Class 1 Physical Comfort/Class 2 Environmental Comfort/Class 3 Social Comfort (00183)
[Diagnostic Division: Pain/Discomfort], Approved 2006; Revised 2013, 2017

DEFINITION: A pattern of ease, relief, and transcendence in physical, psychospiritual, environmental, or social dimensions, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance comfort or feeling of contentment

Expresses desire to enhance relaxation

Expresses desire to enhance resolution of complaints

Sample Clinical Applications: Presence of chronic physical or psychological conditions, or any individual seeking improved quality of life

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Comfort Status: Overall physical, psychospiritual, sociocultural, and environmental ease and safety of an individual

Personal Well-Being: Extent of positive perception of one's health status

Quality of Life: Extent of positive perception of current life circumstances

Client Will (Include Specific Time Frame)

- Verbalize sense of comfort or contentment.
- Demonstrate behaviors of optimal level of ease.
- Participate in desirable and realistic health-seeking behaviors.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Self-Modification Assistance: Reinforcement of self-directed change initiated by the patient to achieve personally important goals

Relaxation Therapy: Use of techniques to encourage and elicit relaxation for the purpose of decreasing undesirable signs and symptoms such as pain, muscle tension, or anxiety

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

NURSING PRIORITY NO. 1 To determine current level of comfort/motivation for growth:

- Determine the type of comfort client is experiencing: (1) relief—as from pain, (2) ease—a state of calm or contentment, or (3) transcendence—a state in which one rises above one’s problems or pain.¹
-  Note cultural or religious beliefs and values that impact perceptions of comfort.
- Ascertain motivation and expectations for improvement. *Motivation to improve and high expectations can encourage client to make changes that will improve his or her life. However, presence of external locus of control or unrealistic expectations may hamper efforts.*
- Discuss concerns with client and active-listen to identify underlying issues (e.g., physical or emotional stressors; external factors such as environmental surroundings, social interactions) that could impact client’s ability to control own well-being. *Helps to determine client’s level of satisfaction with current situation and readiness for change.*
- Establish context(s) in which comfort is realized: (1) physical—pertaining to bodily sensations; (2) psychospiritual—pertaining to internal awareness of self and meaning in one’s life; relationship to a higher order or being; (3) environmental—pertaining to external surroundings, conditions, and influences; or (4) sociocultural—pertaining to interpersonal, family, and societal relationships.¹

Physical

- Verify that client is managing pain and pain components effectively. *Success in this arena usually addresses other issues or emotions (e.g., fear, loneliness, anxiety, noxious stimuli, anger).¹*
- Ascertain what is used or required for comfort or rest (e.g., head of bed up or down, music on or off, white noise, rocking motion, certain person or thing, ability to express and/or manage conflicts).²

Psychospiritual

- Determine how psychological and spiritual indicators overlap (e.g., meaningfulness, faith, identity, self-esteem) for client in enhancing comfort.¹
- Ascertain that client/significant other (SO) has received desired support regarding spiritual enrichment, including prayer, meditation, or access to spiritual counselor of choice.³

Environmental

- Determine that client’s environment respects privacy and provides natural lighting and readily accessible view to outdoors—*an aspect that can be manipulated to enhance comfort.*^{1,3}

Sociocultural

- Ascertain meaning of comfort in context of interpersonal, family, and cultural values and societal relationships.⁴
- Validate client/SO understanding of client’s situation and ongoing methods of managing condition, as appropriate or desired by client. *Considers client/family needs in this area and shows appreciation for their desires.*⁴

NURSING PRIORITY NO. 2 To assist client in developing plan to improve comfort:

- Review knowledge base and note coping skills that have been used previously to change behavior and promote well-being. *Brings these to client’s awareness and promotes use in current situation.*⁸
- Acknowledge client’s strengths in present situation that can be used to build on in planning for future.

Physical

-  Collaborate in treating or managing medical conditions involving oxygenation, elimination, mobility, cognitive abilities, electrolyte balance, thermoregulation, and hydration *to promote physical stability.*^{2,5,6}
- Work with client to prevent pain, nausea, itching, thirst, and other physical discomforts.
-  Suggest parent be present during procedures *to comfort child.*
-  Suggest age-appropriate comfort measures (e.g., back rub, change of position, cuddling, use of heat or cold) *to provide nonpharmacological pain management.*
-  Participate in interventions and age-appropriate activities, such as Therapeutic Touch, biofeedback, self-hypnosis, guided imagery, breathing exercises, play therapy, and humor, *that promote ease and relaxation and can refocus attention.*

-  Assist client to use or modify medication regimen *to make best use of pharmacological pain management.*
- Assist client/SO(s) to develop or modify plan for activity and exercise within individual ability, emphasizing necessity of allowing sufficient time to finish activities.
- Maintain open and flexible visitation with client's desired persons.
- Encourage and plan care to allow individually adequate rest periods *to prevent fatigue.* Encourage client to schedule activities for periods when he/she has the most energy *to maximize effectiveness.*
- Discuss routines to promote restful sleep.

Psychospiritual

- Interact with client in therapeutic manner. *The nurse could be the most important comfort intervention for meeting client's needs. For example, assuring client that nausea can be treated successfully with both pharmacological and nonpharmacological methods may be more effective than simply administering an antiemetic without reassurance and comforting presence.*⁷
- Encourage verbalization of feelings and make time for active-listening and interacting.
- Identify ways (e.g., meditation, sharing oneself with others, being out in nature or garden, other spiritual activities) *to achieve connectedness or harmony with self, others, nature, or a higher power.*
- Establish realistic activity goals with client. *Enhances commitment to promoting optimal outcomes.*
- Involve client/SO(s) in schedule planning and decisions about timing and spacing of treatments *to promote relaxation and desire for involvement in plan.*
- Encourage client to do whatever possible (e.g., self-care, sit up in chair, walk). *Enhances self-esteem and independence.*
-  Use age-appropriate distraction with music, chatting or texting with family/friends, watching TV, and playing video or computer games *to limit dwelling on negatives and to transcend unpleasant sensations and situations.*
- Encourage client to make use of beneficial coping behaviors and assertiveness skills, prioritizing goals and activities. *Promotes sense of control and improves self-esteem.*
- Offer and identify opportunities for client to participate in experiences that enhance control and independence.

Environmental

- Provide quiet environment and calm activities.
- Provide for periodic changes in the personal surroundings when client is confined. Use the individual's input in creating the changes (e.g., seasonal bulletin boards, color changes, rearranging furniture, pictures).
- Suggest activities, such as bird-watching, planting a garden in a window box or terrarium, or populating a fish-bowl or aquarium, *to stimulate observation as well as involvement and participation in activity.*

Sociocultural

-  Encourage age-appropriate diversional activities (e.g., TV, radio, playtime, socialization or outings with others).
- Avoid overstimulation or understimulation (cognitive and sensory).
-  Make appropriate referrals to available support groups, hobby clubs, or service organizations.

NURSING PRIORITY NO. 3 To promote optimum wellness (Teaching/Discharge Considerations):

-  Provide information about condition, health risk factors, or concerns in desired format (e.g., pictures, TV programs, articles, handouts, audio/visual materials, classes, group discussions, Web sites, other databases), as appropriate. *Use of multiple modalities enhances acquisition and retention of information and gives client choices for accessing and applying information.*

Physical

- Promote overall health measures (e.g., nutrition, adequate fluid intake, appropriate vitamin and iron supplementation).
-  Discuss potential complications and possible need for medical follow-up or alternative therapies. *Timely recognition and intervention can promote wellness.*

- Assist client/SO(s) to identify and acquire necessary equipment (e.g., lifts, commode chair, safety grab bars, personal hygiene supplies) to meet individual needs.

Psychospiritual

-  Collaborate with others when client expresses interest in lessons, counseling, coaching, or mentoring to meet or enhance emotional and spiritual comfort.
- Promote client's contributions toward meeting realistic goals.
- Encourage client to take time to be introspective in the search for contentment or transcendence.

Environmental

-  Promote a compassionate, supportive, and therapeutic environment that incorporates client's cultural, age, and developmental factors.
- Review environmental hazards that could influence safety or negatively affect comfort.
- Arrange for home visit and evaluation, as needed.
- Discuss long-term plan for taking care of environmental needs.

Sociocultural

- Advocate for growth-promoting environment in conflict situations and consider issues from client/family and cultural perspective.
- Support client/SO access to resources (e.g., knowledge and skills, financial resources or assistance, personal or psychological support, social systems).

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including client's description of current status or situation.
- Motivation and expectations for change.
- Pertinent cultural or religious beliefs and values.
- Medication use and nonpharmacological measures.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

impaired verbal Communication

Taxonomy II: Perception/Cognition—Class 5 Communication (00051) [**Diagnostic Division:** Social Interaction], Approved 1983; Revised 1996, 1998, 2017

DEFINITION: Decreased, delayed, or absent ability to receive, process, transmit, and/or use a system of symbols.

RELATED FACTORS

Alteration in self-concept; low self-esteem

Cultural incongruence

Emotional disturbance; low self-esteem; vulnerability

Insufficient information or stimuli

DEFINING CHARACTERISTICS

Objective

Absence of eye contact; difficulty in selective attending; partial or total visual deficit

Difficulty comprehending or maintaining communication

Difficulty expressing thoughts verbally [e.g., aphasia, dysphasia, apraxia, dyslexia]

Difficulty forming sentences or words [e.g., aphonia, dyslalia, dysarthria]

Difficulty in use of body or facial expressions; inability to use body or facial expressions

Difficulty speaking/verbalizing; stuttering; slurred speech

Inability to speak; inability to speak language of caregiver

Inappropriate verbalization [e.g., incessant, loose association of ideas; flight of ideas]

At Risk Population: Absence of significant other

Associated Condition: Alteration in development; alteration in perception; central nervous system impairment, physiological condition; oropharyngeal defect; physical barrier; treatment regimen

Sample Clinical Applications: Brain injury or stroke, facial trauma, head or neck cancer, radical neck surgery, laryngectomy, cleft lip/palate, dementia, Tourette's syndrome, autism, schizophrenia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Communication: Reception, interpretation, and expression of spoken, written, and nonverbal messages

Communication: Expressive: Expression of meaningful verbal and/or nonverbal messages

Information Processing: Ability to acquire, organize, and use information

Client Will (Include Specific Time Frame)

- Verbalize or indicate an understanding of the communication difficulty and plans for ways of handling.
- Establish method of communication in which needs can be expressed.
- Participate in therapeutic communication (e.g., using silence, acceptance, restating, reflecting, active-listening, and "I" messages).
- Demonstrate congruent verbal and nonverbal communication.
- Use resources appropriately.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Communication Enhancement: Speech Deficit: Use of strategies augmenting communication capabilities for a person with impaired speech

Communication Enhancement: Hearing Deficit: Use of strategies augmenting communication capabilities for a person with diminished hearing

Active Listening: Attending closely to and attaching significance to a patient's verbal and nonverbal messages

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify physiological or neurological conditions impacting speech, such as severe shortness of breath, cleft palate, facial trauma, neuromuscular weakness, stroke, brain tumors or infections, dementia, brain trauma, deafness/impaired hearing.
-  Review results of diagnostic studies (e.g., speech, language, and hearing evaluations, neurological testing or brain function studies—such as electroencephalogram, computed tomography scan, psychological evaluations) *to assess and delineate underlying conditions affecting verbal communication.*
- Note new onset or diagnosis of deficits that will progress or permanently affect speech.
- Note presence of physical barriers, including tracheostomy/intubation and wired jaws, or problem resulting in failure of voice production or “problem voice” (*pitch, loudness, or quality calls attention to voice rather than what speaker is saying, as might occur with electronic voice box or “talking valves” when tracheostomy in place*).^{7,8}
-  Determine age and developmental considerations when performing verbal examination, noting: (1) child too young for language or has developmental delays affecting speech and language skills or comprehension; (2) autism or other mental impairments; and (3) older client doesn't or isn't able to speak, verbalizes with difficulty, or has difficulty hearing or comprehending language or concepts. (The verbal examination should be adapted to the patient's communication skills and should use clear and concrete language, structure, reassurance, and support.)¹⁻³
- Obtain history of hearing and speech-related pathophysiology or trauma (e.g., cleft lip/palate, traumatic brain injury, shaken baby syndrome, frequent ear infections affecting hearing, sensorineural changes associated with aging).
-  Identify dominant language spoken. *Knowing the client's primary language and fluency in other languages is important to communication. For example, while some individuals may seem to be fluent in conversational English, they may still have limited understanding, especially the language of health professionals, and have difficulty answering questions, describing symptoms, or following directions.*^{3,6,16}
-  Ascertain whether client is recent immigrant, country of origin, and what cultural, ethnic group client identifies as own (e.g., *recent immigrant may identify with home country and its people, beliefs, and healthcare practices*).^{6,16}
-  Determine cultural factors affecting communication, such as beliefs concerning touch, eye contact, gestures, and verbal communications. *Certain cultures may prohibit client from speaking directly to healthcare provider; in some cultures, such as Native American, Appalachian, or African American, direct eye contact may be interpreted as disrespectful, impolite, an invasion of privacy, or aggressive. Those from other cultures may shout and gesture when excited.*⁵ *Silence and tone of voice have various meanings, and slang words can cause confusion or misunderstandings.*⁵
- Identify environmental barriers, such as recent or chronic exposure to hazardous noise in home, job, recreation, or healthcare setting (e.g., rock music, jackhammer, snowmobile, lawn mower, truck traffic or busy highway, heavy equipment, medical equipment). *Noise not only affects hearing but also increases blood pressure and breathing rate, can have negative cardiovascular effects, disturbs digestion, increases fatigue, causes irritability, and reduces attention to tasks.*⁹
- Investigate client reports of problems such as constantly raising voice to be heard, can't hear someone 2 feet away, conversation in room sounds muffled or dull, too much energy required to listen, or pain or ringing in ears after exposure to noise.⁹

- Determine if client with communication impairment has a speech or language problem or both. *When a speech problem is present, the language code can be correct, but words might be garbled, person may stutter, or there may be problems with voice. Language and speech problems can exist together or by themselves. Language is a code made up of rules (e.g., what words mean, how to make new words, how to combine words, what combinations work in what situations). When a person cannot understand the language code, there is a receptive problem.*¹⁰
- Determine presence of psychological or emotional barriers, such as history or presence of psychiatric conditions (e.g., bipolar disorder, schizoid or affective behavior); high level of anxiety, frustration, or fear; and presence of angry, hostile behavior. Note effect on speech and communication.^{1,4}
- Identify information barriers, such as lack of knowledge or misunderstanding of terms related to client's medical conditions, procedures, treatments, and equipment.⁴
- Assess level of understanding in a sensitive manner. *Individual may be reluctant to say he or she doesn't understand or may be embarrassed to ask for help. Head nodding and smiles do not always mean comprehension.*

NURSING PRIORITY NO. 2 To assist client to establish a means of communication to express needs, wants, ideas, and questions:

- Ascertain that you have client's attention before communicating.
- Establish rapport with client, initiate eye contact, shake hands, address by preferred name, meet family members present, ask simple questions, smile, and engage in brief social conversation if appropriate. *Helps establish a trusting relationship with client/family, demonstrating caring about the client as a person.*^{2-4,18}
- Advise other care providers of client's communication deficits (e.g., deafness, aphasia, mechanical ventilation strategies) and needed means of communication (e.g., writing pad, signing, yes/no responses, gestures, picture board) *to minimize client's frustration and promote understanding.*¹⁹
- Provide and encourage use of glasses, hearing aids, dentures, and electronic speech devices as needed *to maximize sensory perception and improve speech patterns.*^{2,4}
- Maintain a calm, unhurried manner and sit at client's eye level if possible. Provide sufficient time for client to respond. *Sitting down conveys that nurse has time and interest in communicating.*
- Pay attention to speaker. Be an active listener.
- ∞ Begin conversation with elderly individual with casual and familiar topics (e.g., weather, happenings with family members) *to convey interest and stimulate conversation and reminiscence.*^{2,14}
- Reduce environmental distractions and background noise (e.g., close the door, turn down the radio or television).^{14,20,21}
- Refrain from shouting when directing speech to a confused, deaf, or hearing-impaired client. Speak slowly and clearly, pitching voice low *to increase likelihood of being understood.*^{2,15,20,21}
- Be honest and let the speaker know when you have difficulty understanding. Repeat part of message that you do understand *so speaker does not have to repeat entire message.*¹¹
- Clarify type and special features of aphasia, when present. *Aphasia is a temporary, permanent, or progressive impairment of language affecting production or comprehension of speech and the ability to read or write. Some people with aphasia have problems primarily with expressive language (what is said), while others have problems with receptive language (what is understood). Aphasia can also be global (person understands almost nothing that is said and says little or nothing).*^{4,11}
- Note diagnosis of apraxia (impairment in carrying out purposeful movements affecting rhythm and timing of speech), dysarthria (language code can be correct but the right body parts do not move at the right time to produce the right message), or dementia (defect is in decline in mental functions, including memory, attention, intellect, and personality) *to help clarify individual needs, appropriate interventions.*^{11,12}
- Determine meaning of words used by the client and congruency of communication and nonverbal messages.
- Evaluate the meaning of words that are used/needed to describe aspects of healthcare (e.g., pain) and ascertain how to communicate important concepts.⁵

- Observe body language, eye movements, and behavioral clues. *For example, client may react with tears, grimacing, stiff posture, turning away, or angry outbursts when pain present.*¹³
- Use confrontation skills, when appropriate, within an established nurse-client relationship to clarify discrepancies between verbal and nonverbal cues.^{4,15}
- Point to objects or demonstrate desired actions when client has difficulty with language. *Speaker's own body language and gestures can be used to assist client's understanding.*
- Validate meaning of nonverbal communication; do not make assumptions *because they may be wrong.* Be honest; if you do not understand, seek assistance from others.¹⁸
- Work with confused, brain-injured, mentally disabled, or sensory-deprived client to correctly interpret his or her environment. Establish understanding and convey to others meaning of symbolic speech to reduce frustration. Teach basic signs such as “eat,” “toilet,” “more,” and “finished” to communicate basic needs.^{4,15}
- Provide reality orientation by responding with simple, straightforward, honest statements. Associate words with objects using repetition and redundancy to improve communication patterns.^{2,4,15}
- Assess psychological response to communication impairment and willingness to find alternative means of communication.
-  Identify family member who can speak for client and who is the family decision maker regarding health-care decisions.^{5,16}
- Note significant other's (SO's)/parents'/caregiver's speech patterns and interactive manner of communicating with client, including gestures.²⁰
-  Obtain interpreter with language or signing abilities and preferably with medical knowledge when needed. *Federal law mandates that interpretation services be made available. A trained, professional interpreter who translates precisely and possesses a basic understanding of medical terminology and healthcare ethics is preferred (over a family member) to enhance client and provider interactions.*⁶
- Evaluate ability to read and write, as well as musculoskeletal status, including manual dexterity (e.g., ability to hold a pen and write), and the need or desire for pictures or written communications and instructions as part of treatment plan.
- Plan for and provide alternative methods of communication.^{2-4,17,22}
Provide pad and pencil or a slate board *when client is able to write but cannot speak.*
 Use letter or picture board *when client can't write and picture concepts are understandable to both parties.*
*Note: Studies show that visual aids may improve the accuracy of medication assessment and may be especially beneficial for clients with communication barriers.*²²
Establish hand or eye signals *when client can understand language but cannot speak or has physical barrier to writing.*
Remove isolation mask *when client is deaf and reads lips.*
Obtain or provide access to typewriter or computer *if communication impairment is long-standing or client is used to this method.*
- Consider form of communication when placing IV. *IV positioned in hand or wrist may limit ability to write or sign.*
- Answer call bell promptly. Anticipate needs and avoid leaving client alone with no way to summon assistance. *Reduces fear, conveys caring to client, and protects nurse from problems associated with failure to provide due care.*⁴
-  Refer for appropriate therapies and support services. *Client and family may have multiple needs (e.g., sources for further examinations and rehabilitation services, local community or national support groups and services for disabled, financial assistance with obtaining necessary aids for improving communication).*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Encourage family presence and use of touch. Involve them in plan of care as much as possible. *Enhances participation and commitment to plan, assists in normalizing family role patterns, and provides support and encouragement when learning new patterns of communicating.*⁴

- Review information about condition, prognosis, and treatment with client/SOs, reinforcing that loss of speech does not imply loss of intelligence.
- Teach client and family the needed techniques for communication, whether it be speech or language techniques or alternate modes of communicating. Encourage family to involve client in family activities using enhanced communication techniques. *Reduces stress of difficult situation and promotes earlier return to more normal life patterns.*⁴
- Assess family for possible role changes resulting from client's impairment. Discuss methods of dealing with impairment.
- Use and assist client/SO(s) to learn therapeutic communication skills of acknowledgment, active-listening, and "I" messages. *Improves general communication skills, emphasizes acceptance, and conveys respect.*
- Discuss ways to provide environmental stimuli as appropriate to maintain contact with reality or reduce environmental stimuli or noise. *Unwanted sound affects physical health, increases fatigue, reduces attention to tasks, and makes speech communication more difficult.*^{9,14}
-  Refer to appropriate resources (e.g., speech or language therapist, support groups [e.g., stroke club], individual/family and/or psychiatric counseling) to address long-term needs and enhance coping skills.
- Refer to NDs ineffective Coping, disabled family Coping, Anxiety, Fear for additional interventions.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, pertinent history information (i.e., physical, psychological, or cultural concerns).
- Meaning of nonverbal cues, level of anxiety client exhibits.

Planning

- Plan of care and specific interventions (e.g., type of alternative communication, translator).
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Discharge needs, referrals made, additional resources available.

readiness for enhanced Communication

Taxonomy II: Perception/Cognition—Class 5 Communication (00157) [Diagnostic Division: Teaching/Learning], Approved 2002; Revised 2013

DEFINITION: A pattern of exchanging information and ideas with others, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance communication

Sample Clinical Applications: Brain injury or stroke, head or neck cancer, facial trauma, cleft lip/palate, Tourette's syndrome, autism, foreign-born individual communicating in second language

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Communication: Reception, interpretation, and expression of spoken, written, and nonverbal messages

Communication: Expressive: Expression of meaningful verbal and/or nonverbal messages

Information Processing: Ability to acquire, organize, and use information

Client/SO/Caregiver Will (Include Specific Time Frame)

- Verbalize or indicate an understanding of the communication process.
- Identify ways to improve communication.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Communication Enhancement: Speech Deficit: Use of strategies augmenting communication capabilities for a person with impaired speech

Communication Enhancement: Hearing Deficit: Use of strategies augmenting communication capabilities for a person with diminished hearing

Active Listening: Attending closely to and attaching significance to a patient's verbal and nonverbal messages

NURSING PRIORITY NO. 1 To assess how client is managing communication and potential difficulties:

- Ascertain circumstances that result in client's desire to improve communication. *Many factors are involved in communication, and identifying specific needs and expectations helps in developing realistic goals and determining likelihood of success.*
- Ascertain motivation and expectations for change. *Motivation to improve and high expectations can encourage client to make changes that will improve his or her life. However, presence of external locus of control or unrealistic expectations may hamper efforts.*
- Evaluate mental status. *Disorientation, acute or chronic confusion, or psychotic conditions may be affecting speech and the communication of thoughts, needs, and desires.*
- Determine client's developmental level of speech and language comprehension. *Provides baseline information for developing plan for improvement.*
- Determine ability to read and write preferred language. *Evaluating grasp of language as well as musculoskeletal status, including manual dexterity (e.g., ability to hold a pen and write), provides information about nature of client's situation. Educational plan can address language skills. Neuromuscular deficits require individual physical or occupational therapeutic program to improve.*
-  Determine country of origin, dominant language, whether client is recent immigrant, and what cultural or ethnic group client identifies as own. *Recent immigrant may identify with home country and its people, language, beliefs, and healthcare practices, thus affecting desire to learn language skills and ability to improve interactions in new country.¹*
-  Ascertain if interpreter is needed or desired. *Law mandates that interpretation services be made available. A trained, professional interpreter who translates precisely and possesses a basic understanding of medical terminology and healthcare ethics is preferred over a family member to enhance client and provider interaction and sharing of information.¹*
- Determine comfort level in expression of feelings and concepts in nonproficient language. *Concern about language skills can impact perception of own ability to communicate effectively.*
- Note any physical challenges to effective communication (e.g., hearing impairment, talking tracheostomy apparatus, wired jaws) or physiological or neurological conditions (e.g., severe shortness of breath, neuromuscular weakness, stroke, brain trauma, deafness, cleft palate, facial trauma). *Client may be dealing with speech or language comprehension or have voice production problems (pitch, loudness, quality) that call attention to voice rather than what speaker is saying. These barriers may need to be addressed to enable client to improve communication skills.^{2,3}*
- Clarify meaning of words used by the client to describe important aspects of life and health or well-being (e.g., pain, sorrow, anxiety). *Words can easily be misinterpreted when sender and receiver have different ideas about their meanings. This can affect the way both client and caregivers communicate important concepts. Restating what one has heard can clarify whether an expressed statement has been understood or misinterpreted.⁴*
- Determine presence of emotional lability or frequency of unstable behaviors. *Emotional or psychiatric issues can affect communication and interfere with understanding.*
- Evaluate congruency of verbal and nonverbal messages. *Communication is enhanced when verbal and nonverbal messages are congruent.⁵*
- Determine lack of knowledge or misunderstanding of terms related to client's specific situation. *Indicators of need for additional information; clarification to help client improve ability to communicate.*
- Evaluate need or desire for pictures or written communications and instructions as part of treatment plan. *Alternative methods of communication can help client feel understood and promote feelings of satisfaction with interaction.*

NURSING PRIORITY NO. 2 To improve client's ability to communicate thoughts, needs, and ideas:

- Maintain a calm, unhurried manner. Provide sufficient time for client to respond. *An atmosphere in which client is free to speak without fear of criticism provides the opportunity to explore all the issues involved in making decisions to improve communication skills.¹⁰*

- Pay attention to speaker. Be an active listener. *The use of active-listening communicates acceptance and respect for the client, establishing trust, and promoting openness and honest expression. It communicates a belief that the client is a capable and competent person.*
- Sit down and maintain eye contact, preferably at the client's level, and spend time with the client. *Conveys message that the nurse has time and interest in communicating.*¹⁰
- Encourage client to express feelings and clarify meaning of nonverbal clues. *Client may be reluctant to share dissatisfaction with events.*
- Help client identify and learn to avoid use of nontherapeutic communication. *These barriers are recognized as detriments to open communication, and learning to avoid them maximizes the effectiveness of communication between client and others.*
- Obtain interpreter with language or signing abilities as needed. *May be needed to enhance understanding of words and language concepts to ascertain that interpretation of communication is accurate.*^{6,10}
- Encourage use of computer/tablet, pad and pencil, slate board, or letter or picture board when interacting or to interface in new situations, as indicated. *When client has physical impairments that interfere with spoken communication, alternative means can provide concepts that are understandable to both parties.*^{4,10}
- Obtain or provide access to voice-enabled computer. *Use of these devices may be more helpful when communication challenges are long-standing or when client is used to using them.*¹
-  Respect client's cultural communication needs. *Different cultures can dictate beliefs of what is normal or abnormal (i.e., in some cultures, eye-to-eye contact is considered disrespectful, impolite, or an invasion of privacy; silence and tone of voice have various meanings, and slang words can cause confusion).*⁴
- Provide or encourage use of glasses, hearing aids, dentures, or electronic speech devices, as needed. *These devices maximize sensory perception and can improve understanding and enhance speech patterns.*⁷
- Reduce distractions and background noises (e.g., close the door, turn down the radio or television). *A distracting environment can interfere with communication, limiting attention to tasks, and makes speech and communication more difficult. Reducing noise can help both parties hear clearly, improving understanding.*⁸
- Associate words with objects using gestures, repetition and redundancy, point to objects, or demonstrate desired actions. *Speaker's own body language can be used to enhance client's understanding when neurological conditions result in difficulty understanding language.*⁹
- Use confrontation skills carefully, when appropriate, and within an established nurse-client relationship. *Can be used to clarify discrepancies between verbal and nonverbal cues, enabling client to look at areas that may require change.*¹⁰

NURSING PRIORITY NO. 3 To promote optimum communication:

-  Discuss with family/significant other (SO) and other caregivers effective ways in which the client communicates. *Identifying positive aspects of current communication skills enables family members to learn and move forward in desire to enhance ways of interacting.*¹⁰
- Encourage client and family to familiarize themselves with and use new or developing communication technologies. *Enhances family relationships and promotes self-esteem for all members, as they are able to communicate regardless of problems (e.g., progressive neurological disorder) that could interfere with ability to interact.*¹⁰
- Reinforce client's/SO's learning and use of therapeutic communication skills of acknowledgment, active-listening, and "I" messages. *Improves general communication skills, emphasizes acceptance, and conveys respect, enabling family relationships to improve.*
-  Refer to appropriate resources (e.g., speech therapist, language classes, individual/family or psychiatric counseling). *May need further assistance to overcome challenges as family reaches toward desired goal of enhanced communication.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, pertinent history information (i.e., physical, psychological, or cultural concerns).
- Meaning of nonverbal cues, level of anxiety client exhibits.
- Motivation and expectations for change.

Planning

- Plan of care and specific interventions (e.g., type of alternative communication, translator).
- Teaching plan.

Implementation/Evaluation

- Progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs, referrals made, additional resources available.

acute Confusion

Taxonomy II: Perception/Cognition—Class 4 Cognition (00128) [**Diagnostic Division:** Neurosensory], Approved 1994; Revised 2006, 2017

DEFINITION: Reversible disturbances of consciousness, attention, cognition, and perception that develop over a short period of time, and which last less than 3 months

RELATED FACTORS

Alteration in sleep-wake cycle; pain
Dehydration; malnutrition
Impaired mobility; inappropriate use of restraints; sensory deprivation
Urinary retention

DEFINING CHARACTERISTICS

Subjective

Hallucinations [visual or auditory]

Objective

Agitation; restlessness

Alteration in cognitive functioning, or level of consciousness

Alteration in psychomotor functioning

Misperception

Inability to initiate goal-directed or purposeful behavior

Inability to follow through with goal-directed or purposeful behavior

Sample Clinical Applications: Brain injury or stroke, respiratory conditions with hypoxia, medication adverse reactions, drug or alcohol intoxication or withdrawal, hyperthermia, infectious processes, malnutrition, eating disorders, fluid and electrolyte imbalances, chemical exposure

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Delirium Level: Severity of disturbance in consciousness and cognition that develops over a short period of time and is reversible

Information Processing: Ability to acquire, organize, and use information

Distorted Thought Self-Control: Self-restraint of disruptions in perception, thought processes, and thought content

Client/Caregiver Will (Include Specific Time Frame)

- Regain and maintain usual reality orientation and level of consciousness.
- Verbalize understanding of causative factors when known.
- Initiate lifestyle or behavior changes to prevent or minimize recurrence of problem.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Delirium Management: Provision of a safe and therapeutic environment for the patient who is experiencing an acute confusional state

Reality Orientation: Promotion of patient's awareness of personal identity, time, and environment

Delusion Management: Promoting the comfort, safety, and reality orientation of a patient experiencing false, fixed beliefs that have little or no basis in reality

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Identify factors present, such as recent surgery or trauma; fluid and electrolyte imbalances; use of large numbers of medications (polypharmacy); intoxication with/withdrawal from a substance (e.g., prescription and over-the-counter [OTC] drugs; alcohol, illicit drugs); history or current seizure activity, episodes of fever, pain, presence of acute infection (especially occult urinary tract infection in elderly client); traumatic events; person with dementia experiencing sudden change in environment, unfamiliar surroundings or people). *Acute confusion is a symptom associated with numerous causes (e.g., hypoxia; metabolic/endocrine/neurological conditions, toxins; electrolyte abnormalities; systemic or central nervous system infections; nutritional deficiencies, acute psychiatric disorders). Note: Delirium due to physical illness is more frequent among the very young and the elderly. Delirium due to drug and alcohol intoxication or withdrawal is more common in persons aged mid-teens to late 30s. Studies show that delirium due to physical illness is more frequent among the very young and those older than 60 years. Delirium due to drug and alcohol intoxication or withdrawal is more common in persons aged mid-teens to late 30s.*^{2,11–13}

- Assess mental status. *Typical symptoms of delirium include anxiety, disorientation, tremors, hallucinations, delusions, and incoherence. Onset is usually sudden, developing over a few hours or days, and resolving over varying periods of time.*^{2,11}
- Evaluate vital signs. *Signs of poor tissue perfusion (i.e., hypotension, tachycardia, tachypnea, or fever) may identify underlying cardiovascular or infectious cause for mental status changes. Note: Clients with delirium frequently display elevated blood pressure because of adrenergic overload in the sympathetic nervous system. Heart rate can be either elevated or decreased (particularly in client on certain medications [e.g., beta blockers, calcium channel blockers]).*¹¹
-  Determine current medications and drug use (especially anti-anxiety agents, barbiturates, certain antipsychotic agents; methyl dopa, disulfiram, cocaine, alcohol, amphetamines, hallucinogens, opiates). *Use, misuse, overdose, and withdrawal of many drugs are associated with high risk of confusion and delirium.*^{1,11}
-  Investigate possibility of alcohol or illicit drug intoxication or withdrawal or prescription or OTC medication toxicity, side effects, or interactions. *Noncompliance with regimen, withdrawal from or overuse of substances, and certain drug combinations increase risk of toxic reactions and adverse reactions or interactions.*^{1,2,12}
- Evaluate for exacerbation of psychiatric conditions (e.g., mood disorder, dissociative disorders, dementia). *Identification of the presence of mental illness provides opportunity for correct treatment and medication.*^{10,11}
- Assess diet and nutritional status to identify possible deficiencies of essential nutrients and vitamins. *Failure to eat (forgetfulness or lack of food) can lead to deficiencies (e.g., vitamin B₁₂, folate, thiamine, iron) that could affect mental status.*^{2,11}
- Evaluate sleep and rest status, noting deprivation or oversleeping. *Discomfort, worry, and lack of sleep and rest can cause or exacerbate confusion. (Refer to ND Insomnia, disturbed Sleep Pattern as appropriate.)*
-  Monitor laboratory values (e.g., complete blood count, blood cultures; oxygen saturation and, in some cases, arterial blood gases with carbon monoxide; blood urea nitrogen and creatinine levels; electrolytes; thyroid function studies; liver function studies, ammonia levels; serum glucose; urinalysis for infection and drug analysis; specific drug toxicologies, drug levels [including peak and trough, as appropriate]).^{1-7,11}
-  Review results of diagnostic studies (e.g., delirium assessment tools, such as the Confusion Assessment Method, delirium index, Mini Mental State Examination, etc.; brain scans or imaging studies, electroencephalogram, lumbar puncture and cerebrospinal fluid studies). *Mental status instruments are helpful because they directly test the client's cognitive performance. However, performance is strongly affected by age, educational level, ethnicity, and language, and they may be difficult for the acutely ill client to perform.*^{5,11}

NURSING PRIORITY NO. 2 To determine degree of impairment:

- Talk with client/significant others (SOs) to determine client's physical, functional, cognitive, and behavioral baseline; observed changes; and onset and precipitator of changes *to understand and clarify the current situation.*¹
-  Collaborate with medical and psychiatric providers *to evaluate extent of impairment in orientation, attention span, ability to follow directions, send and receive communication, and appropriateness of response.*¹
- Note occurrence and timing of agitation, hallucinations, and violent behaviors (e.g., *delirium may occur as early as 1 or 2 days after last drink in an alcoholic; "sundowners syndrome" may occur in intensive care unit, with client oriented during daylight hours but confused during night.*)^{1,3,15}
- Determine threat to safety of client/others. *Delirium can cause client to become verbally and physically aggressive, resulting in behavior threatening to safety of self and others.*

NURSING PRIORITY NO. 3 To maximize level of function, prevent further deterioration:

-  Assist with treatment of underlying problem. *Interventions to establish and maintain normal fluid and electrolyte balance and oxygenation, treat infectious process or pain, detoxify from alcohol and other drugs, and provide psychological interventions can resolve or diminish confusion.*^{1-7,9,11,12,14}
-  Monitor and adjust medication regimen and note response. Determine which medications can be changed or eliminated when polypharmacy, side effects, or adverse reactions are determined to be associated with current condition.

- Implement helpful communication measures.^{1-7,9,11,14}
 Use short, simple sentences. Speak slowly and clearly.
 Call client by name and identify yourself at each contact.
 Tell client what you want done, not what to do.
 Orient client to surroundings, staff, and necessary activities as often as needed.
 Acknowledge client's fears and feelings. *Confusion can be very frightening, especially when client knows thinking is not normal.*
 Listen to what client says and try to identify message and emotion or need being communicated.
 Limit choices and decisions until client is able to make them.
 Give simple directions. Allow sufficient time for client to respond, communicate, and make decisions.
 Present reality concisely and briefly and avoid challenging illogical thinking. *Defensive reactions may result.*
 Refer to ND impaired verbal Communication for additional interventions.
- Manage environment, using the following measures.^{1-7,9-11,14,15}
 Provide undisturbed rest periods. Eliminate extraneous noise and stimuli. *Preventing overstimulation can help client relax and can result in reduced level of confusion.*
 Provide calm and comfortable environment with good lighting. Encourage client to use vision or hearing aids, when needed, *to reduce disorientation and discomfort from sensory overload or deprivation.*
 Observe client on regular basis, informing client of this schedule.
 + Provide adequate supervision (may need one-to-one during severe episode), remove harmful objects from environment, provide siderails and seizure precautions, place call bell and position needed items within reach, clear traffic paths, and ambulate with devices *to meet client's safety needs and reduce risk of falls.*
 Provide clear feedback on appropriate and inappropriate behavior.
 + Remove client from situation; provide time-out or seclusion, as indicated, *for protection of client/others.*
 Encourage family/SO(s) to participate in reorientation and provide ongoing normal life input (e.g., current news and family happenings). Provide normal levels of essential sensory and tactile stimulation—include personal items and pictures. *Client may respond positively to well-known person and familiar items.*
- Note behavior that may be indicative of potential for violence and take appropriate actions to prevent injury to client/caregiver. (Refer to ND risk for other-directed Violence.)
-  Administer medication cautiously to control restlessness, agitation, and hallucinations. *Depending on the cause of acute delirium, medications could include sedatives, neuroleptics, and antidotes. Sedation with conventional antipsychotic agents (e.g., haloperidol, lorazepam, droperidol) may be used, although many other agents may be tried, including electrolytes, glucose, vitamins, antibiotics, etc. (Note: Sedation should be avoided if it will interfere with, or cloud the results of, serial neurological examinations.)*^{2,5-7,11}
-  Assist with treatment of alcohol or drug intoxication and/or withdrawal, as indicated.^{11,12,14}
- Avoid or limit use of restraints. *May worsen agitation and increase likelihood of untoward complications including injury or death.*^{5,12,15}
-  Mobilize elderly client (especially after orthopedic injury) as soon as possible. *Older person with low level of activity prior to crisis is at particular risk for acute confusion and may fare better when out of bed.*^{4,14,15}
- Establish and maintain elimination patterns. *Disruption of elimination may be a cause for confusion, or changes in elimination may also be a symptom of acute confusion.*⁵
-  Consult with psychiatric clinical nurse specialist or psychiatrist for additional interventions related to disruptive behaviors, psychosis, and unresolved symptoms.
- Refer to ND [disturbed Sensory Perception (Specify)] for additional interventions.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Explain reason for confusion, if known. *Acute confusion usually subsides over time as client recovers from underlying cause or adjusts to situation, but it can be frightening to client/SO. Information about cause and treatment to improve condition may be helpful in managing sense of fear and powerlessness.*^{13,14}

- Educate SO/caregivers to monitor client at home for sudden change in cognition and behavior. *An acute change is a classic presentation of delirium and should be considered a medical emergency. Early intervention can often prevent long-term complications.*⁸
-  Discuss need for ongoing medical review of client's medications to limit possibility of misuse and/or potential for dangerous side effects or interactions. *Medications are frequent precipitants of acute confusion, especially in very young or old.*^{2,5,8,9}
- Emphasize importance of keeping vision and hearing aids in good repair and readily available to improve client's interpretation of environmental stimuli and communication.
-  Provide appropriate referrals. *Additional assistance may be required for client with confusion (e.g., cognitive retraining, substance abuse support groups, medication monitoring program, Meals on Wheels, home health, and adult day care).*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Nature, duration, frequency of problem.
- Current and previous level of function, effect on independence and lifestyle (including safety concerns).

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources and specific referrals.

chronic Confusion

Taxonomy II: Perception/Cognition—Class 4 Cognition (00129) [**Diagnostic Division:** Neurosensory], Approved 1994; Revised 2017

DEFINITION: Irreversible, progressive, insidious, and long-term alteration of intellect, behavior, and personality, manifested by impairment in cognitive functions (memory, speech, language, decision making, and executive function), and dependency in execution of daily activities.

DEFINING CHARACTERISTICS

Objective

Adequate alertness to surroundings
 Alteration in at least one cognitive function other than memory
 Alteration in behavior; personality, social functioning
 Alteration in short-term or long-term memory
 Inability to perform at least one daily activity
 Insidious and irreversible onset in cognitive impairment; long-term cognitive impairment; progressive impairment in cognitive functioning

Associated Condition: Cerebral vascular accident; dementia

Sample Clinical Applications: Brain injury or stroke, dementia/Alzheimer's disease, medication adverse reactions, drug or alcohol abuse, malnutrition, eating disorders, chemical exposure

DESIRED OUTCOME/EVALUATION CRITERIA

Sample **NOC** linkages:

Cognitive Orientation: Ability to identify person, place, and time accurately

Physical Injury Severity: Severity of signs and symptoms of injuries to the body

Client Will (Include Specific Time Frame)

- Maintain usual level of orientation.
- Remain safe and free from harm.

Sample **NOC** linkages:

Knowledge: Dementia Management: Extent of understanding conveyed about progressive dementia, its course over an extended period of time, and plan for supportive care as the disease progresses

Family/Significant Other (SO) Will (Include Specific Time Frame)

- Verbalize understanding of disease process and prognosis and client's needs.
- Identify and participate in interventions to deal effectively with situation.
- Provide for maximal independence while meeting safety needs of client.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Dementia Management: Provision of a modified environment for the patient who is experiencing a chronic confusional state

Calming Technique: Reducing anxiety in patient experiencing acute distress

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

NURSING PRIORITY NO. 1 To assess degree of impairment:

- Determine the underlying cause for chronic confusion, as noted in Related Factors. *Helps to sort out possible causes and likelihood for improvement, as well as helping to identify potentially useful interventions and therapies.*¹
-  Review and evaluate responses on diagnostic examinations (e.g., cognitive, functional capacity, behavior, memory impairments, reality orientation, attention span, quality of life). *A combination of tests (e.g., Confusion Assessment Method, Mini-Mental State Examination, Montreal Cognitive Assessment, Alzheimer's Disease Assessment Scale, Brief Dementia Severity Rating Scale, Neuropsychiatric Inventory, Functional Assessment Questionnaire, Clinical Global Impression of Change) is often needed to complete an evaluation of client's overall condition relating to chronic or irreversible condition. Note: Studies show that while a single screening test may identify cognitive decline and functional impairment, many tests serve different clinical and research functions. Therefore, clinical testing will continue to evolve.*^{2,3,7}
- Talk with SO(s) regarding baseline behaviors, length of time since onset or progression of problem, their perception of prognosis, and other pertinent information and concerns for client. *The client's SO/primary caregiver is an invaluable and essential source of information, regarding history and current situation, as both cognitive and behavioral symptoms tend to change over time and are often variable from day to day. If history reveals a gradual and insidious decline over months to years, and if memory loss is a prominent part of the confusion, dementia is likely. Conditions that permanently damage brain structure and tissue (e.g., vascular, traumatic, infectious or demyelinating conditions) can lead to dementia in person of any age.*^{1-4,8,9}
- Obtain information regarding recent changes or disruptions in client's health or routine. *Decline in physical health or disruption in daily living situation (e.g., hospitalization, change in medications, or moving to new home) can exacerbate agitation or bring on acute confusion. (Refer to ND acute Confusion.)*
- Evaluate client's response to primary care providers as well as receptiveness to interventions. *Awareness of these dynamics is helpful for evaluation of ongoing needs for both client and caregiver as client becomes increasingly dependent on caregivers or resistant to interventions.*
- Determine client and caregiver anxiety level in relation to situation. Note behavior that may be indicative of potential for violence. *The diagnosis of irreversible condition, the organic brain changes, and the day-to-day problems of living with it causes great stress and can potentiate violence.*⁴

NURSING PRIORITY NO. 2 To limit effects of deterioration/maximize level of function:

-  Assist in treating conditions (e.g., depression, infections, malnutrition, electrolyte imbalances, and adverse medication reactions) *that may contribute to or exacerbate distress, discomfort, and agitation.*¹⁻⁶
- Implement behavioral and environmental management interventions to promote orientation, provide opportunity for client interaction using current cognitive skills, and preserve client's dignity and safety:^{6,9,11,12}
 Ascertain interventions previously used or tried and evaluate effectiveness.
 Provide calm environment and minimize relocations; eliminate extraneous noise and stimuli *that may increase client's level of agitation or confusion.*
 Introduce yourself at each contact, if needed. Call client by preferred name.
 Use touch judiciously. Tell client what is being done before touching *to reduce sense of surprise or negative reaction.*
 Be supportive and sensitive to fears, misperceived threats, and frustration with expressing what is wanted.
 Be open and honest when discussing client's disease, abilities, and prognosis.
 Maintain continuity of caregivers and care routines as much as possible.
 Use positive statements, offer guided choices between two options.
 Avoid speaking in loud voice, crowding, restraining, shaming, demanding, or condescending actions toward client.
 Set limits on acting-out behavior *for safety of client/others.*
 Remove from stressors and agitation triggers or danger, move client to quieter place, and offer privacy.

Simplify client's tasks and routines *to accommodate fluctuating abilities and to reduce agitation associated with multiple options or demands.*

Provide for or assist with daily care activities, including bathing, dressing, grooming, toileting, and exercise. *Client may "forget" how to perform activities of daily living.*

Monitor and assist with meeting nutritional needs and feeding and fluid intake and monitor weight. Provide finger food if client has problems with eating utensils or is unable to sit to eat.

Assist with toileting and perineal care, as needed. Provide incontinence supplies.

Allow adequate rest between stimulating events.

Use lighting and visual aids *to reduce confusion.*

Encourage family/SO(s) to provide ongoing orientation/input to include current news and family happenings.

Maintain reality-oriented relationship and environment (e.g., clocks, calendars, personal items, seasonal decorations).

Encourage participation in resocialization groups *to help restore or maintain client's independence and dignity.*

Allow client to reminisce or exist in own reality if not detrimental to well-being.

Avoid challenging illogical thinking *because defensive reactions may result.*

Provide appropriate safety measures. *Client who is confused needs close supervision. Safety measures (such as use of identification bracelet and alarms on unlocked exits, lockup of toxic substances and medication, supervision of outdoor activities and wandering, removal of car or car keys, lowered temperature on hot water tank) can prevent injuries.*⁴

- Avoid use of restraints as much as possible. Investigate use of alternatives (such as bed nets, electronic bed pads, chair alarms, laptop trays), when required. *Although restraints can prevent falls, they can increase client's agitation and distress, resulting in injury or even death.*^{7,9,10}
-  Administer medications (e.g., antidepressants, anxiolytics, antipsychotics), as ordered, at lowest possible therapeutic dose. Monitor for expected and/or adverse responses, side effects, and interactions. *May be used to manage symptoms of psychosis and aggressive behaviors but need to be used cautiously.*^{5,13}
-  Implement complementary therapies (e.g., music or dance therapy; animal-assisted therapy; massage, Therapeutic Touch [if touch is tolerated], aromatherapy, bright light treatment) as ordered or desired. Monitor client's response to each modality and modify as indicated. *Use of alternative therapies tailored to the client's preferences, skills, and abilities can be calming and provide relaxation and can be carried out by a wide range of health and social care providers and volunteers.*¹¹
- Refer to NDs acute Confusion, impaired Memory, impaired verbal Communication for additional interventions.

NURSING PRIORITY NO. 3 To assist SO(s) to develop coping strategies:

-  Determine family dynamics, cultural values, resources, availability, and willingness to participate in meeting client's needs. Evaluate SO's attention to own needs, including health status, grieving process, and respite. *Primary caregiver and other members of family will suffer from the stress that accompanies caregiving and will require ongoing information and support.*
- Discuss caregiver burden when appropriate. Provide educational materials and list of available resources, help lines, Web sites, and so forth, as desired, *to assist SO(s) in dealing and coping with long-term care issues.*^{5,7,9} (Refer to NDs caregiver Role Strain, risk for caregiver Role Strain.)
- Involve SO(s) in care and discharge planning. Maintain frequent interactions with SOs *in order to relay information, to change care strategies, try different responses, or implement other problem-solving solutions.*⁶
-  Identify appropriate community resources (e.g., Alzheimer's Disease and Related Disorders Association, stroke or other brain injury support groups, senior support groups, specialist day services, home care, respite care; adult placement and short-term residential care; clergy, social services, occupational and physical therapists; assistive technology and telecare; attorney services for advance directives, durable power of attorney) *to provide support for client and SOs and assist with problem solving.*^{5,11}

NURSING PRIORITY NO. 4 To promote optimal functioning and safety (Teaching/Discharge Considerations):

-  Discuss how client's condition may progress, ongoing age-appropriate treatment needs, and appropriate follow-up. *Intermittent evaluations are needed to determine client's general health, any deterioration in cognitive function, or required adjustment in medication regimen to help the client maintain the highest possible level of functioning.*⁶
-  Review medications with SO/caregiver(s), including dosage, route, action, expected and reportable side effects, and potential drug interactions *to prevent or limit complications associated with multiple psychiatric and central nervous system medications.*⁵
-  Develop plan of care with family to meet client's and SO's individual needs. *The individual plan is dependent on cultural and belief patterns as well as family resources (personal, emotional, financial).*⁶
- Instruct SO/caregivers to share information about client's condition, functional status, and medications whenever encountering new providers. *Clients often have multiple doctors, each of whom may prescribe medications with potential for adverse effects and overmedication.*
- Provide appropriate referrals (e.g., Meals on Wheels, adult day care, home-care agency, nursing home placement, respite care for family member). *May need additional assistance to maintain the client in the home setting or make arrangements for placement if necessary.*⁶

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including current level of function, recent changes, and rate of anticipated changes.
- Client/caregiver response to situation.
- Results of diagnostic testing.

Planning

- Plan of care and who is involved in planning.
- Teaching Plan

Implementation/Evaluation

- Response to interventions and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

risk for acute Confusion

Taxonomy II: Perception/Cognition—Class 4 Cognition (00173) [**Diagnostic Division:** Neurosensory], Approved 2006; Revised 2013, 2017

DEFINITION: Susceptible to reversible disturbances of consciousness, attention, cognition, and perception that develop over a short period of time, which may compromise health.

RISK FACTORS

Alteration in sleep-wake cycle; pain
Dehydration; malnutrition
Impaired mobility; inappropriate use of restraints; sensory deprivation
Urinary retention

At Risk Population: Age ≥60 years; male gender
History of cerebral vascular accident

Associated Condition: Alteration in cognitive functioning; delirium; dementia; impaired metabolic functioning; infection; pharmaceutical agents

Sample Clinical Applications: Brain injury or stroke, respiratory conditions with hypoxia, medication adverse reactions, drug or alcohol intoxication or withdrawal, hyperthermia, infectious processes, malnutrition, eating disorders, fluid and electrolyte imbalances, chemical exposure

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Delirium Level: Severity of disturbance in consciousness and cognition that develops over a short period of time and is reversible

Information Processing: Ability to acquire, organize, and use information

Risk Control: Personal actions to prevent, eliminate, or reduce modifiable health threats

Client/Caregiver Will (Include Specific Time Frame)

- Maintain usual level of consciousness and cognition.
- Verbalize understanding of individual risk factor(s).
- Engage in activities or interventions to prevent or reduce risk of confusion.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Reality Orientation: Promotion of patient's awareness of personal identity, time, and environment

Teaching: Disease Process: Assisting the patient to understand information related to a specific disease process

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Identify risk factors present, such as recent trauma or fall; use of large numbers of medications (polypharmacy); intoxication with/withdrawal from a substance (e.g., prescription and over-the-counter [OTC] drugs; alcohol, illicit drugs); history or current seizures; episodes of fever, pain, or acute infection; exposure to toxic substances; traumatic events in client's/significant other's (SO's) life; person with dementia experiencing sudden change in environment/unfamiliar surroundings or people; and exacerbation of psychiatric conditions (e.g., mood disorder, dissociative disorders). *Individuals are at risk of developing confusion associated with numerous causes (e.g., hypoxia, abnormal metabolic conditions, ingestion of toxins or medications, electrolyte abnormalities, sepsis/systemic infections, nutritional deficiencies, endocrine disorders, central nervous system infections, other neurological pathology, acute psychiatric disorders). Note: Delirium due to physical illness is more frequent among the very young and the elderly. Delirium due to drug and alcohol intoxication or withdrawal is more common in persons aged mid-teens to late 30s.*^{2-5,8}
- Evaluate vital signs for indicators of poor tissue perfusion (i.e., hypotension, tachycardia, tachypnea). *May identify underlying cardiovascular or infectious cause for mental status changes.*
-  Assess mental status. *Typical symptoms of delirium include anxiety, disorientation, tremors, hallucinations, delusions, and incoherence. Onset is usually sudden, developing over a few hours or days, and resolving over varying periods of time.*^{2,6,7}
-   Determine current medication regimen/drug use—especially anti-anxiety agents, barbiturates, certain antipsychotic agents, methyl dopa, disulfiram, cocaine, alcohol, amphetamines, hallucinogens, and opiates, which are associated with high risk of confusion, disorientation, and delirium; and OTC medications, such as Benadryl and Tylenol PM, which can cause an exaggerated response (including “sundowner’s syndrome”) in elderly individuals. Note schedule of use (e.g., cimetidine + antacid, digoxin + diuretics). *Combinations can increase risk of adverse reactions/interactions, thus affecting mental status.*^{2-5,9}
- Determine client’s mobility and functional level. *Conditions or situations that limit client’s mobility and independence potentiate prospect of acute confusional state.*
- Ascertain life events (e.g., death of spouse/other family member, absence of known care provider, move from lifelong home, catastrophic natural disaster) *that can affect client’s perceptions, attention, and concentration.*³
- Assess diet and nutritional status *to identify possible deficiencies of essential nutrients and vitamins that could affect mental status.*^{2,5}
- Evaluate sleep and rest status, noting deprivation or oversleeping. (Refer to NDs Insomnia, Sleep Deprivation, as appropriate.)
-  Monitor laboratory values (e.g., complete blood count, blood cultures; oxygen saturation and, in some cases, arterial blood gases with carbon monoxide; BUN and Cr levels; electrolytes; thyroid function studies; liver function studies, ammonia levels; serum glucose; urinalysis for infection and drug analysis; specific drug toxicologies and drug levels [including peak and trough, as appropriate]) *to identify imbalances that have potential for causing confusion.*^{1,2,5,8}

NURSING PRIORITY NO. 2 To maximize level of function, prevent further deterioration, correct existing risk factors:

-  Assist with treatment of underlying problem (e.g., drug intoxication or substance abuse, infectious processes, hypoxemia, biochemical imbalances, nutritional deficits, pain management) *to reduce potential for confusion.*^{1,2,5,8}
-  Monitor and adjust medication regimen and note response. *May identify medications that can be changed or eliminated in client prone to adverse or exaggerated responses to medications (including confusion).*^{1,2,5}
- Provide normal levels of essential sensory and tactile stimulation—include personal items and pictures, desired music, activities, and contacts. Encourage family/SO(s) to participate in orientation by providing ongoing input (e.g., current news and family happenings).^{1,2}
- Maintain calm environment and eliminate extraneous noise and stimuli *to prevent overstimulation.*

-  Provide adequate supervision: remove harmful objects from environment, provide siderails and seizure precautions, place call bell and position needed items within reach, clear traffic paths, and ambulate with devices *to meet client's safety needs and reduce risk of falls.*
- Encourage client to use vision or hearing aids and other adaptive equipment when needed *to assist client in interpretation of environment and communication.*
- Avoid or limit use of restraints. *Can cause agitation and increase likelihood of untoward complications.*^{4,7}
- Promote early ambulation and recreational activities *to enhance well-being and reduce effects of prolonged bedrest or inactivity.*¹
- Establish and maintain elimination patterns. *Disruption of elimination may be a cause for confusion or precipitate delirium.*⁷

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Explain reason(s) for confusion, if known. *Although acute confusion usually subsides over time as the client recovers from the underlying cause and/or adjusts to a situation, it can initially be frightening to a client/SO. Therefore, information about the cause and appropriate treatment to improve the condition may be helpful in managing a sense of fear and powerlessness.*
-  Discuss need for ongoing medical review of client's medications *to limit possibility of misuse or potential for dangerous side effects or interactions.*¹
- Review ways to maximize sleep (e.g., preferred bedtime rituals; comfortable room temperature, bedding, and pillows; eliminate or reduce extraneous noise or stimuli and interruptions) *to prevent confusional state caused by sleep deprivation.*¹
-  Provide appropriate referrals (e.g., medication monitoring program, nutritionist, substance abuse treatment, support groups, home health and adult day care).^{1,2}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Existing conditions and risk factors for individual.
- Current level of function, effect on independence and ability to meet own needs, including food and fluid intake and medication use.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources and specific referrals.

Constipation

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00011) [**Diagnostic Division:** Elimination], Approved 1975; Revised 1998, 2017

DEFINITION: Decrease in normal frequency of defecation accompanied by difficult or incomplete passage of stool and/or passage of excessively hard, dry stool.

***Author note: After reviewing current research and all NDs involving constipation, it appears that chronic functional Constipation is actually the more commonly occurring form. To this end the assessment and interventions here reflect only what is presented in the Related Factors and Defining Characteristics. More in-depth assessment and interventions will be found in chronic functional Constipation.

RELATED FACTORS

Abdominal muscle weakness

Average daily physical activity is less than recommended for gender and age

Confusion; depression; emotional disturbance

Eating habit change (e.g., foods, eating times); inadequate dietary habits; insufficient fiber or fluid intake; dehydration

Decrease in gastrointestinal motility

Habitually ignores urge to defecate; irregular defecation habits; inadequate toileting habits

Inadequate dentition or oral hygiene

Obesity

Pharmaceutical agent; laxative abuse

DEFINING CHARACTERISTICS

Subjective

Anorexia

Abdominal pain; pain with defecation

Change in bowel pattern; decrease in frequency or volume of stool; hard, formed stool; liquid stool; inability to defecate

Increase in abdominal pressure; feeling of rectal fullness or pressure; straining with defecation

Indigestion; vomiting; headache; fatigue

Objective

Abdominal tenderness with/without palpable muscle resistance; distended abdomen

Atypical presentations in older adults [e.g., changes in mental status, urinary incontinence, unexplained falls, elevated body temperature]

Borborygmi; hypoactive or hyperactive bowel sounds

Hard, formed stool; presence of soft pastelike stool in rectum; liquid stool; straining with defecation

Bright red blood with stool; liquid stool

Percussed abdominal dullness; palpable abdominal or rectal mass

Severe flatus

Associated Condition: Electrolyte imbalance; iron salts

Hemorrhoids; Hirschsprung's disease; postsurgical bowel obstruction; prostate enlargement; tumor

Neurological impairment; pregnancy

Rectal abscess; rectal anal fissure or stricture; rectal ulcer

Rectal prolapse; rectocele

Sample Clinical Applications: Abdominal or pelvic surgeries; hemorrhoids, anal lesions, irritable bowel syndrome, diverticulitis, spinal cord injury (SCI), multiple sclerosis (MS), and other neurological conditions; hypothyroidism, iron deficiency anemia; uremia, kidney dialysis; Alzheimer's disease/other dementias or psychiatric conditions

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Bowel Elimination: Formation and evacuation of stool

Nutritional Status: Nutrient Intake: Nutrient intake to meet metabolic needs

Self-Care: Non-Parenteral Medications: Personal actions to administer oral and topical medications to meet therapeutic goals independently with or without assistive device

Client Will (Include Specific Time Frame)

- Establish or regain normal pattern of bowel functioning.
- Verbalize understanding of etiology and appropriate interventions or solutions for individual situation.
- Demonstrate behaviors or lifestyle changes to prevent recurrence of problem.
- Participate in bowel program, as indicated.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Constipation/Impaction Management: Prevention and alleviation of constipation/impaction

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Ostomy Care: Maintenance of elimination through a stoma and care of surrounding tissue

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Review medical/surgical history as indicated in Related Factors above *to identify conditions commonly associated with constipation.* (Refer to ND chronic functional Constipation).
-   Note client's age. *Constipation is more likely to occur in individuals older than 65 years of age, but can occur in any age from infant to elderly. A bottle-fed infant is more prone to constipation than a breastfed infant, especially when formula contains iron. Toddlers are at risk because of developmental factors (e.g., too young, too interested in other things, rigid schedule during potty training), and children and adolescents are at risk because of unwillingness to take breaks from play, poor eating and fluid intake habits, and withholding because of perceived lack of privacy. Many older adults experience constipation as a result of duller nerve sensations, immobility, dehydration, and electrolyte imbalances; incomplete emptying of the bowel; or failing to attend to signals to defecate.*^{1-4,7}
- Review daily dietary regimen, noting if diet is deficient in fiber. *Imbalanced nutrition influences the amount and consistency of feces.*
- Assess general oral and dental health. *Dental problems can impact dietary intake (e.g., loss of teeth or other oral conditions can force individuals to eat soft foods or liquids mostly lacking in fiber).*³

- Determine fluid intake to note deficits.
-  Evaluate medication or drug usage for agents that could slow passage of stool and cause or exacerbate constipation.
- Note energy and activity level and exercise pattern. *Lack of physical activity or regular exercise is often a factor in constipation.*
- Identify areas of life changes or stressors. *Factors such as pregnancy, travel, traumas, changes in personal relationships, occupational factors, or financial concerns can cause or exacerbate constipation.*⁵
- Determine access to bathroom, privacy, and ability to perform self-care activities.
- Investigate reports of pain with defecation. *Hemorrhoids, rectal fissures or prolapse, skin breakdown, or other abnormal findings may be hindering passage of stool or causing client to hold stool.*^{1,4-6}
-   Discuss laxative and enema use. Note signs or reports of laxative abuse or overuse of stimulant laxatives. *This is most common among older adults preoccupied with having daily bowel movement.*^{4,5,7}
- Auscultate abdomen for presence, location, and characteristics of bowel sounds reflecting bowel activity.
- Palpate abdomen for hardness, distension, and masses indicating possible obstruction or retention of stool.
- Perform digital rectal examination, as indicated, to evaluate rectal tone and detect tenderness, blood, or detect fecal impaction.
-  Assist with medical work-up (e.g., x-rays, abdominal imaging, colonoscopy, proctosigmoidoscopy, ano-rectal function tests; colonic transit studies, stool sample tests) for identification of possible causative factors. Refer to ND: chronic functional Constipation for further assessments and interventions regarding dietary issues in constipation.

NURSING PRIORITY NO. 2 To determine usual pattern of elimination:

- Discuss customary elimination habits (e.g., normal urge time [client unable to eliminate unless in own home], passing hard stool after prolonged effort, anal pain, or bleeding). Determine what feature the client finds most distressing. *Helps to identify and clarify client's perception of problem. For example, constipation has been defined as not only infrequent stools, but also straining with bowel movements, hard stools, unproductive urges, and feeling of incomplete evacuation.*⁶
- Note factors that usually stimulate bowel activity and any interferences present. *Client may describe having to sit in a particular position or needing to apply perineal pressure or digital stimulation to start stool. Interferences can include not wanting to use a particular facility or not wanting to interrupt play or an activity.*⁶

NURSING PRIORITY NO. 3 To assess current pattern of elimination:

- Note color, odor, consistency, amount, and frequency of stool following each bowel movement during assessment phase. *Provides a baseline for comparison, promoting recognition of changes. If usual number of weekly bowel movements is decreased to three or less, stool is hard and formed, or client is straining, constipation is likely present.*²
- Ascertain duration of current problem and client's degree of concern. *Long-standing condition that client has "lived with" may not cause undue concern, while acute postsurgical constipation can cause great distress. Client's response may/may not be congruent with the severity of condition.*
-  Note pharmacological agents client has used (e.g., fiber pills, laxatives, suppositories, enemas) to determine effectiveness of current regimen and whether laxative use is appropriate and helpful.

NURSING PRIORITY NO. 4 To facilitate return to usual/acceptable pattern of elimination:

-  Promote lifestyle changes.¹⁻⁸
Limit foods with little or no fiber or diet high in fats (e.g., ice cream, cheese, meats, fast foods, processed foods). Note: Clients with descending or sigmoid colostomy must avoid constipation. Some may find it helpful to create their own dietary bulk laxative by combining unprocessed millers bran, applesauce, and prune juice.

Promote adequate fluid intake, including water, high-fiber fruit and vegetable juices, fruit/vegetable smoothies, and popsicles. Suggest drinking warm, stimulating fluids (e.g., decaffeinated coffee, hot water, tea) *to avoid dehydration; promote moist, soft feces; and facilitate passage of stool.*

Encourage daily activity and exercise within limits of individual ability *to stimulate contractions of the intestines.*

Encourage client to not ignore urge. Provide privacy and routinely scheduled time for defecation (bathroom or commode preferable to bedpan) *to promote psychological readiness and comfort.*

- Provide sitz bath before stools *to relax sphincter* and after stools *for cleansing and soothing effect to rectal area.*⁴
-  Review client's current medication regime with physician *to determine if drugs contributing to constipation can be discontinued or changed.*
-  Administer stool softeners *(to provide moisture to stool)*, mild stimulants *(to cause rhythmic contractions of the bowel)*, lubricants *(to enable stool to more easily pass)*, saline or hyperosmolar laxatives, or bulk-forming agents *(to draw water into colon)* as ordered or routinely, when appropriate (e.g., for client receiving opiates, decreased level of activity/immobility).^{1-3,5-8}
-  Apply lubricant/anesthetic ointment to anus, if needed.
-  Establish bowel program to include predictable interval timing for colostomy irrigation or toileting, use of particular position for defecation, abdominal massage, colostomy irrigation, biofeedback for pelvic floor dysfunction, and medications as indicated *to provide predictable and effective elimination and reduce evacuation problems when long-term or permanent bowel dysfunction is present.*

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):^{1,6}

-  Discuss client's particular anatomy and physiology of bowel and acceptable variations in elimination.
- Provide information and resources to client/significant other about relationship of diet, fluid, exercise, and healthy elimination.
- Provide social and emotional support *to help client manage actual or potential disabilities associated with long-term bowel management.* Discuss rationale for and encourage continuation of successful interventions.
- Encourage client to maintain elimination diary, if appropriate, *to facilitate monitoring of long-term problem and choice of interventions.*
- Work to implement bowel management program that is easily replicated in home and community settings.
- Identify specific actions to be taken if problem does not resolve *to promote timely intervention, thereby enhancing client's independence.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Usual and current bowel pattern, duration of the problem, and interventions used.
- Characteristics of stool.
- Individual contributing factors.

Planning

- Plan of care, specific interventions or changes in lifestyle necessary to correct individual situation, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Change in bowel pattern, character of stool.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Recommendations for follow-up care.
- Specific referrals made.

chronic functional Constipation

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00235) [Diagnostic Division: Elimination], Approved 2013; Revised 2017

DEFINITION: Infrequent or difficult evacuation of feces, which has been present for at least 3 of the prior 12 months.

RELATED FACTORS

Decrease in food intake; insufficient food intake; low caloric intake
 Food disproportionately high in protein and fat; low-fiber diet
 Insufficient fluid intake; dehydration
 Habitually ignores urge to defecate
 Frail elderly syndrome; immobility; sedentary lifestyle

DEFINING CHARACTERISTICS

Subjective

Pain with defecation
 Prolonged straining
 [Feeling as though something is blocking stool from passing or stool is still in rectum after bowel movement]

Objective

ADULT: Presence of ≥ 2 of the following symptoms on Rome III classification system:
 Lumpy or hard stools; or straining; or sensation of incomplete evacuation; or sensation of anorectal obstructions; or manual maneuvers to facilitate defecations (digital manipulation, pelvic floor support) in $\geq 25\%$ of defecations; or ≤ 3 evacuations per week
 CHILD ≥ 4 years: Presence of ≥ 2 criteria on Roman III Pediatric classification system for ≥ 2 months:

≤2 defecations per week; ≥1 episode of fecal incontinence per week; stool retentive posturing; painful or hard bowel movements; presence of large fecal mass in the rectum; large diameter stools that may obstruct the toilet

CHILD ≤4 years: Presence of 2 criteria on Roman III Pediatric classification system for ≥1 month:

≤2 defecations per week; ≥1 episode of fecal incontinence per week; stool retentive posturing; painful or hard bowel movements; presence of large fecal mass in the rectum; large diameter stools that may obstruct the toilet

GENERAL

Distended abdomen; palpable abdominal mass

Fecal impaction

Leakage of stool with digital stimulation

Pain with defecation

Positive fecal occult blood

Prolonged straining

Type 1 or 2 Bristol Stool Chart

Associated Condition: Amyloidosis; anatomic neuropathy; chronic renal insufficiency

Anal fissure or stricture; ischemic, or postinflammatory, or surgical stenosis

Chronic intestinal pseudo-obstruction; colorectal cancer; extra intestinal mass; Hirschsprung's disease; hemorrhoids; inflammatory bowel disease; slow colon transit time

Cerebral vascular accident; diabetes; multiple sclerosis; myotonic dystrophy; paraplegia; Parkinson's disease;

Dermatomyositis; porphyria; scleroderma

Hypercalcemia; hypothyroidism, panhypopituitarism;

Pelvic floor dysfunction; perineal damage; pregnancy; proctitis

Pharmaceutical agent; polypharmacy

Sample Clinical Applications: Abdominal surgeries, hemorrhoids, anal lesions, irritable bowel syndrome, diverticulitis, spinal cord injury (SCI), multiple sclerosis (MS), hypothyroidism, iron deficiency, scleroderma, Alzheimer's disease/dementia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Bowel Elimination: Formation and evacuation of stool

Gastrointestinal Function: Ability of the gastrointestinal tract to ingest and digest food products, absorb nutrients, and eliminate waste

Client Will (Include Specific Time Frame)

- Establish or regain normal pattern of bowel functioning.
- Document that bowel function has improved, noting an increase in frequency of stools and/or decrease in straining at stool.
- Verbalize understanding of etiology and appropriate interventions or solutions for individual situation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Constipation/Impaction Management: Prevention and alleviation of constipation/impaction

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Medication Management: Facilitation of safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

-  Review medical/surgical history to identify conditions commonly associated with functional constipation. Causes may be classified as primary and secondary. Primary causes are related to problems inherent to the intestine; subdivided into normal-transit constipation, slow-transit constipation, and anorectal dysfunction. Secondary causes include (1) gastrointestinal disorders (e.g., intestinal tumors, stenosis; idiopathic megacolon; rectocele, rectal prolapse, anal fissure; irritable bowel syndrome); (2) metabolic and endocrine disorders (e.g., hyper/hypocalcemia, diabetes, hyperparathyroidism, chronic renal insufficiency); (3) neurological conditions (e.g., Parkinson's disease, stroke, dementia syndromes, multiple sclerosis, spinal cord injuries); (4) psychogenic disorders (e.g., anxiety, depression); (5) dehydration; and (6) the use of a variety of medications (e.g., opioids, anti-inflammatories, calcium channel blockers, calcium and iron supplements, anticholinergics, antipsychotics, antihistamines).^{1,2,13} Note: Functional constipation can also be associated with symptoms arising in the mid- or lower gastrointestinal tract that are not otherwise attributable to anatomic or biochemical defects. There is increasing evidence that a considerable number of individuals with constipation also have a disorder of the process of rectal evacuation.^{4,13}
-  Note client's age, gender, and general health status. Constipation is more likely to occur in individuals older than 65 years of age, but it may occur in client of any age with chronic or debilitating conditions. Approximately 95% of childhood constipation is functional in nature without any obvious cause. Children with anorectal malformations and Hirschsprung's disease have abnormal peristaltic waves in the colon, which result either in stagnant stool or an overactive colon.^{2,6-8,10} Note: Prevalence estimates by gender support a female-to-male ratio of 2.2:1.¹³
-  Evaluate current medications or drug usage for agents that could slow passage of stool and cause or exacerbate constipation (e.g., opioids, anti-inflammatories, calcium channel blockers, calcium and iron supplements, anticholinergics, antidepressants, antipsychotics, antihistamines, anticonvulsants, diuretics, chemotherapy, contrast media, steroids).¹⁻³
-  Note interventions client has tried to relieve current situation (e.g., fiber pills, laxatives, suppositories, enemas) and document success or lack of effectiveness.
-  Assist with medical work-up (e.g., lower GI series x-rays, abdominal imaging [e.g., defecography], colonoscopy, sigmoidoscopy; anorectal function tests [e.g., anal manometry, blood expulsion tests]; colonic transit studies) for identification of possible causative factors and to show how well food moves through the colon.^{8,9,11}

NURSING PRIORITY NO. 2 To assess current pattern of elimination:^{10,11}

- Note color, odor, consistency, amount, and frequency of stool following each bowel movement during assessment phase utilizing elimination diary or calendar. Provides a baseline for comparison, promoting recognition of changes.
- Auscultate abdomen for presence, location, and characteristics of bowel sounds reflecting bowel activity.
- Palpate abdomen for hardness, distention, and masses, indicating possible obstruction or retention of stool.
- Perform digital rectal examination, as indicated, to evaluate rectal tone and detect tenderness, blood, or fecal impaction.

NURSING PRIORITY NO. 3 To reduce unacceptable pattern of elimination:

-  Collaborate in treatment of underlying medical cause where appropriate (e.g., surgery to repair rectal prolapse, biofeedback to retrain anorectal or pelvic floor dysfunction, medications, and combinations of therapies as indicated) to improve body and bowel function. Note: Treatment is highly individual. For example, clients with slow-transit constipation tend to benefit from fiber, osmotic laxatives, and stimulant laxatives (e.g., bisacodyl), whereas those with evacuation disorders usually do not need medication other than fiber supplementation following pelvic floor retraining.^{4,12}
-  Review client's current medication regimen with physician to determine if drugs contributing to constipation can be discontinued or changed.

-  Administer medications, as indicated, such as stool softeners (e.g., docusate sodium [Colase, Surfak]) *to provide moisture to stool*, mild stimulants (e.g., bisacodyl [Dulcolax, Bisco-Lax]) *to cause rhythmic muscle contractions and improve transit time*, osmotic agents (e.g., polyethylene glycol [PEG, Miralax]) *to absorb water in intestine*, and opioid antagonist (e.g., methylnaltrexone [Relistor]) *to treat constipation in client with advanced/terminal illness necessitating long-term opioid analgesia and/or client who is unresponsive to laxatives*.
-  Remove impacted stool digitally, when necessary, after applying lubricant and anesthetic ointment to anus *to soften impaction and decrease rectal pain*.
-  Administer enemas (e.g., hyperosmolar agents [e.g., Fleet enema] *to draw water into colon*) or suppositories, as indicated.^{4,6}
-  Promote lifestyle changes:¹⁻¹¹
 Instruct in and encourage a personalized dietary program that involves adjustment of dietary fiber and bulk in diet (e.g., fruits, vegetables, whole grains) and fiber supplements (e.g., wheat bran, psyllium) *to improve consistency of stool and increase transit time through colon if slow transit through colon is causing symptoms*.
 Promote adequate fluid intake, including water, high-fiber fruit and vegetable juices, fruit/vegetable smoothies, and popsicles. Suggest drinking warm, stimulating fluids (e.g., decaffeinated coffee, hot water, tea) *to avoid dehydration; promote moist, soft feces; and facilitate passage of stool*.
-  Instruct in/assist with other means of triggering defecation (e.g., abdominal massage, digital stimulation, placement of rectal stimulant suppositories) *to provide predictable and effective elimination and reduce evacuation problems when long-term or permanent bowel dysfunction is present*.
-   Refer for physical therapy or other medical/surgical practitioners for additional interventions as indicated. *Physical therapy may be useful in improving mobility, pelvic floor retraining, and activity levels. Bio-feedback treatment with muscle relaxation of anal sphincters and the puborectalis can result in a cure for constipation associated with certain evacuation disorders. Surgical interventions may be used in some instances (e.g., Malone antegrade continence enema procedure, sacral anterior root stimulation) to treat long-term, intractable constipation due to neurogenic bowel.*^{5,12}

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):¹⁻¹¹

-  Discuss client's particular anatomy and physiology of bowel and acceptable variations in elimination.
- Provide information and resources to client/significant other about relationship of diet, exercise, fluid, and appropriate use of laxatives, as indicated.
- Provide social and emotional support *to help client manage actual or potential disabilities associated with long-term bowel management*. Discuss rationale for and encourage continuation of successful interventions.
- Encourage client to maintain elimination diary, if appropriate, *to facilitate monitoring of long-term condition and reveal most helpful interventions*.
-  Collaborate with medical providers and client/caregiver in designing bowel management program to be easily replicated in home and community settings.
-  Identify specific actions to be taken if problem does not resolve (e.g., return to physician for additional testing and interventions) *to promote timely intervention, thereby enhancing client's independence*.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Usual and current bowel pattern, duration of the problem, and interventions used.
- Characteristics of stool.
- Individual contributing factors.

Planning

- Plan of care, specific interventions or changes in lifestyle necessary to correct individual situation, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Change in bowel pattern, character of stool.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Recommendations for follow-up care.
- Specific referrals made.

risk for chronic functional Constipation

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (000236) [Diagnostic Division: Elimination], Approved 2013; Revised 2017

DEFINITION: Susceptible to infrequent or difficult evacuation of feces, which has been present nearly 3 of the prior 12 months, which may compromise health.

RISK FACTORS

Decrease in food intake; insufficient food intake; low caloric intake

Depression

Food disproportionately high in protein and fat; low-fiber diet

Insufficient fluid intake; dehydration

Habitually ignores urge to defecate

Frail elderly syndrome; immobility; sedentary lifestyle

Associated Condition: Amyloidosis; anatomic neuropathy; chronic renal insufficiency

Anal fissure or stricture; ischemic, or postinflammatory, or surgical stenosis

Chronic intestinal pseudo-obstruction; colorectal cancer; extra intestinal mass; Hirschsprung's disease; hemorrhoids; inflammatory bowel disease; slow colon transit time

Cerebral vascular accident; diabetes; multiple sclerosis; myotonic dystrophy; paraplegia; Parkinson's disease;
 Dermatomyositis; porphyria; scleroderma
 Hypercalcemia; hypothyroidism, panhypopituitarism
 Pelvic floor dysfunction; perineal damage; pregnancy; proctitis
 Pharmaceutical agent; polypharmacy

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Bowel Elimination: Formation and evacuation of stool

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Knowledge: Medication: Extent of understanding conveyed about the safe use of medication

Client Will (Include Specific Time Frame)

- Maintain normal pattern of bowel functioning.
- Verbalize understanding of etiology and appropriate interventions or solutions for individual situation.
- Engage in behaviors or lifestyle changes to prevent constipation.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Constipation/Impaction Management: Prevention and alleviation of constipation/impaction

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Medication Management: Facilitation of safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To identify individual risk factors:

-  Review medical/surgical history to identify conditions commonly associated with functional constipation. *Note: Causes may be classified as primary and secondary. Primary causes are related to problems inherent to the intestine and are subdivided into normal-transit constipation, slow-transit constipation, and anorectal dysfunction. Secondary causes include gastrointestinal disorders, metabolic and endocrine disorders, neurological conditions, congestive cardiac insufficiency, psychogenic disorders, dehydration, and the use of a variety of medications.^{1,2,5} Note: Functional constipation can also be associated with symptoms arising in the mid- or lower gastrointestinal tract that are not otherwise attributable to anatomic or biochemical defects. There is increasing evidence that a considerable number of individuals with constipation also have a disorder of the process of rectal evacuation.^{3,5,11}*
-  Note client's age, gender, and general health status. *Constipation is more likely to occur in individuals older than 65 years of age, but it may occur in client of any age with chronic or debilitating conditions. Approximately 95% of childhood constipation is functional in nature without any obvious cause.³⁻⁵*
-  Evaluate current medication for agents that could slow passage of stool and cause or exacerbate constipation (e.g., opioids, anti-inflammatories, calcium channel blockers, calcium and iron supplements, anticholinergics, antidepressants, antipsychotics, antihistamines, anticonvulsants, diuretics, chemotherapy, contrast media, steroids).^{2,6}
-  Review daily dietary regimen. *Imbalanced nutrition influences the amount and consistency of feces. Inadequate dietary fiber (vegetable, fruits, whole grains) and highly processed foods (e.g., fast foods, junk foods, packaged snack, or microwavable quick meals) contribute to poor intestinal function.^{1,7-9}*
-  Determine fluid intake to note deficits. *Most individuals do not drink enough fluids, even when healthy, reducing the speed at which stool moves through the colon. Active fluid loss through sweating, vomiting, diarrhea, or bleeding can greatly increase chances for constipation.^{2,7,9}*

- Note energy and activity level and exercise pattern. *Lack of physical activity or regular exercise is often a factor in constipation.*^{2,10}

NURSING PRIORITY NO. 2 To assess current pattern of elimination:

- Discuss usual elimination pattern and use of laxatives *to establish baseline and identify possible areas for intervention or instruction.*
- Note color, odor, consistency, amount, and frequency of stool following each bowel movement during assessment phase. *Provides a baseline for comparison, promoting recognition of changes.*
- Auscultate abdomen for presence, location, and characteristics of bowel sounds *reflecting bowel activity.*
- Palpate abdomen for hardness, distention, and masses, *indicating possible obstruction or retention of stool.*

NURSING PRIORITY NO. 3 To facilitate normal bowel function:

-  Promote healthy lifestyle for elimination:¹⁻¹⁰
Encourage balanced fiber and bulk (e.g., fruits, vegetables, whole grains) in diet and fiber supplements (e.g., wheat bran, psyllium) *to promote soft consistency of stool and facilitate passage through colon.*
Promote adequate fluid intake, including water, high-fiber fruit and vegetable juices, fruit/vegetable smoothies, and popsicles. Suggest drinking warm, stimulating fluids (e.g., decaffeinated coffee, hot water, tea) *to avoid dehydration; promote moist, soft feces; and facilitate passage of stool.*
Encourage daily activity and exercise within limits of individual ability to stimulate contractions of the intestines.
Encourage client to not ignore urge. Provide privacy and routinely scheduled time for defecation (bathroom or commode preferable to bedpan) *to promote psychological readiness and comfort.*

NURSING PRIORITY NO. 4 Promote wellness (Teaching/Discharge Considerations):^{2,8,11}

-  Discuss physiology and acceptable variations in elimination. *May help reduce concerns and anxiety about situation.*
- Review individual risk factors or potential problems and specific interventions for prevention of constipation.
-  Promote treatment of underlying medical causes where appropriate *to improve organ function, including the bowel.*
-  Collaborate with medical providers and client/caregiver in designing bowel management program to be easily replicated in home and community setting.
- Educate client/significant other about safe and risky practices for managing constipation. *Information can assist client to make beneficial choices when need arises.*
- Refer to NDs functional Constipation; Constipation; risk for perceived Constipation for additional interventions as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Current bowel pattern, characteristics of stool, medications.
- Individual risk factors.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

perceived Constipation

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00012) [Diagnostic Division: Elimination], Approved 1988

DEFINITION: Self-diagnosis of constipation combined with abuse of laxatives, enemas, and/or suppositories to ensure a daily bowel movement.

RELATED FACTORS

Cultural or family health beliefs
Impaired thought process

DEFINING CHARACTERISTICS

Subjective

Expects daily bowel movement
Expects daily bowel movement at same time every day
Laxative, enema, or suppository abuse

Sample Clinical Applications: Irritable bowel, confused states/dementia, hypochondriasis

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Health Beliefs: Personal convictions that influence health behaviors

Bowel Elimination: Formation and evacuation of stool

Knowledge: Health Behavior: Extent of understanding conveyed about the promotion and protection of health

(continues on page 196)

perceived Constipation (continued)

Client Will (Include Specific Time Frame)

- Verbalize understanding of physiology of bowel function.
- Identify acceptable interventions to promote adequate bowel function.
- Decrease reliance on laxatives and/or enemas.
- Establish individually appropriate pattern of elimination.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Counseling: Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others (SOs) to enhance or support coping, problem solving, and interpersonal relationships

Medication Management: Facilitation of safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To identify factors affecting individual beliefs:

-  Determine client's understanding of a "normal" bowel pattern. Compare with client's current bowel functioning. *Helps to identify areas for discussion or intervention. For example, what is considered "normal" varies with the individual, cultural, and familial factors with differences in expectations and dietary habits.¹ In addition, individuals can think they are constipated when, in fact, their bowel movements are regular and soft, possibly revealing a problem with thought processes or perception. Some people believe they are constipated, or irregular if they do not have a bowel movement every day because of ideas instilled from childhood.² The elderly client may believe that laxatives or purgatives are necessary for elimination, when in fact the problem may be long-standing habits (e.g., insufficient fluids, lack of exercise and/or fiber in the diet).³*
- Discuss client's use of laxatives. *Perceived constipation typically results in self-medicating with various laxatives. Although laxatives may correct the acute problem, chronic use leads to habituation, requiring ever-increasing doses that result in drug dependency and, ultimately, a hypotonic laxative colon.⁵*
- Identify interventions used by client to correct perceived problem to establish needed changes or interventions or points for discussion and teaching.

NURSING PRIORITY NO. 2 To promote wellness (Teaching/Discharge Considerations):

-  Discuss the following with client/SO/caregiver to clarify issues regarding actual and perceived bowel functioning and to provide support during behavior modification/bowel retraining:^{3,4}
Review anatomy and physiology of bowel function and acceptable variations in elimination.
 Identify detrimental effects of habitual laxative or enema use and discuss alternatives.
Provide information about relationship of diet, hydration, and exercise to improved elimination.
Encourage client to maintain elimination calendar or diary, if appropriate.
Provide support by active-listening and discussing client's concerns or fears.
Provide social and emotional support to help client manage actual or potential disabilities associated with long-term bowel management.
Encourage use of stress-reduction activities and refocusing of attention while client works to establish individually appropriate pattern.
- Offer educational materials and resources for client/SO to peruse at home to assist him or her in making informed decisions regarding constipation and management options.

-  Refer to medical/psychiatric providers, as indicated. **Client with a fixed perception of constipation where none actually exists may require further assessment and intervention.**
- Refer to ND Constipation for additional interventions, as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, client's perceptions of the problem.
- Current bowel pattern, stool characteristics.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Changes in bowel pattern, character of stool.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Referral for follow-up care.

risk for Constipation

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00015) [Diagnostic Division: Elimination], Submitted 1998; Revised 2013; 2017

DEFINITION: Susceptible to a decrease in normal frequency of defecation accompanied by difficult or incomplete passage of stool, which may compromise health.

RISK FACTORS

Abdominal muscle weakness

Average daily physical activity is less than recommended for gender and age

Confusion; depression; emotional disturbance

Eating habit change (e.g., foods, eating times); inadequate dietary habits; insufficient fiber or fluid intake; dehydration

Decrease in gastrointestinal motility

(continues on page 198)

risk for Constipation (continued)

Habitually ignores urge to defecate; irregular defecation habits; inadequate toileting habits

Inadequate dentition or oral hygiene

Obesity

Pharmaceutical agent; laxative abuse

Associated Condition: Electrolyte imbalance; iron salts

Hemorrhoids; Hirschsprung's disease; postsurgical bowel obstruction; prostate enlargement; tumor

Neurological impairment; pregnancy

Rectal abscess; rectal anal fissure or stricture; rectal ulcer

Rectal prolapse; rectocele

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Bowel Elimination: Formation and evacuation of stool

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Knowledge: Medication: Extent of understanding conveyed about the safe use of medication

Client Will (Include Specific Time Frame)

- Maintain effective pattern of bowel functioning.
- Verbalize understanding of risk factors and appropriate interventions or solutions related to individual situation.
- Demonstrate behaviors or lifestyle changes to prevent developing problem.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Constipation/Impaction Management: Prevention and alleviation of constipation/impaction

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Medication Management: Facilitation of safe and effective use of prescription and over-the-counter drugs

NURSING PRIORITY NO. 1 To identify individual risk factors/needs:

- Review medical/surgical history *to identify conditions commonly associated with constipation, including problems with colon or rectum (e.g., obstruction, scar tissue or stricture, diverticulitis, irritable bowel syndrome, tumors, anal fissure), metabolic or endocrine disorders (e.g., diabetes mellitus, hypothyroidism, uremia), limited physical activity (e.g., bedrest, poor mobility, chronic disability), chronic pain problems (especially when client is on pain medications), pregnancy and childbirth, recent abdominal or perianal surgery, and neurological disorders (e.g., stroke, traumatic brain injury, Parkinson's disease, MS, spinal cord abnormalities).*^{1-3,8}
- ∞ Note client's age. *Constipation is more likely to occur in individuals older than 65 years of age, but it can occur in any age from infant to elderly. A bottle-fed infant is more prone to constipation than a breastfed infant, especially when formula contains iron. Toddlers are at risk because of developmental factors, and children. Adolescents are at risk because of unwillingness to take break from play, poor eating and fluid intake habits, and withholding because of perceived lack of privacy. Many older adults experience constipation as a result of duller nerve sensations, immobility, dehydration, and electrolyte imbalances; incomplete emptying of the bowel; or failing to attend to signals to defecate.*¹⁻⁴
- Discuss usual elimination pattern and use of laxatives *to establish baseline and identify possible areas for intervention or instruction.*⁸

-  Ascertain client's family and cultural beliefs and practices about bowel elimination, such as “must have a bowel movement every day or I need an enema.” *These factors reflect familial or cultural thinking about elimination, which affect client's lifetime patterns.*
- Review usual dietary regimen. *Imbalanced nutrition influences the amount and consistency of stool.² Inadequate dietary fiber (vegetable, fruits, whole grains) and highly processed foods contribute to poor intestinal function.^{1,3,5}*
- Assess general oral and dental health. *Dental problems can impact dietary intake (e.g., loss of teeth can force individuals to eat soft foods that are mostly lacking in fiber).^{1,3}*
- Determine fluid intake to note deficits. *Most individuals do not drink enough fluids, even when healthy, reducing the speed at which stool moves through the colon. Active fluid loss through sweating, vomiting, diarrhea, or bleeding can greatly increase chances for constipation.^{1-4,6}*
-  Evaluate medication or drug usage for agents that could slow passage of stool and increase risk of constipation (e.g., narcotic pain relievers, antidepressants, anticonvulsants, aluminum-containing antacids, chemotherapy, iron supplements, contrast media, steroids).¹⁻⁷
- Note energy and activity level and exercise pattern. *Lack of physical activity or regular exercise is often a factor in constipation.^{1-5,7}*
- Identify areas of life changes or stressors. *Factors such as pregnancy, travel, traumas, and changes in personal relationships; occupational factors; or financial concerns can cause or exacerbate constipation.^{4,7}*
- Determine access to bathroom, privacy, and ability to perform self-care activities.
- Auscultate abdomen for presence, location, and characteristics of bowel sounds *reflecting bowel activity.*

NURSING PRIORITY NO. 2 To facilitate an acceptable pattern of elimination:

-  Promote healthy lifestyle for elimination:¹⁻⁸
Instruct in and encourage balanced fiber and bulk (e.g., fruits, vegetables, whole grains) in diet and fiber supplements (e.g., wheat bran, psyllium) *to improve consistency of stool and facilitate passage through colon.*
Limit foods with little or no fiber or diet high in fats (e.g., ice cream, cheese, meats, fast food, processed foods).
Promote adequate fluid intake, including water, high-fiber fruit and vegetable juices, fruit/vegetable smoothies, and popsicles. Suggest drinking warm, stimulating fluids (e.g., decaffeinated coffee, hot water, tea) *to avoid dehydration; promote moist, soft feces; and facilitate passage of stool.*
Encourage daily activity and exercise within limits of individual ability to stimulate contractions of the intestines.
Encourage client to not ignore urge. Provide privacy and routinely scheduled time for defecation (bathroom or commode preferable to bedpan) *to promote psychological readiness and comfort.*
-  Recommend use of medications (stool softeners, mild stimulants, or bulk-forming agents) as needed and/or routinely when appropriate *to prevent constipation (e.g., client taking pain medications, especially opiates, or who is inactive or immobile).⁸*

NURSING PRIORITY NO. 3 Promote wellness (Teaching/Discharge Considerations):

-  Discuss physiology and acceptable variations in elimination. *May help reduce concerns and anxiety about situation.^{1,5,7}*
- Review individual risk factors or potential problems and specific interventions for prevention of constipation.^{1,5,7}
-  Encourage treatment of underlying medical causes where appropriate *to improve organ function, including the bowel.^{1,5,7}*
- Educate client/significant other about safe and risky practices for managing constipation. *Information can assist client to make beneficial choices when need arises.^{1,5,7}*
- Encourage client to maintain elimination diary, if appropriate, *to help monitor bowel pattern.^{1,5,7}*

-  Discuss client's current medication regime with physician *to determine if drugs that may contribute to constipation can be discontinued or changed.*⁸
- Refer to NDs Constipation; chronic functional Constipation; perceived Constipation for additional interventions as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Current bowel pattern, characteristics of stool, medications.
- Individual risk factors.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

Contamination

Taxonomy II: Safety/Protection—Class 4 Environmental Hazards (00181) [**Diagnostic Division:** Safety], Approved 2006; Revised 2017

DEFINITION: Exposure to environmental contaminants in doses sufficient to cause adverse health effects.

RELATED FACTORS

External

Carpeted flooring; flaking, peeling surface in presence of young children; playing where environmental contaminants are used; inadequate household hygiene practices

Chemical contamination of food or water; ingestion of contaminated material

Unprotected exposure to chemical; or heavy metal, or radioactive material

Inadequate municipal services [e.g., trash removal, sewage treatment facilities]
 Inadequate or inappropriate use of protective clothing; inadequate personal hygiene practices
 Use of environmental contaminants in the home; inadequate breakdown of contaminant; use of noxious material in insufficiently ventilated area or without effective protection

Internal

Concomitant exposure; inadequate nutrition; smoking

DEFINING CHARACTERISTICS

Author Note: Defining characteristics are dependent on the causative agent. Agents cause a variety of individual organ responses as well as systemic responses.

Subjective/Objective

Pesticides: Dermatological, gastrointestinal, neurological, pulmonary, or renal effects of pesticide

Chemicals: [Major chemical agents: petroleum-based agents, anticholinesterases; type I agents act on proximal tracheobronchial portion of the respiratory tract, type II agents act on alveoli, type III agents produce systemic effects]

Dermatological, gastrointestinal, immunological, neurological, pulmonary, or renal effects of chemical exposure

Biologics: [Toxins from living organisms—bacteria, viruses, fungi]

Dermatological, gastrointestinal, neurological, pulmonary, or renal effects of exposure to biologicals

Pollution: [Major locations: air, water, soil; major agents: asbestos, radon, tobacco (smoke), heavy metal, lead, noise, exhaust]

Neurological or pulmonary effects of pollution exposure

Waste: [Categories of waste: trash, raw sewage, industrial waste]

Dermatological, gastrointestinal, hepatic, or pulmonary effects of waste exposure

Radiation: [External exposure through direct contact with radioactive material]

Immunological, genetic, neurological, or oncological effects of radiation exposure

At Risk Population: Children <5 years; female gender; older adults

Exposure to areas with high contaminant level; exposure to atmospheric pollutants, or to bioterrorism, or to disaster, or to radiation; previous exposure to contaminant

Gestational age during exposure

Associated Condition: Pre-existing disease; pregnancy

Sample Clinical Applications: *Escherichia coli* infection, plague, hantavirus, asthma, botulism, cholera, lead or other heavy metal poisoning, chemical burns, asbestosis, carbon monoxide poisoning, radiation sickness

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Symptom Severity: Severity of adverse physical, emotional, and social responses

Knowledge: Personal Safety: Extent of understanding conveyed about prevention of unintentional injuries to self

Risk Control: Environmental Hazards: Personal actions to understand, prevent, eliminate, or reduce the threat of exposure to biological, chemical, physical, biomechanical, or physical hazards in personal environment

(continues on page 202)

Contamination (continued)

Client Will (Include Specific Time Frame)

- Be free of injury and adverse health effects.
- Verbalize understanding of individual factors that contributed to injury and plans for correcting situation(s) where possible.
- Modify environment, as indicated, to enhance safety.

Sample NOC linkages:

Community Health Status: General state of well-being of a community or population

Community Risk Control: Environmental Hazards: Community actions to monitor, eliminate, or reduce environmental hazards

Community Disaster Response: Community response following a natural or man-made calamitous event

Client/Community Will (Include Specific Time Frame)

- Identify hazards that led to exposure or contamination.
- Correct environmental hazards, as identified.
- Demonstrate necessary actions to promote community safety.

ACTIONS/INTERVENTIONS

In reviewing this ND, it is apparent there is overlap with other diagnoses. We have chosen to present generalized interventions. Although there are commonalities to Contamination situations, we suggest that the reader refer to other primary diagnoses, as indicated, such as ineffective Airway Clearance, ineffective Breathing Pattern, impaired Gas Exchange, impaired Home Maintenance, risk for Infection, risk for Injury, risk for Poisoning, impaired/risk for impaired Skin Integrity, risk for Suffocation, and risk for physical Trauma.

Sample NIC linkages:

Environmental Management: Safety: Monitoring and manipulation of the physical environment to promote safety

Community Health Development: Assisting members of a community to identify a community's health concerns, mobilize resources, and implement solutions

Environmental Risk Protection: Preventing and detecting disease and injury in populations at risk from environmental hazards

NURSING PRIORITY NO. 1 To evaluate degree/source of exposure:

-  Ascertain type of contaminant(s) to which client has been exposed (e.g., chemical, biological, air pollutant), the manner of exposure (e.g., inhalation, ingestion, topical), whether exposure was accidental or intentional, and immediate or delayed reactions. *Determines course of action to be taken by all emergency and other care providers. Note: Although exposure history is often difficult to determine, national environmental agencies are working to identify types of chemicals that most humans are exposed to and the effects of those exposures. Since 1999, the Centers for Disease Control and Prevention (CDC) have measured over 300 environmental chemicals in people's blood, urine, breast milk, and meconium.⁵ Note: Intentional exposure to hazardous materials requires notification of law enforcement for further investigation and possible prosecution.¹⁻⁶*
-  Note age and gender. *Children (less than 5 years of age) are at greater risk for adverse effects from exposure to contaminants because (1) smaller body size causes them to receive a more concentrated "dose" than adults; (2) they spend more time outside than most adults, increasing exposure to air and soil pollutants; (3) young children spend more time on the floor, increasing exposure to toxins in carpets and low cupboards;*

(4) they consume more water and food per pound than adults, increasing their body weight-to-toxin ratio; and (5) development of fetal, infant, and young children's organ systems can be disrupted. Older adults have a normal decline in function of immune, integumentary, cardiac, renal, hepatic, and pulmonary systems; an increase in adipose tissue mass; and a decline in lean body mass. Females in general have a greater proportion of body fat than men, increasing the chance of accumulating more lipid-soluble toxins.¹⁻⁶

- Ascertain geographical location (e.g., home, work) where exposure occurred. Individual and/or community intervention may be needed to modify or correct problem.
-  Note socioeconomic status and availability and use of resources. Living in poverty increases potential for multiple exposures, delayed or lack of access to healthcare, and poor general health, potentially increasing the severity of adverse effects of exposure.⁶
- Determine factors associated with particular contaminant:

Pesticides: Determine if client has ingested contaminated foods (e.g., fruits, vegetables, commercially raised meats) or inhaled agent (e.g., aerosol bug sprays, in vicinity of crop spraying).^{2,3,9}

Chemicals: Ascertain if client uses environmental contaminants in the home or at work (e.g., pesticides, chemicals, chlorine household cleaners) and fails to use or inappropriately uses protective clothing.^{2,3,9}

 **Pollution air/water:** Determine if client has been exposed and is sensitive to atmospheric pollutants (e.g., radon, benzene [from gasoline], carbon monoxide, automobile emissions [numerous chemicals], chlorofluorocarbons [refrigerants, solvents], ozone or smog, particles [acids, organic chemicals, particles in smoke], commercial plants [e.g., pulp and paper mills]).⁷ *Note: The Environmental Protection Agency (EPA, 2013) identified six pollutants (carbon monoxide, lead, nitrogen oxides, ground-level ozone, particle pollution [often referred to as particulate matter], sulfur oxides) as “criteria” air pollutants because it regulates them by developing human health-based and/or environmentally based criteria for setting permissible levels.*¹⁵

Investigate possibility of home-based exposure to air pollution. Toxins may include carbon monoxide (e.g., poor ventilation, especially in the winter months [poor heating systems, use of charcoal grill indoors, car left running in garage], cigarette or cigar smoke indoors, ozone [spends a lot of time outdoors such as playing children, adults participating in moderate to strenuous work or recreational activities]).^{3,7}

Investigate possibility of exposure to water pollution in or around the home. Water pollutants come from many sources (including and not limited to) oil, grease, chemical toxins from paint thinners, cleaning products, pharmaceuticals, personal-care products; pesticides and nutrients from lawns/gardens, heavy metals, viruses, bacteria and nutrients from animal waste; failing septic systems or improper sewage disposal; dirt/groundwater runoff.^{3,7}

Biologics: Determine if client may have been exposed to biological agents (bacteria, viruses, fungi) or bacterial toxins (e.g., botulinum, ricin). *Exposure occurring as a result of an act of terrorism is relatively rare; however, individuals may be exposed to bacterial agents or toxins through contaminated or poorly prepared foods.*

Waste: Determine if client lives in area where trash and garbage accumulates or is exposed to raw sewage or industrial wastes that can contaminate soil and water.

Radiation: Ascertain if client/household member experienced accidental exposure (e.g., occupation in radiography, living near or working in nuclear industries or electrical-generating plants).

- Observe for signs and symptoms of infective agent and sepsis, such as fatigue, malaise, headache, fever, chills, diaphoresis, skin rash, and altered level of consciousness. *Initial symptoms of some diseases may mimic influenza and be misdiagnosed if healthcare providers do not maintain an index of suspicion.*
- Note presence and degree of chemical burns and initial treatment provided.
-  Assist with diagnostic studies, as indicated. *Provides information about type and degree of exposure and organ involvement or damage.*
- Identify psychological response (e.g., anger, shock, acute anxiety, confusion, denial) to accidental or mass exposure incident. *Although these are normal responses, they may recycle repeatedly and result in posttrauma syndrome if not dealt with adequately.*
-  Alert proper authorities to presence/exposure to contamination, as appropriate. *Depending on agent, there may be reporting requirements to local, state, and national agencies such as the local health department, the Environmental Protection Agency (EPA), and Centers for Disease Control and Prevention (CDC).*

NURSING PRIORITY NO. 2 To assist in treating effects of exposure:

-  Implement a coordinated decontamination plan (e.g., removal of clothing, showering with soap and water, other initial decontamination procedures) following consultation with medical toxicologist, hazardous materials team, industrial hygiene, and safety officer *to prevent further harm to client and to protect healthcare providers.*^{8,9}
- Ensure availability and proper use of personal protective equipment (PPE) (e.g., high-efficiency particulate air [HEPA] filter masks, special garments, barrier materials, including gloves and face shield) *to protect from exposure to biological, chemical, and radioactive hazards.*⁸⁻¹⁰
- Provide for isolation or group/cohort individuals with same diagnosis or exposure, as resources require. *Limited resources may dictate open wardlike environment; however, the need to control spread of infection still exists. Only plague, smallpox, and viral hemorrhagic fevers require more than standard infection control precautions.*
-  Provide therapeutic interventions, as individually appropriate. *Specific needs of the client and the level of care available at a given time and location determine response.*
-   Refer pregnant client for individually appropriate diagnostic procedures or screenings. *Helpful in determining effects of teratogenic exposure on fetus allowing for informed choices and preparations. Chemical toxins can include (and are not limited to) lead, arsenic, chlorine, mercury, pesticides.*¹⁶
-   Screen breast milk in lactating client following radiation exposure. *Depending on type and amount of exposure, breastfeeding may need to be briefly interrupted or occasionally terminated.*¹²⁻¹⁴
-  Cooperate with and refer to appropriate agencies (e.g., CDC, U.S. Army Medical Research Institute of Infectious Diseases, Federal Emergency Management Agency, Department of Health and Human Services, Office of Emergency Preparedness, EPA) *to prepare for and manage mass casualty incidents.*^{9,10}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations): Client/Caregiver

- Identify individual safety needs and injury or illness prevention in home, community, and work setting.
- Install carbon monoxide monitors and other indoor air pollutant detectors in home, as appropriate.
- Review individual nutritional needs, appropriate exercise program, and need for rest. *Essentials for well-being and recovery.*
- Repair, replace, or correct unsafe household items and situations (e.g., storage of solvents in soda bottles, flaking or peeling paint or plaster, filtering unsafe tap water).
-  Emphasize importance of supervising infant/child or individuals with cognitive limitations.
-  Encourage removal of or proper cleaning of carpeted floors, especially for small children and persons with respiratory conditions. *Carpets hold up to 100 times as much fine particle material as a bare floor and can contain metals and pesticides.*¹
- Identify commercial cleaning resources, if appropriate, *for safe cleaning of contaminated articles and surfaces.*
- Install dehumidifier in damp areas *to retard growth of molds.*¹
- Encourage timely cleaning or replacement of air filters on furnace and air-conditioning unit. *Good ventilation cuts down on indoor air pollution from carpets, machines, paints, solvents, cleaning materials, and pesticides.*
- Discuss protective actions for specific “bad air” days. *Measures may include limiting or avoiding outdoor activities, especially in sensitive groups (e.g., children who are active outdoors, adults involved in moderate or strenuous outdoor activities, persons with respiratory diseases).*⁶
- Review effects of secondhand smoke and importance of refraining from smoking in home and car where others are likely to be exposed.
- Recommend periodic inspection of well water and tap water *to identify possible contaminants.*
- Encourage client/caregiver to develop a personal or family disaster plan, to gather needed supplies to provide for self/family during a community emergency, and to learn how specific public health threats might affect client and actions *to reduce the risk to health and safety.*

- Instruct client to always refer to local authorities and health experts for specific up-to-date information for community and to follow their advice.
-  Refer to counselor or support groups for ongoing assistance in dealing with traumatic incident and aftereffects of exposure.
- Provide bibliotherapy including written resources and appropriate Web sites *for review and self-paced learning*.
-  Refer to a smoking-cessation program, as needed.

Community

- Promote community education programs in different modalities, languages, cultures, and educational levels geared to *increasing awareness of safety measures and resources available to individuals/community*.
- Review pertinent job-related health department and Occupational Safety and Health Administration regulations.
- Refer to local resources that provide information about air quality (e.g., pollen index, “bad air days”).
- Encourage community members/groups to engage in problem-solving activities.
-  Ascertain that there is a comprehensive disaster plan for the community that includes a chain of command, equipment, communication, training, decontamination area(s), and safety and security plans *to ensure an effective response to any emergency (e.g., flood, toxic spill, infectious disease outbreak, radiation release)*.¹¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Details of specific exposure, including location and circumstances.
- Client’s/caregiver’s understanding of individual risks/safety concerns.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans for discharge needs, lifestyle and community changes, and who is responsible for actions to be taken.
- Specific referrals made.

risk for Contamination

Taxonomy II: Safety/Protection—Class 4 Environmental Hazards (00180) [**Diagnostic Division:** Safety], Approved 2006; Revised 2013; 2017

DEFINITION: Susceptible to exposure to environmental contaminants, which may compromise health.

RISK FACTORS

External

Carpeted flooring; flaking, peeling surface in presence of young children; playing where environmental contaminants are used; inadequate household hygiene practices

Chemical contamination of food or water; ingestion of contaminated material

Unprotected exposure to chemical, or heavy metal, or radioactive material

Inadequate municipal services [e.g., trash removal, sewage treatment facilities]

Inadequate or inappropriate use of protective clothing; inadequate personal hygiene practices

Use of environmental contaminants in the home; inadequate breakdown of contaminant; use of noxious material in insufficiently ventilated area or without effective protection

Internal

Concomitant exposure; inadequate nutrition; smoking

At Risk Population: Children <5 years; female gender; older adults

Exposure to areas with high contaminant level; exposure to atmospheric pollutants, or to bioterrorism, or to disaster, or to radiation; previous exposure to contaminant

Gestational age during exposure

Associated Condition: Pre-existing disease; pregnancy

Sample Clinical Applications: *Escherichia coli* infection, plague, hantavirus, asthma, botulism, cholera, lead or other heavy metal poisoning, chemical burns, asbestosis, carbon monoxide poisoning, radiation sickness

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Personal Safety: Extent of understanding conveyed about risk reduction and prevention of unintentional injuries to self

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Verbalize understanding of individual factors that contribute to possibility of injury and take steps to correct situation(s).
- Demonstrate behaviors and lifestyle changes to reduce risk factors and protect self from injury.
- Modify environment as indicated to enhance safety.
- Be free of injury.
- Support community activities for disaster preparedness.

Sample NOC linkages:

Community Health Status: General state of well-being of a community or population

Community Risk Control: Environmental Hazards: Community actions to monitor, eliminate, or reduce environmental hazards

Community Disaster Readiness: Community preparedness to respond to a natural or man-made calamitous event

Community Will (Include Specific Time Frame)

- Identify hazards that could lead to exposure or contamination.
- Correct environmental hazards as identified.
- Demonstrate necessary actions to promote community safety and disaster preparedness.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk-reduction strategies for an individual or group

Community Health Development: Assisting members of a community to identify a community's health concerns, mobilize resources, and implement solutions

Environmental Risk Protection: Preventing and detecting disease and injury in populations at risk from environmental hazards

NURSING PRIORITY NO. 1 To evaluate degree/source of risk inherent in the home, community, and work site:

- Ascertain type of contaminant(s) and exposure routes posing a potential hazard to client or community (e.g., air, soil, or water pollutants; food source, chemical, biological, radiation) as listed in Risk Factors. *Determines course of action to be taken by client/community/care providers.*
-  Note age and gender of client(s) or community base (e.g., community health clinic serving primarily economically disadvantaged children or elderly; school near large industrial plant, family living in smog-prone area). *Young children, frail elderly, and females have been found to be at higher risk for effects of exposure to many toxins.*^{1,2} (Refer to ND Contamination.)
- Ascertain client's geographic location at home or work (e.g., lives where crop spraying is routine; works in nuclear plant; contract worker or soldier returning from combat area). *Individual and/or community intervention may be needed to reduce risks of accidental or intentional exposures.*
- Note socioeconomic status and availability and use of resources. *Living in poverty increases the potential for multiple exposures, delayed or lack of access to healthcare, and poor general health.*³
- Determine client's/significant other's (SO's) understanding of potential risk and appropriate protective measures.

NURSING PRIORITY NO. 2 To assist client to reduce or correct individual risk factors:

-  Assist client to develop plan to address individual safety needs and injury or illness prevention in home, community, and work setting.
- Repair, replace, or correct unsafe household items or situations (e.g., flaking or peeling paint or plaster, filtering unsafe tap water).
- Review effects of secondhand smoke and importance of refraining from smoking in home or car *where others are likely to be exposed*.
-  Encourage removal or proper cleaning of carpeted floors, especially for small children and persons with respiratory conditions. *Carpets hold up to 100 times as much fine-particle material as a bare floor and can contain metals and pesticides.*¹
- Encourage timely cleaning or replacement of air filters on furnace and air-conditioning unit. *Good ventilation cuts down on indoor air pollution from carpets, machines, paints, solvents, cleaning materials, and pesticides.*
- Recommend periodic inspection of well water and tap water *to identify possible contaminants*.
- Encourage client to install carbon monoxide monitors and other air pollutant detectors in home as appropriate.
- Recommend placing dehumidifier in damp areas *to retard growth of molds*.
- Review proper handling of household chemicals:^{4,5,9}
 Read chemical labels *to be aware of primary hazards (especially in commonly used household cleaning and gardening products)*.
 Follow directions printed on product label (e.g., avoid use of certain chemicals on food preparation surfaces, refrain from spraying garden chemicals on windy days).
 Choose least hazardous products for the job, preferably multiuse products *to reduce number of different chemicals used and stored*. Use products labeled “nontoxic” wherever possible.
 Use form of chemical that most reduces risk of exposure (e.g., cream instead of liquid or aerosol).
 Wear protective clothing, gloves, and safety glasses when using chemicals. Avoid mixing chemicals at all times and use in well-ventilated areas.
 Store chemicals in locked cabinets. Keep chemicals in original labeled containers and do not pour into other containers.
-  Place safety stickers on chemicals *to warn of harmful contents*.
- Review proper food-handling, storage, and cooking techniques.
-   Stress importance of pregnant or lactating women following fish or wildlife consumption guidelines provided by state, U.S. territorial, or Native American tribes. *Ingestion of noncommercial fish or wildlife can be a significant source of pollutants.*⁸

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations): Home

- Discuss general safety concerns with client/SO/employees *to ensure that people are educated about potential risks, and ways to manage risks*.
-  Stress importance of supervising infant/child or individuals with cognitive limitations *to protect those who are unable to protect themselves*.
-  Post emergency and poison control numbers in a visible location.
- Encourage learning cardiopulmonary resuscitation and first aid for toxic exposures.
- Discuss protective actions for specific “bad air” days (e.g., limiting/avoiding outdoor activities).
- Review pertinent job-related safety regulations. Emphasize necessity of wearing appropriate protective equipment.
- Encourage client/caregiver to develop a personal/family disaster plan, to gather needed supplies to provide for self/family during a community emergency, and to learn how specific public health threats might affect client and actions to promote preparedness and reduce the risk to health and safety.
- Provide information and refer to appropriate resources about potential toxic hazards and protective measures. Provide bibliotherapy including written resources and appropriate Web sites *for client review and self-paced learning*.

-  Refer to a smoking-cessation program as needed.

Community

- Promote education programs geared toward increasing awareness of safety measures and resources available to individuals/community.
- Review pertinent job-related health department and Occupational Safety and Health Administration regulations *to safeguard the workplace and the community*.
- Ascertain that there is a comprehensive disaster plan in place for the community that includes a chain of command, equipment, communication, training, decontamination area(s), and safety and security plans *to ensure an effective response to any emergency (e.g., flood, toxic spill, infectious disease outbreak, radiation release)*.⁶
-   Refer to appropriate agencies (e.g., CDC, U.S. Army Medical Research Institute of Infectious Diseases, Federal Emergency Management Agency, Department of Health and Human Services, Office of Emergency Preparedness, EPA) *to prepare for and manage mass casualty incidents*.⁷

DOCUMENTATION FOCUS

Assessment/Reassessment

- Client's/caregiver's understanding of individual risks and safety concerns.
- Community risks for exposure or contamination.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans, lifestyle and community changes, and who is responsible for actions to be taken.
- Specific referrals made.

compromised family Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00074) [Diagnostic Division: Social Interaction], Submitted 1980; Revised 1996, 2017

DEFINITION: A usually supportive primary person (family member; significant other; or close friend) provides insufficient, ineffective, or compromised support, comfort, assistance, or encouragement that may be needed by the client to manage or master adaptive tasks related to his or her health challenge.

RELATED FACTORS

Coexisting situations affecting the support person; preoccupation by support person with concern outside of family

Exhaustion of support person's capacity; insufficient reciprocal support

Family disorganization

Insufficient information available to support person; misinformation obtained by support person

Insufficient understanding, or misunderstanding of information by support person

Insufficient support given by client to support person

DEFINING CHARACTERISTICS

Subjective

Client complaint or concern about support person's response to health problem

Support person reports inadequate knowledge or understanding that interferes with effective supportive behaviors

Support person reports preoccupation with own reaction to client's need

Objective

Assistive behaviors by support person produce unsatisfactory results

Protective behavior by support person incongruent with client's abilities

Limitation in communication between support person and client

Support person withdraws from client

At Risk Population: Developmental or situational crisis experienced by support person; family role change; prolonged disease that exhausts capacity of support person

Sample Clinical Applications: Chronic conditions (e.g., chronic obstructive pulmonary disease [COPD], AIDS, Alzheimer's disease, pain, renal failure), substance abuse, cancer, depression, hypochondriasis

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Family Coping: Capacity of the family to manage stressors that tax family resources

Family Normalization: Capacity of a family to develop strategies for optimal functioning when a member has a chronic illness or disability

Caregiver-Patient Relationship: Positive interactions and connections between the caregiver and care recipient

Family Will (Include Specific Time Frame)

- Identify resources within themselves to deal with the situation.
- Interact appropriately with the client, providing support and assistance, as indicated.
- Provide opportunity for client to deal with situation in own way.
- Verbalize knowledge and understanding of illness, disability, or condition.

- Express feelings honestly.
- Identify need for and seek outside support.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Family Involvement Promotion: Facilitating participation of family members in the emotional and physical care of the patient

Family Support: Promotion of family values, interests, and goals

Caregiver Support: Provision of the necessary information, advocacy, and support to facilitate primary patient care by someone other than a healthcare professional

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify underlying situation(s) that may contribute to the inability of family to provide needed assistance to the client. *Circumstances may have preceded the illness and now have a significant effect (e.g., client was a substance abuser; client had a heart attack during sexual activity, and mate is afraid any activity may cause a repeat).*¹
-  Note cultural factors related to family relationships that may be involved in problems of caring for member who is ill. *Family composition and structure, methods of decision making, and gender issues and expectations will affect how family deals with stress of illness/negative prognosis. Depending on role the ill client has in the family (e.g., mother or father), other members may have difficulty assuming authoritative role and managing the family.*⁶
- Note the length of illness or condition (e.g., cancer, multiple sclerosis) and/or other long-term situations that may exist. *Chronic or unresolved illness, accompanied by changes in role performance or responsibility, often exhausts supportive capacity and coping abilities of significant other (SO)/family.*¹
- Assess information available to and understood by the family/SO(s). *Access to and understanding of information regarding the specific illness or condition, treatment, and prognosis are essential to family cooperation and care of the client.*^{2,3}
- Discuss family perceptions of situation. *Expectations of client and family members may/may not be realistic and may interfere with ability to cope with situation.*¹
- Identify role of the client in family and how illness has changed the family organization. *Illness affects how client performs usual functions in the family and affects how others in the family take over those responsibilities. These changes may result in dysfunctional behaviors, anger, hostility, and hopelessness.*¹
- Note factors (beside the client's illness) that are affecting abilities of family members to provide needed support. *Individual members' preoccupation with own needs and concerns can interfere with providing needed care or support during stresses of long-term illness. Additionally, caregivers may incur decreased or lost income or risk losing own health insurance if they alter their work hours to care for client.*¹

NURSING PRIORITY NO. 2 To assist family to reactivate/develop skills to deal with current situation:

- Listen to client's/SO's comments, remarks, and expression of concern(s). Note nonverbal behaviors and responses and congruency. *Provides information and promotes understanding of client's view of the illness and needs related to current situation.*
- Encourage family members to verbalize feelings openly and clearly. *Promotes understanding of feelings in relationship to current events and helps them to hear what other person is saying, leading to more appropriate interactions.*⁵
- Discuss underlying reasons for client's behavior. *Helps family/SO understand and accept or deal with client behaviors that may be triggered by emotional or physical effects of illness.*⁴

- Assist the family and client to understand “who owns the problem” and who is responsible for resolution. Avoid placing blame or guilt. *When these boundaries are defined, each individual can begin to take care of own self and stop taking care of others in inappropriate ways.*^{3,4}
- Encourage client and family to develop problem-solving skills to deal with the situation. *Use of these skills enables each member of the family to identify what he or she sees as the problem to be dealt with and contribute ideas for solutions that are acceptable to him or her, promoting more effective interactions among the family members.*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide information for family/SO(s) about specific illness/condition. *Promotes better understanding of need for following therapeutic regimen to provide maximum benefit.*⁸
- Involve client and family in planning care as often as possible. *When family members are knowledgeable and understand needs, commitment to plan is enhanced.*^{7,8}
- Promote assistance of family in providing client care, as appropriate. *Identifies ways of demonstrating support while maintaining client's independence (e.g., providing favorite foods, engaging in diversional activities).*⁵
-  Refer to appropriate resources for assistance, as indicated (e.g., counseling, psychotherapy, financial, spiritual). *May need additional help, and getting to the appropriate resource provides accurate help for individual situation (e.g., family counseling, financial planning).*^{7,8}
- Refer to NDs Anxiety, Death Anxiety, ineffective Coping, readiness for enhanced family Coping, disabled family Coping, Fear, Grieving, as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including current and past coping behaviors, emotional response to situation and stressors.
- Availability and use of support systems.

Planning

- Plan of care, who is involved in planning, and areas of responsibility.
- Teaching plan.

Implementation/Evaluation

- Responses of family members/client to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans and who is responsible for actions.
- Specific referrals made.

defensive Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00071) [**Diagnostic Division:** Ego Integrity], Approved 1988; Revised 2008

DEFINITION: Repeated projection of falsely positive self-evaluation based on a self-protective pattern that defends against underlying perceived threats to positive self-regard.

RELATED FACTORS

Conflict between self-perception and value system; uncertainty
 Insufficient confidence in others; insufficient support systems
 Insufficient resilience
 Unrealistic self-expectations

DEFINING CHARACTERISTICS

Subjective

Denial of problems or weaknesses
 Hypersensitive to a discourtesy or criticism
 Projection of blame or responsibility
 Rationalization of failures

Objective

Alteration in reality testing; reality distortion
 Difficulty establishing or maintaining relationships
 Grandiosity
 Insufficient participation in or follow-through with treatment
 Superior attitude toward others; ridicule of others; hostile laughter

Sample Clinical Applications: Eating disorders, substance abuse, chronic illness; bipolar, adjustment, or dissociative disorders

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Acceptance: Health Status: Personal actions to reconcile change in health circumstances

Coping: Personal actions to manage stressors that tax an individual's resources

Social Interaction Skills: Personal behaviors that promote effective relationships

Client Will (Include Specific Time Frame)

- Verbalize understanding of own problems and stressors.
- Identify areas of concern or problems.
- Demonstrate acceptance of responsibility for own actions, successes, and failures.
- Participate in treatment program or therapy.
- Maintain involvement in relationships.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

(continues on page 214)

defensive Coping (continued)

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

Counseling: Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem solving, and interpersonal relationships

NURSING PRIORITY NO. 1 To determine degree of impairment:

- Assess ability to comprehend current situation, developmental level of functioning. *Crucial to planning care for this individual. Client will typically have difficulty communicating and responding emotionally in an expected manner in these circumstances.*¹
- Determine level of anxiety and effectiveness of current coping mechanisms. *Severe anxiety will interfere with ability to cope, and client will need to assess what is working and develop new ways to deal with current situation.*²
-  Perform or review results of testing, such as the Taylor Manifest Anxiety Scale and Marlowe-Crowne Social Desirability Scale, as indicated. *Helps to identify coping styles, enabling more accurate therapeutic interventions.*⁷
- Determine coping mechanisms used (e.g., projection, avoidance, rationalization) and purpose of coping strategy (e.g., may mask low self-esteem). *Provides information about how these behaviors affect current situation.*³
- Assist client to identify and consider need to address problem differently. *Until client is willing to consider different approaches to dealing with situation, little progress can be expected.*¹
- Describe all aspects of the problem through the use of therapeutic communication skills such as active-listening. *Provides an opportunity for the client to clarify the situation and begin to look at options for problem solving.*²
- Observe interactions with others. *Noting difficulties and ability to establish satisfactory relationships can provide clues to client behaviors that interfere with interactions with others.*²
- Note availability of family/friends support for client in current situation. *Significant others may not be supportive when person is denying problems or exhibiting unacceptable behaviors.*⁶
- Note expressions of grandiosity in the face of contrary evidence (e.g., “I’m going to buy a new car” when the individual has no job or available finances). *Evidence of distorted thinking and possibility of mental illness.*³
- Assess physical condition. *Defensive coping style has been connected with physical well-being and illnesses, especially chronic health concerns (e.g., congestive heart failure, diabetes, chronic fatigue syndrome).*⁵

NURSING PRIORITY NO. 2 To assist client to deal with current situation:

- Provide explanation of rules of the treatment program and discuss consequences of lack of cooperation. Encourage client participation in setting of consequences and agreement to them. *Promotes understanding and possibility of cooperation on the part of the client, especially when client has been involved in the decisions.*²
- Set limits on manipulative behavior; be consistent in enforcing consequences when rules are broken and limits tested. *Providing clear information and following through on identified consequences reduces the ability to manipulate staff or therapist and environment.*³
- Develop therapeutic relationship to enable client to test new behaviors in a safe environment. Use positive, nonjudgmental approach and “I” messages. *Promotes sense of self-esteem and enhances sense of control.*
- Encourage control in all situations possible; include client in decisions and planning. *Preserves autonomy, enabling realization of sense of self-worth.*

- Acknowledge individual strengths and incorporate awareness of personal assets and strengths in plan. *Promotes use of positive coping behaviors and progress toward effective solutions.*⁴
- Convey attitude of acceptance and respect (unconditional positive regard). *Avoids threatening client's self-concept, preserving existing self-esteem.*²
- Encourage identification and expression of feelings. *Provides opportunity for client to learn about and accept self and feelings as normal.*²
- Provide or encourage use of healthy outlets for release of hostile feelings (e.g., punching bags, pounding boards). Involve in outdoor recreation program when available. *Promotes acceptable expression of these feelings, which, when unexpressed, can lead to development of undesirable behaviors and make situation worse.*⁴
- Provide opportunities for client to interact with others in a positive manner. *Promotes self-esteem and encourages client to learn how to develop and enhance relationships.*⁴
- Assist client with problem-solving process. Identify and discuss responses to situation, maladaptive coping skills. Suggest alternative responses to situation. *Helps client select more adaptive strategies for coping.*²
- Use confrontation judiciously to help client begin to identify defense mechanisms (e.g., denial, projection) that are hindering development of satisfying relationships.²
-  Assist with treatments for physical illnesses as appropriate. *Taking care of physical self will enable client to deal with emotional and psychological issues more effectively.*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Use cognitive-behavioral therapy. *Helps change negative thinking patterns when rigidly held beliefs are used by client to defend the individual against low self-esteem.*³
- Encourage client to learn and use relaxation techniques, guided imagery, and positive affirmation of self. *Enables client to incorporate and practice new behaviors to deal with stressors and view or respond to situation in a more realistic and positive manner.*⁴
- Promote involvement in activities or classes as appropriate. *Client can practice new skills, develop new relationships, and learn new and positive ways of interacting with others.*¹
-  Refer to additional resources (e.g., substance rehabilitation, family or marital therapy), as indicated. *Can be useful in making desired changes and developing new coping skills.*²
- Refer to ND ineffective Coping for additional interventions.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, client perception of the present situation, presenting behaviors.
- Usual coping methods, degree of impairment.
- Health concerns.

Planning

- Plan of care, specific interventions, and who is involved in development of the plan.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Referrals and follow-up programming.

disabled family Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00073) [Diagnostic Division: Social Interaction], Submitted 1980; Revised 1996, 2008

DEFINITION: Behavior of primary person (family member, significant other, or close friend) that disables his or her capacities and the client’s capacities to effectively address tasks essential to either person’s adaptation to the health challenge.

RELATED FACTORS

Ambivalent family relationships
Chronically unexpressed feelings by support person
Differing coping styles between support person and client
Differing coping styles between support persons
Inconsistent management of family’s resistance to treatment

DEFINING CHARACTERISTICS

Subjective

[Expresses despair regarding family reactions or lack of involvement]

Objective

Abandonment; depression
Adopts illness symptoms of client; psychosomatic symptoms
Agitation; aggression; hostility; intolerance
Client dependence; family behaviors detrimental to well-being; neglect of relationship of family member
Disregard for client’s needs; neglect of basic needs or treatment regimen of client; performing routines without regard for client’s needs; prolonged hyperfocus on client; distortion of reality about client’s health problems
Impaired ability to structure a meaningful life; impaired individualism

Sample Clinical Applications: Chronic conditions (e.g., chronic obstructive pulmonary disease [COPD], AIDS, Alzheimer’s disease, chronic pain, renal failure, brain/spinal cord injury [SCI]), substance abuse, cancer, genetic conditions (e.g., Down syndrome, sickle cell disease, Huntington’s disease), depression, hypochondriasis

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Family Normalization: Capacity of a family to develop strategies for optimal functioning when a member has a chronic illness or disability

Family Coping: Capacity of the family to manage stressors that tax family resources

Caregiver Role Endurance: Factors that promote family care provider's capacity to sustain caregiving over an extended period of time

Family Will (Include Specific Time Frame)

- Verbalize more realistic understanding and expectations of the client.
- Visit or contact client regularly.
- Participate positively in care of client, within limits of family's abilities and client's needs.
- Express feelings and expectations openly and honestly as appropriate.
- Access available resources/services to assist with required care.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Family Therapy: Assisting family members to move their family toward a more productive way of living

Family Support: Promotion of family values, interests, and goals

Family Involvement Promotion: Facilitating participation of family members in the emotional and physical care of the patient

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Ascertain pre-illness behaviors and interactions of the family. *Provides comparative baseline for developing plan of care and determining interventions needed.*^{4,8}
- Identify current behaviors of the family members (e.g., withdrawal or not visiting, brief visits, ignoring client when visiting; anger and hostility toward client and others; ways of touching between family members; expressions of guilt). *Indicators of extent of problems existing within family. Relationships among family members before and after current illness affect ability to deal with problems of caretaking and lengthy illness.*^{1,8}
- Discuss family perceptions of situation. *Expectations of client and family members may not be realistic and may interfere with ability to deal with situation.*⁶
-  Note cultural factors related to family relationships that may be involved in problems of caring for member who is ill. *Family composition and structure, methods of decision making, gender issues, and expectations will affect how family perceives situation and deals with stress of illness, negative prognosis.*⁷
- Note other factors that may be stressful for the family (e.g., financial difficulties or lack of community support, as when illness occurs when out of town). *Appropriate referrals can be made to provide information and assistance as needed. If not addressed, these problems can lead to caregiver burnout and compassion fatigue.*⁶
- Determine readiness of family members to be involved with care of the client. *Family members are involved in their lives, jobs, and families and may find it difficult to manage tasks necessary for helping with care of the client.*^{5,6}

NURSING PRIORITY NO. 2 To provide assistance to enable family to deal with the current situation:

- Establish rapport with family members who are available. *Promotes therapeutic relationship and support for problem-solving solutions.*¹

- Acknowledge difficulty of the situation for the family. *Communicates understanding of family's feelings and can reduce blaming and guilt feelings.*²
- Active-listen to concerns, note both overconcern and lack of concern. *Identifies accuracy of client's information and measure of concern, which may interfere with ability to resolve situation.*²
- Allow free expression of feelings, including frustration, anger, hostility, and hopelessness, while placing limits on acting out or inappropriate behaviors. *Provides opportunity to identify accuracy and validate appropriateness of feelings. Limits or minimizes risk of violent behavior.*⁴
- Give accurate information to SO(s) from the beginning. *Establishes trust and promotes opportunity for clarification and correction of misunderstandings.*⁴
-  Act as liaison between family and healthcare providers. *Establishes single contact to provide explanations and clarify treatment plan, enhancing reliability of information.*⁴
-  Provide brief, simple explanations about use and alarms when equipment (such as a ventilator) is required. Identify appropriate professional(s) for continued support and problem solving. *Having information and ready access to appropriate resources can reduce feelings of helplessness and promote sense of control.*¹
- Provide time for private interaction between client and family/SO(s). *Individuals need to talk about what is happening and process new and frightening information to learn to deal with situation or diagnosis within family relationships.*³
-  Accompany family when they visit client. *Being available for questions, concerns, and support promotes trusting relationship in which family feels free to learn all they can about situation or diagnosis.*³
- Assist SO(s) to initiate therapeutic communication with client. *Learning to use new methods of communication (active-listening and "I" messages) can enhance relationships and promote effective problem solving for the family.*³
- Include SO(s) in the plan of care. Provide instruction and demonstrate necessary skills. *Promotes family's ability to provide care and develop a sense of control over difficult situation.*^{4,5}
-  Refer client to protective services as necessitated by risk of physical harm or neglect. *Removing client from home is sometimes necessary to individual safety. May reduce stress on family to allow opportunity for therapeutic intervention.*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Assist family to identify coping skills being used and how these skills are or are not helping them deal with situation. *When family members know this information, they can begin to enhance those skills that are more effective in promoting healthy family functioning in difficult times.*⁴
- Answer family's questions patiently and honestly. Reinforce information provided by other providers. *Continues trusting relationship with family members and promotes understanding of the situation/prognosis so family members can deal more effectively with what is happening.*¹
- Reframe negative expressions into positive whenever possible. *A positive frame contributes to supportive interactions and can lead to better outcomes.*³
- Respect family needs for withdrawal and intervene judiciously. *Situation may be overwhelming, and time away can be beneficial to continued participation. A brief respite can refresh family members who are serving as caregivers and permit renewed ability to manage situation.*¹
- Encourage family to deal with the situation in small increments rather than trying to deal with the whole picture. *Reduces likelihood of individual being overwhelmed by possibilities that may face them in potentially disabling or fatal outcomes.*¹
- Assist the family to identify familiar things that would be helpful to the client (e.g., a family picture on the wall), especially when hospitalized for a long time, such as in hospice or long-term care. *Reinforces and maintains orientation and provides a sense of home and family for client.*^{1,5}
- Refer family to appropriate resources as needed (e.g., family therapy, financial counseling, spiritual advisor). *May need additional help to deal with difficult situation or illness.*⁶
- Refer to ND Grieving as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, current and past behaviors, family members who are directly involved and support systems available.
- Emotional response(s) to situation or stressors.
- Specific health and therapy challenges.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses of individuals to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Ongoing needs, available resources, other follow-up recommendations, and who is responsible for actions.
- Specific referrals made.

ineffective Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00069) [Diagnostic Division: Ego Integrity], Submitted 1978; Revised 1998

DEFINITION: A pattern of invalid appraisal of stressors with cognitive and or behavioral efforts that fails to manage demands related to well-being, inadequate choices of practiced responses, and/or inability to use available resources.

RELATED FACTORS

High degree of threat; inaccurate threat appraisal

Inability to conserve adaptive energies; inadequate tension release strategies; insufficient sense of control

Inadequate confidence in ability to deal with a situation; inadequate opportunity to prepare for stressor

Inadequate resources; insufficient social support

(continues on page 220)

ineffective Coping (continued)

DEFINING CHARACTERISTICS

Subjective

Inability to deal with a situation or ask for help
Alteration in sleep pattern; fatigue; frequent illness
Substance abuse

Objective

Alteration in concentration; inability to attend to information
Change in communication pattern
Destructive behavior toward self or others
Difficulty organizing information
Inability to meet role expectation, basic needs
Insufficient access of social support
Insufficient goal-directed behavior, problem-solution skills, or problem resolution
Ineffective coping strategies
Risk-taking behavior

At Risk Population: Maturational or situational crisis

Sample Clinical Applications: New diagnosis of major illness, chronic conditions, major depression, substance abuse, eating disorders, bipolar disorder, social anxiety disorder, pregnancy, parenting

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Coping: Personal actions to manage stressors that tax an individual's resources

Impulse Self-Control: Self-restraint of compulsive or impulsive behaviors

Decision-Making: Ability to make judgments and choose between two or more alternatives

Client Will (Include Specific Time Frame)

- Assess the current situation accurately.
- Identify ineffective coping behaviors and consequences.
- Verbalize awareness of own coping abilities.
- Verbalize feelings congruent with behavior.
- Meet psychological needs as evidenced by appropriate expression of feelings, identification of options, and use of resources.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Impulse Control Training: Assisting the patient to mediate impulsive behavior through application of problem-solving strategies to social and interpersonal situations

NURSING PRIORITY NO. 1 To determine degree of impairment:

- Identify individual stressors (e.g., family, social, work environment, life changes or nursing/healthcare management). *Helps define problem(s), providing a starting point for intervention.*¹
- Evaluate ability to understand events, provide realistic appraisal of situation. *Necessary information for developing workable plan of care.*²
- Identify developmental level of functioning. *Recognizing that people tend to regress to a lower developmental stage during illness or crisis enables more appropriate interventions to be implemented.*²
- Assess current functional capacity and note how it is affecting the individual's coping ability. *Promotes identification of strategies that will be helpful in current situation.*
- Determine alcohol intake, drug use, smoking habits, and sleeping and eating patterns. *Substance abuse impairs ability to deal with what is happening in current situation. Identification of impaired sleeping and eating patterns provides clues to extent of anxiety and impaired coping.*^{2,3,14}
- Ascertain impact of illness on sexual needs and relationship. *Illnesses, medications, and many treatment regimens can affect sexual functioning, further stressing coping ability.*^{2,3}
- Assess level of anxiety and coping on an ongoing basis. *Identifies changes in ability to cope and worsening of ability to understand at an early stage where intervention can be most effective.*⁴
- Note speech and communication patterns. Be aware of negative or catastrophizing thinking. *Identifies existing problems and assesses ability to understand situation and communicate needs.*^{7,13}
- Observe and describe behavior in objective terms. Validate observations. *Promotes accuracy and assures correctness of conclusions to arrive at the best possible solutions.*⁷

NURSING PRIORITY NO. 2 To assess coping abilities and skills:

- Ascertain client's understanding of current situation and its impact on life and work. *Client may not understand situation, and being aware of these factors is necessary to planning care and identifying appropriate interventions.*⁸
- Active-listen and identify client's perceptions of what is happening and effectiveness of coping techniques. *Reflecting client's thoughts can provide a forum for understanding perceptions in relation to reality for planning care and determining accuracy of interventions needed.*^{2,3}
-  Discuss cultural background and whether some beliefs from family may contribute to difficulties coping with situation. *Family of origin can have a positive or negative effect on individual's ability to deal with stressful situations.*⁵
- Evaluate client's decision-making ability. *When ability to make decisions is impaired by illness or treatment regimen, it is important to take this into consideration when planning care to maximize participation and positive outcomes.*⁹
- Determine previous methods of dealing with life problems. *Identifies successful techniques that can be used in current situation. Often client is preoccupied by current concerns and does not think about previous successful skills.*⁸

NURSING PRIORITY NO. 3 To assist client to deal with current situation:

- Call client by name. Ascertain how client prefers to be addressed. *Using client's name enhances sense of self and promotes individuality and self-esteem.*²
- Encourage communication with staff/significant others (SOs). *Developing positive interactions between staff, SO(s), and client ensures that everyone has the same understanding.*⁸
- Use reality orientation (e.g., clocks, calendars, bulletin boards) and make frequent references to time and place as indicated. Place needed and familiar objects within sight for visual cues. *Often client can be disoriented by changes in routine and anxiety about illness and treatment regimens, and these measures help the client maintain orientation and a sense of reality.*⁹
- Provide for continuity of care with same personnel taking care of the client as often as possible. *Developing relationships with same caregivers promotes trust and enables client to discuss concerns and fears freely.*⁹

- Explain disease process, procedures, or events in a simple, concise manner. Devote time for listening. *May help client to express emotions, grasp situation, and feel more in control.*
-  Discuss use of medications as needed. *Short-term use of anti-anxiety medication or antidepressants may be helpful for lifting mood and encouraging individual to develop new coping skills.*⁶
- Provide for a quiet environment and position equipment out of view as much as possible. *Anxiety is increased by noisy surroundings.*
- Schedule activities so periods of rest alternate with nursing care. Increase activity slowly. *Client is weakened by illness and failure to cope with situation. Ensuring rest can promote ability to cope.*⁸
- Assist client in use of diversion, recreation, and relaxation techniques. *Learning new skills can be helpful for reducing stress and will be useful in the future as the client learns to cope more successfully.*
- Emphasize positive body responses to medical conditions, but do not negate the seriousness of the situation (e.g., stable blood pressure during gastric bleed or improved body posture in depressed client). *Acknowledging the reality of the illness while accurately stating the facts can provide hope and encouragement.*⁸
- Encourage client to try new coping behaviors and gradually master situation. *Practicing new ways of dealing with what is happening leads to being more comfortable and can promote a positive outcome as client relaxes and handles illness and treatment regimen more successfully.*⁹
- Confront client when behavior is inappropriate, pointing out difference between words and actions. *Provides external locus of control, enhancing safety while client learns self-control.*²
- Assist in dealing with change in concept of body image as appropriate. (Refer to ND disturbed Body Image.) *New view of self may be negative, and client needs to incorporate change in a positive manner to enhance self-image.*¹⁰

NURSING PRIORITY NO. 4 To provide for meeting psychological needs:

- Treat the client with courtesy and respect. Converse at client's level, providing meaningful conversation while performing care. *Enhances therapeutic relationship.*²
- Take advantage of teachable moments. *Individuals learn best and are open to new information when they feel accepted and are in a comfortable environment.*¹⁰
- Allow client to react in own way without judgment by staff/caregivers. Provide support and diversion as indicated. *Unconditional positive regard and support promote acceptance, enabling client to deal with difficult situation in a positive way.*⁸
- Encourage verbalization of fears and anxieties and expression of feelings of denial, depression, and anger. *Free expression allows for dealing with these feelings, and when the client knows that these are normal reactions, he or she can deal with them better.*¹⁰
- Help client to learn how to substitute positive thoughts for negative ones (i.e., "I can do this; I am in charge of myself"). *The mind plays a significant role in one's response to stressors, and negative thoughts can actually increase the impact of the stressor.*¹³
- Provide opportunity for expression of sexual concerns. *Important aspect of person that may be difficult to express. Providing an opening for discussion by asking sensitive questions allows client to talk about concerns.*¹⁰
- Help client to set limits on acting-out behaviors and learn ways to express emotions in an acceptable manner. *Enables client to gain sense of self-esteem, promoting internal locus of control.*²

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-  Give updated or additional information needed about events, cause (if known), and potential course of illness as soon as possible. *Knowledge helps reduce anxiety or fear and allows client to deal with reality.*⁸
- Provide and encourage an atmosphere of realistic hope. *Promotes optimistic outlook, energizing client to address situation. Client needs to hear positive things while undergoing difficult circumstances.*⁸
-  Give information about purposes and side effects of medications and treatments. *Client feels included (promoting sense of control), enabling client to cope with situation in a more positive manner.*⁸

-  Emphasize importance of follow-up care. *Checkups verify that regimen is being followed accurately and that healing is progressing to promote a satisfactory outcome.*⁸
- Encourage and support client in evaluating lifestyle, occupation, and leisure activities. *Helps client to look at difficult areas that may contribute to anxiety and ability to cope and to make changes gradually without undue or debilitating anxiety.*^{8,14}
- Discuss effects of stressors (e.g., family, social, work environment, or nursing/healthcare management) and ways to deal with them. *Addressing these factors will enable client to develop strategies to make changes needed to promote wellness.*⁸
- Provide for gradual implementation and continuation of necessary behavior or lifestyle changes. *Change is difficult, and beginning slowly enhances commitment to plan.*⁸
- Discuss or review anticipated procedures and client concerns, as well as postoperative expectations when surgery is recommended. *Knowledge allays fears and helps client to understand procedures and treatments and expected results. When client has prior information about what to expect during postoperative course, he or she will remain calm, anxiety will be reduced, and client will cope more effectively with situation.*^{10,12}
-  Refer to outside resources and professional therapy as indicated or ordered. *May be necessary to assist with long-term improvement.*¹⁰
- Determine desire for religious representative or spiritual counselor and facilitate arrangements for visit. *Spiritual needs are an integral part of being human, and determining and meeting individual preferences help client deal with concerns and desires for discussion or assistance in this area.*¹¹
-  Provide information or consultation as indicated for sexual concerns. Provide privacy when client is not in home. *Individuals are sexual beings, and concerns about role in family/relationship and ability to function are often not readily expressed. Discussion opens opportunity for clarification and understanding and helps to meet need for intimacy.*¹⁰
- Refer to other NDs as indicated (e.g., Anxiety, impaired verbal Communication, acute/chronic Pain, risk for self/other-directed Violence).

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline findings, degree of impairment, and client's perceptions of situation.
- Coping abilities and previous ways of dealing with life problems.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Medication dose, time, and client's response.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and actions to be taken.
- Support systems available, specific referrals made, and who is responsible for actions to be taken.

ineffective community Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00077) [Diagnostic Division: Social Interaction], Approved 1994; Revised 1998, 2017

DEFINITION: A pattern of community activities for adaptation and problem-solving that is unsatisfactory for meeting the demands or needs of the community.

RELATED FACTORS

Inadequate resources for problem-solving
Insufficient community resources
Nonexistent community systems

DEFINING CHARACTERISTICS

Subjective

Community does not meet expectations of its members
Perceived community vulnerability or powerlessness
Excessive stress

Objective

Deficient community participation
Elevated community illness rate
Excessive community conflict
High incidence of community problems [e.g., homicides, vandalism, robbery, terrorism, abuse, unemployment, poverty, militancy, mental illness]

At Risk Population: History of/exposure to disaster

Sample Clinical Applications: High rate of illness, injury, or violence in community

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Community Competence: Capacity of a community to collectively problem-solve to achieve community goals

Community Health Status: General state of well-being of a community or population

Community Disaster Readiness: Community preparedness to respond to a natural or man-made calamitous event

Community Will (Include Specific Time Frame)

- Recognize negative and positive factors affecting community's ability to meet its demands or needs.
- Identify alternatives to inappropriate activities for adaptation and problem-solving.
- Report a measurable increase in necessary or desired activities to improve community functioning.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Community Health Development: Assisting members of a community to identify a community's health concerns, mobilize resources, and implement solutions

Environmental Management: Community: Monitoring and influencing of the physical, social, cultural, economic, and political conditions that affect the health of groups and communities

Community Disaster Preparedness: Preparing for an effective response to a large-scale disaster

NURSING PRIORITY NO. 1 To identify causative or precipitating factors:

- Evaluate community activities as related to meeting collective needs within the community itself and between the community and the larger society. *Determines what activities are currently available and what needs are not being met, either by the local or county/state entities. Provides information on which to base the steps needed to begin planning for desired changes.*¹
- Note community reports of community functioning (e.g., immunization status, transportation, water supply, financing), including areas of weakness or conflict. *Community is responsible for identifying needed changes for possible action.*¹
- Identify effects of Related Factors on community activities. Note immediate needs (e.g., healthcare, food, shelter, funds). *Provides a baseline to determine community needs, and identifying factors that are pertinent to the community allows community to deal with current concerns.*^{1,5}
- Plan for the possibility of a disaster when determined by current circumstances. *In relation to threats, terrorist activities, and natural disasters, actions need to be coordinated between the local and the larger community.*⁵
- Determine availability and use of resources. *Helpful to begin planning to correct deficiencies that have been identified. Sometimes even though resources are available, they are not being appropriately or fully used.*²
- Identify unmet demands or needs of the community. *Determining deficiencies is a crucial step to developing an accurate plan for correction. Sometimes elected bodies see the problems differently from the general population and conflict can arise; therefore, it is important for communication to resolve the issues that are in question.*²

NURSING PRIORITY NO. 2 To assist the community to reactivate/develop skills to deal with needs:

- Determine community strengths. *Promotes understanding of ways in which community is already meeting identified needs, and once identified, they can be built on to develop plan to improve community.*¹
- Identify and prioritize community goals. *Goals enable the identification of actions to direct the changes that are needed to improve the community. Prioritizing enables actions to be taken in order of importance.*¹
- Encourage community members/groups to engage in problem-solving activities. *Individuals who are involved in the problem-solving process and make a commitment to the solutions have an investment and are more apt to follow through on their commitments.*^{3,5}
- Develop a plan jointly with community to deal with deficits in support. *Working together will enhance efforts and help to meet identified goals.*^{3,5}

NURSING PRIORITY NO. 3 To promote wellness as related to community health:

-  Create plans managing interactions within the community itself and between the community and the larger society. *These activities will meet collective needs.*¹
- Assist the community to form partnerships within the community and between the community and the larger society. *Promotes long-term development of the community to deal with current and future problems.*¹
- Provide channels for dissemination of information to the community as a whole (e.g., Web sites, print media; radio and TV reports, community bulletin boards; speakers' bureau; reports to committees, councils, advisory boards on file and accessible to the public). *Having information readily available for everyone provides opportunity for all members of the community to know what is being planned and have input into the planning. Keeping community informed promotes understanding of needs and plans and probability of follow-through to successful outcomes.*¹
-  Make information available in different modalities and geared to differing educational levels and cultural and ethnic populations of the community. *Ensures understanding by all members of the community and promotes cooperation with planning and follow-through.*¹
- Seek out and evaluate underserved populations, including the homeless. *These members of the community often need to be helped to become productive citizens and be involved in the changes that are occurring.*³
- Work with community members to identify lifestyle changes that can be made to meet the goals identified to improve community deficits. *Changing lifestyles can promote a sense of power and encourage members to become involved in improving their community.*^{4,5}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including perception of community members regarding problems.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response of community entities to plan, interventions, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans and who is responsible for actions to be taken.

readiness for enhanced Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00158) [Diagnostic Division: Ego Integrity], Submitted 2002; Revised 2013

DEFINITION: A pattern of valid appraisal of stressors with cognitive and/or behavioral efforts to manage demands related to well-being, which can be strengthened.

DEFINING CHARACTERISTICS**Subjective**

Expresses desire to enhance knowledge of stress management strategies and management of stressors

Expresses desire to enhance use of emotion-oriented strategies and problem-oriented strategies

Expresses desire to enhance social support and use of spiritual resources

Awareness of possible environmental change

Sample Clinical Applications: Chronic health conditions (e.g., asthma, diabetes mellitus, arthritis, systemic lupus, multiple sclerosis [MS], AIDS), mental health concerns (e.g., seasonal affective disorder, attention deficit disorder, Down syndrome)

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Coping: Personal actions to manage stressors that tax an individual's resources

Personal Well-Being: Extent of positive perception of one's health status

Quality of Life: Extent of positive perception of current life circumstances

Client Will (Include Specific Time Frame)

- Assess current situation accurately.
- Identify effective coping behaviors currently being used.
- Verbalize feelings congruent with behavior.
- Meet psychological needs as evidenced by appropriate expression of feelings, identification of options, and use of resources.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

Self-Modification Assistance: Reinforcement of self-directed change initiated by the patient to achieve personally important goals

NURSING PRIORITY NO. 1 To determine needs and desire for improvement:

- Evaluate client's understanding of situation and ability to provide realistic appraisal of situation. *Provides information about client's perception, cognitive ability, and whether the client is aware of the facts of the situation, which reveals essential information for planning care.*¹
- Determine stressors that may be affecting client. *Accurate identification of situation that client is dealing with provides information for planning interventions to enhance coping abilities.*¹

- Ascertain motivation and expectations for change. *Motivation to improve and high expectations can encourage client to make changes that will improve his or her life. However, presence of external locus of control or unrealistic expectations may hamper efforts.*⁵
- Identify social supports available to client. *Available support systems, such as family/friends, can provide client with ability to handle current stressful events, and “talking it out” with an empathic listener will help client move forward to enhance coping skills.*²
- Review coping strategies client is aware of and currently using. *The desire to improve one’s coping ability is based on an awareness of the status of the stressful situation.*²
- Determine use of alcohol or other drugs and smoking habits during times of stress. *Recognition that substituting these actions or old habits for dealing with anxiety increases individual’s awareness of opportunity to choose new ways to cope with life stressors.*⁶
- Assess level of anxiety and coping on an ongoing basis. *Provides baseline to develop plan of care to improve coping abilities.*²
- Note speech and communication patterns. *Assesses ability to understand and provides information necessary to help client make progress in desire to enhance coping abilities.*²
- Evaluate client’s decision-making ability. *Understanding client’s ability provides a starting point for developing plan and determining what information client needs to develop more effective coping skills.*¹

NURSING PRIORITY NO. 2 To assist client to develop enhanced coping skills:

- Active-listen and clarify client’s perceptions of current status. *Reflecting client’s statements and thoughts can provide a forum for understanding perceptions in relation to reality for planning care and determining accuracy of interventions needed.*⁴
- Review previous methods of dealing with life problems. *Enables client to identify successful techniques used in the past, promoting feelings of confidence in own ability.*²
- Discuss desire to improve ability to manage stressors of life. *Understanding client’s decision to seek new information to enhance life will help client determine what is needed to learn new coping skills.*²
- Discuss client’s understanding of concept of knowing what can and cannot be changed. *Acceptance of reality that some things cannot be changed allows client to focus energies on dealing with things that can be changed.*⁶
- Help client strengthen problem-solving skills. *Learning the process for problem solving will promote successful resolution of potentially stressful situations that arise.*^{4,6}

NURSING PRIORITY NO. 3 To promote optimal well-being (Teaching/Learning Considerations):

- 🏠 Discuss predisposing factors related to individual’s response to stress. *Understanding that genetic influences, past experiences, and existing conditions determine whether a person’s response is adaptive or maladaptive will give client a base on which to continue to learn what is needed to improve life.*³
- Encourage client to develop a stress-management program. *An individualized program of relaxation, meditation, etc., enhances sense of balance in life and strengthens client’s ability to manage challenging situations.*⁵
- Recommend involvement in activities of interest, such as exercise/sports, music, and art. *Individuals must decide for themselves what coping strategies are adaptive for them. Most people find enjoyment and relaxation in these kinds of activities.*⁶
- Discuss possibility of doing volunteer work in an area of the client’s choosing. *Many individuals report satisfaction in giving of themselves—involvement with caring for others/pets, and client may find sense of fulfillment in service to others.*¹
- Refer to classes and/or reading material and Web sites, as appropriate. *May be helpful to further learning and pursuing goal of enhanced coping ability.*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Baseline information, client's perception of need to enhance abilities.
- Coping abilities and previous ways of dealing with life problems.
- Motivation and expectation for change.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and actions to be taken.
- Support systems available, specific referrals made, and who is responsible for actions to be taken.

readiness for enhanced community Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00076) [Diagnostic Division: Social Interaction], Approved 1994; Revised 2013

DEFINITION: A pattern of community activities for adaptation and problem-solving for meeting the demands or needs of the community, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

- Expresses desire to enhance problem-solving for identified issue, planning for predictable stressors
- Expresses desire to enhance community responsibility for stress management, resources for managing stressors
- Expresses desire to enhance communication among community members, between groups and larger community
- Expresses desire to enhance availability of community recreation/relaxation programs

(continues on page 230)

readiness for enhanced community Coping (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Community Competence: Capacity of a community to collectively problem-solve to achieve community goals

Community Health Status: General state of well-being of a community or population

Community Disaster Readiness: Community preparedness to respond to a natural or man-made calamitous event

Community Will (Include Specific Time Frame)

- Identify positive and negative factors affecting management of current and future problems/stressors.
- Have an established plan in place to deal with identified problems and stressors.
- Describe management of challenges in characteristics that indicate effective coping.
- Report a measurable increase in ability to deal with problems and stressors.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Program Development: Planning, implementing, and evaluating a coordinated set of activities designed to enhance wellness, or to prevent, reduce, or eliminate one or more health problems for a group or community

Environmental Management: Community: Monitoring and influencing of the physical, social, cultural, economic, and political conditions that affect the health of groups and communities

Health Policy Monitoring: Surveillance and influence of government and organization regulations, rules, and standards that affect nursing systems and practices to ensure quality care of patients

NURSING PRIORITY NO. 1 To determine existence of and deficits or weaknesses in management of current and future problems/stressors:

- Review community plan for dealing with problems and stressors, untoward events such as natural disaster or terrorist activity. *Provides a baseline for comparisons of preparedness with other communities and developing plan to address concerns.*⁴
- Assess effects of Related Factors on management of problems and stressors. *Identifying social supports available and awareness of the power of the community can enhance the plans needed to improve the community.*¹
- Identify limitations in current pattern of community activities, such as transportation, water needs, and roads. *Recognition of the factors that can be improved through adaptation and problem solving will make it easier for the community to proceed with planning to make necessary improvements.*³
- Evaluate community activities as related to management of problems and stressors within the community itself and between the community and the larger society. *Disasters occurring in a community (or in the country as a whole) affect the local community and need to be recognized and addressed.*⁴

NURSING PRIORITY NO. 2 To assist the community in adaptation and problem-solving for management of current and future needs/stressors:

- Define and discuss current needs and anticipated or projected concerns. *Agreement on scope and parameters of needs is essential for effective planning.*
- Determine community's strengths. *Plan can build on strengths to address areas of weakness.*

- Identify and prioritize goals to facilitate accomplishment. *Helps to bring the community together to meet a common concern or threat, maintain focus, and facilitate accomplishment.*⁴
- Identify and interact with available resources (e.g., persons, groups, financial, governmental, as well as other communities). *Promotes cooperation. Major catastrophes, such as earthquakes, floods, and terrorist activity, affect more than the local community, and communities need to work together to deal with and accomplish reconstruction and future growth.*⁵
- Make a joint plan with the community and the larger community to deal with adaptation and problem-solving. *Promotes management of problems and stressors to enable most effective solution for identified concern.*²
- Seek out and involve underserved and at-risk groups within the community, including the homeless. *Supports communication and commitment of community as a whole.*²

NURSING PRIORITY NO. 3 To promote optimal well-being of community:

- Assist the community to form partnerships within the community and between the community and the larger society. *Promotes long-term developmental growth of the community.*⁴
- Support development of plans for maintaining these interactions.⁵
- Establish mechanism for self-monitoring of community needs and evaluation of efforts. *Facilitates proactive—rather than reactive—responses by the community.*⁵
- Use multiple formats to disseminate information, such as TV, radio, print media, and billboards, as well as computer bulletin boards, speakers' bureau, and reports to community leaders and groups on file and accessible to the public. *Keeps community informed regarding plans, needs, and outcomes to encourage continued understanding and participation.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings and community's perception of situation.
- Identified areas of concern, community strengths and weaknesses.

Planning

- Plan and who is involved and responsible for each action.
- Teaching plan.

Implementation/Evaluation

- Response of community entities to the actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan.

Discharge Planning

- Short- and long-term plans to deal with current, anticipated, and potential problems and who is responsible for follow-through.
- Specific referrals made, coalitions formed.

readiness for enhanced family Coping

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00075) [Diagnostic Division: Social Interaction], Submitted 1980; Revised 2013

DEFINITION: A pattern of management of adaptive tasks by primary person (family member, significant other, or close friend) involved with the client's health challenge, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to acknowledge growth impact of crisis
 Expresses desire to choose experiences that optimize wellness
 Expresses desire to enhance connection with others who have experienced a similar situation
 Expresses desire to enhance health promotion, enrichment of lifestyle

Sample Clinical Applications: Genetic disorders (e.g., Down syndrome, cystic fibrosis, neural tube defects), traumatic injury (e.g., amputation, spinal cord), chronic conditions (e.g., asthma, AIDS, Alzheimer's disease)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Family Normalization: Capacity of a family to develop strategies for optimal functioning when a member has a chronic illness or disability

Family Coping: Capacity of the family to manage stressors that tax family resources

Family Functioning: Capacity of a family to meet the needs of its members during developmental transitions

Family Will (Include Specific Time Frame)

- Express willingness to look at own role in the family's growth.
- Verbalize desire to undertake tasks leading to change.
- Report feelings of self-confidence and satisfaction with progress being made.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Normalization Promotion: Assisting parents and other family members of children with chronic illnesses or disabilities in providing normal life experiences for their children and families

Family Support: Promotion of family values, interests, and goals

Family Involvement Promotion: Facilitating participation of family in the emotional and physical care of the patient

NURSING PRIORITY NO. 1 To assess situation and adaptive skills being used by the family members:

- Determine individual situation and stage of growth family is experiencing and demonstrating. *Essential elements needed to identify family needs and develop plan of care for improving communication and interactions. Changes that are occurring may help family adapt, grow, and thrive when faced with these transitional events.*^{1,6}

- Ascertain motivation and expectations for change. *Motivation to improve and high expectations can encourage individuals to make changes that will improve their lives; however, presence of external locus of control or unrealistic expectations may hamper efforts.*
- Observe communication patterns of family. Listen to family's expressions of hope, planning, and effect on relationships and life. *Provides clues to difficulties that individuals may have in expressing themselves effectively to others. Beginning to plan for the future with hope promotes changes in relationships that can enhance living for those involved.*³
- Note expressions such as "Life has more meaning for me since this has occurred." *Such statements identify change in values that may occur with the diagnosis or stress of a serious or potentially fatal illness.*¹
-  Identify cultural or religious health beliefs and expectations. *For example: Navajo parents may define family as nuclear, extended, or clan, and it is important to identify who are the primary child-rearing persons. Beliefs about causes of condition may affect how family interacts with client (e.g., African Americans may believe the condition is punishment for improper behavior and may react with anger and statements of condemnation).*⁵

NURSING PRIORITY NO. 2 To assist family to develop/strengthen potential for growth:

- Provide time to talk with family to discuss their views of the situation. *Provides an opportunity to hear family's understanding and determine how realistic their ideas are for planning how they are going to deal with situation in the most positive manner.*³
- Establish a relationship with family/client. *Therapeutic relationships foster growth and enable family to identify skills needed for coping with difficult situation or illness.*³
- Provide a role model with whom the family may identify. *Setting a positive example can be a powerful influence in changing behavior, and as family members learn more effective communication skills, consideration for others, warmth, and understanding, family relationships will be enhanced.*²
- Discuss importance of open communication and of not having secrets. *Functional communication is clear, direct, open, and honest, with congruence between verbal and nonverbal. Dysfunctional communication is indirect, vague, and controlled, with many double-bind messages. Awareness of this information can enhance relationships among family members.*³
- Demonstrate techniques such as active-listening, "I" messages, and problem solving. *Learning these skills can facilitate effective communication and improve interactions within the family.*²
- Establish social goals of achieving and maintaining harmony with oneself, family, and community. *Enables client to interact with others in positive ways.*³

NURSING PRIORITY NO. 3 To promote optimum family well-being (Teaching/Discharge Considerations):

-  Assist family to support the client in meeting own needs within ability or constraints of the illness or situation. *Family members may do too much for client or may not do enough, believing client "wants to be babied." With information and support, they can learn to allow client to take the lead in doing what he or she is able to do.*³
- Provide experiences for the family to help them learn ways of assisting and supporting client. *Learning is enhanced when individual participates in hands-on opportunities to try out new activities.*⁴
-  Discuss cultural beliefs and practices that may impact family members' interaction with client and dealing with condition. *Preconceived biases may interfere with efforts toward positive growth.*⁵
-  Identify other individuals/groups with similar conditions and assist client/family to make contact (groups such as Reach for Recovery, CanSurmount, Al-Anon, and so on). *Provides ongoing support for sharing common experiences, problem-solving, and learning new behaviors.*
- Assist family members to learn new, more effective ways of dealing with feelings and reactions. *Growth process is essential to reach the goal of enhancing the family relationships.*³

- Encourage family members to pursue personal interests, hobbies, or leisure activities *to promote individual well-being and strengthen coping abilities*.⁶

DOCUMENTATION FOCUS

Assessment/Reassessment

- Adaptive skills being used, stage of growth.
- Family communication patterns.
- Motivation and expectations for change.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified needs for follow-up care, support systems.
- Specific referral made.

Death Anxiety

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00147) [**Diagnostic Division:** Ego Integrity], Approved 1998; Revised 2006, 2017

DEFINITION: Vague uneasy feeling of discomfort or dread generated by perceptions of a real or imagined threat to one's existence.

RELATED FACTORS

Anticipation of: pain, suffering, adverse consequences of anesthesia, impact of death on others
 Confronting the reality of terminal disease; fear of the dying process; experiencing dying process; perceived imminence of death
 Discussions on the topic of death
 Negative thoughts related to death and dying; observations related to death
 Uncertainty of prognosis; nonacceptance of own mortality
 Uncertainty about: the existence of a higher power, life after death, encountering a higher power

DEFINING CHARACTERISTICS

Subjective

Concern about strain on the caregiver; worried about the impact of one's death on significant other

Deep sadness; powerlessness

Fear of: developing a terminal illness, the dying process, pain or suffering related to dying, loss of mental abilities when dying; premature death; prolonged dying process

Negative thoughts related to death and dying

At Risk Population: Discussions on the topic of death; observations related to dying process; experiencing dying process; near-death experience

Associated Condition: Terminal illness

Sample Clinical Applications: Chronic debilitating health conditions, cancer, hospital admission, impending major surgery

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Dignified Life Closure: Personal actions to maintain control when approaching end of life

Hope: Optimism that is personally satisfying and life supporting

Acceptance: Health Status: Personal actions to reconcile significant changes in health circumstances

Client Will (Include Specific Time Frame)

- Identify and express feelings (e.g., sadness, guilt, fear) freely and effectively.
- Look toward or plan for the future one day at a time.
- Formulate a plan dealing with individual concerns and eventualities of dying.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Dying Care: Promotion of physical comfort and psychological peace in the final phase of life

Spiritual Support: Assisting the patient to feel balance and connection with a greater power

Grief Work Facilitation: Assistance with the resolution of a significant loss

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine how client sees self in usual lifestyle role functioning and determine perception and meaning of anticipated loss to him/her and significant other(s) (SO(s)). *Provides information that can be compared to changes that are occurring. Understanding these factors are helpful for planning.*¹
- Ascertain current knowledge of situation. *Identifies misconceptions, lack of information, and other pertinent issues and determines accuracy of knowledge. Healthcare providers may not be anticipating death at this time or in current situation.*¹
- Determine client's role in family constellation. Observe patterns of communication in family and response of family/SO to client's situation and concerns. *In addition to identifying areas of need or concern, this also reveals strengths useful in addressing the current concerns.*³
- Assess impact of client reports of subjective experiences and experience with death (or exposure to death); for example, witnessed violent death, as a child viewed body in casket, etc. *Identifies possible feelings that may be affecting current situation, thus promoting accurate planning.*²
-  Identify cultural factors or expectations and impact on current situation and feelings. *These factors affect client attitude toward events and impending loss. For instance, in Russia, the head of the family is informed*

first of the impending death, as the head of the family may not want the client to know so he or she will have a peaceful death. Many cultures prefer to keep the client at home instead of in a long-term care facility or hospital. In the United States, hospice is often used to provide palliative care and comfort during the client's final days in any setting.⁴

-  Note age, physical and mental condition, and complexity of therapeutic regimen. May affect ability to handle current situation. Younger people may handle stress of illness in more positive ways. Older people may be more accepting of possibility of death. Individuals of any age will deal with situation in his/her own way, depending on diagnosis, condition, expectations, and situation.⁸
- Determine ability to manage own self-care, end-of-life decisions, and other affairs, as well as awareness and use of available resources. Information will be necessary for determining needs and planning care.⁸
- Observe behavior indicative of the level of anxiety present (mild to panic). The level of anxiety affects client's/ SO's ability to process information and participate in activities.⁵
-  Note use of drugs (including alcohol), presence of insomnia, excessive sleeping, and avoidance of interactions with others. Indicators of withdrawal and need for intervention to deal with symptoms or help client deal realistically with diagnosis or illness.⁶
- Determine sense of futility, feelings of hopelessness, helplessness, and lack of motivation to help self. Indicators of depression and need for early intervention to help client acknowledge and deal with impending death.^{7,8}
- Listen for expressions of inability to find meaning in life or suicidal ideation. Signs of depression indicating need for referral to therapist/psychiatrist and possible pharmacological treatment to help client deal with terminal illness or situation.⁷

NURSING PRIORITY NO. 2 To assist client to deal with situation:

- Provide open and trusting relationship. Promotes opportunity to explore feelings about impending death.²
- Make time for nonjudgmental discussion of philosophical issues or questions about spiritual impact of illness or situation. Can help client clarify own position on these issues.³
- Respect client's desire or request not to talk. Provide hope within parameters of the individual situation. Promotes open environment that encourages client to talk freely about thoughts and feelings. Client may not be ready to talk about situation or concerns about death, or he or she may be denying the reality of what is happening.^{1,8}
- Encourage expressions of feelings (e.g., anger, fear, sadness, etc.). Acknowledge anxiety or fear. Do not deny or reassure client that everything will be all right. Be honest when answering questions and providing information. Enhances trust and a therapeutic relationship.²
- Use therapeutic communication skills of active-listening. Technique acknowledges reality of feelings and encourages client to find own solutions.²
- Provide information about normalcy of feelings and individual grief reaction. Most individuals question their reactions and whether they are normal, and information can provide reassurance.³ (Refer to ND Grieving.)
- Identify coping skills currently used and how effective they are. Be aware of defense mechanisms being used by the client. Provides a starting point to plan care and assists client to acknowledge reality and deal more effectively with what is happening.³
- Review life experiences of loss, noting client strengths and successes. Provides opportunity to identify and use previously successful skills.²
- Provide a calm, peaceful setting and privacy, as appropriate. Promotes relaxation and enhances ability to deal with situation.⁸
- Include family in discussions and decision making, as appropriate. Involved family members can provide support and ideas for problem-solving.⁷
-  Note client's religious or spiritual orientation, involvement in religious or church activities, and presence of conflicts regarding spiritual beliefs. May benefit by referral to appropriate resource to help client resolve issues, if desired.⁷
- Assist client to engage in spiritual growth activities, experience prayer or meditation, and practice forgiveness to heal past hurts. Provide information that anger with God is a normal part of the grief process. May reduce feelings of guilt or conflict, allowing client to move forward toward resolution.¹

-  Refer to therapists, spiritual advisors, or counselors, as appropriate. *Promotes facilitation of grief work.*
-  Refer to community agencies and resources. *Assists client/SO in planning for eventualities (legal issues, hospice home care, funeral plans, etc.).*

NURSING PRIORITY NO. 3 To promote independence:

-  Support client's efforts to develop realistic steps to put plans into action. *Provides sense of control over situation in which client does not have much control.*¹
- Direct client's thoughts beyond the present state, encouraging him/her to try to enjoy each day and look to the future, as appropriate. *Being in the moment can help client enjoy this time rather than dwelling on what is ahead.*
- Provide opportunities for client to make simple decisions. *Enhances sense of control.*
- Develop individual plan using client's locus of control. *Incorporating locus of control (internal or external) enhances success of plan by enabling client/family to manage situation more effectively.*²
- Treat expressed decisions and desires with respect and convey to others, as appropriate. *Expresses regard for the individual and enhances sense of control in situation that is not controllable.*⁸
- Assist with completion of Advance Directives and cardiopulmonary resuscitation instructions. *Provides opportunity for client to understand options and express desires.*
-  Refer to palliative, hospice, or end-of-life care resources, as appropriate. *Provides support and assistance to client and SO/family through potentially complex and difficult process. Choice of type of care is dependent on timing of care (e.g., palliative care interfaces with curative treatment, which hospice does not allow).*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including client's fears and signs/symptoms being exhibited.
- Responses and actions of family/SOs.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified needs and who is responsible for actions to be taken.
- Specific referrals made.

Decisional Conflict [Specify Level]

Taxonomy II: Life Principles—Class 3 Value/Belief/Action Congruence (00083) [**Diagnostic Division:** Ego Integrity], Approved 1988; Revised 2006

DEFINITION: Uncertainty about course of action to be taken when choice among competing actions involves risk, loss, or challenge to values and beliefs.

RELATED FACTORS

Conflict with moral obligation
 Conflicting information sources; insufficient information
 Inexperience with or interference in decision making
 Moral principle, rule, or value supports mutually inconsistent actions
 Unclear personal values or beliefs; perceived threat to value system

DEFINING CHARACTERISTICS**Subjective**

Uncertainty about choices; recognizes undesired consequences of actions being considered
 Distress while attempting a decision
 Questioning of moral principle, rule, values, or personal beliefs/values while attempting a decision

Objective

Delay in decision making; vacillating among choices
 Self-focused
 Physical sign of tension or distress

Sample Clinical Applications: Therapeutic options with undesired side effects (e.g., amputation, visible scarring) or conflicting with belief system (e.g., blood transfusion, termination of pregnancy); chronic disease states, dementia, Alzheimer's disease, terminal or end-of-life situations

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Decision-Making: Ability to make judgments; choose between two or more alternatives

Health Beliefs: Personal convictions that influence health behaviors

Psychosocial Adjustment: Life Change: Psychosocial adaptation of an individual to a life change

Client Will (Include Specific Time Frame)

- Verbalize awareness of positive and negative aspect of choices and alternative actions.
- Acknowledge and ventilate feelings of anxiety and distress associated with choice or related to making difficult decision.
- Identify personal values and beliefs concerning issues.
- Make decision(s) and express satisfaction with choices.
- Meet psychological needs as evidenced by appropriate expression of feelings, identification of options, and use of resources.
- Display relaxed manner, calm demeanor, and be free of physical signs of distress.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Values Clarification: Assisting another to clarify her/his own values in order to facilitate effective decision-making

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Determine usual ability to manage own affairs. Clarify who has legal right to intervene on behalf of child/developmentally delayed adult (e.g., parent, other relative, or court-appointed guardian/advocate). *Family disruption or conflicts can complicate decision-making process. All adults have the right to make their own decisions unless a legal court has ruled the individual is incompetent and a guardian is appointed.*⁴
- Note expressions of indecision, dependence on others, and availability and involvement of support persons (e.g., lack of or conflicting advice). *Care providers need to be sensitive to the physical, cognitive, and emotional effects of illness on decision-making capabilities and whether the individual wants to be involved in making the decision.*⁶
- Ascertain dependency of other(s) on client and/or issues of codependency. *Influence of others may lead client to make decision that is not what is really wanted or in his/her best interest.*¹
- Active-listen and identify reason for indecisiveness. *Helps client to clarify problem and begin looking for resolution. May talk about uncertainty—and alternative choices that can lead to risky, uncertain outcomes—and the need to make value judgments about losses versus gains.*^{2,6}
-  Identify cultural values and beliefs or moral obligations and principles that may be creating conflict for client and complicating decision-making process. *These issues must be addressed before client can be at peace with the decision that is made.*⁵
- Determine effectiveness of current problem-solving techniques. *Provides information about client's ability to make decisions that are needed or desired.*¹
- Note presence and intensity of physical signs of anxiety (e.g., increased heart rate, muscle tension). *Client may be conflicted about the decision that is required and may need help to deal with anxiety to begin to deal with reality of situation. Different treatment decisions may have more uncertainty and generate more conflict in client.*^{2,6}
- Listen for expressions of inability to find meaning in life or reason for living, feelings of futility, or alienation from God or others. (Refer to ND Spiritual Distress, as indicated.) *May need to talk about reasons for feelings of alienation to resolve concerns and may engage in questioning about own values.*^{6,10}
- Review information client has to support the decision to be made. *Inaccurate or incomplete information and misinterpretations complicate the process and may result in a poor outcome.*^{7,8}

NURSING PRIORITY NO. 2 To assist client to develop/effectively use problem-solving skills:

- Promote safe and hopeful environment, as needed. *Client needs to be protected and supported while he or she regains inner control.*⁷
- Encourage verbalization of conflicts and concerns. *Helps client to clarify these issues so he or she can come to a resolution of the situation.*^{7,8}
- Accept verbal expressions of anger or guilt. Set limits on maladaptive behavior. *Verbalization of feelings enables client to sift through feelings and begin to deal with situation. Behavior that is inappropriate is not helpful for dealing with the situation and will lead to feelings of guilt and low self-worth.*²

- Clarify and prioritize individual goals, noting where the subject of the “conflict” falls on this scale. *Helps to identify importance of problems client is addressing, enabling realistic problem-solving.*²
- Identify strengths and use of positive coping skills (e.g., use of relaxation techniques, willingness to express feelings). *Helpful for developing solutions to current situation.*¹
- Identify positive aspects of this experience and assist client to view it as a learning opportunity. *Reframing the situation can help the client see things in a different light, enabling client to develop new and creative solutions.*¹
- Correct misperceptions client may have and provide factual information, as needed. *Promotes understanding and enables client to make better decisions for own situation.*^{1,6}
- Provide opportunities for client to make simple decisions regarding self-care and other daily activities. Accept choice not to do so. Advance complexity of choices, as tolerated. *Acceptance of what client wants to do, with gentle encouragement to progress, enhances self-esteem and ability to try more. Providing individualized decision support can help the client move to more difficult decisions.*^{1,6}
- ∞ Encourage child to make developmentally appropriate decisions concerning own care. *Fosters child’s sense of self-worth and enhances ability to learn and exercise coping skills.*⁴
- Discuss time considerations, setting time line for small steps and considering consequences related to not making or postponing specific decisions to facilitate resolution of conflict. *When time is a factor in making a decision, these strategies can promote movement toward solution.*⁴
- Have client list some alternatives to present situation or decisions, using a brainstorming process. Include family in this activity, as indicated (e.g., placement of parent in long-term care facility, use of intervention process with addicted member). *Involving family and looking at different options can promote successful resolution of decision to be made. Refer to NDs interrupted Family Processes, dysfunctional Family Processes, compromised family Coping, Moral Distress.*^{7,8}
- Practice use of problem-solving process with current situation and decision. *Promotes identification of different possibilities that may not have been thought of otherwise.*¹
- 🌐 Discuss and clarify spiritual concerns, accepting client’s values in a nonjudgmental manner. *Client will be willing to consider own situation when accepted as an individual of worth.*⁵

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Promote opportunities for using conflict-resolution skills, identifying steps as client does each one. *Learning this process can help to solve current dilemma and provide the person with skills he or she can use in the future.*³
- Provide positive feedback for efforts and progress noted. *Client needs to hear he or she is doing well, and feedback promotes continuation of efforts.*²
- Encourage involvement of family/significant others (SOs), as desired or available. *Provides support for the client and facilitates resolution.*⁹
- Support client for decisions made, especially if consequences are unexpected or difficult to cope with. *Positive feedback promotes feelings of success even when difficult situations occur or outcome is less than desired.*⁹
- 🧠 Encourage attendance at stress-reduction or assertiveness classes. *Learning these skills can help client achieve a lowered stress level that can promote ability to make decisions.*⁴
- 🧠 Refer to other resources, as necessary (e.g., clergy, psychiatric clinical nurse specialist or psychiatrist, family or marital therapist, addiction support groups). *May need this additional help to deal with complicated problems and facilitate problem-solving and decision making.*²

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, behavioral responses, degree of impairment in lifestyle functioning.
- Individuals involved in the conflict.
- Personal values and beliefs.

Planning

- Plan of care, specific interventions, and who is involved in the planning process.
- Teaching plan.

Implementation/Evaluation

- Client's and involved individuals' responses to interventions, teaching, and actions performed.
- Ability to express feelings and identify options.
- Use of resources.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, actions to be taken, and who is responsible for doing.
- Specific referrals made.

readiness for enhanced Decision-Making

Taxonomy II: Life Principles—Class 3 Value/Belief/Action Congruence (00184) [Diagnostic Division: Ego Integrity], Submitted 2006; Revised 2013

DEFINITION: A pattern of choosing a course of action for meeting short- and long-term health-related goals, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance decision making, risk-benefit analysis of decisions

Expresses desire to enhance congruency of decisions with goal/values, or sociocultural values/goal

Expresses desire to enhance understanding of choices for decision making, meaning of choices

Expresses desire to enhance use of reliable evidence for decisions

Sample Clinical Applications: Any acute or chronic condition, or healthy individual looking to improve well-being

(continues on page 242)

readiness for enhanced Decision-Making (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Decision-Making: Ability to make judgments and choose between two or more alternatives

Health Beliefs: Personal convictions that influence health behaviors

Personal Autonomy: Personal actions of a competent individual to exercise governance in life decisions

Health-Promoting Behavior: Personal actions to sustain or increase wellness

Client Will (Include Specific Time Frame)

- Identify risks and benefit of decisions.
- Express beliefs about the meaning of choices.
- Make decisions that are congruent with personal and sociocultural values and goals.
- Use reliable evidence for decisions.

ACTION/INTERVENTIONS

Sample **NIC** linkages:

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Values Clarification: Assisting another to clarify her/his own values in order to facilitate effective decision-making

Teaching: Individual: Planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine usual ability to manage own affairs. *Provides baseline for understanding client's decision-making process. There may be variations in attitudes toward risk in different areas of the country that will affect this individual's decision-making preferences.*⁸
- Note expressions of decision, dependability, and availability of support persons. *Having support for decision making and having good information regarding pros and cons of choices helps client to feel comfortable with the decisions made.*⁸
- Active-listen and identify reason(s) client would like to improve decision-making abilities and expectations for change. *As client articulates reasons for improvement, they become more clear, and direction is provided.*² *Motivation to improve and high expectations can encourage client to make changes that will improve his or her life. However, presence of external locus of control or unrealistic expectations may hamper efforts.*
- Note presence of physical signs of anxiety. *Client may be excited about the quest for improvement, and excitement may be interpreted as anxiety. It is important to clarify meaning of physical signs.*²
- Identify cultural values, beliefs, or moral obligations and principles that guide or affect the decision-making process. *Preconceived biases may color decisions and need to be recognized in order to enhance efforts toward growth.*⁵
- Discuss meaning of life, reasons for living, belief in God or higher power, and how these relate to current desire for improvement or growth. *Helps client to clarify beliefs and how they relate to decision-making process.*⁶ (Refer to ND readiness for enhanced Spiritual Well-Being.)

NURSING PRIORITY NO. 2 To assist client to improve/effectively use problem-solving skills:

- Promote safe and hopeful environment and help client identify own inner control. *Will help client understand the control he or she has over decisions made.*¹

- Encourage verbalization of ideas, concerns, and particular decisions that need to be made.⁶
- Correct misperceptions client may have and provide factual information as needed. *Promotes understanding and enables client to make better decisions for own situation.*^{1,8}
- Clarify and prioritize individual's goals, noting possible conflicts or “stumbling” blocks that may be encountered. *As client weighs pros and cons of decision making, taking into account negative aspects of situation, decisions will be more realistic and acceptable to client.*³
- Discuss dependence on others, involvement of support persons, and possibility for conflicting advice or goals. *While it is appropriate to consider the opinions of others when making choices, one needs to be aware of the potential for conflicting views when seeking advice and make own decisions free of pressure from others.*⁸
- Identify positive aspects of this experience and assist client to view it as a learning opportunity. *As client reframes experience as an opportunity, he or she will be able to use this learning for future situations.*³
- Assist client in learning how to find factual information (e.g., use of the library, Internet). *Individual who takes advantage of these resources will benefit from the knowledge gained. Client will need to be cautious in evaluating information to verify accuracy.*⁸
- Discuss the process of performing a risk-benefit analysis to aid in making decisions. *The individual who learns this skill will be able to use it in many areas of life to enhance relationships, both personal and business.*³
- Have client list some alternatives to present decisions, using a brainstorming process. Include significant other (SO)/family in this activity if appropriate. *Looking at different options can strengthen the decision-making process.*⁷
- ∞ Encourage children to make age-appropriate decisions. *Learning problem-solving at an early age will enhance sense of self-worth and ability to exercise coping skills.*
- 🌐 Discuss and clarify spiritual beliefs, accepting client's values in a nonjudgmental manner. *Client may be able to decide what is really acceptable or unacceptable in the choice situation related to beliefs or values that have been expressed.*⁸

NURSING PRIORITY NO. 3 To promote optimum well-being (Teaching/Discharge Considerations):

- 🏠 Identify opportunities for using conflict-resolution skills. *Emphasizing each step as it is used will help with learning these skills.*⁶
- Provide positive feedback for efforts, growth in use of skills, and learning efforts. *As individual is moving forward in learning new skills, hearing positive feedback provides reinforcement for individuals to continue efforts.*³
- Encourage involvement of family/SOs as desired/appropriate. *Helps all family members to improve conflict-resolution skills. When family works together, relationships are enhanced and family members can live fuller lives.*⁴
- Recommend attending stress-reduction and/or assertiveness classes as desired. *Individual can learn additional skills to enhance decision making, improving ability to make life better.*²
- 🗣️ Refer to other resources as necessary (e.g., clergy, psychiatrist, clinical psychiatric nurse specialist, family/marital therapist). *May need additional counseling to help with specific concerns.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, behavioral responses.
- Individuals involved in improving conflict skills.
- Personal values, beliefs, and motivation for change.

Planning

- Plan of care, specific interventions, and who is involved in the planning process.
- Teaching plan.

Implementation/Evaluation

- Client's and involved individual's responses to interventions, teaching, and actions performed.
- Ability to express feelings, identify options, use resources.

- Attainment or progress toward desired outcomes(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, actions to be taken, and who is responsible for doing.
- Specific referrals made.

ineffective Denial

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00072) [Diagnostic Division: Ego Integrity], Approved 1988; Revised 2006

DEFINITION: Conscious or unconscious attempt to disavow the knowledge or meaning of an event to reduce anxiety and/or fear, leading to the detriment of health.

RELATED FACTORS

Anxiety; perceived inadequacy in dealing with strong emotions
 Insufficient sense of control; fear of losing autonomy
 Excessive stress; ineffective coping strategies
 Threat of unpleasant reality
 Fear of separation, death
 Insufficient emotional support

DEFINING CHARACTERISTICS

Subjective

Minimizes symptoms; displaces source of symptoms
 Does not admit impact of disease on life
 Displaces fear of impact of the condition
 Denies fear of death or invalidism

Objective

Delay in seeking healthcare; refusal of healthcare
 Does not perceive relevance of symptoms, danger
 Use of dismissive gestures or comments when speaking of distressing event
 Inappropriate affect

Use of treatment not advised by healthcare professional

Sample Clinical Applications: Chronic illnesses, eating disorders, substance abuse, Alzheimer's disease, terminal conditions, bipolar disorder, body dysmorphic disorder

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Acceptance: Health Status: Personal actions to reconcile significant changes in health circumstances

Health Beliefs: Perceived Threat: Personal conviction that a threatening health problem is serious and has potential negative consequences for lifestyle

Psychosocial Adjustment: Life Change: Adaptive psychosocial response of an individual to a significant life circumstance

Client Will (Include Specific Time Frame)

- Acknowledge reality of situation or illness.
- Express realistic concern and feelings about symptoms or illness.
- Seek appropriate assistance for presenting problem.
- Display appropriate affect.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Anxiety Reduction: Minimizing apprehension, dread, foreboding, or uneasiness related to an unidentified source of anticipated danger

Counseling: Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem-solving, and interpersonal relationships

Coping Enhancement: Facilitation of cognitive and behavioral effort to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify situational crisis or problem and client's perception of the situation. *Identification of both reality and client's perception, which may not be the same as the reality, is necessary for planning care accurately.*¹
-  Ascertain cultural values or religious beliefs affecting perception of situation and sense of personal responsibility for crisis. *Client will make choices regarding therapeutic regimen or lifestyle changes incorporating own cultural and social factors. Conflicts may arise when provider and patient disagree on healthcare beliefs and practices. Knowing that lifestyle or choices may have caused or contributed to current situation may limit client's ability to accept outcome or view event realistically.*^{5,7}
- Determine stage and degree of denial. *These factors will help identify whether the client is in early stages of denial and may be more amenable to intervention than those who are well entrenched in their beliefs. Treatment needs to begin where the client is and progress from there.*^{1,6}
- Compare client's description of symptoms or conditions to reality of clinical picture and impact of illness or problem on lifestyle. *Identifies extent of discrepancy between the two and where treatment needs to start to help client accept reality.*¹

NURSING PRIORITY NO. 2 To assist client to deal appropriately with situation:

- Develop nurse-client relationship using therapeutic communication skills of active-listening and "I" messages. *Promotes trust in which client can begin to look at reality of situation and deal with it in a positive manner.*²

- Provide safe, nonthreatening environment. *Allows client to feel comfortable enough to talk freely without fear of judgment and to deal with issues realistically.*²
- Encourage expressions of feelings, accepting client's view of the situation without confrontation. Set limits on maladaptive behavior *to promote safety. Helps client to work through and understand feelings. Unacceptable behavior is counterproductive to making progress, as client will view self negatively.*²
- Present accurate information as appropriate, without insisting that the client accept what has been presented. *Avoids confrontation, which may further entrench client in denial. Open manner permits client to feel value of self in situation and to begin to accept reality.*^{2,7}
- Discuss client's behaviors in relation to illness (e.g., diabetes mellitus, alcoholism, chronic pain conditions, terminal cancer) and point out the results of these behaviors. *Information can help client accept reality and opt to change behaviors.*³
- Encourage client to talk with significant others (SO[s]/friends). *May clarify concerns and reduce isolation and withdrawal. Constructive feedback from others facilitates understanding.*⁴
-  Involve in group sessions. *Promotes discussion and feedback to enhance learning. Client can hear other views of reality and test own perceptions.*⁴
- Avoid agreeing with inaccurate statements or perceptions. *Prevents perpetuating false reality.*²
- Provide positive feedback for constructive moves toward independence. *Promotes repetition of desired behavior.*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide written information about illness or situation for client and family. *Provides client/family with reminders and resources they can refer to as they consider options.*¹
- Involve family members/SO(s) in long-range planning. *Provides support and helps to identify and meet individual needs for the future.*⁴
-  Refer to appropriate community resources (e.g., Diabetes Association, MS Society, Alcoholics Anonymous). *May be needed to help client with long-term adjustment.*
- Refer to ND ineffective Coping.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, degree of personal vulnerability and denial.
- Impact of illness or problem on lifestyle.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Use of resources.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions taken.
- Specific referrals made.

impaired Dentition

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00048) [**Diagnostic Division:** Food/Fluid], Approved 1998; Revised 2017

DEFINITION: Disruption in tooth development/eruption patterns or structural integrity of individual teeth.

RELATED FACTORS

Barrier to self-care; difficulty accessing dental care
Excessive intake of fluoride or use of abrasive oral cleaning agents
Habitual use of staining substances [e.g., tobacco, coffee, tea, red wine]
Inadequate dietary habits; malnutrition
Pharmaceutical agent
Inadequate oral hygiene
Insufficient knowledge of dental health

DEFINING CHARACTERISTICS

Subjective

Toothache

Objective

Halitosis
Enamel discoloration; erosion of enamel; excessive oral plaque/calculus
Abraded teeth; dental or root caries; tooth fracture; loose tooth; absence of teeth
Premature loss of primary teeth; incomplete tooth eruption for age
Malocclusion; tooth misalignment; facial asymmetry

At Risk Population:

Economically disadvantaged; genetic predisposition

Associated Condition: Bruxism, chronic vomiting; oral temperature sensitivity; pharmaceutical agent

Sample Clinical Applications: Facial trauma or surgery, malnutrition, eating disorders, head or neck cancer, seizure disorder

(continues on page 248)

impaired Dentition (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Oral Health: Condition of the mouth, teeth, gums, and tongue

Self-Care: Oral Hygiene: Personal actions to care for own mouth and teeth independently with or without assistive device

Knowledge: Health Behavior: Extent of understanding conveyed about the promotion and protection of health

Client/SO Will (Include Specific Time Frame)

- Display healthy gums and mucous membranes and teeth that are in good repair.
- Report adequate nutritional and fluid intake.
- Verbalize understanding of appropriate oral hygiene regimen.
- Demonstrate effective dental hygiene skills.
- Follow through on referrals for appropriate dental care.

ACTION/INTERVENTIONS

Sample **NIC** linkages:

Oral Health Restoration: Promotion of healing for a patient who has an oral mucosa or dental lesion

Teaching: Individual: Planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs

Referral: Arrangement for services by another care provider or agency

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Inspect oral cavity. Note presence or absence and intactness of teeth or dentures and appearance of gums. *Provides baseline for planning and interventions in terms of safety, nutritional needs, and aesthetics.*
- Evaluate current status of dental hygiene and oral health *to determine need for instruction or coaching, assistive devices, and/or referral to dental care providers.*
- Note presence of halitosis. *Bad breath may be result of numerous local or systemic conditions, including smoking, periodontal disease, dehydration, malnutrition, ketoacidosis, nasal and sinus infections, and some medications and drugs. Management can include improved mouth care or treatment of underlying conditions.*¹¹
- ∞ Document age, developmental and cognitive status, and manual dexterity. Evaluate nutritional and health state, noting presence of conditions such as bulimia or chronic vomiting; musculoskeletal impairments; or problems with mouth (e.g., bleeding disorders, cancer lesions, abscesses, facial trauma). *Factors affecting client's dental health and ability to provide effective oral care.*^{1,12}
- Note current situation that will affect dental health (e.g., presence of airway/endotracheal [ET] intubation, facial fractures, jaw surgery, new braces, use of anticoagulants or chemotherapy) that require special mouth care activities.^{7,8}
- Document (photograph) facial injuries before treatment *to provide "pictorial baseline" for future comparison and evaluation.*

NURSING PRIORITY NO. 2 To treat/manage dental care needs:

- Ascertain client's usual method of oral care *to provide continuity of care or to build on client's existing knowledge base and current practices in developing plan of care.*
- Assist with or provide oral care, as indicated.^{2,8,9,12}
Offer tap water or saline rinses or diluted alcohol-free mouthwashes.

Provide gentle gum massage and tongue brushing with soft toothbrush using fluoride toothpaste *to manage tar-tar buildup, if appropriate.*

Use foam sticks *to swab gums and oral cavity when brushing is not possible or inadvisable.*

Assist with brushing and flossing when client is unable to do self-care.

Demonstrate and assist with electric or battery-powered mouth care devices (e.g., toothbrush, plaque remover) as indicated.

Assist with or provide denture care when indicated (e.g., remove and clean after meals and at bedtime).

-  Remind client to brush teeth as indicated. *Cues, modeling, or pantomime may be helpful if client is young, elderly, or cognitively or emotionally impaired.*¹²
-  Reposition ET tubes and airway adjuncts routinely, carefully padding and protecting teeth and prosthetics.⁷
- Suction as needed if client is unable to manage secretions.
- Remind client of importance of maintaining good jaw and facial alignment when fractures are present.
-   Encourage appropriate diet for optimal nutrition, considering client's special needs such as pregnancy, age and developmental concerns, and ability to chew (e.g., liquids or soft foods) and offering low-sugar, low-starch foods and snacks *to minimize tooth decay and improve overall health. Note: Emerging research is revealing important relationships between nutrition, tooth decay, and periodontal disease and chronic health conditions such as heart disease, diabetes, and immune-compromising conditions.*^{2,9,13}
- Encourage client to avoid thermal stimuli *when teeth are sensitive* and to use specific toothpastes designed to *reduce sensitivity of teeth.*
-  Administer antibiotics as needed *to treat oral or gum infections that may be present and to prevent hospital-acquired infection in the critically ill client whose teeth or gums may be colonized by significant bacteria.*³
-  Recommend use of analgesics and topical analgesics as needed *when dental pain is present.*
-  Administer prophylactic antibiotic therapy prior to some dental procedures *in susceptible individuals* (e.g., presence of prosthetic heart valve, prior infective endocarditis, certain congenital heart defects, cardiac transplant with subsequent valvulopathy) *to reduce risk of infective endocarditis or migration of bacteria to other body organs.*¹⁰
-  Direct client to notify dental care provider when bleeding disorder is present or anticoagulant therapy (including aspirin) is being used. *May impact choice of procedure or technique in order to prevent excess bleeding.*
-  Refer to appropriate care providers (e.g., nutritionist, dental hygienists, dentists, periodontist, oral surgeon).

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Instruct client/caregiver to inspect oral cavity and in home-care interventions *to provide good oral care and prevent tooth decay and periodontal disease.*^{4,5,9}
-  Review or demonstrate proper toothbrushing techniques (e.g., spending several minutes brushing, reaching all tooth surfaces, brushing with bristles at a “45-degree angle” to teeth surfaces) after meals, and daily flossing. Suggest brushing with fluoride-containing toothpaste if client is able to swallow and manage oral secretions. Avoid sharing toothbrushes. Brush child's teeth until he/she can perform alone. *This is the most effective way of reducing oral bacteria and plaque formation and preventing cavities and periodontal disease.*⁸
- Discuss dental and oral health needs, both as client perceives needs and according to professional standards. *Client's perceptions are shaped by self-image, family, and cultural expectations or conditions created by disease or trauma. Current healthcare practices and education are geared toward practices that improve client's appearance and health, including reduced consumption of refined sugars, optimal fluoridation, access to preventative and restorative dental care, prevention of oral cancers, and prevention of craniofacial injuries.*^{4,5}
-  Recommend that clients of all ages decrease sugary and high-carbohydrate foods in diet and snacks *to reduce buildup of plaque and risk of cavities caused by acids associated with the breakdown of sugar and starch.*⁴
-  Instruct older client and caregiver(s) concerning their special needs and importance of regular dental care. *Elderly are prone to experience decay around older fillings (also have more fillings in mouth); have receding gums, exposing root surfaces, which decay easily; have reduced production of saliva and use multiple*

medications that can cause dry mouth with loss of tooth and gum protection; and have loosening of teeth or poorly fitting dentures associated with gum or bone loss. These factors (often compounded by disease conditions and lack of funds) affect nutrient intake, chewing, swallowing, and oral cavity health.^{5,12}

-  Advise mother regarding age-appropriate concerns:^{1,4-6}

Instruct mother to refrain from allowing baby to fall asleep with bottle containing formula, milk, or sweetened beverages. Suggest use of water and pacifier during night *to prevent bottle tooth decay.*

Determine pattern of tooth appearance and tooth loss and compare to norms for primary and secondary teeth. Discuss tooth discoloration and needed follow-up. *Brown or black spots on teeth usually indicate decay; gray tooth color may indicate nerve injury; and multiple cavities in adolescent could be caused from repeated vomiting or bulimia.*

Discuss pit and fissure sealants. *Painted-on tooth surface sealants are becoming widely available to reduce number of cavities and sometimes are available through community dental programs.*

Determine if school dental health programs are available or recommend regular professional dental examinations as child grows.

Discuss with children/parents problems associated with oral piercing if individual is contemplating piercing or needs to know what to watch for after piercing. *Common symptoms that occur with piercing of lips, gums, and tongue include pain, swelling, infection, increased flow of saliva, and chipped or cracked teeth requiring diligent oral care or more frequent dental examination to prevent complications.*

Discuss use of or need for safety devices (e.g., helmets, face mask, mouth guards) *to prevent or limit severity of sports-related facial injuries and tooth damage or loss.*

-   Discuss with pregnant women special needs and regular dental care. *Pregnant women need additional calcium and phosphorus to maintain good dental health and provide for strong teeth and bones in fetal development. Many women avoid dental care during pregnancy because of concerns for fetal health or for other reasons (including lack of financial resources). However, one research study of 400 women suggests that pregnant women who receive treatment for periodontal disease can reduce their risk of giving birth to a low-birth-weight or preterm baby.*¹⁴
-  Review resources that are needed and available for the client to perform adequate dental hygiene care (e.g., toothbrush, paste, clean water, referral to dental care providers, access to financial assistance, personal care assistant).
-  Encourage cessation of tobacco (especially smokeless) and enrolling in smoking-cessation classes *to reduce risk of oral cancers and other health problems.*
-  Discuss advisability of dental checkup and care prior to instituting chemotherapy or radiation *to minimize oral, dental, or tissue damage.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including individual factors influencing dentition problems.
- Baseline photos and description of oral cavity or structures.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

risk for delayed Development

Taxonomy II: Growth/Development—Class 2 Development (00112) [**Diagnostic Division:** Teaching/Learning], Submitted 1998; Revised 2013, 2017

DEFINITION: Susceptible to delay of 25% or more in one or more of the areas of social or self-regulatory behavior, or in cognitive, language, gross, or fine motor skills, which may compromise health.

RISK FACTORS

Inadequate nutrition

Presence of abuse; substance misuse/[abuse]

Individual

At Risk Population:

Behavioral disorder

Economically disadvantaged; maternal functional illiteracy

Exposure to violence or natural disaster

History of adoption; involvement with the foster care system

Inadequate maternal nutrition; insufficient or late-term prenatal care

Maternal age ≤ 15 years or ≥ 35 years; maternal substance misuse/[abuse], positive drug screen

Unplanned or unwanted pregnancy

Associated Condition: Brain injury; seizure disorder

Caregiver learning disability or mental health issue

Chronic illness; prenatal infection; recurrent otitis media

Congenital or genetic disorder; endocrine or seizure disorders

Failure to thrive; hearing or vision impairment

(continues on page 252)

risk for delayed Development (continued)

Treatment regimen

Sample Clinical Applications: Congenital or genetic disorders, prematurity, infection, nutritional problems (malnutrition, anorexia, failure to thrive), toxic exposures (e.g., lead), substance abuse, endocrine disorders, abuse or neglect, developmental delay

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Child Development: [specify age]: Milestones of physical, cognitive, and psychosocial progression by [specify] months or years of age

Client Will (Include Specific Time Frame)

- Perform motor, social, self-regulatory behavior, cognitive, and language skills appropriate for age or within scope of present capabilities.

Sample NOC linkages:

Knowledge: Parenting: Extent of understanding conveyed about provision of a nurturing and constructive environment for a child from 1 year through 17 years of age

Parenting Performance: Parental actions to provide a child a nurturing and constructive physical, emotional, and social environment

Parent/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of age-appropriate development and expectations.
- Identify individual risk factors for developmental delay or deviation.
- Formulate plan(s) for prevention of developmental deviation.
- Initiate interventions or lifestyle changes promoting appropriate development.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Developmental Enhancement: Infant, Child [or] Adolescent: Facilitating or teaching parents/caregivers to facilitate the optimal gross motor, fine motor, language, cognitive, social, and emotional growth of child under 1 year of age, preschool and school-age children, or during the transition from childhood to adulthood

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

NURSING PRIORITY NO. 1 To assess for causative/contributing risk factors:

-   Identify condition(s) that could contribute to developmental deviations. *This list is extensive and widely variable. Potential for developmental issues might be apparent at birth (e.g., neonatal brain injury, especially that occurring before or at time of birth; prematurity; extremes of maternal age; unwanted or complicated pregnancy; known prenatal substance abuse, etc.). However, risks are not confined to the child's birth events, but also encompass parent/family issues and environment (e.g., family history of developmental disorders; mother with mental illness or retardation, child with acute or chronic severe illness and lengthy hospitalizations; family poverty with inadequate living quarters, nutrition, nurturing, or supervision; family instability or violence; shaken baby syndrome and other maltreatment or child abuse; institutional home or foster system during early life or prior to adoption).*^{1,11–13,16,17}

-  Participate in screening child's development level by means of observation and history related by concerned parents/other significant others. *Developmental delay occurs when a child fails to achieve one or more developmental milestones within an expected time period; it may be in one or more areas (e.g., cognitive, social and emotional, speech and language, fine motor skills or gross motor skills) and may be the result of one or multiple factors.*^{1,13}
-  Obtain information from variety of sources. *Parents are often the first ones to think that there is a problem with their baby's development and should be encouraged to have routine well-baby checkups and screening for developmental delays. Teachers, family members, day-care or foster care providers, physicians, and others interacting with a client (older than infant) may have valuable input regarding behaviors that may indicate problems or developmental issues.*^{1,2,11–13,16,17}
-  Identify cultural beliefs, norms, and values, as they may impact parent/caregiver view of situation. *Culture shapes parenting practices, understanding of health and illness, perceptions related to development, and beliefs about individuals affected by developmental disorders. These cultural implications underscore the importance of having a broad array of tools for assessment and instruction, as well as a good understanding of the child's culture.*^{3,12}
- Ascertain nature of required parent/caregiver activities and evaluate caregiver's abilities to perform needed activities.
- Note severity and pervasiveness of situation (e.g., potential for long-term stress leading to abuse or neglect versus situational disruption during period of crisis or transition that may eventually level out). *Situations require different interventions in terms of the intensity and length of time that assistance and support may be critical to the parent/caregiver. A crisis can produce great change within a family, some of which can be detrimental to the individual or family unit.*^{4–6}
- Evaluate environment in which long-standing care will be provided. *The physical, emotional, financial, and social needs of a family are impacted and intertwined with the needs of the client. Changes may be needed in the physical structure of the home or family roles, resulting in disruption and stress, placing everyone at risk.*^{4,6}
-  Refer for and assist with in-depth evaluation, if indicated, using an authoritative text (e.g., Gesell, Mussen-Congor) or assessment tools (e.g., Ages and Stages Questionnaire, Parents Evaluation of Developmental Status, Temperament and Atypical Behavior Scale, Denver II Developmental Screening Test, Bender's Visual Motor Gestalt Test). *Provides guide for comparative measurement as child/individual progresses. Note: Often there is no single diagnostic test for a specific developmental delay. There are tools to evaluate child's skills in certain areas, such as motor development, speech, language, math, etc. However, a diagnosis is often determined over months or years. Also, a child who is delayed in an area at a certain age may "catch up" in later years.*^{1,8–12}

NURSING PRIORITY NO. 2 To assist in preventing or limiting developmental delays:

-  Note chronological age and review with parents the expectations for "normal development" in infancy and early childhood at clinic visits *to help determine developmental expectations (e.g., when child should roll over, sit up alone, speak first words, attain a certain weight or height) and how the expectations may be altered by child's condition. Ideally, children should be screened for developmental delay at the 9-, 18-, and 24- or 30-month visit, and at 15, 18, and again at 24 months for autism spectrum disorders.*^{14,15} *For high-risk individuals, including children affected by biological (e.g., low birth weight) and psychosocial (e.g., foster care, homelessness) risk factors, earlier and more frequent formal developmental screening may be warranted. Note: Pediatrician may screen with a motor quotient (MQ), which is child's age calculated by milestones met divided by chronological age and multiplied by 100. An MQ between 50 and 70 requires further evaluation and intervention.*^{1,7,16}
- Describe realistic, age-appropriate patterns of development to parent/caregiver and promote activities and interactions that support developmental tasks where client is at this time. *Important in planning interventions in keeping with the individual's current status and potential. Each child will have own unique strengths and challenges.*^{1–3,11,17}

-  Collaborate with related professional resources, as indicated (e.g., physical, occupational, rehabilitation, speech therapists; home health agencies; social services, nutritionist; special education teacher, family therapists; technological and adaptive equipment specialists; vocational counselor). *Multidisciplinary team care increases the likelihood of developing a well-rounded plan of care that meets client/family's specialized and varied needs, minimizing identified risks.*^{4,10–12}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Engage in and encourage prevention strategies (e.g., abstinence from drugs, alcohol, and tobacco during pregnancy, referral for treatment programs, referral for violence prevention counseling, anticipatory guidance for potential handicaps [vision, hearing, failure to thrive]). *Promoting wellness starts with preventing complications and acting early to limit severity of anticipated problems. Such strategies can often be initiated by nurses where the potential is first identified, in the community setting.*^{1,4}
- Evaluate client's progress on continual basis. Identify target symptoms requiring intervention *to make referrals in a timely manner and/or to make adjustments in plan of care, as indicated.*²
- Emphasize importance of follow-up appointments as indicated *to promote ongoing evaluation, support, or management of situation.*^{2,12}
- Discuss proactive wellness actions to take (e.g., periodic laboratory studies to monitor nutritional status, getting immunizations on schedule to prevent serious infections) *to avoid preventable complications.*²
- Maintain a positive, hopeful attitude. Encourage setting of short-term realistic goals for achieving developmental potential. *Small, incremental steps are often easier to deal with, and successes enhance hopefulness and well-being.*⁶
- Provide information as appropriate, including pertinent reference materials and reliable Web sites. *Bibliotherapy provides opportunity to review data at own pace, enhancing likelihood of retention.*^{1,2}
-  Encourage attendance at educational programs (e.g., parenting classes, infant stimulation sessions; food buying, cooking, and nutrition; home and family safety, anger management, seminars on life stresses, aging process) *to address specific learning need or desires and interact with others with similar life challenges.*^{2,11}
-  Refer to available community and national resources if appropriate (e.g., early intervention programs, gifted and talented programs, sheltered workshop, crippled children's services, medical equipment and supplier, caregiver support and respite services). *Can provide assistance to support family and help identify community responsibilities (e.g., services required to be provided to school-age child if developmental disabilities are diagnosed).*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, individual needs, including developmental level.
- Caregiver's understanding of situation and individual role.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Caregiver response to teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified long-term needs and who is responsible for actions to be taken.
- Specific referrals made, sources for assistive devices, educational tools.

Diarrhea

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (0013) [**Diagnostic Division:** Elimination], Approved 1975; Nursing Diagnosis Extension and Classification Revision 1998, 2017

DEFINITION: Passage of loose, unformed stools.

RELATED FACTORS

Increase in stress level; anxiety
Laxative or substance abuse

DEFINING CHARACTERISTICS**Subjective**

Abdominal pain
Bowel urgency; cramping

Objective

Hyperactive bowel sounds
Loose liquid stools >3 in 24 hours

At Risk Population: Exposure to contaminant or toxin or unsanitary food preparation

(continues on page 256)

Diarrhea (continued)

Associated Condition: Enteral feedings

Gastrointestinal irritation or inflammation; malabsorption

Parasite

Treatment regimen

Sample Clinical Applications: Inflammatory bowel disease, gastritis, enteral feedings, alcohol abuse, antibiotic use, food allergies or contamination, AIDS, radiation, parasites

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Bowel Elimination: Formation and evacuation of stool

Hydration: Adequate water in the intracellular and extracellular compartments of the body

Self-Management: Acute Illness: Personal actions to manage a reversible illness, its treatment, and to prevent complications

Client Will (Include Specific Time Frame)

- Reestablish and maintain normal pattern of bowel functioning.
- Verbalize understanding of causative factors and rationale for treatment regimen.
- Demonstrate appropriate behavior to assist with resolution of causative factors (e.g., proper food preparation or avoidance of irritating foods).

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Diarrhea Management: Management and alleviation of diarrhea

Fluid Monitoring: Collection and analysis of patient data to regulate fluid balance

Perineal Care: Maintenance of perineal skin integrity and relief of perineal discomfort

NURSING PRIORITY NO. 1 To assess causative factors/etiology:

- ∞ Note client's age and evaluate client's/caregiver's perception of severity of symptoms. *Acute diarrhea is usually caused by an infection, while chronic diarrhea is usually related to a functional disorder or intestinal disease. Viral diarrhea is most common among young children. Adults tend to average one bout of acute diarrhea each year. Chronic (persistent) diarrhea may be a symptom of a chronic disease and often affects adults more than children. People perceive having diarrhea in many different ways, but generally if client is having loose, watery stools occurring more than three times a day for 3 days or more, the diagnosis of diarrhea can be made. The condition can affect people of all ages, although its effect is more dangerous for infants and frail elderly (due to risk of dehydration).*¹⁻³
- Obtain comprehensive history of symptoms to help in identifying cause and treatment needs.^{1,2,4-6,13,14}
 - ▢ Ascertain onset and pattern of diarrhea, noting whether it is acute or chronic. **Acute diarrhea** is caused by (1) viral, bacterial, or parasitic infections (e.g., Norwalk virus, rotavirus; salmonella, shigella; giardia, amebiasis, respectively); (2) bacterial food-borne toxins (e.g., Staphylococcus aureus, Escherichia coli); (3) medications (e.g., antibiotics, chemotherapy agents, colchicine, laxatives); and (4) enteral tube feedings. It lasts a few days up to a week. **Chronic diarrhea** is caused by irritable bowel syndrome, infectious diseases, inflammatory bowel disease, colon cancer and treatments, severe constipation, malabsorption disorders, laxative abuse, and certain endocrine disorders (e.g., hyperthyroidism, Addison's disease). It almost always lasts for more than 3 weeks.

Review history and observe stools for **characteristics** (e.g., soft to watery stools, bloody, greasy), **frequency** (e.g., more than normal number of stools/day), **time of day** (e.g., after meals), **volume**, and **duration**. Identify any **associated signs/symptoms** (e.g., fever/chills, abdominal cramping, emotional upset, weight loss), **aggravating factors** (e.g., stress, foods), or **mitigating factors** (e.g., changes in diet, use of prescription or over-the-counter [OTC] medications).

Note reports of abdominal or rectal pain. *Pain is often present with inflammatory bowel disease, irritable bowel syndrome, and mesenteric ischemia.*

-  Determine recent travel to developing countries or foreign environments, change in drinking water or food intake or consumption of unsafe food, swimming in untreated surface water, or similar illness of family members/others close to client *that may help identify causative environmental factors.*^{2,4-6}
-  Review medications, noting side effects and possible interactions. *Many drugs (e.g., antibiotics such as cephalosporins, erythromycin, penicillins, quinolones, tetracyclines, digitalis, angiotensin-converting enzyme inhibitors, NSAIDs, hypoglycemia agents, cholesterol-lowering drugs) can cause or exacerbate diarrhea, particularly in the elderly and in those who have had surgery on the intestinal tract.*^{1,2,6-8}
- Evaluate diet history, noting food allergies or intolerances, and food and water safety issues, and note general nutritional, fluid, and electrolyte status *that may be causing or exacerbating diarrhea.*
- Auscultate abdomen for presence, location, and characteristics of bowel sounds. *High-pitched, rapidly occurring, and loud or tinkling bowel sounds often accompany diarrhea.*⁹
-  Determine if incontinence is present. *May indicate presence of fecal impaction, particularly in the elderly, where impaction may be accompanied by diarrhea.*³ (Refer to ND Bowel Incontinence.)
-  Review results of laboratory testing on stool specimens. *Can reveal presence of bacterial or viral infection, parasites, fat, blood, offending drugs, metabolic disorder, malabsorption syndrome, gastroenteritis, colitis, etc.*^{1,2,4-6}
-  Assist with/prepare for additional evaluation as indicated. *Chronic diarrhea may require more invasive testing, including upper and/or lower gastrointestinal radiographs, ultrasound, endoscopic evaluations, biopsy, etc.*¹²

NURSING PRIORITY NO. 2 To alleviate/limit condition:

-  Assist with treatment of underlying conditions (e.g., infections, malabsorption syndrome, cancer) and complications of diarrhea. *Treatments are varied and may be as simple as allowing time for recovery from a self-limiting gastroenteritis or may require complex treatments, including antimicrobials and rehydration, or community health interventions for contaminated food or water sources.*¹⁴
- Encourage bedrest during an acute episode. *Rest reduces intestinal motility and metabolic rate when infection or hemorrhage is a complication.*^{1-6,8,10}
-  Restrict solid food intake, if indicated. *May help in short term to allow for bowel rest and reduced intestinal workload, especially if cause of diarrhea is under investigation or vomiting is present. Note: A child's preferred or usual diet may be continued to prevent or limit dehydration, with the possible limitation of fruit, fruit juices, or milk, if these factors are exacerbating the diarrhea.*^{5,9,10}
- Limit caffeine and high-fat (e.g., butter, fried foods) or high-protein (e.g., meats) foods known to cause or aggravate diarrhea (e.g., extremely hot or cold foods, chili), milk, and fruits or fruit juices as appropriate.^{1-6,8,10}
-  Adjust strength and/or rate of enteral tube feedings; change formula as indicated *when diarrhea is associated with tube feedings.*^{1-6,8,10}
-  Consider change in infant formula. *Diarrhea may be result of or aggravated by intolerance to specific formula.*^{9,10}
-  Change client's routine medications as appropriate (e.g., stopping magnesium-containing antacid or antibiotic causing diarrhea).^{7,8}
- Promote the use of relaxation techniques (e.g., progressive relaxation exercise, visualization techniques) *to decrease stress and anxiety.*^{1-6,8,10}
-  Administer medications *to treat or limit diarrhea, as indicated, depending on cause. May include use of antidiarrheals, anti-infectives, antispasmodics, etc.*^{1-6,8,10,14}

- Assist client to manage situation.¹²

Respond to call for assistance promptly.

Place bedpan in bed with client (if desired) or commode chair near bed *to provide quick access and reduce need to wait for assistance of others.*

Provide privacy, remove stool promptly, and use room deodorizers *to reduce noxious odors and limit embarrassment.*

Use incontinence pads, depending on the severity of the problem.

Provide emotional and psychological support. *Diarrhea can be a source of great embarrassment and can lead to social isolation and feeling of powerlessness. Intimate relationship and sexual activity may be affected and need specific interventions to resolve.*

- Maintain skin integrity:¹²

Assist as needed with pericare after each bowel movement *to prevent skin excoriation and breakdown.*

Provide prompt diaper or incontinence pad change and gentle cleansing *because skin breakdown can occur quickly with diarrhea.*

Apply lotion or skin barrier ointment as needed.

Provide dry linen as necessary.

Expose perineum and buttocks to air or use heat lamp with caution if needed *to keep area dry.*

Refer to ND impaired Skin Integrity.

NURSING PRIORITY NO. 3 To restore/maintain hydration/electrolyte balance:

- Note reports of thirst, less frequent or absent urination, dry mouth and skin, weakness, light-headedness, and headache. *Signs/symptoms of dehydration and need for rehydration.*^{1-3,5,6,10}
- ∞ Observe for or question parents about young child crying with no tears, fever, decreased urination or no wet diapers for 6 to 8 hours, listlessness or irritability, sunken eyes, dry mouth and tongue, and suspected or documented weight loss. *Child needs urgent or emergency treatment for dehydration if these signs are present and child is not taking fluids.*^{1-3,5,6,10}
- ∞ Note presence of low blood pressure or postural hypotension, tachycardia, poor skin hydration, or turgor. *Presence of these factors indicates severe dehydration and electrolyte imbalance. The frail elderly can progress quickly to this point, especially when vomiting is present or client's normal food and fluid intake is below requirements.*^{1-3,5,6,10}
- Monitor total intake and output, including stool output as possible. *Provides estimation of fluid needs.*^{1,3,5,6,10}
- ∞ Weigh infant's diapers to determine output.^{1-3,5,6,10}
- Offer and encourage water, plus broth or soups that contain sodium, or soft fruits or vegetables that contain potassium *to replace water and electrolytes.*^{1-3,5,6,10}
- Recommend oral intake of beverages such as Gatorade, Pedialyte, Infalyte, and Smart Water. *Commercial rehydration solutions containing electrolytes may prevent or correct imbalances.*^{1-3,5,6,10}
- 💉 Administer IV fluids, electrolytes, and enteral or parenteral feedings, as indicated. *IV fluids may be needed either short term to restore hydration status (e.g., acute gastroenteritis) or long term (severe osmotic diarrhea). Enteral or parenteral nutrition is reserved for clients unable to maintain adequate nutritional status because of long-term diarrhea (e.g., wasting syndrome, malnutrition states).*^{1-3,5,6,10}

NURSING PRIORITY NO. 4 To promote return to normal bowel functioning:

- Encourage intake of nonirritating liquids, increasing intake as tolerated and gradually returning to normal diet.^{1,2,4-6,10,11,13}
- Recommend products such as natural fiber, plain natural yogurt, and Lactinex *to restore normal bowel flora.*^{1,2,4-6,10,11}
- 💊 Administer medications as ordered *to treat infectious process, decrease motility, and/or absorb water.*^{1,2,4-6,10,11}

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-  Review individual's causative factors and appropriate interventions *to prevent recurrence*.
-  Discuss medication regimen, including prescription and OTC drugs, *especially when client has multiple medications with potential for diarrhea as side effect or interaction*.¹²
-  Encourage/refer for vaccines, as indicated. *Vaccines could include those recommended for travelers to susceptible areas of the world (e.g., cholera or typhoid vaccines) and/or could be preventative therapies for infants. For example, currently two oral live-virus vaccines are marketed in the United States for the prevention of rotavirus gastroenteritis, a major cause of severe diarrhea in infants.*^{5,13}
- Instruct clients planning to travel outside the United States about traveler's diarrhea and ways to prevent or limit food- and water-borne illness (e.g., *do not drink tap water, use tap water ice cubes, or brush your teeth with tap water; avoid raw fruits and vegetables unless they can be peeled; avoid raw or rare meat or fish; discuss destination with local health department for particular recommendations, such as advisability of use of protective antibiotics*).^{12,13}
- Assess home or living environment, if indicated. *Discussion with client/caregivers may be needed regarding (1) sanitation and hygiene (e.g., hand hygiene and laundry practices), (2) safe food storage and preparation (to reduce risk of foodborne infections), and (3) particular risks in select populations (e.g., persons with chronic liver disease should avoid shellfish; persons with impaired immune defenses are at increased risk for diarrhea associated with raw dairy products or unheated deli meats; pregnant women should avoid undercooked meats [infectious diarrhea]).*¹²
- Emphasize importance of hand hygiene *to prevent spread of infectious causes of diarrhea such as Clostridium difficile, S. aureus, etc.*¹⁵
- Instruct parent/caregiver in signs of dehydration and importance of fluid and electrolyte replacement, as well as simple food and fluids to provide rehydration.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Assessment findings, including characteristics and pattern of elimination.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to treatment, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge planning

- Recommendations for follow-up care.

risk for Disuse Syndrome

Taxonomy II: Activity/Rest—Class 2 Activity/Exercise (00040) [**Diagnostic Division:** Activity/Rest], Submitted 1988; Revised 2013, 2017

DEFINITION: Susceptible to deterioration of body systems as the result of prescribed or unavoidable musculoskeletal inactivity, which may compromise health.

AUTHOR NOTE: Complications from immobility can include decreased strength or endurance, activity intolerance, impaired sitting or standing or walking; pressure ulcer, impaired urinary or bowel function; respiratory complications, such as pneumonia; systemic infections; blood clots; orthostatic hypotension; and disorientation, body image disturbance, ineffective coping, and powerlessness.

RISK FACTORS

Pain

Associated Condition: Alteration in level of consciousness

Mechanical or prescribed immobility; paralysis

Sample Clinical Applications: Multiple sclerosis (MS), cerebral palsy, muscular dystrophy, postpolio syndrome, brain injury or stroke, spinal cord injury (SCI), arthritis, osteoporosis, fractures, amputation, dementia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Immobility Consequences: Physiological: Severity of compromise in physiological functioning due to impaired physical mobility

Risk Control: Personal actions to prevent, eliminate, or reduce modifiable health threats

Immobility Consequences: Psycho-Cognitive: Severity of compromise in psycho-cognitive functioning due to impaired physical mobility

Client Will (Include Specific Time Frame)

- Display intact skin and tissues or achieve timely wound healing.
- Maintain or reestablish effective elimination patterns.
- Be free of signs/symptoms of infectious processes.
- Demonstrate absence of pulmonary congestion with breath sounds clear.
- Demonstrate adequate peripheral perfusion with stable vital signs, skin warm and dry, and palpable peripheral pulses.

- Maintain usual reality orientation.
- Maintain or regain optimal level of cognitive, neurosensory, and musculoskeletal functioning.
- Express sense of control over the present situation and potential outcome.
- Recognize and incorporate change into self-concept in accurate manner without negative self-esteem.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

Bed Rest Care: Promotion of comfort and safety and prevention of complications for a patient unable to get out of bed

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

NURSING PRIORITY NO. 1 To evaluate probability of developing complications:

- Identify underlying conditions/pathology (e.g., cancer, trauma; fractures with casting, immobilization devices; surgery, chronic disease conditions, malnutrition; neurological conditions [e.g., stroke, brain or spinal cord injury, postpolio syndrome, multiple sclerosis]; chronic pain conditions; use of predisposing medications [e.g., steroids]) *that can cause or exacerbate problems associated with inactivity and immobility. Bedrest, immobility, and/or lack of physical activity (for any reason) causes a loss of protein and muscle deterioration. “Disuse syndrome” is a classic pattern of muscular deconditioning and atrophy resulting from inactivity or immobilization. Once muscle is lost, it is difficult to gain it back.*¹⁰
-  Identify potential concerns, including cognition, mobility, and exercise status. *Disuse syndrome can be a complication of and cause for bedridden state. The syndrome can include muscle and bone atrophy, stiffening of joints, brittle bones, reduction of cardiopulmonary function, loss of red blood cells, decreased sex hormones, decreased resistance to infections, increased proportion of body fat in relation to muscle mass, and chemical changes in the brain, which adversely impact client’s activities of daily living (ADLs), social life, and quality of life.*^{1,2,10}
-  Note client’s age. *Age-related physiological changes (e.g., decrease in muscle mass and/or function, increased levels of proinflammatory cytokines, increased production of free radicals or impaired detoxification, malnutrition, low hormone output, reduced neurological drive) accompanied by chronic illness predispose older adults to functional decline related to inactivity and immobility.*^{1,3,8–10}
-  Determine if client’s condition is acute/short term or whether it may be a long-term/permanent condition. *Relatively short-term conditions (e.g., simple fracture treated with cast) may respond quickly to rehabilitative efforts. Long-term conditions (e.g., stroke, aged person with dementia, cancers, demyelinating or degenerative diseases, SCI, psychological problems such as depression or learned helplessness) have a higher risk of complications for the client and caregiver. Note: Studies carried out with intensive-care patients supported that prolonged immobilization leads to disuse atrophy of muscles and other physiological changes that decrease patients’ ability to tolerate physical activity. They also found that muscle atrophy begins within hours of immobilization, leading to a 4% to 5% loss of muscle strength for each week of bedrest.*^{11,12}
- Assess and document (ongoing) client’s functional status, including cognition, vision, and hearing, social support, psychological well-being, and abilities in performance of ADLs *for a comparative baseline, to evaluate response to treatment, and to identify preventative interventions or necessary services.*⁸
- Evaluate client’s risk for injury. *Risk is greater in client with cognitive problems, lack of safe or stimulating environment, inadequate mobility aids, and/or sensory-perception problems.*³

-  Ascertain attitudes of individual/significant other (SO) about condition (e.g., cultural values, stigma). Note misconceptions. *The client may be influenced (positively or negatively) by peer group, cultural, and family role expectations.*
- Evaluate client's/family's understanding and ability to manage care for prolonged period. Ascertain availability and use of support systems. *Caregivers may be influenced by their own physical or emotional limitations, degree of commitment to assisting the client toward optimal independence, or available time.*³
-  Review psychological assessment of client's emotional status. *Potential problems that may arise from presence of condition need to be identified and dealt with to avoid further debilitation. Common associated psychological changes include depression, anxiety, and avoidance behaviors.*^{2,3}

NURSING PRIORITY NO. 2 To identify/provide individually appropriate preventive or corrective interventions:

-  **Skin:**^{6,7}
Inspect skin on a frequent basis, noting changes. Monitor skin over bony prominences.
Reposition frequently as individually indicated *to relieve pressure.*
Provide skin care daily and prn, drying well and using gentle massage and lotion *to stimulate circulation.*
Keep skin, clothing, and area clean and dry *to prevent skin irritation and breakdown.*
Initiate use of padding devices (e.g., foam, egg-crate/gel/water/air mattress or cushions) *to reduce pressure on and enhance circulation to compromised tissues.*
Review nutritional status and promote diet with adequate protein, calorie, and vitamin and mineral intake *to aid in healing and promote general good health of skin and tissues.*
Refer to NDs impaired Skin Integrity, impaired Tissue Integrity, and risk for Pressure Ulcer for additional interventions.
- **Elimination:**⁶⁻⁸
Observe elimination pattern, noting changes and potential problems.
Encourage a balanced diet, including fruits and vegetables high in fiber and with adequate fluids *for optimal stool consistency and to facilitate passage through colon.*
Provide or encourage adequate fluid intake, include water and cranberry juice *to reduce risk of urinary infections.*
Maximize mobility at earliest opportunity.
 Evaluate need for stool softeners or bulk-forming laxatives.
Implement consistent bowel management or bladder training programs, as indicated.
Monitor urinary output and characteristics *to identify changes associated with infection.*
Refer to NDs Constipation, Diarrhea, bowel Incontinence, impaired Urinary Elimination, and Urinary Retention for additional interventions.
- **Respiration:**^{6,7}
Monitor breath sounds and characteristics of secretions *for early detection of complications (e.g., atelectasis, pneumonia).*
Encourage ambulation and upright position. Reposition, cough, and deep breathe on a regular schedule *to facilitate clearing of secretions and improve lung function.*
Encourage use of incentive spirometry. Suction as indicated *to clear airways.*
Demonstrate techniques and assist with postural drainage when indicated for long-term airway clearance difficulties.
Assist with and instruct family and caregivers in quad coughing techniques or diaphragmatic weight training *to maximize ventilation (in presence of SCI).*
-  Discourage smoking. Refer for a smoking-cessation program as indicated.
Refer to NDs ineffective Airway Clearance, ineffective Breathing Pattern, impaired Gas Exchange, and impaired spontaneous Ventilation for additional interventions.

- Vascular (tissue perfusion):⁶⁻⁸

Assess cognition and mental status (ongoing). *Changes can reflect state of cardiac health or cerebral oxygenation impairment or be indicative of a mental or emotional state that could adversely affect safety and self-care.*

Determine core and skin temperature. Investigate development of cyanosis and changes in mentation to identify changes in oxygenation status.

Evaluate circulation and nerve function of affected body parts on a routine, ongoing basis. *Changes in temperature, color, sensation, and movement can be the effect of immobility, disease, aging, or injury.*

Encourage or provide adequate fluid to prevent dehydration and impaired circulation.

Monitor blood pressure before, during, and after activity—sitting, standing, and lying if possible—to ascertain response to and tolerance of activity.

Assist with position changes as needed. Raise head gradually. Institute sitting upright on side of bed and arising slowly where appropriate to reduce incidence of injury that may occur as a result of orthostatic hypotension.

Maintain proper body position; avoid use of constricting garments and restraints to prevent vascular congestion.

 Provide range-of-motion exercise. Refer for and assist with physical therapy exercises for strengthening, restoration of optimal range of motion, and prevention of circulatory problems related to disuse. Note: Tilt table may be used in physical therapy after neurological insults to improve client's tolerance of upright position and improve functional recovery.^{4,15}

Mobilize quickly and as often as possible, using mobility aids and frequent rest stops to assist client in continuing activity. Upright position and weight bearing help maintain bone strength, improve circulation, and prevent postural hypotension.^{8,15}

  Institute peripheral vascular support measures (e.g., anti-embolism hose, Ace wraps, sequential compression devices) to enhance venous return and reduce incidence of deep vein thrombosis. Note: With prolonged bedrest and lack of physical activity, the number of red blood cells declines, which decreases the amount of oxygen being delivered to the tissues. Blood clots and inflammation increase.¹³

Refer to NDs risk for Activity Intolerance, risk for decreased Cardiac Output, risk for Peripheral Neurovascular Dysfunction, and ineffective peripheral Tissue Perfusion for additional interventions.

- Musculoskeletal (mobility, range of motion, strength, and endurance):^{5-8,13}

 Perform or assist with range-of-motion exercises and involve client in core strengthening and active exercises as soon as possible with physical or occupational therapy to promote bone health, muscle strengthening, flexibility, optimal conditioning, and functional ability.

Maximize involvement in self-care to restore or maintain strength, functional abilities, and early independence in self-care activities.

Intersperse activity with rest periods. Pace activities as possible to increase strength and endurance in a gradual manner and reduce failure of planned exercise because of exhaustion or overuse of weak muscles or injured area.

 Identify need and use of supportive devices (e.g., cane, walker, functional positioning splints) as appropriate to assist with safe mobility and functional independence.

 Evaluate role of physiological and psychological pain in mobility problem. Implement pain management program as individually indicated.

Avoid or monitor closely the use of restraints and immobilize client as little as possible to reduce possibility of agitation and injury.

Refer to NDs risk for Falls; impaired physical Mobility; impaired Sitting, impaired Standing, or impaired Walking; acute Pain; chronic Pain; and chronic Pain Syndrome for additional interventions.

- Sensory Perception:^{6-8,13,14}

Orient client as necessary to time, place, person, and situation. Provide cues for orientation (e.g., clock, calendar). *Disturbances of sensory stimulation, interpretation, and thought processes are associated with immobility as well as aging, being ill, disease processes/treatments, and medication effects.*

Avoid or monitor closely the use of restraints and immobilize the client as little as possible *to reduce the possibility of agitation and injury.*

Provide appropriate level of environmental stimulation (e.g., music, TV, radio, personal possessions, visitors). *Needs vary depending on the client, the nature of the current problem, and whether client is at home or in a healthcare facility. Having normal life cues can help with mental stimulation and restoration of health.*

Encourage participation in recreational or diversional activities and a regular exercise program (as tolerated) *to decrease the sensory deprivation associated with immobility and isolation.*

Promote regular sleep hours, use of sleep aids, and usual presleep rituals *to promote normal sleep and rest cycle.*

Refer to NDs chronic Confusion, decreased Diversional Activity Engagement, Insomnia, and [disturbed Sensory Perception] for additional interventions.

- Self-Esteem, Powerlessness, Hopelessness, Social Isolation:^{6,7,9}

Determine factors that may contribute to impairment of client's self-esteem and social interactions. *Many factors can be involved, including the client's age, relationship status, and usual health state; presence of disabilities, including pain; financial, environmental, and physical problems; and current situation causing immobility and client's state of mind concerning the importance of the current situation in regard to the rest of client's life and desired lifestyle.*

Ascertain if changes in client's situation are likely to be short term/temporary or long term/permanent. *Can affect both the client and care provider's coping abilities and willingness to engage in activities that prevent or limit effects of immobility.*

Assess living situation (e.g., lives with spouse, parents, alone) and determine factors that may positively or adversely affect client's progress, roles, and/or safety.

Explain or review all care procedures and plans. *Improves knowledge and facilitates decision making. Involves client in own care, enhances sense of control, and promotes independence.*

Encourage questions and verbalization of feelings. *Aids in reducing anxiety and promotes learning about condition and specific needs.*

Acknowledge concerns; provide presence and encouragement.

 Refer for mental, psychological, or spiritual services as indicated *to provide counseling, support, and medications.*

Provide for and assist with mutual goal setting, involving SO(s). *Promotes sense of control and enhances commitment to goals.*

Ascertain that client can communicate needs adequately (e.g., call light, writing tablet, picture or letter board, interpreter).

Refer to NDs impaired Verbal Communication, Powerlessness, ineffective Role Performance, Self-Esteem [specify], impaired Social Interaction, and Social Isolation for additional interventions.

- Body Image:^{6,7}

Evaluate for presence or potential for physical, emotional, and behavioral conditions that may contribute to isolation and degeneration. *Disuse syndrome often affects those individuals who are already isolated for one reason or another (e.g., serious illness or injury with disfigurement, frail elderly living alone, individual with severe depression, person with unacceptable behavior or without support system).*

Orient to body changes through discussion and written information *to promote acceptance and understanding of needs.*

Promote interactions with peers and normalization of activities within individual abilities. *Physical activity and social interactions stimulate the production of chemical substances produced by the body that generate increased feelings of well-being, vitality, and alertness.*

Refer to NDs disturbed Body Image, disturbed Personal Identity, situational low Self-Esteem, and Social Isolation for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Assist client/caregivers in development of individualized plan of care *to best meet the client's potential, enhance safety, and prevent or limit affects of disuse.*
- Provide information about individual needs and areas of concern (e.g., client's mental status, living environment, nutritional needs). *Information can help client and care providers to understand what long-term goals could be attained, what barriers may need to be overcome, and what constitutes progress or lack of progress requiring further evaluation and intervention.*⁶
- Review therapeutic regimen. *Treatment may be required for underlying condition(s), stress management, medications, therapies, and needed lifestyle changes.*
- Encourage involvement in regular exercise program, including flexibility, resistance and strengthening activities, and active or assistive range of motion *to limit consequences of disuse and maximize level of function.*²
- Promote self-care and SO-supported activities *to gain or maintain independence.*
- Recommend suitable balanced nutrition as well as use of supplements if needed *to provide energy for healing and maximal organ function.*
-  Refer to appropriate community health providers and resources *to provide necessary assistance (e.g., help with meal preparation, financial help for groceries, dietitian, or nutritionist).*⁷
- Review signs/symptoms requiring medical evaluation/follow-up *to promote timely interventions and limit adverse effects of situation.*⁶
- Identify community support services (e.g., financial, counseling, home maintenance, respite care, transportation).
-  Refer to appropriate rehabilitation or home-care and support resources *to help client/care providers learn more about specific condition and acquire needed assistance, adaptive devices, and necessary equipment.*

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Assessment findings, noting individual areas of concern, functional level, degree of independence, support systems and available resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Changes in level of functioning.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made, resources for specific equipment needs.

decreased Diversional Activity Engagement

Taxonomy II: Health Promotion—Class 1 Health Awareness (00097) [**Diagnostic Division:** Activity/Rest], Approved 1980; Revised 2017

DEFINITION: Reduced stimulation interest or participation in recreational or leisure activities.

RELATED FACTORS

Current setting does not allow engagement in activity
 Environmental barrier
 Impaired mobility; insufficient energy or motivation
 Insufficient diversional activity

DEFINING CHARACTERISTICS

Subjective

Boredom; discontent with situation

Objective

Alteration in mood
 Current setting does not allow engagement in activities
 Physical deconditioning; impaired mobility; frequent naps

At Risk Population: Extremes of age; prolonged hospitalization or institutionalization

Associated Condition: Prescribed immobility; psychological distress; therapeutic isolation

Sample Clinical Applications: Traumatic injuries, chronic pain, prolonged recovery (e.g., postoperative, complicated fractures), cancer therapy, chronic/debilitating conditions (e.g., congestive heart failure [CHF], chronic obstructive pulmonary disease [COPD], renal failure, multiple sclerosis [MS]), awaiting organ transplantation

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Motivation: Inner urge that moves or prompts an individual to positive action(s)

Leisure Participation: Use of relaxing, interesting, and enjoyable activities to promote well-being

Social Involvement: Social interactions with persons, groups, or organizations

Client Will (Include Specific Time Frame)

- Recognize own psychological response (e.g., hopelessness and helplessness, anger, depression) and initiate appropriate coping actions.
- Engage in satisfying activities within personal limitations.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Recreation Therapy: Purposeful use of recreational activities to enhance independent function and social skills, as well as reduce or eliminate the effects of illness or disability

Activity Therapy: Prescription of and assistance with specific physical, cognitive, social, and spiritual activities to increase the range, frequency, or duration of an individual's or group's activity

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

NURSING PRIORITY NO. 1 To assess precipitating/etiological factors:

-  Assess client's physical, cognitive, emotional, and environmental status. *Validates reality of diversional deprivation when it exists or identifies the potential for loss of desired diversional activity in order to plan for prevention or early intervention where possible. Note: Studies show that key problems faced by clients who are hospitalized (or in a long-term facility, or immobilized) for extended periods of time include boredom, stress, and depression. These negative states can impede recovery and lead clients to report symptoms more frequently.*^{1,10}
-  Observe for restlessness, flat facial expression, withdrawal, hostility, yawning, or statements of boredom as noted above, especially in individual likely to be confined either temporarily or long term. *May be indicative of need for diversional interventions.*
-  Note potential impact of current disability or illness on lifestyle (e.g., young child with leukemia, elderly person with fractured hip, individual with severe depression). *Provides comparative baseline for assessments and interventions.*⁸
-  Be aware of age and developmental level, gender, cultural factors, and the importance of a given activity in client's life. *Cultural issues include gender roles, communication styles, privacy and personal space; expectations and views regarding time and activities; and control of the immediate environment, family traditions, and social patterns. When illness interferes with individual's ability to engage in usual activities, such as a lifelong dancer with incapacitating osteoporosis (or a woman with strong cultural expectations who is unable to take care of her family), the person may have difficulty engaging in meaningful substitute activities.*¹¹
- Determine client's actual ability to participate in available activities, noting attention span, physical limitations and tolerance, level of interest or desire, and safety needs. *Presence of depression or disinterest in life; problems of immobility; protective isolation; and lack of stimulation, developmental delay, or sensory deprivation may interfere with desired activity. However, lack of involvement may not reflect client's actual abilities, but may rather be a matter of misperception about abilities.*⁸

NURSING PRIORITY NO. 2 To motivate and stimulate client involvement in solutions:

-  Institute or continue appropriate actions to deal with concomitant conditions such as anxiety, depression, grief, dementia, physical injury, isolation and immobility, malnutrition, acute or chronic pain, etc. *These conditions interfere with the individual's ability to engage in meaningful activities that will stimulate his/her interest.*

- Introduce activities at client's current level of functioning, progressing to more complex activities, as tolerated. *Provides opportunity for client to experience successes, reaffirming capabilities and enhancing self-esteem.*⁷
- Establish therapeutic relationship, acknowledging reality of situation and client's feelings. *May be feeling sense of loss when unable to participate in usual activities or to interact socially as desired.*⁷
- Accept hostile expressions while limiting aggressive acting-out behavior. *Permission to express feelings of anger and hopelessness allows for beginning resolution. However, destructive behavior is counterproductive to self-esteem and problem-solving.*⁷
- Involve client and parent/significant other (SO)/caregiver in determining client's needs, desires, and available resources. *Helps ensure that plan is attentive to client's interests and resources, increasing likelihood of client participation.*²
- ∞ Encourage parent/caregiver of young child to engage in play with confined child. *Play is essential to young child's development, can help redirect child's attention from pain of condition, and reduce child's boredom and stress.*^{3,12}
- Review history of lifelong activities and hobbies client has enjoyed. Discuss reasons client is not doing these activities now and whether client can or would like to resume these activities. *Diversional activities can provide positive and productive avenues into which client can channel thoughts and time.*⁴
- Assist client/caregiver to set realistic goals for diversional activities, communicating hope and patience. *Can help client realize that this situation is not hopeless, that there are choices for improving the current situation, and that the future can hold the promise for improvement.*
- Provide instruction in relaxation techniques (e.g., meditation, sharing experiences, reminiscence, soft music, guided visualization) to enhance coping skills.⁷
- Participate in decisions about timing and spacing of visitors and leisure and care activities to promote relaxation and reduce sense of boredom as well as prevent overstimulation and exhaustion.⁷
- Encourage client to assist in scheduling required and optional activity choices. *For example, client may want to watch favorite television show at bath time; if bath can be rescheduled later, client's sense of control is enhanced.*⁷
- Encourage mix of desired activities/stimuli (e.g., music, news, educational presentations, movies, computer or Internet access, books or other reading materials, visitors, games, arts and crafts, sensory enrichment [e.g., massage, aromatherapy], grooming and beauty care, cooking, social outings, gardening, discussion groups, as appropriate). *Activities need to be personally meaningful and not physically/emotionally overwhelming for client to derive the most benefit.*^{4,9}
- Refrain from making changes in schedule without discussing with client. *It is important for staff to be sensitive and responsible in making and following through on commitments to client.*⁷
- 🏠 Provide change of scenery (indoors and outdoors where possible). Provide for periodic changes in the personal environment when client is confined inside, eliciting the client's input for likes and desires. *Change (e.g., new pictures on the wall, seasonal colors/flowers, altering room furniture, outdoor light and air) can provide positive sensory stimulation, reduce client's boredom, and improve sense of normalcy and control.*⁵
- 🏠 Suggest activities such as bird feeders/baths for bird-watching, a garden in a window box or terrarium, or a fishbowl or aquarium to stimulate observation as well as involvement and participation in activity (e.g., bird identification, picking out feeders and seeds).⁷
- 🧠 Involve recreational, occupational, play, music, or movement therapists as appropriate to help identify enjoyable activities for client and to procure assistive devices or modify activities for individual situation. *Assists client to express needs and feelings, share experiences, escape healthcare routines, and participate in self-healing.*^{1,6,9}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Explore options for useful activities using the person's strengths/abilities and interests to engage the client/SO.
-  Make appropriate referrals to available resources (e.g., exercise groups, senior activities, hobby clubs, volunteering, companion and service organizations) *to introduce or continue diversional activities in community/home settings.*
- Refer to NDs ineffective Coping, Hopelessness, Powerlessness, and Social Isolation for additional interventions.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Specific assessment findings, including blocks to desired activities.
- Individual choices for activities.

Planning

- Plan of care, specific interventions, and who is involved in planning.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Referrals made and available community resources.

risk for Dry Eye

Taxonomy II: Safety/Protection—Class 5 Physical Injury (00219) [**Diagnostic Division:** Safety], Accepted 2010; Revised 2013, 2017

DEFINITION: Susceptible to eye discomfort or damage to the cornea and conjunctiva due to reduced quantity or quality of tears to moisten the eye, which may compromise health.

RISK FACTORS

Air conditioning; air pollution, excessive wind, low humidity; sunlight exposure

Caffeine intake; vitamin A deficiency

Insufficient knowledge of modifiable factors; prolonged reading; smoking

At Risk Population: Aging; female gender, history of allergy; contact lens wearer

Associated Condition: Autoimmune disease; hormonal change; neurological lesion with sensory or motor reflex loss; ocular surface damage; mechanical ventilation; treatment regimen

Sample Clinical Applications: Any condition where client is unable to protect self from drying of eye tissues, including facial or general trauma or surgery; mechanical ventilation; brain injury, cerebrovascular accident (CVA); neurological conditions such as Parkinson's disease, Bell's palsy; diabetic retinopathy; lupus; rheumatoid arthritis

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Dry Eye Severity: Severity of signs and symptoms of insufficient tears

Risk Control: Visual Impairment: Personal actions to prevent, eliminate, or reduce threats to visual function

Knowledge: Medication: Extent of understanding conveyed about the safe use of medication

Client Will (Include Specific Time Frame)

- Be free of discomfort or damage to eye related to dryness.
- Verbalize understanding of risk factors and ways to prevent dry eye.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Dry Eye Prevention: Prevention and early detection of dry eye in an individual at risk

Medication Administration: Eye: Preparing and instilling ophthalmic medications

NURSING PRIORITY NO. 1 To identify causative/precipitating factors related to risk:

- Obtain history of eye conditions when assessing client concerns overall. Note reports of dry sensation, burning, itching, pain, foreign body sensation, light sensitivity (photophobia), and blurred or fluctuating vision. *These symptoms can be associated with dry eye syndrome and, if present, require further evaluation and possible treatment.*¹
-  Note presence of conditions listed in risk factors above *to identify client with possible dry eye syndrome. Dry eye occurs when the quantity and/or quality of tears fails to keep the surface of the eye adequately lubricated. Dry eye is most commonly caused by increased tear evaporation or insufficient aqueous tear production. This can occur because of damage to eye surface (e.g., chemical burn) or be associated with disease conditions, neurological disorders, environmental factors, and electronic device use. Note: Studies have associated systemic diseases (e.g., rheumatoid arthritis and Sjögren's syndrome, allergies, thyroid disorders) with dry eye,*

and some studies have associated dry eye with arterial hypertension and type 2 diabetes, although not all studies are in accord.^{1-4,7}

-  Note client's gender and age. *Note: Studies show a higher incidence of dry eye syndrome in females than males, especially over the age of 50.*^{1,2,4}
- Determine client's current situation (e.g., admitted to facility for procedures/surgery, recent neurological event, mechanical ventilation, facial or eye trauma; eye infections, lower eyelid malposition) *that places client at high risk for dry eye associated with low or absent blink reflex and/or decreased tear production.*⁵
- Determine client's history/presence of seasonal or environmental allergies. *which may cause or exacerbate conjunctivitis.*
- Review living and work environment *to identify factors (e.g., exposure to smoke, wind, or chemicals; poor lighting, long periods of computer use or eye-straining work) that can cause or exacerbate dry eyes.*
-  Assess client's medications, noting use of certain drugs (e.g., antihistamines, beta blockers, antidepressants, and oral contraceptives) *known to decrease tear production.*¹
-  Refer for diagnostic evaluation and interventions as indicated. *Symptom questionnaire may reveal need for further evaluation.*

NURSING PRIORITY NO. 2 To promote eye health/comfort:

-  Assist in/refer for treatment of underlying cause of dry eyes. *Interventions could range from changing a medication that is causing decreased tear production to surgery to correct an anatomic abnormality of the eyelid that interferes with blinking. Referral may be needed (e.g., to rheumatologist or endocrinologist for treatment of autoimmune condition or diabetes).*⁶
-  Administer artificial tears, lubricating eyedrops, or ointments as indicated *when client is unable to blink or otherwise protect eyes while in healthcare facility.*⁵

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

-  Instruct high-risk client in self-management interventions *to prevent or limit symptoms of dry eye.*^{6,7}
 Avoid air blowing in eyes *such as might occur with hair dryers, car heaters, air conditioners, or fans directed toward eyes.*
 Wear eyeglasses or safety shield glasses on windy days *to reduce effects of the wind* and goggles while swimming *to protect eyes from chemicals in the water.*
 Take proper care of contact lenses and adhere to prescribed wearing time.
 Add moisture to indoor air, especially in winter.
 Take eye breaks during long reading and computer tasks or when watching TV for long periods of time.
 Blink repeatedly for a few seconds *to help spread tears evenly over eye.*
 Position computer screen below eye level. *This may help slow the evaporation of tears between eye blinks.*
 Cessation of smoking and avoidance of smoking environments. *Smoke can worsen dry eye symptoms.*
 Discuss dietary changes if indicated. *Some physicians and nutritionists recommend a diet high in vitamin A, which is found in liver, carrots, and broccoli, and/or a diet high in omega-3 fatty acids, which are found in fish, walnuts, and vegetable oil, to prevent dry eye associated with vitamin A deficiency.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors identified.
- Client concerns or difficulty making and following through with plan.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward outcomes.

Discharge Planning

- Referrals to other resources.
- Long-term need and who is responsible for actions.

risk for Dry Mouth

Taxonomy II: Safety/Protection—Class 5 Physical Injury (00261) [**Diagnostic Division:** Safety], Approved 2016

DEFINITION: Susceptible to discomfort or damage to the oral mucosa due to reduced quantity and quality of saliva to moisten the mucosa, which may compromise health.

RISK FACTORS

Dehydration

Depression; excessive stress; excitement

Smoking

Associated Condition: Chemotherapy; radiation to the head and neck; oxygen therapy; systemic diseases; pregnancy

Fluid restriction; inability to feed orally

Pharmaceutical agent

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Oral Health: Condition of the mouth, teeth, gums, and tongue

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client/Caregiver Will (Include Specific Time Frame)

- Be free of discomfort or damage to mouth related to dryness.
- Verbalize understanding of risk factors and ways to prevent dry mouth.

Note: Many of the assessments and interventions in this ND are the same or similar to those in ND impaired Oral Mucous Membrane Integrity.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Oral Health Maintenance: Maintenance and promotion of oral hygiene and dental health for the patient at risk for developing oral or dental lesions

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

-  Perform oral screening or comprehensive assessment upon admission to facility using tool (e.g., Oral Health Assessment Tool for Long-Term Care), as indicated. *Use of standardized tool is beneficial in evaluating health of entire mouth including lips, tongue, gums, and other soft tissues.*⁴
- Note presence of diseases/conditions (e.g., Sjögren's syndrome, dementias, diabetes, anemia, cystic fibrosis, rheumatoid arthritis, hypertension, Parkinson's disease, stroke; dehydration [as might occur with fever, vomiting, diarrhea, blood loss, burns]) and treatments (e.g., nerve damage to the head and neck from injury or surgery; damage to the salivary glands as might occur from radiation to the head and neck, or chemotherapy for various cancers). *These factors/conditions are often associated with dry mouth.*^{1,2}
-  Review client's medications. *Dry mouth is a common side effect of many prescription and nonprescription drugs, including (but not limited to) muscle relaxants, sedatives, antidepressants, psychotropics, anti-anxiety agents; analgesics, antihistamines/decongestants; antileptics, antihypertensives, diuretics; antidiarrheals, anti-emetics, bronchodilators.*³ *Note: In 2013, the Centers for Disease Control and Prevention (CDC) reported that over 400 medications have been implicated in dry mouth.*
-  Perform regular oral exams several times/day. Pay attention to client reports of thirst, burning in mouth or tongue; dry throat; problems swallowing or speaking. Observe for dried, flaky, whitish saliva in and around the mouth, thick saliva that sticks to lip, bits of food or other matter on the teeth, tongue, and gums; cracked lips, raw-appearing red tongue, sores in corners of mouth; bad breath. *These signs and symptoms reveal severely dry mouth, reduced saliva, and possible systemic dehydration. Note: If client is receiving radiation therapy for cancer, the symptoms can greatly increase client's discomfort.*¹²
-  Determine status of oral hygiene. Observe for chipped, sharp-edged teeth, or malpositioned teeth. Note fit of dentures or other prosthetic appliances when used. *Healthy teeth or well-fitting dentures have a strong effect on oral health and comfort of the oral mucosa, as well as the ability to eat (chewing, swallowing). Note: One recent study reported that people with broken teeth, absent teeth, or loose or ill-fitting dentures were more than 9 times more likely to report at least one oral impact (including dry mouth) than did those with well-fitting dentures.*¹¹ *Conversely, dry mouth can lead to ongoing dental cavities and mouth infections.*¹¹
- Evaluate lifestyle concerns (e.g., smoking, chewing tobacco, breathing or sleeping with open mouth). *Such factors can cause or exacerbate dry mouth.*
- Determine problems with food and fluid intake (e.g., avoiding eating, reports change in taste, chews painstakingly, swallows numerous times for even small bites; insufficient fluid intake/dehydration; unexplained weight loss). *Malnutrition and dehydration are associated with problems with oral mucous membranes.*⁵

NURSING PRIORITY NO. 2 To correct identified/developing problems:

-  Collaborate in treatment of underlying conditions, *which may correct or reduce problem with dry mouth.*
-  Adjust medication regimen *to reduce use of drugs with potential for causing or exacerbating painful dry mouth.*
-  Provide comfort mouth care (e.g., water; sodium bicarbonate solutions, mucosal coating agents, topical anesthetic gargles). Use petroleum jelly, cocoa butter, or a mild lip balm to keep lips moist. *May improve client comfort by hydration of mucous membrane surfaces.*^{5,6,9}
-  Avoid mouthwashes containing alcohol (*drying effect*) or hydrogen peroxide (*drying and foul tasting*).⁷

-  Use lemon/glycerin swabs with caution. *Although some sources mention use of glycerin swabs, the issue appears to be controversial, with some stating that glycerin should not be used as it absorbs water and actually dries the oral cavity and can result in decreased salivary amylase, as well as erosion of tooth enamel.*^{5,8}
- Encourage use of chewing gum, hard candy, etc., *to stimulate flow of saliva to neutralize acids and limit bacterial growth.*²
- Avoid dry foods, such as crackers, cookies, and toast, or soften them with liquids before eating. Sip liquids with meals to moisten foods and help with swallowing.⁸
- Encourage adequate fluids *to prevent dehydration and oral dryness and limit bacterial overgrowth.*⁸
- Suggest use of vaporizer or room humidifier *to increase humidity if client is mouth breather or ambient humidity is low.*
-  Discuss and instruct caregiver(s) in special mouth care required during end-of-life care/hospice *to promote optimal comfort in client who has stopped eating or drinking, who has dry mouth, and may not have sensation of thirst.*⁹

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-   Recommend regular dental checkups and care and episodic evaluation of oral health prior to certain medical treatments (e.g., chemotherapy, radiation) *to maintain oral health and reduce risks associated with impaired tissues.*
- Review current oral hygiene practices and concerns. Provide informational resources, including reliable Web sites about oral health *to reinforce learning and encourage proper care.*
- Provide nutritional information *to correct deficiencies, reduce mucosal inflammation or gum disease, and prevent dental caries.*
- Emphasize benefit of avoiding alcohol and smoking or chewing tobacco, *which can contribute to mucosal inflammation and gum disease.*
- Discuss need for and demonstrate use of special appliances (e.g., power toothbrushes, dental water jets, flossing instruments, applicators) if indicated. *Enhances independence in self-care.*
-   Identify community resources (e.g., low-cost dental clinics, smoking-cessation resources, cancer information services or support group, Meals on Wheels, supplemental nutrition program, home-care aide) *to meet individual needs.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Condition of oral mucous membranes, routine oral care habits and interferences.
- Availability of oral care equipment and products.
- Knowledge of proper oral hygiene and care.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made, resources for special appliances.

ineffective adolescent Eating Dynamics

Taxonomy II: Nutrition—Class 1 Ingestion (00269) [Diagnostic Division: Food/Fluid] Approved 2016

DEFINITION: Altered eating attitudes and behaviors resulting in over or under eating patterns that compromise nutritional health.

RELATED FACTORS

Altered family dynamics; negative parental influences on eating behaviors
 Anxiety; depression; excessive stress
 Changes to self-esteem upon entering puberty
 Eating disorder; inadequate choice of food
 Eating in isolation; excessive family mealtime control; irregular mealtime; stressful mealtimes
 Media influence on knowledge of, or eating behaviors of high caloric unhealthy foods
 Psychological abuse or neglect

DEFINING CHARACTERISTICS

Subjective

Complains of hunger between meals; poor appetite

Objective

Frequent snacking; frequently eating from fast food restaurants; frequently eating processed food, or poor quality food

(continues on page 276)

ineffective adolescent Eating Dynamics (continued)

Avoids participation in regular mealtimes; food refusal

Overeating, undereating

Associated Condition: Physical challenge with eating or feeding

Physical or psychological health issues of parents

Sample Clinical Applications: Anorexia, bulimia nervosa, obesity, bariatric surgery, substance abuse, depression, anxiety disorder

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Eating Disorder: Self-Control: Personal actions to eliminate maladaptive behaviors and to adopt and maintain healthy eating patterns and optimum body weight

Nutritional Status: Biochemical Measures: Body fluid components and chemical indices of nutritional status

Client Will (Include Specific Time Frame)

- Make nutritionally adequate choices of food/fluids.
- Assume control over mealtime.
- Identify feelings and underlying dynamics of low self-esteem/changes of puberty.
- Display normalization of laboratory values reflecting appropriate nutrient intake.

Sample **NOC** linkages:

Knowledge: Eating Disorder Management: Extent of understanding conveyed about an eating disorder, its treatment, and the prevention of disease progression and complications

Parenting Performance: Parental actions to provide a child a nurturing and constructive physical, emotional, and social environment

Parent/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of under/overinvolved parenting style.
- Identify specific actions that affect eating habits.
- Demonstrate willingness to work together as a family to resolve presenting problems.

Refer to NDs: Nutrition, imbalanced: less than body requirement; Overweight; Obesity as indicated for additional interventions specific to client's situation.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Nutritional Counseling: Use of an interactive helping process focusing on the need for diet modifications

Family Therapy: Assisting family members to move their family toward a more productive way of living

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Note age and developmental level of client and place in family order. *The adolescent period of development is a period of vulnerability for the development of problems with eating.⁸ Family order may impact how other members respond to or handle conflict.*
-  Discuss client's perception of the current situation and motivation for change. *Important to understand client's belief and understanding and whether current situation is viewed as a problem.⁶*

- Assess eating habits and nutritional intake. *Helps determine behaviors to be changed and provides basis for planning care.*¹
-  Identify family cultural/religious factors and finances. *Personal beliefs and finances affect choices when developing meal plans.*
-  Determine dynamics of family system. *How the family deals with the adolescent is critical to the outcome of the illness. Family-based treatment can be important for the client's recovery.*²
- Perform a complete physical exam. *Provides a baseline for comparison as client progresses through treatment.*³
- Assess current weight. *to identify deviations from the norm and establish baseline parameters.*³
-  Evaluate possibility of attention-deficit hyperactivity disorder (ADHD). *Although research has lagged in this area, there are reasons to believe that girls with this disorder may be at increased risk for eating disorders such as body dissatisfaction, showing distress through eating disorders, underweight or overweight.*⁵
- Note issues of self-esteem client may express. *Adolescents often struggle with concerns about their body in relation to others and often believe they are not as worthwhile as their peers.*⁶
-  Identify gender of the client. *Although females with eating disorders outnumber males by a significant number, males make up an important aspect of this problem, are more reluctant to seek help, and may need special accommodations, such as an all-male treatment team.*⁷
-  Discuss client's/family's eating patterns and attitudes toward food. *Provides information that will be helpful to plan for needed changes and may reveal problems of others needing to be addressed.*^{9,10}
-  Review lab studies reflecting nutritional status. *Helpful in identifying deficiencies and therapeutic needs.*

NURSING PRIORITY NO. 2 To assist client to develop skills to manage adequate nutritional needs:

- Promote therapeutic nurse/client/family relationship. *A trusting relationship allows the individuals to freely share and be open and honest with self and therapist.*²
- Assist client to make achievable goals to maintain healthy eating habits. *Increases likelihood of successful change.*²
-  Refer to dietician. *Provides information and guidance in determining individual nutritional needs incorporating child's likes and is mindful of dislikes.*
-  Discuss frequent use of processed or fast-food sources for meals. *While this may expedite meals for the busy family, they do not provide the nutrition needed for growing children or general health of other family members and are not cost effective.*¹⁰
-  Emphasize need to avoid comparing self with others, encouraging client to look at positive aspects of self. *Adolescents tend to look at friends, TV, models, and others to model themselves after rather than accepting their body as being all right as is.*¹⁰
- Note perceptions client may express and discuss realities. *Correcting misperceptions helps the adolescent adjust choices of food and activities for more positive results.*⁶
- Address physical/safety issues client presents. *Physical changes in the body that are occurring with client's current eating habits affect how client views self-esteem and contribute to lack of attention to safety issues.*⁴
- Remind family/friends that teasing client about body/eating habits is not to be done. *Teasing can be damaging, regardless of whether client is obese or thin, and is counterproductive.*²
-  Refer for family therapy as indicated. *May help resolve parent and adolescent issues interfering with relationship and manifesting in unhealthy eating behaviors.*²
-  Encourage client to become involved in enjoyable physical activities. *Participation in these activities can enhance self-esteem, promote self-reliance and confidence, and lead to improved weight management.*⁸
- Refer to NDs chronic low Self-Esteem for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- Involve client in school and social activities. *Continuing scholastic studies will improve sense of accomplishment, and involvement in social groups will provide opportunities to make friends and enjoy activities that may involve eating in accepted manner.*⁹

- Talk with adolescent about involvement with social media. *Social media is found to have a negative effect on self-esteem for adolescents, and sharing this information can help the individual change her/his attitude.*⁴
- Identify appropriate online reference sites. *Can provide information and recipes to help with meal planning over time to achieve long-term goals.*
-  Identify community support programs and resources as needed. *Useful in sustaining efforts for change.*
-  Refer parents to parenting classes, such as effectiveness training, etc., and group therapy. *Will help parents learn how to interact with their growing adolescent as both develop positive relationships.*¹¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including eating habits, attitude toward them, food choices.
- Interactions with others, peers, and family.
- Motivation for change.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and changes.
- Attainment or progress toward desired outcomes.
- Modification to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions.
- Specific referrals made.

ineffective child Eating Dynamics

Taxonomy II: Nutrition—Class 1 Ingestion (00270) [Diagnostic Division: Food/Fluid], Approved 2016

DEFINITION: Altered attitudes, behaviors, and influences on child eating patterns resulting in compromised nutritional health

RELATED FACTORS

Eating Habits:

Bribing or forcing child to eat; excessive parental control over child's eating experience; limiting child's eating or rewarding child to eat

Consumption of large volumes of food in a short period of time; inadequate choice of food

Disordered eating habits; eating in isolation; unpredictable eating patterns

Excessive parental control over family meal time; lack of regular mealtimes; stressful mealtimes

Unstructured eating of snacks between meals

Family Process:

Abusive relationship

Anxious, hostile, insecure, or tense parent-child relationship

Disengaged, overinvolved, or underinvolved parenting style

Parental:

Anorexia; inability to support healthy eating patterns

Depression; ineffective coping strategies; substance misuse/[abuse]

Inability to divide eating or feeding responsibility between parent and child

Lack of confidence in child to develop healthy eating patterns or grow appropriately

Environmental:

Media influence on knowledge of, or eating behaviors of, high caloric unhealthy foods

DEFINING CHARACTERISTICS

Subjective

Complains of hunger between meals; poor appetite

Objective

Frequent snacking; frequently eating from fast food restaurants; frequently eating processed food or poor quality food

Avoids participation in regular mealtimes; food refusal

Overeating, undereating

At Risk Population: Economically disadvantaged; homeless

Involved with the foster care system

Life transition

Parental obesity

Associated Condition: Physical challenge with eating or feeding

Physical or psychological health issues of parents

Sample Clinical Applications: Obesity, anorexia, substance abuse

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Eating Disorder Self-Control: Personal actions to eliminate maladaptive behaviors and to adopt and maintain healthy eating patterns and optimum body weight

(continues on page 280)

ineffective child Eating Dynamics (continued)

Child Will (Include Specific Time Frame)

- Ingest appropriate amount of calories/nutrients to meet metabolic needs.
- Achieve/maintain body weight appropriate for height.

Sample **NOC** linkages:

Knowledge: Eating Disorder Management: Extent of understanding conveyed about an eating disorder, its treatment, and the prevention of disease progression and complications

Parenting Performance: Parental actions to provide a child a nurturing and constructive physical, emotional, and social environment

Parent/Caregiver Will (Include Specific Time Frame)

- Acknowledge that child is having problems with eating.
- Verbalize understanding of under-/overinvolved parenting style.
- Identify specific actions that affect eating habits.
- Demonstrate willingness to work together as a family to resolve presenting problems.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Parenting Promotion: Providing parenting information, support, and coordination of comprehensive services to high-risk families

Nutritional Counseling: Use of an interactive helping process focusing on the need for diet modifications

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine individual situation (e.g., bribing or forcing child to eat, excessive parental control over child's eating experience, stressful mealtimes, inappropriate choice of foods). *Provides information to develop plan of care.*³
- Assess child's health status, weight, age, stage of growth and development. *Information needed to determine nutritional needs and desired change in weight.*⁴
- Ascertain family functioning and relationships that may affect child's eating disorder. *How family members interact with one another; arguments, or disagreements can affect child's eating behaviors.*³
- Note child's eating habits, eating in isolation, unpredictable eating patterns, eating snacks between meals. *These factors can lead to weight gain as child grows.*⁵
- Determine family habits of watching TV and other social media especially while eating. *The influence of media (especially food commercials) on family and child's eating of high calorie unhealthy foods is well documented.*⁴
- Evaluate physical activities of all family members. *Inactivity can contribute to increased risk of obesity. A significant number of children are obese or overweight at an earlier age than in the past.*¹
- Note environmental factors, including family functioning and parenting style, mother's eating disorder or mental status, relationship between mother and child. *Self-report interviews reveal problem areas for mothers and children to determine needs for intervention.*³ Note: While primary focus has been directed toward mothers, either or both parents may have issues to be addressed.
-  Identify family cultural/religious beliefs and finances. *Personal beliefs and financial resources affect how family views food and impacts meal plans.*

NURSING PRIORITY NO. 2 To assist family/child to develop new habits/patterns of family functioning and eating behaviors:

- Develop therapeutic nurse-client relationship. Be attentive, provide encouragement for efforts, use skills of active listening and I messages to maintain open communication. *Promotes trusting situation in which client is able to express self and be honest and open with self and nurse.*
- Discuss eating behaviors with family/child, identifying areas for change. *Realizing how eating patterns affect children can enable parents to be willing to make changes for better nutrition and overall health.*⁴
- Help parents learn new methods of planning and cooking foods. *Learning healthy ways of eating can help parents and children establish nutritionally sound habits of eating.*⁴
- Discuss parental involvement with child's eating behaviors. *Parents may not trust child to make healthy choices for eating, resulting in overinvolvement or anxious behaviors affecting child's eating.*³

NURSING PRIORITY NO. 3 To establish nutritionally adequate plan that meets needs of family members:

- Involve parents and child in developing achievable short- and long-term goals. *Increases likelihood of success if all parties agree on the goals.*
-  Consult with dietician. *Provides information and guidance in determining individual nutritional needs incorporating child's likes and being mindful of dislikes.*
- Develop a plan, taking into account previously determined problems of family's eating behaviors. *Sitting down as a family at regularly scheduled times in a "media-free zone" that encourages open family communication can reduce stress levels and enhance food intake.*¹
- Encourage parents to relax and allow child to make own decisions about eating. *Children will eat what they need when given the opportunity to make own choices.*³
- Talk about frequent use of processed or "fast food" sources for meals. *While this may expedite meals for the busy family, they do not provide the nutrition needed for growing children as well as general health of other family members, and are not cost effective.*²

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

- Emphasize importance of well-balanced nutrition intake within financial concerns. *Individuals may have never learned how to shop for and prepare affordable quality foods.*¹
- Identify appropriate online reference sites. *Can provide information and recipes to help with meal planning over time to achieve long-term goals.*
- Assist in developing regular exercise and stress reduction programs. *Helps family members learn ways to manage weight and stress levels, improving general well-being.*⁶
-  Refer parents to classes in parenting, nutritional food preparation, or therapeutic needs. *Can be helpful when needed to assist family to learn new ways of dealing with issues/problems.*⁴
-  Identify community support programs and resources as needed. *Useful in sustaining efforts for change.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Health status and weight of child and parents.
- Parents' understanding of or perception of problems.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Parent/child responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.

Discharge Planning

- Long-term needs, and who is responsible for actions to be taken.
- Specific referrals made.

ineffective infant Eating Dynamics

Taxonomy II: Nutrition—Class 1 Ingestion (00271) [Diagnostic Division: Food/Fluid], Approved 2016

DEFINITION: Altered parental behaviors resulting in over or under eating patterns.

RELATED FACTORS

Abusive relationship

Attachment issues; disengaged parenting style; over-involved or under-involved parenting style

Lack of knowledge of infant's developmental stages or for appropriate methods of feeding infant for each stage of development

Lack of knowledge of parent's responsibility in infant feeding; multiple caregivers

Lack of confidence in child to develop healthy eating habits or to grow appropriately

Media influence on knowledge of, or feeding infant high caloric unhealthy foods

DEFINING CHARACTERISTICS

Objective

Food refusal; poor appetite

Inappropriate transition to solid foods

Overeating or undereating

At Risk Population: Abandonment; involvement with the foster care system

Economically disadvantaged; homeless

History of unsafe eating and feeding experiences

Life transitions

Small for gestational age; prematurity; neonatal intensive care experiences; prolonged hospitalization

Associated Condition: Chromosomal disorders; genetic disorder; neural tube defects; sensory integration problems; congenital heart disease

Cleft lip or palate; physical challenge with eating

Physical or psychological health issues of parents

Prolonged enteral feedings

Sample Clinical Applications: Cleft lip/palate, congenital heart disease, premature infant

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Infant Nutritional Status: Amount of nutrients ingested and absorbed to meet metabolic needs and foster growth of an infant

Infant Will (Include Specific Time Frame)

- Ingest appropriate amount of calories/nutrients to meet metabolic needs.
- Achieve/maintain optimum body weight.

Knowledge: Infant Care: Extent of understanding conveyed about caring for a baby from birth to first birthday

Parenting Performance: Infant: Parental actions to provide an infant a safe, nurturing, and positive physical, emotional, spiritual, and social environment from 28 days to first birthday

Parents Will (Include Specific Time Frame)

- Verbalize understanding of infant feeding problems.
- Participate in treatment program as able.
- Attend classes to obtain knowledge about infant needs and developmental issues.
- Verbalize knowledge of appropriate methods of feeding infant at each stage of development.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Teaching: Infant Nutrition (specify) months: Instruction on nutrition and feeding practices through the 12 months of life

Parenting Promotion: Providing parenting information, support, and coordination of comprehensive services to high-risk families

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify current situation and specific needs of infant and parents. *Information necessary to define needs and develop plan of care.*
- Assess parents' knowledge of infant feeding needs. *Parents may require basic information or may just need additional information to understand current situation.*²
- Note interaction between parent and infant. *Parent may need assistance with handling infant, and caregiver is able to foster appropriate behavior and discourage maladaptive behavior.*⁴
- Obtain baseline weight and weigh on predetermined schedule. *Weight loss can indicate problems with feeding, inability to suck sufficiently and correctly, insufficient quantity of breast milk.*⁵
- Determine sucking dynamics of the breastfed infant, especially preterm infants. *Breastfeeding is the ultimate nutritional goal, and effective sucking is vital to accomplishing adequate intake.*⁵
- Note feeding problems, such as colic, vomiting, slow feeding, or refusal to eat. *Mild to moderately severe issues may be managed by care provider, while more-complicated cases may require referral to specialists.*¹
-  Identify family cultural/religious beliefs and finances. *Personal beliefs and financial resources affect how family views feeding choice (i.e., breast or bottle) and food choices when solids are introduced.*

NURSING PRIORITY NO. 2 To promote effective infant eating dynamics:

- Develop positive nurse/family relationship. *Enables family to feel comfortable discussing issues with nurse, being open and honest about concerns and anxieties.*³
-  Consult with dietician. *Provides information and guidance in determining individual nutritional needs incorporating infant's particular issues.*
- Provide information about normal growth, development, and nutritional needs when no problems are present. *Helps parents understand what to look for as infant progresses.*¹
- Discuss needs of infant with structural abnormalities, i.e., naso-oropharynx, larynx, and trachea, cleft lip or palate, esophagus, esophageal atresia or stenosis, stricture. *Investigation of individual situation can identify specific needs, difficulty with feeding, child's growth pattern, interaction between parent and child.*¹
- Provide information about neurodevelopmental disability that has been identified in newborn. *Each situation will need individual assessment regarding how is the problem manifested; the problems with feeding, weight, and development; the emotional climate in the family during feeding or other caregiving.*¹
- Discuss the basic food rules. *Parents control what, when, and where infant is fed. Infant controls how much they eat in order to learn internal regulation of eating in accordance with physiological signals of hunger and fullness.*¹
- Give assistance to parents requiring help with management skills. *Setting time limits for meals, ignoring noneating behavior, and using positive reinforcement to motivate infant can promote positive feeding behaviors.*⁴

Refer to ND ineffective infant Feeding Pattern for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- Encourage family members to set realistic goals for achieving necessary lifestyle changes. *Depending on the family situation, families will be dealing with problems as infant grows, and having written goals provides reminder of what needs to be done.*⁷
- Discuss methods family can take to make needed changes in family functioning, parenting styles. *Evidence exists to show that associations exist between family characteristics and feeding behavior problems in early childhood.*³
-  Identify support groups based on individual needs. *Provides opportunity for parents to interact with others addressing similar issues.*
-  Refer to community resources (e.g., public health visitor program, home care, day care/respite care, nutrition program/food bank). *Additional support and assistance enhances parents' opportunity for meeting established goals.*
-  Refer to parenting classes, individual and family therapy, and/or psychiatric counseling, as indicated. *Additional help will enable family to cope with problems in more positive ways.*⁴
- Suggest participation in group or community activities, e.g., assertiveness classes, volunteer work. *Involve-ment with others in these activities helps individuals to learn new ways of coping with problems in their own family.*²

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings, noting specific family problems and infant issues.
- Underlying dynamics of current situation.
- Family support, availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, actions performed, and changes that may be indicated.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and goals and who is responsible for actions to be taken.
- Specific referrals made.

risk for Electrolyte Imbalance

Taxonomy II: Nutrition—Class 5 Hydration (00195) [Diagnostic Division: Food/Fluid], Submitted 2008; Revised 2013, 2017

DEFINITION: Susceptible to changes in serum electrolyte levels, which may compromise health.

RISK FACTORS

Diarrhea; vomiting

Excessive or insufficient fluid volume

Associated Condition: Endocrine regulatory dysfunction [e.g., glucose intolerance, increase in IGF-1, androgen, DHEA, and cortisol]; renal dysfunction

Compromised regulatory mechanism [e.g., diabetes insipidus, syndrome of inappropriate secretion of antidiuretic hormone]

Treatment regimen

Sample Clinical Applications: Renal failure, anorexia nervosa, diabetes mellitus, Crohn's disease; gastroenteritis, pancreatitis, traumatic brain injury, cancer, multiple trauma, burns, sickle cell disease

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Electrolyte & Acid/Base Balance: Balance of electrolytes and nonelectrolytes in the intracellular and extracellular compartments of the body

Fluid Balance: Balance of the input and output of fluids in the body

Client Will (Include Specific Time Frame)

- Display laboratory results within normal range for individual.
- Be free of complications resulting from electrolyte imbalance.

(continues on page 286)

risk for Electrolyte Imbalance (continued)

Sample **NOC** linkages:

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Identify and plan for individual risks.
- Engage in appropriate behaviors or lifestyle changes to prevent or reduce frequency of electrolyte imbalances.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Electrolyte Monitoring: Collection and analysis of patient data to regulate electrolyte balance

Fluid/Electrolyte Management: Regulation and prevention of complications from altered fluid and/or electrolyte levels

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify client with current or newly diagnosed condition commonly associated with electrolyte imbalances, such as inability to eat or drink, febrile illness, and active bleeding or other fluid loss, including vomiting, diarrhea, gastrointestinal drainage, and burns. *The nurse taking a history on a new client, in both community health settings and acute care, should be alert to the possibility of electrolyte imbalances either being caused by an underlying condition or actually causing the client's symptoms. Symptoms of electrolyte imbalance depend upon the specific mineral affected but can include fatigue, muscle cramping, weakness, irregular heartbeat, confusion, and blood pressure changes.*¹⁰
- ∞ Assess specific client risk, noting client age (including premature infants or sick newborn, elderly debilitated client) and chronic disease processes that may lead to electrolyte imbalance, including kidney disease, metabolic or endocrine disorders, chronic alcoholism, cancers or cancer treatments, conditions causing hemolysis such as massive trauma, multiple blood transfusions, and sickle cell disease.^{1,18} *Electrolyte excesses are caused by factors that (1) increase electrolyte intake or absorption, (2) shift electrolytes from an electrolyte pool to the extracellular fluid, or (3) decrease electrolyte excretion.⁴ Electrolyte deficits are caused by factors that (1) decrease electrolyte intake or absorption, (2) shift electrolytes from the extracellular fluid to an electrolyte pool, (3) increase electrolyte excretion, or (4) cause abnormal loss of electrolytes.⁴*
- 🩺 Review client's medications for those associated with electrolyte imbalance. *Note: There are many such medications, including (but not limited to) diuretics, laxatives, corticosteroids, barbiturates, certain antidepressants (e.g., SSRIs), antihypertensive agents, antiepileptics, some hormones/birth control pills, and some antibiotics and antifungal agents.*

NURSING PRIORITY NO. 2 To identify potential electrolyte deficit:

- Assess mental status, noting client/caregiver report of change—altered attention span, recall of recent events, and other cognitive functions. *Altered mental status is the most common sign of sodium imbalances.*^{2,18}
- Monitor heart rate and rhythm by palpation and auscultation. *Weak pulse or thready pulse can be associated with hypokalemia; tachycardia, bradycardia, and other dysrhythmias are associated with various electrolyte imbalances, including potassium, calcium, and magnesium.*^{1–3,16}
- Auscultate breath sounds, assess respirations noting rate and depth and ease of respiratory effort, observe color of nailbeds and mucous membranes, and note pulse oximetry or blood gas measurement, as indicated. *Certain electrolyte imbalances, such as hypokalemia, can cause or exacerbate respiratory insufficiency.*²

-  Review electrocardiogram (ECG). *The ECG reflects electrophysiological, anatomical, metabolic, and hemodynamic alterations and is routinely used for the diagnosis of electrolyte and metabolic disturbances, as well as myocardial ischemia, cardiac dysrhythmias, structural changes of the myocardium, and drug effects.*¹⁻⁴
- Assess gastrointestinal symptoms, noting presence, absence, and character of bowel sounds; presence of acute or chronic diarrhea; and persistent vomiting and high nasogastric tube output. *Any disturbance of gastrointestinal (GI) functioning carries with it the potential for electrolyte imbalances.*^{4,5}
- Review client's food intake. Note presence of anorexia/other eating disorders, vomiting, or recent fad or unusual diet, and look for chronic malnutrition. *Can point to potential electrolyte imbalances, either deficiencies or excesses, such as high sodium content.*⁵
- Evaluate motor strength and function. *Neuromuscular function, including steadiness of gait, handgrip strength, reactivity of reflexes, and muscle weakness, can provide clues to electrolyte imbalances, including calcium, magnesium, phosphorus, sodium, and potassium.*^{2,4,16}
- Assess fluid intake and output. *Many factors, such as inability to swallow, large diuresis, chronic kidney failure, trauma, or surgery, affect an individual's fluid balance, thereby disrupting electrolyte transport, function, and excretion.*¹⁻⁵
-  Review laboratory results for abnormal findings. *Electrolytes include sodium, potassium, calcium, chloride, bicarbonate (carbon dioxide), and magnesium. These chemicals are absolutely essential in many bodily functions, including fluid balance, movement of fluid within and between body compartments, nerve conduction, muscle contraction—including the heart, blood clotting, and pH balance. Excitable cells, such as nerve and muscle, are particularly sensitive to electrolyte imbalances.*^{4,6}
- Assess for specific imbalances:

Sodium (Na⁺) *Dominant extracellular cation and cannot freely cross the cell membrane.*⁶

-  Review laboratory results—normal range in adults is 135 to 145 mEq/L. *Elevated sodium (hypernatremia) can occur if client has an overall deficit of total body water, which occurs via two mechanisms (inadequate fluid intake and water loss),^{7,8} and can be associated with low potassium, metabolic acidosis, and hypoglycemia.*²

Monitor for physical or mental disorders impacting fluid intake. *Impaired thirst sensation and inability to express thirst or obtain needed fluids may lead to hypernatremia.*^{7,8}

Note presence of medical conditions that may impact sodium level. *Congestive heart failure, liver and kidney failure, pneumonia, metabolic acidosis, and intestinal conditions resulting in prolonged GI suction are associated with hyponatremia.*^{4,6} *Hypernatremia can result from simple conditions such as febrile illness causing fluid loss and/or restricted fluid intake or from complicated conditions such as kidney and endocrine diseases affecting sodium intake or excretion.*⁸

Note presence of cognitive dysfunction such as confusion, restlessness, and abnormal speech (*which may be a cause or effect of sodium imbalance*); orthostatic blood pressure changes, tachycardia, or low urine output; or other clinical findings such as generalized weakness, swollen tongue, weight loss, and seizures. *Signs suggesting hypernatremia.*^{7,8}

Assess for nausea, abdominal cramping, lethargy, and orthostatic blood pressure changes—if fluid volume is also depleted, confusion, decreased level of consciousness, or headache. *Signs and symptoms suggestive of hyponatremia, which can lead to seizures and coma if untreated.*⁶

-  Review drug regimen. *Drugs such as anabolic steroids, angiotensin, cisplatin, and mannitol may increase sodium level. Drugs such as diuretics, laxatives, theophylline, and triamterene can decrease sodium level.*⁴

Potassium (K⁺) *Most abundant intracellular cation, obtained through diet and excreted via the kidneys.*⁹

Identify at-risk populations. *Extremes of age (premature or elderly); ingestion of unusual diet with high-potassium, low-sodium foods; clients receiving IV potassium boluses or transfusions of whole blood or packed cells; and use of potassium supplements, including over-the-counter (OTC) herbals or salt substitutes, increase possibility of hyperkalemia.*

-  Review laboratory results—normal range in adults is 3.5 to 5.0 mEq/L.

Obtain ECG as indicated.

Note presence of medical conditions that may impact potassium level. *Metabolic acidosis, burn or crush injuries, massive hemolysis, diabetes, kidney disease/renal failure, cancer, and sickle cell trait are associated with hyperkalemia.*¹⁰ *Situations that may lead to hypokalemia are those that decrease potassium intake—excessive fluid resuscitation, fasting, and unbalanced diet or eating disorders/anorexia; shift potassium from the extracellular fluid into cells—alkalosis, some malignancies; or increased potassium loss through diuresis or renal disorders such as acute tubular necrosis, nasogastric suction, and diarrhea.*^{1,19}

Evaluate reports of abdominal cramping, fatigue, hyperactive bowel motility, and muscle twitching and cramps followed by muscle weakness. Note presence of depressed reflexes and ascending flaccid paralysis of legs and arms. *Signs/symptoms suggesting hyperkalemia.*^{2,9}

Note presence of weakness and fatigue (most common), as well as anorexia, abdominal distention, diminished bowel sounds, palpitations, postural hypotension, muscle cramps and pain (severe hypokalemia), and flaccid paralysis. *May be manifestations of hypokalemia.*^{1,19}

 Review drug regimen. *Use of potassium-sparing diuretics; other medications, such as NSAIDs, angiotensin-converting enzyme inhibitors, angiotensin-receptor blockers; and heparin and certain antibiotics such as pentamidine may increase potassium level.*^{6,9,10} *Medications such as some pulmonary medications (e.g., albuterol, terbutaline), steroids, certain antimicrobials (e.g., penicillins, aminoglycosides), laxatives, and some diuretics may cause hypokalemia.*¹⁹

Calcium (Ca²⁺) *Most abundant cation in the body participates in almost all vital processes, working with sodium to regulate depolarization and the generation of action potentials. Disruption of these processes causes cellular irritability and dysfunction.*^{2,4,10,12,15}

 Laboratory results—normal range for adults is 8.5 to 10.5 mg/dL. *Elevated calcium (hypercalcemia) is associated with excessive urination (polyuria), constipation, lethargy, muscle weakness, anorexia, headache, and coma. Hypocalcemia can lead to cardiac dysrhythmias, hypotension, and heart failure; muscle cramps and facial spasms (positive Chvostek's sign); numbness, tingling sensations, and muscle twitching (positive Trousseau's sign); seizures; or tetany. Low serum albumin levels and vitamin D deficiency may also be associated with hypocalcemia.*^{4,11}

Note presence of medical conditions impacting calcium level. *Acidosis, Addison's disease, cancers (e.g., bone, lymphoma, leukemias), hyperparathyroidism, lung disease (e.g., tuberculosis, histoplasmosis), thyrotoxicosis, and polycythemia may lead to an increased calcium level. Chronic diarrhea and intestinal disorders such as Crohn's disease; pancreatitis, alcoholism, renal failure, or renal tubular disease; recent orthopedic surgery or bone healing; history of thyroid surgery or irradiation of upper middle chest and neck; and psychosis may result in hypocalcemia.*^{2,4,11}

 Review drug regimen. *Drugs such as anabolic steroids, some antacids, lithium, oral contraceptives, vitamins A and D, and amoxapine can increase calcium levels. Drugs such as albuterol, glucocorticoids, and insulin; laxative overuse; and phosphates, trazodone, or long-term anticonvulsant therapy can decrease calcium levels.*⁴

Magnesium (Mg²⁺) *The second-most abundant intracellular cation after potassium, magnesium controls absorption or function of sodium, potassium, calcium, and phosphorus.*^{2,4,9,10,13,14}

 Review laboratory results—normal range in adults is 1.5 to 2.0 mEq/L. *Excess magnesium (hypermagnesemia) occurs rarely but affects the central nervous, neuromuscular, and cardiopulmonary systems.*

Note GI and renal function. *Main controlling factors of magnesium are GI absorption and renal excretion.*¹² *Low levels of potassium (most common), as well as calcium, phosphorus, and magnesium, may be manifest at the same time if GI absorption is impaired.*¹⁴ *High levels of magnesium, calcium, phosphate, and potassium often occur together in setting of kidney disease.*^{13,14}

Note presence of medical condition impacting magnesium level. *Diabetic acidosis, multiple myeloma, renal insufficiency, eclampsia, asthma, certain cardiac dysrhythmias, tumor lysis syndrome, GI hypomotility, adrenal insufficiency, neoplasms with skeletal muscle involvement, extensive soft tissue injury or necrosis, shock, sepsis, severe burns, and cardiac arrest are associated with hypermagnesemia.*^{4,12,13,15} *Conditions resulting in decreased intake (e.g., starvation, alcoholism, parenteral feeding); excess GI losses (e.g., diarrhea, vomiting, nasogastric suction, malabsorption); renal losses (e.g., inherited renal tubular defects among others);*

or miscellaneous other causes, including calcium abnormalities, chronic metabolic acidosis, and diabetic ketoacidosis, can lead to hypomagnesemia.^{2,4,12}

Monitor for symptoms of hypermagnesemia. Presence of nausea, vomiting, weakness, and vasodilation suggest mild to moderate elevation of magnesium level (>3.5 – 5.0 mEq/L), while the presence of heart blocks, ventilatory failure, and stupor are associated with severe hypermagnesemia (>10.0 mEq/L), which can lead to coma and death.¹⁴

Note muscular weakness, tremors, seizures, paresthesia, hypertension, and cardiac abnormalities. Signs of hypomagnesemia that may lead to potentially fatal complications, including ventricular dysrhythmias, coronary artery vasospasm, and sudden death.^{9,13}

 Review drug regimen. Drugs such as aspirin and progesterone may increase magnesium level; albuterol, digoxin, diuretics, oral contraceptives, aminoglycosides, proton-pump inhibitors, immunosuppressants, cisplatin, and cyclosporines are some of the medications that may decrease magnesium levels.⁴

NURSING PRIORITY NO. 3 To prevent imbalances:

-  Collaborate in the treatment of underlying conditions to prevent or limit effects of electrolyte imbalances caused by disease or organ dysfunction.
-  Observe and intervene with elderly hospitalized individuals upon admission and during facility stay. Elderly are more prone to electrolyte imbalances related to fluid imbalances, the use of multiple medications including diuretics and heart and blood pressure medications, a lack of appetite or interest in eating or drinking, a lack of appropriate dietary and/or medication supervision at home, etc.²
- Provide balanced nutrition to hospitalized client, using best route for feeding and monitoring intake, weight, and bowel function. Obtaining and utilizing electrolytes and other minerals depend on client receiving them in a readily available route, preferably by oral ingestion, or by GI tube or parenteral route.
- Measure and report all fluid losses, including emesis, diarrhea, and wound or fistula drainage. Loss of fluids rich in electrolytes can lead to imbalances.
- Maintain fluid balance to prevent dehydration and shifts of electrolytes.
-  Use a pump or controller device when administering IV electrolyte solutions to provide medication at desired rate and prevent untoward effects of excessive or too rapid delivery.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Discuss ongoing concerns for clients with chronic health problems, such as kidney disease, diabetes, and cancer; individuals taking multiple medications; and/or clients deciding to take medications or OTC drugs differently than prescribed. By addressing these issues during each clinic visit, it may be possible to identify client at risk for electrolyte imbalances. Early intervention can help prevent serious complications.
-  Consult with dietitian or nutritionist for specific teaching needs. Learning how to incorporate foods that increase electrolyte intake or identifying food or condiment alternatives when client is taking in too much of an electrolyte (such as client with renal failure, and not on dialysis, failing to curtail high-potassium foods) increases client's self-sufficiency and likelihood of success.
-  Teach client/caregiver to take or administer drugs as prescribed—especially diuretics, antihypertensives, and cardiac drugs—to reduce potential of complications associated with medication-induced electrolyte imbalances.
- Instruct client/caregiver in reportable symptoms. For example, sudden change in mentation or behavior 2 days after starting a new diuretic could indicate hyponatremia, or an elderly person taking digitalis for atrial fibrillation and a diuretic may be hypokalemic.²
- Provide information regarding calcium supplements, as indicated. It is popular wisdom to instruct people, women in particular, to take calcium for prevention of osteoporosis. However, calcium absorption cannot take place without vitamins D and K and magnesium. Client taking calcium may need additional information or resources.¹⁶
-  Review client's medications at each visit for possible change in dosage or drug choice based on client's response, change in condition, or development of side effects.

-  Discuss medications with primary care provider *to determine if different pharmaceutical intervention is appropriate. For example, changing to potassium-sparing diuretic or withholding a diuretic in presence of hypokalemia may correct imbalance.*¹⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified or potential risk factors for individual.
- Assessment findings, including vital signs, mentation, muscle strength and reflexes, presence of fatigue, respiratory distress.
- Results of laboratory tests and diagnostic studies.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to treatment, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for actions to be taken.
- Specific referrals made.

impaired urinary Elimination

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00016) [**Diagnostic Division:** Elimination], Approved 1973; Revised 2006, 2017

DEFINITION: Dysfunction in urine elimination.

RELATED FACTORS

Multiple causality

DEFINING CHARACTERISTICS

Subjective

Frequent voiding; urinary urgency or hesitancy
Dysuria
Nocturia; [enuresis]

Objective

Urinary incontinence
Urinary retention

Associated Condition: Anatomic obstruction; sensory motor impairment; urinary tract infection

Sample Clinical Applications: Urinary tract infection (UTI), benign prostatic disease (BPH), bladder cancer, interstitial cystitis, spinal cord injury (SCI), multiple sclerosis (MS), pregnancy, childbirth, pelvic trauma, abdominal surgery, dementia, Alzheimer's disease

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Urinary Elimination: Collection and drainage of urine

Urinary Continence: Control of elimination of urine from the bladder

Self-Care: Toileting: Personal actions to toilet self independently with or without assistive device

Client Will (Include Specific Time Frame)

- Verbalize understanding of condition.
- Identify specific causative factors.
- Achieve normal elimination pattern or participate in measures to correct or compensate for defects.
- Demonstrate behaviors or techniques to prevent urinary infection.
- Manage care of urinary catheter or stoma and appliance following urinary diversion.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Urinary Elimination Management: Maintenance of an optimum urinary elimination pattern

Urinary Catheterization: Insertion of a catheter into the bladder for temporary or permanent drainage of urine

Perineal Care: Maintenance of perineal skin integrity and relief of perineal discomfort

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note presence of physical diagnoses that may be involved, such as UTI or dehydration, surgery (including urinary diversion), neurological conditions (e.g., MS, stroke, Parkinson's disease; paraplegia, tetraplegia), mental or emotional dysfunction (e.g., impaired cognition, delirium, confusion, depression, Alzheimer's disease), prostate disorders, recent or multiple pregnancies, and pelvic trauma.
- Determine pathology of bladder dysfunction relative to identified medical diagnosis. *Identifies direction for further evaluation and treatment options to discover specifics of individual situation. For example, in neurological or demyelinating diseases, such as MS, problem may be failure to store urine, empty bladder, or both.*^{1,6}
- ∞ Note client's age and gender. *Incontinence is twice as common in women as in men and affects at least one in three older women; painful bladder syndrome or interstitial cystitis (PBS/IC) is more common in women.*^{3,7}
- 🩺 Perform physical examination (e.g., cough test for incontinence, palpation for bladder retention and masses, prostate size, observation for urethral stricture).⁸
- Investigate reports of pain, noting location, duration, and intensity; the presence of bladder spasms; and back or flank pain, to assist in differentiating between bladder and kidney cause of dysfunction. *Note: Bladder pain located suprapubically, vaginally, in the perineum, low back, or medial aspects of the thighs that is relieved by voiding and often recurs with bladder filling suggests presence of PBS/IC.*⁷
- Observe current voiding pattern and time, color, and amount voided, as indicated to determine type of problem present and to assist in finding likely cause.
- 📋 Have client complete standardized self-report tool, such as the Pelvic Pain and Urgency/Frequency client symptom survey, as indicated. *Helpful in evaluating the presence and severity of PBS/IC symptoms.*^{7,12}
- 📋 Note reports of exacerbations (flare-ups) of symptoms of urgency and frequency, which may/may not be accompanied by pain, pressure, or spasm to assist in differentiating between bladder and kidney as cause of dysfunction. *Note: Clients with PBS/IC void very frequently (has been reported to be up to 60 times/day) with voided volumes usually less than normal.*^{7,13,15}
- Determine client's usual daily fluid intake (both amount and beverage choices and use of caffeine). Note condition of skin and mucous membranes and color of urine to determine level of hydration.
- 💊 Review medication regimen to identify drugs that can alter bladder or kidney function (e.g., some antihypertensive agents [e.g., angiotensin-converting enzyme inhibitors (ACE), beta-blockers]; anticholinergics [e.g., antihistamines, antiparkinsonian drugs]; antidepressants, antipsychotics; sedatives, hypnotics, opioids; caffeine; alcohol).⁹
- 🧴 Send urine specimen (midstream clean-voided or catheterized) for culture and sensitivities in presence of signs of UTI—cloudy, foul odor, and/or bloody urine.
- 🧴 Review lab tests for hyperglycemia, hyperparathyroidism, or other metabolic conditions, as well as changes in renal function, presence of infection/sexually transmitted infection, and cytology revealing cancer.
- 🧴 Review results of other diagnostic studies (e.g., uroflowmetry; cystometrogram; postvoid residual ultrasound (bladder scan), pressure flow, leak point pressure measurement; videourodynamics; electromyography; kidneys, ureters, and bladder imaging) to identify presence and type of elimination problem.¹⁰
- 🧴 Prepare for/review results of bladder cystoscopy and distention test as appropriate to help identify presence of PBS/IC. *Note: Bladder distention test may also be used as initial therapy.*¹⁷

NURSING PRIORITY NO. 2 To assess degree of interference/disability:

- Ascertain client's previous pattern of elimination and compare with current situation. Note reports of problems (e.g., frequency, urgency, painful urination; leaking or incontinence; changes in size or force of urinary stream; problems emptying bladder completely; nocturia, enuresis) to assist in identification and treatment of particular dysfunction.
- Ascertain client's/significant other's (SO's) perception of problem, degree of disability, and impact on self-image (e.g., client may be restricting social, employment, or travel activities; having sexual or relationship difficulties; experiencing depression).

-  Note influence of culture or ethnicity, as well as gender, on client's view of problems of incontinence. *Limited evidence exists to understand and help people cope with the physical and psychosocial consequences of this chronic, socially isolating, and potentially devastating disorder.*⁴
- Have client keep a voiding diary for prescribed number of days to record fluid intake, voiding times, precise urine output, and dietary intake. *Helps determine baseline symptoms, the severity of frequency/urgency, and whether diet is a factor if symptoms worsen.*

NURSING PRIORITY NO. 3 To assist in treating/preventing urinary alteration:

-  Encourage fluid intake up to 1,500 to 2,500 mL/day (within cardiac tolerance), including cranberry juice. *Maintains renal function, prevents infection and formation of urinary stones, avoids encrustation around indwelling catheter, or may be used to flush urinary diversion appliance.*
- Regulate liquid intake at prescheduled times to promote predictable voiding pattern.
- Discuss possible dietary restrictions (e.g., especially coffee, alcohol, carbonated drinks, citrus, tomatoes, and chocolate) based on individual symptoms.⁷
-  Assist with developing toileting routines (e.g., timed voiding, bladder training, prompted voiding, habit retraining) as appropriate. *For adults who are cognitively intact and physically capable of self-toileting, bladder training, timed voiding, and habit retraining may be beneficial.*^{3,11} *However, bladder retraining is not recommended for clients with PBS.*⁷
- Encourage client to verbalize fear or concerns (e.g., disruption in sexual activity, inability to work, concern about involvement in social activities). *Open expression allows client to talk about, deal with feelings, and begin to solve the identified problems.*
-  Modify medication regimens as appropriate. For example, administer prescribed diuretics in the morning to lessen nighttime voiding, and reduce or eliminate use of hypnotics, if possible, as client may be too sedated to recognize or respond to urge to void.³
-  Implement and monitor interventions for specific elimination problem (e.g., pelvic floor exercises or other bladder retraining modalities; medication regimen, antimicrobials [single dose is frequently being used for UTI], sulfonamides, antispasmodics). Evaluate client's response to modify treatment as needed.
-  Refer to appropriate resources (e.g., medical supply company, ostomy nurse, rehabilitation team) for assistance, as desired or needed, to promote self-care.
-  Discuss possible surgical procedures and medical regimen as indicated (e.g., client with benign prostatic hypertrophy, bladder or prostatic cancer, PBS/IC). *For example, cystoscopy with bladder hydrodistention for PBS/IC or an electrical stimulator may be implanted to treat chronic urinary urge incontinence, nonobstructive urinary retention, and symptoms of urgency and frequency.*^{4,7}
- Refer to specific NDs urinary Incontinence (specify) and [acute/chronic] Urinary Retention for additional interventions/treatment regimens.

NURSING PRIORITY NO. 4 To assist in management of long-term urinary dysfunction:

-  Instruct client/SO/caregivers in cues that client needs (e.g., voiding on routine schedule; showing client location of the bathroom; providing adequate room lighting, signs, color coding of door) *assistance in continued continence, especially when in unfamiliar surroundings.*^{3,16}
-  Keep bladder deflated by use of an indwelling catheter connected to closed drainage. Investigate alternatives when possible. *Measures such as intermittent catheterization, surgical interventions, urinary drugs, voiding maneuvers, and condom catheter may be preferable to the indwelling catheter to provide more effective control and prevent possibility of recurrent infections.*
- Use latex-free catheter and care supplies, if indicated. *Reduces risk of developing sensitivity to latex, which can develop in individuals requiring frequent catheterization or who have long-term indwelling catheters.*
- Check frequently for bladder distention and observe for overflow. *Requires immediate intervention to reduce risk of infection or autonomic hyperreflexia.*

- Recommend a regular bladder or diversion appliance emptying schedule. *Avoids accidents and prevents embarrassment to the individual.*²
- Emphasize importance of routine diversion appliance care and assist client to recognize and deal with problems such as alkaline salt encrustation, ill-fitting appliance, malodorous urine, infection, etc. *Provides information and promotes competence in care, increasing self-confidence in dealing with appliance on a regular basis.*²

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-  Review expectations and prognosis of underlying condition (e.g., MS, prostate disease). *Provides information to assist client/significant other (SO) to make informed decisions and plan for possible changes.*
- Emphasize importance of keeping perineal area clean and dry. *Reduces risk of infection or skin breakdown.*
- Instruct female clients with UTI to drink large amounts of fluid, void immediately after intercourse, wipe from front to back, promptly treat vaginal infections, and take showers rather than tub baths as appropriate. *These measures can limit risk of or avoid reinfection.*³
-  Recommend smoking-cessation program as appropriate. *Cigarette smoking can be a source of bladder irritation.*
- Encourage SO(s) who participate in routine care to recognize complications (including latex allergy) necessitating medical follow-up. *Client may be embarrassed to discuss symptoms, and caregivers need to be alert to changes that necessitate evaluation and treatment.*⁴
- Instruct in proper application and care of appliance for urinary diversion. Encourage liberal fluid intake, avoidance of foods and medications that produce strong odor, and use of white vinegar or deodorizer in pouch to promote odor control. *These measures help to ensure patency of device and prevent embarrassing situations for client.*²
-  Identify sources for supplies and programs or agencies providing financial assistance. *Lack of access to necessities can be a barrier to management of incontinence and having help to obtain needed equipment can assist with daily care.*⁴
- Recommend avoidance of gas-forming foods in presence of ureterosigmoidostomy. *Flatus can cause urinary incontinence.*¹
- Recommend use of silicone catheter. *Although these catheters are more expensive than rubber catheters, they are more comfortable and generally cause fewer problems with infection when permanent or long-term catheterization is required.*^{5,14}
- Demonstrate proper positioning of catheter drainage tubing and bag. *Facilitates drainage and prevents reflux and complications of infection.*
-  Refer client/SO(s) to appropriate community resources such as ostomy specialist, support group, sex therapist, psychiatric clinical nurse specialist, etc. *May be necessary to deal with changes in body image and function.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including previous and current pattern of voiding, nature of problem, effect on desired lifestyle.
- Cultural factors or concerns.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources and specific referrals made.
- Individual equipment needs and sources.

impaired Emancipated Decision-Making

Taxonomy II: Life Principles—Class 3 Values/Belief/Action/Congruence (00242) [Diagnostic Division: Ego Integrity], Approved 2013; Revised 2017

DEFINITION: A process of choosing a healthcare decision that does not include personal knowledge and/or consideration of social norms or does not occur in a flexible environment, resulting in decisional dissatisfaction.

RELATED FACTORS

Decrease in understanding of all available healthcare options; insufficient information regarding healthcare options

Inability to adequately verbalize perceptions about healthcare options; insufficient confidence to openly discuss healthcare options

Inadequate time to discuss healthcare options; insufficient privacy to openly discuss healthcare options

Insufficient self-confidence in decision making

(continues on page 296)

impaired Emancipated Decision-Making (continued)

DEFINING CHARACTERISTICS

Subjective

Feeling constrained in describing own option
 Inability to choose a healthcare option that best fits current lifestyle
 Inability to describe how option will fit into current lifestyle
 Excessive concern about what others think is the best decision
 Excessive fear of what others think about decision

Objective

Delay in enacting chosen healthcare option
 Distress when listening to other's opinion
 Limited verbalization about healthcare option in other's presence
At Risk Population: Limited decision-making experience; traditional hierarchical family or healthcare systems

Sample Clinical Applications: Any condition/situation requiring healthcare decisions

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Decision-Making: Ability to make judgements and choose between two or more alternatives

Participation in Health Care Decisions: Personal involvement in selecting and evaluating healthcare options to achieve desired outcome

Client Will (Include Specific Time Frame)

- Verbalize concern about healthcare decision making.
- Express understanding of available healthcare options.
- Discuss healthcare options openly and with confidence.
- Participate in decision making freely and openly.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Health System Guidance: Facilitating a patient's location and use of appropriate health services

NURSING PRIORITY NO. 1 To assess causative/contributing factors (e.g., dementia or delirium):

- Determine usual ability to make decisions and factors that are currently interfering with making a personal choice. *Individual may not have sufficient knowledge or may be influenced by family pressures that may prevent making an independent decision.*^{1,3}
- Note expressions of indecision, dependence on others, and availability and involvement of support persons. *Caregivers need to be sensitive to the physical, emotional, and cognitive effects of the situation on decision-making capabilities.*²
- Discuss issue of whether individual wants to be involved in decision making. *External influences may pressure person to give up own responsibility for the decision.*²

- Identify previous decisions individual has made and environment in which those and current decisions were/are made. *Provides information about client's ability and circumstances surrounding decision making.*¹
- Active-listen and identify reasons for indecisiveness. *Helps client to clarify problem and begin to look at alternatives for situation.*¹
-  Identify cultural values, beliefs, moral obligations, or ethical concerns that may be creating conflict in current situation. *These issues need to be resolved before client will be comfortable with decision.*⁵
- Review information client has to support the decision to be made. *Provides opportunity to clarify and correct misinformation or inaccurate perceptions that can affect the outcome.*²

NURSING PRIORITY NO. 2 To assist client to become empowered and able to make effective decisions:

- Promote safe and hopeful environment as needed, including a therapeutic nurse-client relationship. *Client needs to feel safe and supported to be comfortable in own ability to make satisfactory decisions.*²
- Encourage verbalization of conflicts and concerns. *Helps to identify and clarify these issues so individual can reach a satisfying solution.*¹
- Clarify and prioritize individual goals. *Enables client to look at the importance of the issues of the conflict and reach realistic problem-solving.*⁴
- Identify strengths and use of positive coping skills, relaxation techniques, and willingness to express feelings. *Encourages individual to view themselves as a capable person who can make a desired decision.*⁴
- Discuss time constraints related to the decision to be made. *Healthcare decisions (i.e., breastfeeding) may need to be made quickly depending on the circumstances.*¹
- Help client to learn the problem-solving process. *Provides a structure for individual to look at alternatives for making a decision in current situation and for other decisions that need to be made in the future.*⁶
- Discuss and clarify spiritual concerns, accepting client's values in a nonjudgmental manner. *Client will be willing to consider own situation when accepted as an individual of worth.*

NURSING PRIORITY NO. 3 To promote independence (Teaching/Discharge Considerations):

-  Provide opportunities for practicing problem-solving skills. *Helps client to become more confident and solve current and future situations.*⁴
- Encourage family to become involved as desired/available. *Facilitates understanding of individual's needs and abilities, promoting support and acceptance of ability of family member.*⁵
- Discuss attendance at assertiveness and stress-reduction classes, if able. *Learning these skills helps client to become able to make decisions in a more decisive manner.*¹
-  Refer to other resources as indicated (e.g., public health, support group, clergy, psychiatrist, clinical specialist, psychiatric nurse). *May need additional help to manage difficult decision making.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, behavioral responses, and degree of impairment in lifestyle functioning.
- Individual involved in the conflict.
- Personal values and beliefs, moral or ethical concerns.

Planning

- Plan of care, specific interventions, and who is involved in the planning process.
- Teaching plan.

Implementation/Evaluation

- Client's and individuals' involved responses to interventions, teaching, and actions performed.
- Ability to express feelings and identify options.

- Use of resources.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, actions to be taken, and who is responsible for doing.
- Specific referrals made.

readiness for enhanced Emancipated Decision-Making

Taxonomy II: Life Principles—Class 3 Values/Belief/Action/Congruence (00243) [Diagnostic Division: Ego Integrity], Approved 2013

DEFINITION: A process of choosing a healthcare decision that includes personal knowledge and/or consideration of social norms, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance:

Ability to choose healthcare options that best fit current lifestyle; ability to enact chosen healthcare options

Ability to understand all available healthcare options

Ability to verbalize own opinion without constraint; comfort to verbalize healthcare options in the presence of others

Decision making; confidence in decision making

Privacy to discuss healthcare options; confidence to discuss healthcare options openly

Sample Clinical Applications: Any condition/situation requiring healthcare decisions

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Decision-Making: Ability to make judgments and choose between two or more alternatives

Participation in Health Care Decisions: Personal involvement in selecting and evaluating healthcare options to achieve desired outcome

Client Will (Include Specific Time Frame)

- Gather information including opinions of others while making own decision.
- Express comfort with taking adequate time to make decision.

- Make decision that is congruent with lifestyle and personal and sociocultural values and goals.
- Acknowledge comfort with own decision.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Health System Guidance: Facilitating a patient's location and use of appropriate health services

NURSING PRIORITY NO. 1 To determine current decision-making abilities and needs:

- Determine usual ability to manage own affairs and make own decisions. *Provides baseline for understanding client's usual manner of making decisions.*¹
- Note availability of support person. *Having support can provide individual with positive feedback regarding the validity of the choice.*³
- Active-listen and identify reason(s) client is ready to improve decision-making ability. *Provides opportunity for individuals to clarify and understand how decisions are made and how they can help to achieve desired goals.*¹
-  Identify cultural values, beliefs, moral obligations, and ethical principles that guide or affect the decision-making process. *Although individuals believe they are able to look at the issues with an unbiased eye, it has been shown that one's unconscious biases may interfere with making a decision that is desired.*⁴
-  Discuss meaning of life and reasons for living and how these relate to desire for improvement. *Cutting-edge research is demonstrating that the mind within the brain affects how these issues impact the individual's decision-making process.*⁵

NURSING PRIORITY NO. 2 To assist client to improve/effectively use problem-solving skills:

- Promote safe and hopeful environment and help client identify own inner control. *Individuals can take into consideration the context and pertinent facts when they feel safe and believe the decision making is in their control and make a rational and well-thought-out decision.*⁶
- Encourage verbalization of ideas, concerns, and particular decisions that need to be made. *Identifying these issues all help client make desired choices.*⁶
- Correct misconceptions and biases client may have. *People often have unconscious biases that can interfere with decision making. Helping to clarify these ideas will make for efficient decisions.*⁴
- Identify positive aspects of this learning opportunity. *Every day individuals make decisions, often without giving thought to what is needed to make a good decision. Decision making can be developed by using rational and lateral thinking.*⁶
- Discuss the process of practicing making decisions. *Decision making is a skill that we use every day at home, work, school, and in every aspect of our lives, so the more one knows about an effective process, the better one's decisions can be.*⁶
-  Encourage children to make age-appropriate decisions. *The earlier they learn the problem-solving process, more self-esteem and coping skills will be enhanced.*⁷
- Discuss client's spiritual beliefs and values. *Accepting these in a nonjudgmental manner can help the individual look at what he/she believes in relation to these issues and decision making.*⁷

NURSING PRIORITY NO. 3 To promote optimum independence (Teaching/Discharge Considerations):

- Identify opportunities for using problem-solving skills. *Emphasizing each step as it is used will facilitate the learning process.*⁷

- Involve family and significant others as desired by client. *Helps all those involved to improve their decision-making skills and enhance relationships, and client can live a fuller life.*⁸
-  Recommend client attend assertiveness and/or stress-reduction classes as desired. *Provides opportunity to learn new ways of dealing with problems and enhancing decision-making abilities and life in general.*⁸
-  Refer to other resources as necessary (e.g., public health, healthcare providers, clergy, support group, clergy, psychiatrist/clinical specialist psychiatric nurse). *May need additional assistance for specific problems and/or support long-term needs.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, behavioral responses.
- Motivation for change.
- Personal values, beliefs.

Planning

- Plan of care, specific interventions and actions to be performed.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Ability to express feelings and confidence in decision-making process.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for impaired Emancipated Decision-Making

Taxonomy II: Life Principles—Class 3 Values/Belief/Action/Congruence (00244) [**Diagnostic Division:** Ego Integrity], Approved 2013; Revised 2017

DEFINITION: Susceptible to a process of choosing a healthcare decision that does not include personal knowledge and/or consideration of social norms or does not occur in a flexible environment, resulting in decisional dissatisfaction.

RISK FACTORS

Decrease in understanding of all available healthcare options; insufficient information regarding healthcare options

Inability to adequately verbalize perceptions about healthcare options; insufficient confidence to openly discuss healthcare options

Inadequate time to discuss healthcare options; insufficient privacy to openly discuss healthcare options

Insufficient self-confidence in decision-making

Sample Clinical Applications: Any condition/situation requiring healthcare decisions

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Decision-Making: Ability to make judgements and choose between two or more alternatives

Participation in Health Care Decisions: Personal involvement in selecting and evaluating healthcare options to achieve desired outcome

Client Will (Include Specific Time Frame)

- Acknowledge awareness of difficulty in healthcare decision making.
- Seek information for making healthcare decisions.
- Discuss options openly with family/others as appropriate.
- Develop confidence as decisions are made.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

Health System Guidance: Facilitating a patient's location and use of appropriate health services

Refer to ND impaired Emancipated Decision Making for Interventions, Documentation, and References.

labile Emotional Control

Taxonomy II: Perceptual/Cognition—Class 4 Cognition (00251) [**Diagnostic Division:** Ego Integrity], Approved 2013; Revised 2017

DEFINITION: Uncontrollable outbursts of exaggerated and involuntary emotional expression.

RELATED FACTORS

Alteration in self-esteem
 Emotional disturbance; stressors
 Fatigue; insufficient muscle strength
 Insufficient knowledge of disease or of symptom control
 Social distress
 Substance misuse/[abuse]

DEFINING CHARACTERISTICS

Subjective

Embarrassment regarding emotional expression
 Excessive laughing/crying without feeling happiness
 Expression of emotion incongruent with triggering factor

Objective

Absence of eye contact
 Difficulty in use of facial expressions
 Uncontrollable/involuntary crying, laughing
 Withdrawal from social or occupational situations

Associated Condition: Brain injury; functional impairment; mood disorder; musculoskeletal disorder; pharmaceutical agent; physical disability; psychiatric disorder

Sample Clinical Applications: Traumatic brain injury, stroke, multiple sclerosis, psychiatric disorders, substance abuse

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Mood Equilibrium: Appropriate adjustment of prevailing emotional tone in response to circumstances

Client Will (Include Specific Time Frame)

- Acknowledge problem with emotional control.
- Identify feelings that occur with episodes of uncontrollable emotions.
- Follow medication regimen.
- Participate in recommended activities/rehabilitation.

ACTIONS/INTERVENTIONS

Sample NIC linkage:

Mood Management: Providing for safety, stabilization, recovery, and maintenance of a person who is experiencing dysfunctionally depressed or elevated mood

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine individual factors related to client situation. *Many different physiological/psychological factors may be involved in loss of emotional control for a given person. Identifying these factors will help to develop a plan of care specific to this individual.*¹
- Assess demographic, clinical, psychiatric, and stroke lesion characteristics. *Identifies individual areas that are affected, possibly related to injury to anterior regions of the cerebral hemispheres.*²
- Note when episodes of loss of control occur. *Determines frequency of incidents and factors associated with condition or with first stroke.*²
- Identify client's perception of incidents. *Most people are embarrassed by these outbursts, believing they could control them. Individuals with multiple sclerosis are prone to these episodes.*¹
- Evaluate for depression. *Depression may be a factor for these individuals, but a pseudobulbar affect (PDA) needs to be recognized as different because treatments are different for these conditions.*¹

NURSING PRIORITY NO. 2 To determine effective control of labile episodes:

- Develop a plan of care to meet the needs of the individual situation. *Provides effective care for specific problems the client is experiencing.*¹
- Establish a therapeutic nurse/client relationship. *Promotes trust and willingness to share concerns about problems that arise.*
- Note feelings of emotional exhaustion and social isolation. *Client may not recognize that PDA is a medical condition and may tend to remove themselves from situations that trigger the episodes.*⁴
- Assure client that the symptoms are real and need to be treated. *Healthcare providers may not know about this condition, and the client may not recognize that these are symptoms and therefore not report them.*⁴
- Correct misperceptions and provide accurate information. *Promotes understanding and helps client to be proactive in care.*⁴

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Involve family in treatment plan. *Provides support for the client and promotes understanding of the uncontrollable episodes.*⁴
-  Discuss use of medication. *Tricyclic antidepressants (TCAs) and selective serotonin reuptake inhibitors (SSRIs) are used in clinical practice, but there was no PDA-specific treatment until Nuedexta (a fixed-dose combination of dextromethorphan hydrobromide/quinidine sulfate [DHQ]) was recently approved.*^{4,5}
-  Encourage involvement in social activities. *Enhances ability to participate with others.*²
-  Refer for physical therapy and rehabilitation. *Client may exhibit emotional lability following stroke and can benefit from these activities.*³
-  Refer to other resources as necessary, such as group therapy, psychiatric therapy, and assertiveness training. *This additional help will enable client to develop a more positive lifestyle.*¹

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Assessment findings, including triggering or associated factors, impact of condition on life, other pertinent information.

Planning

- Plan of care, specific interventions, and who is involved in planning process.
- Teaching plan.

Implementation/Evaluation

- Response to intervention, teaching, and actions performed.
- Ability to express feelings and control emotions.

- Use of resources.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs, actions to be taken and who is responsible for doing them.
- Specific referrals made.

imbalanced Energy Field

Taxonomy II: Activity/Rest—Class 3 Energy Balance (00273) [Diagnostic Division: Ego Integrity], Approved 2016

DEFINITION: A disruption in the vital flow of human energy that is normally a continuous whole and is unique, dynamic, creative, and nonlinear

RELATED FACTORS

Anxiety
Discomfort; pain
Excessive stress
Interventions that disrupt the energetic pattern or flow

DEFINING CHARACTERISTICS

Subjective

Expression of the need to regain the experience of the whole

Objective

Arrhythmic, irregular, or dissonant rhythms of the energy field patterns; pulsating to pounding frequency of the energy field patterns; magnetic pull to an area of the energy field
Random or strong or tumultuous or weak energy field patterns; rapid or slow energy field patterns
Blockage or congestion of the energy flow; energy deficit or hyperactivity of the energy flow; pulsations or tingling or unsynchronized rhythms sensed in the energy flow
Temperature differentials of cold or heat in the energy flow

At Risk Population: Crisis states; life transition

Associated Condition: Illness; injury

Sample Clinical Applications: Illness, trauma, cancer, chronic pain, impaired immune system, fatigue, surgical procedures, posttraumatic stress disorder, high-risk pregnancy, labor and delivery, end of life

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Personal Well-Being: Extent of positive perception of one's current health status

Coping: Personal actions to manage stressors that tax an individual's resources

Symptom Control: Personal actions to minimize perceived adverse changes in physical and emotional functioning

Client Will (Include Specific Time Frame)

- Acknowledge feelings of anxiety and distress.
- Verbalize sense of relaxation and well-being.
- Display reduction in severity and/or frequency of symptoms.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Therapeutic Touch: Attuning to the universal energy field, seeking to act as a healing influence, and using the natural sensitivity of hands passing over the body to gently focus, direct, and modulate the human energy field

Healing Touch: Providing a noninvasive, biofield therapy using touch and compassionate intentionality to influence the energy system of a person, affecting their physical, emotional, mental, and spiritual health and healing

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

Pain Management: Acute: Alleviation or reduction of pain to a level that is acceptable to the patient in the immediate healing period following tissue damage from an identifiable cause such as trauma, surgery, injury

NURSING PRIORITY NO. 1 To determine causative/contributing factors:

-  Review current situation and concerns of client. Encourage client to talk about condition, past history, emotional state, or other relevant information. Note body gestures, tone of voice, and words chosen to express feelings and issues. *Studies demonstrate that biofield, or energy field, therapies (e.g., Healing Touch, Therapeutic Touch [TT]) produce positive outcomes by decreasing levels of anxiety and pain perception and improving sense of well-being and quality of life. Research has also shown significant reduction in PTSD symptoms and depression, as well as reduced cynicism in active duty military, and TT may be beneficial in reducing behavioral symptoms of dementia (e.g., manual manipulation/restlessness, vocalization, pacing).*^{8,10–15,20}
- Determine client's motivation and desire for treatment. *Following an explanation of the process and expected results, client may have unrealistic expectations or may understand purpose and believe process will be helpful.*^{2,17,18} *Although attitude can affect success of therapy, it is often successful even when the client is skeptical.*¹¹
-  Note use of medications and other drug use (e.g., alcohol). *May affect client's ability to relax and take full advantage of the therapy process.*⁴ *However, it may be helpful in reducing anxiety level in individuals undergoing alcohol withdrawal.*⁹
-  Perform or review results of testing, as indicated, such as the State-Trait Anxiety Inventory or the Affect Balance Scale. *Provides measure of the client's anxiety to evaluate need for treatment or intervention.*³

NURSING PRIORITY NO. 2 To evaluate energy field:

- Develop therapeutic nurse-client relationship, initially accepting role of healer or guide as client desires. *This relationship is one in which both participants recognize each other as unique and important human beings and in which mutual learning occurs. The role of the nurse and the use of self as a therapeutic tool are recognized.*⁴
- Place client in sitting or supine position with legs and arms uncrossed. Place pillows or other supports to enhance comfort. *Promotes relaxation and feelings of peace, calm, and security, preparing the client to derive the most benefit from the procedure.*¹
- Center self physically and psychologically. *A quiet mind and focused attention turn to the healing intent.*⁶
- Move hands slowly over the client at level of 2 to 6 inches above skin. *Assesses state of energy field and flow of energy within the system. The feelings that may be noted are tingling, warmth, coolness, comfort, peace, calm, and security.*⁵
- Identify areas of imbalance or obstruction in the field. *Areas of asymmetry; feelings of heat or cold, tingling, congestion or pressure, decreased or disrupted energy flow, pulsation, congestion, heaviness, and decreased flow may be identified.*⁷

NURSING PRIORITY NO. 3 To provide therapeutic intervention:

- Explain the therapy process and answer questions as indicated *to prevent unrealistic expectations. The therapy is the knowledgeable and purposeful patterning of the client environmental energy field to relieve discomfort and anxiety. Providing information that the fundamental focus is on healing and wholeness, not curing signs/symptoms of disease, helps the client to understand the process.*^{6,20}
- Discuss findings of evaluation with client. *Including the client in the process by sharing the findings of the nurse combined with sensations the client experienced provides the best opportunity to derive benefit from the procedure.*²
- Assist client with exercises to promote “centering.” *Deep breathing, guided imagery, and the process of centering increase the potential to self-heal, enhance comfort, and reduce anxiety.*²
- Perform the unruffling process, keeping hands 2 to 6 in. from client’s body and sweeping them downward and out of the field from head to toe, concentrating on areas of congestion. *Dissipates impediments to free flow of energy within the system and between nurse and client, promoting the reception of healing energy and allowing the client to use own resources for self-healing.*⁶
- Focus on areas of disturbance identified, holding hands over or on skin, or place one hand in back of body with other hand in front. At the same time, concentrate on the intent to help the client heal. *This move allows the client’s body to pull or repattern energy as needed and corrects energy imbalances.*¹
- ∞ Shorten duration of treatment 2 to 3 min as appropriate. *Children, elderly individuals, those with head injuries, and others who are severely debilitated are generally more sensitive to overloading energy fields.*^{1,2}
- Make coaching suggestions in a soft voice. *Pleasant images or other visualizations and deep breathing enhance feelings of relaxation and help to relieve anxiety.*^{1,2}
- Use hands-on massage or apply pressure to acupressure points as appropriate during the process. *The addition of these methods can enhance the relaxation and benefit client receives from therapy.*⁶
- Note changes in energy sensations as session progresses. Stop when the energy field is symmetrical and there is a change to feelings of peaceful calm. *Signifies energy is balanced, further intervention is not necessary, and client is ready to rest.*^{1,2}
- Hold client’s feet for a few minutes at end of session. *Assists in “grounding” the body energy, completing the session.*¹
- Provide client time for a period of peaceful rest following procedure. *Biofield therapy promotes feelings of peace and comfort, relieving anxiety and promoting self-healing.*¹

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Allow period of client dependency, as appropriate. *Period of dependency permits client to strengthen own inner resources at his or her own pace.*¹

- Encourage ongoing practice of the therapeutic process. *Helping client and family members to learn the skill will promote feelings of control of illness and health. It can be used anytime, anywhere, and with friends and family.*^{4,19}
- Instruct in use of stress-reduction activities (e.g., centering/meditation, relaxation exercises, guided imagery). *Continuous use of these activities can promote mind-body-spirit harmony.*²
- Discuss importance of integrating techniques into daily activity plan for sustaining or enhancing sense of well-being. *Helps client to understand that making these a way of life will help them in dealing with challenges of illness and promote a healthy lifestyle.*¹
- Have client practice each step and demonstrate the complete therapeutic process following the session. *Client displays readiness to assume responsibilities for self-healing as he or she learns the process.*^{1,2}
- Promote attendance at a support group where members can help each other practice and learn the techniques. *The support of others helps the client to become proficient in new skill.*²
-  Reinforce that biofield therapies are complementary interventions and stress the importance of seeking timely evaluation and continuing other prescribed treatment modalities as appropriate. *Failure to follow prescribed therapeutic regimen may result in poor outcome and worsening of condition.*
-  Refer to other resources as identified (e.g., psychotherapy, clergy, medical treatment of disease processes, hospice). *Encourages the individual to address total well-being and facilitate peaceful death as appropriate.*⁶

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including characteristics and differences in the energy field.
- Client's perception of problem and motivation for treatment.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Characteristics of energy work performed.
- Changes in energy field.
- Client's response to interventions (physical, mental, emotional), teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals if made.

risk for Falls

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00155) [**Diagnostic Division:** Safety], Submitted 2000; Revised 2013; 2017

DEFINITION: Susceptible to increased susceptibility to falling, which may cause physical harm and compromise health.

RISK FACTORS

Children

Absence of stairway gate or window guard; insufficient automobile restraints

Environment

Use of restraints

Exposure to unsafe weather-related condition

Cluttered environment; use of throw rugs; insufficient anti-slip material in bathroom

Unfamiliar setting; insufficient lighting

Physiological

Alteration in blood glucose level

Decrease in lower extremity strength; difficulty with gait; immobility

Diarrhea; incontinence; urinary urgency

Faintness when extending or turning neck; orthostatic hypotension

Sleeplessness

Other

Alcohol consumption

Insufficient knowledge of modifiable factors

At Risk Population: Age ≥ 65 years or ≤ 2 years; male gender when < 1 year of age

History of falls; living alone

Associated Condition: Acute illness; anemia; neoplasm; neuropathy; orthostatic hypotension; vascular disease

Alteration in cognitive functioning

Arthritis; condition affecting the foot; lower limb prosthesis; use of assistive device

Hearing impairment; impaired balance or vision; proprioceptive deficit

Postoperative recovery period; pharmaceutical agent

Sample Clinical Applications: Amputation, arthritis, osteoporosis, fractures, joint replacement surgery; seizure disorder, cerebrovascular disease, cataracts, dementia, paralysis, hypotension, cardiac dysrhythmias, inner ear infection, alcohol abuse or intoxication; trauma or surgery (general)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Physical Injury Severity: Severity of signs and symptoms of injuries to the body

Client Will (Include Specific Time Frame)

- Be free of injury.

Knowledge: Fall Prevention: Extent of understanding conveyed about prevention of falls

Fall Prevention Behavior: Personal or family caregiver actions to minimize risk factors that might precipitate falls in the personal environment

Falls Occurrence: Number of times an individual falls

Client/Caregivers Will (Include Specific Time Frame)

- Verbalize understanding of individual risk factors that contribute to possibility of falls.
- Demonstrate behaviors and lifestyle changes to reduce risk factors and protect self from injury.
- Modify environment as indicated to enhance safety.
- Be free of falls.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Fall Prevention: Instituting special precautions with patient at risk for injury from falling

Environmental Management: Safety: Monitoring and manipulation of the physical environment to promote safety

NURSING PRIORITY NO. 1 To evaluate source/degree of risk:

-   Review client's general health status, *noting multiple factors that may affect safety, such as chronic/debilitating conditions, use of more than four prescriptions, recent trauma (especially a fall within the past 3 to 12 months), prolonged bedrest or immobility, unstable balance on standing, and a sedentary lifestyle. Note: Many fall-risk assessment tools have been developed and compared. Best practice interventions in fall reduction have been shown to be (1) the use of a screening tool, (2) visual identification of client at high risk for falls, (3) directed multifactorial interdisciplinary risk factor interventions, and (4) client and care provider education.*^{1,9}
- Evaluate client's current disorders/conditions that could enhance risk potential for falls. *Acute, even short-term, situations can affect any client, such as sudden dizziness, positional blood pressure changes, new medication, change in glasses prescription, and recent use of alcohol/other drugs.*¹⁰
-   Assess and document client's fall risk using a fall-risk scale (e.g., Morse Fall Scale [MFS], Functional Ambulation Profile, Tinetti Balance and Gait Assessment, Timed-Up-and-Go [TUG]) upon admission, change in status, transfer, and discharge. *Fall-risk scales are widely used in acute-care and long-term settings and include numbered rating scales for (1) history of falls, (2) secondary diagnosis, (3) use of ambulatory aid,*

(4) presence of IV, (5) gait and transfer abilities, and (6) mental status. An MFS score greater than 51 indicates the client is at high risk for falls and requires high fall-prevention interventions. A TUG scale greater than 14 seconds combined with three other risk factors (such as support needed for cognition, transportation, and attendance at multiple appointments) places a client at high risk for falls.^{1,2,7,8,10}

-  Note client's age/developmental level, gender, decision-making ability, and level of competence. *Infants, young children (e.g., climbing on objects, stairs), young adults (e.g., sports activities), and elderly (e.g., significant vision, cognitive, or mobility impairments; osteoporosis; loss of muscle, fat, and subcutaneous tissue) are at greatest risk because of developmental issues or impaired/lack of ability to self-protect. Note: Tools for adult fall-risk assessment have been found to be unreliable in infants and children. Most falls in this age group occur outside the clinical setting, but assessment of facility environment and developmental issues in hospitalized children must include many factors, such as crib and play area safety, cosleeping issues, lapses of caregiver attention (such as falling asleep while feeding), medical and nursery equipment on which a toddler might climb, etc.*^{2,9}
- Assess client's cognitive status (e.g., presence of brain injury, dementia, neurological disorders, visual/hearing/other sensory impairments). *Affects ability to perceive own limitations or recognize danger. If client is unable to protect self, responsibility falls upon primary care provider(s).*
- Evaluate client's general and hip muscle strength, postural stability, gait and standing balance, gross and fine motor coordination. Review history of past or current physical injuries (e.g., musculoskeletal injuries, orthopedic surgery) that may be altering coordination, gait, and balance.
-  Review client's ongoing medication regimen, noting number and type of drugs that could impact fall potential. *Studies have confirmed that use of four or more medications (polypharmacy) increases the risk of falls. The probability of using a medication that introduces risk increased that risk from 25% when one medicine was administered to 60% when six or more medicines were being taken.*¹¹
-  Assess mood, coping abilities, and personality styles. *Individual's temperament, typical behavior, stressors, and level of self-esteem can affect attitude toward safety issues, resulting in carelessness or increased risk-taking without consideration of consequences.*⁷⁻⁹
- Determine client's/significant other's (SO's) level of knowledge about and attendance to safety needs. *May reveal lack of knowledge needed to provide for safety, a choice to make a different decision for some reason (e.g., "We can't hire a home assistant"; "I can't watch him every minute"; "It's not manly"), or a lack of resources to attend to safety issues in all settings.*^{3,9}
- Evaluate client's use, misuse, or failure to use assistive aids when indicated. *Client may have assistive device but is at high risk for falls while adjusting to altered body state and use of unfamiliar device. Client might refuse to use devices for various reasons (e.g., waiting for help; just doesn't like it for whatever reason).*⁷⁻⁹
- Identify hazards in the care setting, home, or other environment. *Determining needs and deficits provides opportunities for environmental redesign and instruction (e.g., concerning clearing of hazards, modification of lighting, equipment placement and space management; intensifying client supervision; obtaining safety equipment; referring for vision evaluation).*^{7,8,12}
-  Ascertain caregiver's expectations of client (whether child, cognitively impaired, and/or elderly family member) and compare with actual abilities. *Reality of client's abilities and needs may be different from perception or desires of caregivers.*
- Note socioeconomic status and availability and use of resources in other circumstances. *Can affect current coping abilities and fall risk.*

NURSING PRIORITY NO. 2 To assist client/caregiver to reduce or correct individual risk factors:

-  Collaborate in treatment of disease or condition(s) (e.g., acute illness, dementia, incontinence, neurological or musculoskeletal conditions) to improve client's overall health and thereby reduce potential for falls.
- Review consequences of previously determined risk factors and client/SO response (e.g., client's current fall and hip fracture caused by failure to make safety provisions for client's impairments).³
-  Participate in communicating fall risk status when client is in care facility to (1) patient/SO (e.g., verbal reminders of fall-prevention interventions in place to reduce client's risk; visible signage); (2) to staff (e.g.,

consistent use of fall-assessment tool; shift-to-shift report; documentation in client record; (3) within unit/ across units (e.g., hand-off communication to report client's fall risk to receiving unit/facility). *These interventions are found to be part of "best-practice" interventions to reduce fall risk in client while acute care (e.g., hospital, short-stay or rehabilitation unit; extended and long-term care units).*¹³

-   Recommend or implement needed interventions and safety devices to manage conditions that could contribute to falling and to promote safe environment for individual and others.^{1-9,12}

Situate bed to enable client to exit toward his or her stronger side whenever possible.

Place bed in lowest possible position, use raised-edge mattress, pad floor at side of bed, or place mattress on floor as appropriate.

Use half siderail instead of full siderails or upright pole to assist individual in arising from bed.

Provide chairs with firm, high seats and lifting mechanisms when indicated.

Provide appropriate day or night lighting; evaluate vision, encourage use of prescription eyewear.

Assist with transfers and ambulation; show client/SO ways to move safely.

Provide and instruct in use of mobility devices and safety devices, like grab bars and call light or personal assistance systems.

Clear environment of hazards (e.g., obstructing furniture, small items on the floor, electrical cords, throw rugs).

Lock wheels on movable equipment (e.g., wheelchairs, beds).

Encourage use of treaded slippers, socks, and shoes, and maintain nonskid floors and floor mats.

Provide foot and nail care.

-  Provide or encourage use of analgesics before activity if pain is interfering with desired activities. *Balance and movement can be impaired by pain associated with multiple conditions such as trauma or arthritis.*^{1,2}
-  Follow up with physician to review client's usual medication regimen (e.g., narcotics/opiates, psychotropics, antihypertensives, diuretics), which can contribute to weakness, confusion, and balance and gait disturbances. May benefit from evaluating drug concentrations of certain medications (e.g., anticonvulsants, tricyclic antidepressants, antiarrhythmics) or may need an adjustment to dose, time of administration, or a change in choice of medication prescribed.⁶⁻¹¹
-   Discuss benefits of supplemental estrogen, calcium, and vitamin D, as indicated. Refer for further evaluation as indicated. *Primary prevention of osteoporosis could be important in reducing falls and risk for fractures.*¹²
-  Refer to physical medicine specialist, physical or occupational therapist, as appropriate. *May require evaluation (e.g., balance, muscle strength) and treatment to improve client's balance, strength, or mobility; to improve or relearn ambulation; and to identify and obtain appropriate assistive devices for mobility, environmental safety, or home modification.*
-  Perform home visit when appropriate. *Useful in determining client's specific needs and available resources or verifying that home safety issues are addressed, including supervision, access to emergency assistance, and client's ability to manage self-care in the home.*

NURSING PRIORITY NO. 3 To promote safety (Teaching/Discharge Considerations):¹⁻⁶

-  Educate client/SO/caregivers in fall prevention; address the need for exercise balanced with need for client/care provider safety. *While fall prevention is necessary, the need to protect the client from harm must be balanced with preserving client's independence. If the client is overly afraid of falling, the lack of activity will result in deconditioning and an even greater risk of falling.*³
- Discuss importance of monitoring client/intervening in conditions (e.g., client fatigue; acute illness; depression; objects that block traffic patterns in home; insufficient lighting; unfamiliar surroundings; client attempting tasks that are too difficult for present level of functioning; inability to contact someone when help is needed) that have been shown to contribute to occurrence of falls.^{7,8}
- Address individual environmental factors associated with falling and create or instruct in a safe physical environment, such as bed height, room lighting, removal of loose carpet or throw rugs, repair of uneven flooring, and installing grab bars in bathrooms.

-  Refer to community resources as indicated. Provide written material for review and reinforcement of learning. *Client/caregivers may need or desire information (now or later) about financial assistance, home modifications, referrals for counseling, home care, sources for safety equipment, or placement in an extended care facility.*
- Connect client/family with sources of assistance (e.g., neighbors, friends, support groups) *to check on client on regular basis and to assist elderly or handicapped individuals in providing such things as structural maintenance; clearing of snow, gravel, or ice from walks and steps; etc.*
- Promote community awareness about the problems of design of buildings, equipment, transportation, and workplace accidents that contribute to falls.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors noting current physical findings (e.g., bruises, cuts, anemia; use of alcohol, drugs, and prescription medications).
- Client's/caregiver's understanding of individual risks and safety concerns.
- Caregiver's expectations of client's abilities.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term plans for discharge needs, lifestyle, and home setting and community changes and who is responsible for actions to be taken.
- Specific referrals made.

dysfunctional Family Processes

Taxonomy II: Role Relationships—Class 2 Family Relationships (00063) [Diagnostic Division: Social Interaction],
Submitted as dysfunction Family Processes: Alcoholism 1994; Revised: name change 2008, 2013, 2017

DEFINITION: Family functioning which fails to support the well-being of its members.

RELATED FACTORS

Addictive personality; substance misuse/[abuse]

Ineffective coping strategies; insufficient problem-solving skills

DEFINING CHARACTERISTICS

Subjective

Feelings

Abandonment; confuses love and pity; moodiness; failure

Anger, frustration; shame, embarrassment; hurt; unhappiness; guilt

Anxiety, tension, distress; low self-esteem, worthlessness; lingering resentment

Depression; hostility; fear; confusion; dissatisfaction; loss

Emotionally controlled by others; emotional isolation,

Feeling different from others; loss of identity; feeling unloved, misunderstood

Loneliness; powerlessness; insecurity; hopelessness; rejection

Taking responsibility for substance abuser's behavior; vulnerability; mistrust

Roles and Relationships

Family denial; deterioration in family relationships; disturbance in family dynamics; ineffective communication with partner; intimacy dysfunction

Change in role function; disruption in family roles or rituals; inconsistent parenting; perceived insufficient parental support; chronic family problems

Insufficient relationship skills; insufficient cohesiveness

Pattern of rejection; neglect of obligation to family member

Objective

Feelings

Repressed emotions

Roles and Relationships

Closed communication systems

Conflict between partners; diminished ability of family members to relate to each other for mutual growth and maturation; triangulating family relationships

Insufficient family respect for individuality or autonomy of its members

Behavioral

Alteration in concentration; disturbance in academic performance in children; failure to accomplish developmental tasks; difficulty with life-cycle transition

Blaming; inappropriate anger expression; criticizing; verbal abuse of children/partner/parent

Harsh self-judgment; difficulty having fun; self-blaming; social isolation; complicated grieving; seeking of approval or affirmation

Inability to meet the emotional, security, or spiritual needs of its members

Inability to adapt to change; immaturity; stress-related physical illnesses; inability to deal constructively with traumatic experiences

Inappropriate anger expression; blaming; criticizing; verbal abuse of children/partner/parent

(continues on page 314)

dysfunctional Family Processes (continued)

Ineffective communication skills; controlling, contradictory, or paradoxical communication pattern; power struggles

Insufficient problem-solving skills; conflict avoidance; orientation favors tension relief rather than goal attainment; agitation; escalating conflict; chaos

Inability to express or accept a wide range of feelings; difficulty with intimate relationship; decrease in physical contact

Lying; broken promises; unreliable behavior; manipulation; dependency

Rationalization; denial of problems; refusal to get help; inability to accept or receive help appropriately

Substance abuse; enabling substance use pattern; insufficient knowledge about substance abuse; special occasions centered on substance use; nicotine addiction

At Risk Population: Economically disadvantaged

Genetic predisposition to substance misuse/[abuse]; family history of substance misuse/[abuse]; family history of resistance to treatment;

Associated Condition: Biological factors; intimacy dysfunction; surgical procedure

Sample Clinical Applications: Alcohol abuse or withdrawal, prescription or illicit drug abuse, fetal alcohol syndrome

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Family Functioning: Capacity of a family to meet the needs of its members during developmental transitions

Family Social Climate: Capacity of a family to provide a supportive milieu as characterized by family member relationships and goals

Substance Addiction Consequences: Severity of change in health status and social functioning due to substance addiction

Family Will (Include Specific Time Frame)

- Verbalize understanding of dynamics of codependence.
- Participate in individual/family treatment programs.
- Identify ineffective coping behaviors and consequences of choices or actions.
- Plan for necessary lifestyle changes.
- Take action to change self-destructive behaviors or alter behaviors that contribute to substance abuse.
- Demonstrate improvement in parenting skills.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Counseling: Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem solving, and interpersonal relationships

Substance Use Treatment: Care of patient and family members demonstrating dysfunction as a result of substance abuse or dependence

Family Process Maintenance: Minimization of family process disruption effects

NURSING PRIORITY NO. 1 To assess contributing factors/underlying problem(s):

- Assess current level of functioning of family members. *Information necessary for planning care determines areas for focus and potential for change.*²
- Ascertain family's understanding of current situation; note results of previous involvement in treatment. *Family with a member who is addicted to alcohol has often had frequent hospitalizations in the past. Knowing what has brought about the current situation will determine a starting place for this treatment plan.*²
- Review family history and explore roles of family members and circumstances involving substance use. *Although one member may be identified as the client, all of the family members are participants in the problem and need to be involved in the solution.*⁵
- Determine history of accidents or violent behaviors within family and current safety issues. *Identifies family at risk and degree of concern or disregard of individual members to determine course of action to prevent further violence.*^{2,4}
- Discuss current and past methods of coping. *Family members have developed coping skills to deal with behaviors of client, which may or may not be useful to changing the situation. Skills identified as useful can help to change the present situation. Those identified as not helpful (enabling behaviors) can be targeted for intervention to bring about desired changes and improve family functioning.*^{1,2,5}
- Determine extent and understanding of enabling behaviors being evidenced by family members. *Family members may have developed behaviors that support the client continuing the pattern of addiction. Awareness, identification, and knowledge of these behaviors provide opportunity for individuals to begin the process of change.*^{2,5}
- Identify sabotage behaviors of family members. *Issues of secondary gain (conscious or unconscious) may impede recovery. Even though family member(s) may verbalize a desire for the individual to be healthy (or substance free), the reality of interactive dynamics is that they may unconsciously not want the individual to recover because this would affect the role(s) of the family member(s) in the relationship.*²
- Note presence and extent of behaviors of family, client, and staff that might be "too helpful," such as frequent requests for assistance, excuses for not following through on agreed-on behaviors, and feelings of anger or irritation with others. *Identification of specific behaviors (enabling) can help family members see what they do that complicates acceptance of situation by substance abuser and that need to be changed to facilitate resolution of problem.*⁵

NURSING PRIORITY NO. 2 To assist family to change destructive behaviors:

- Seek mutual agreement on behaviors and responsibilities for nurse and client/family members. *Maximizes understanding of what is expected of each person and minimizes opportunity for manipulation of each individual.*⁵
- Confront and examine denial and sabotage behaviors used by family members. *Identifies specific behaviors that individuals can be aware of and begin to change so they can move beyond blocks to recovery.*⁶
- Discuss use of anger, rationalization, or projection and ways in which these interfere with problem resolution. *Awareness of own feelings can lead to a decision to change; client then has to face the consequences of his or her own actions and may choose to get well.*⁶
- Encourage family to identify and deal with anger. Solve concerns and develop solutions. *Understanding what leads to anger and violence can lead to new behaviors and changes in the family for healthier relationships.*³
- Determine family strengths, areas for growth, and individual/family successes. *Family members may not realize they have strengths, and as they identify these areas, they can choose to learn and develop new strategies for a more effective family structure.*²
- Remain nonjudgmental in approach to family members and to member who uses alcohol or drugs. *Individual already sees self as unworthy, and judgment on the part of caregivers to family will interfere with ability to be a change agent.*⁵
- Provide information regarding effects of addiction on mood and personality of the involved person. *Family members have been dealing with client's behavior for a time, and information can help them to understand and cope with negative behaviors without being judgmental or reacting angrily.*²

- Distinguish between destructive aspects of enabling behavior and genuine motivation to aid the user. *Family members often want to help but need to distinguish between behavior that is helpful and that which is not to begin to solve problems of addiction.*⁶
- Identify use of manipulative behaviors and discuss ways to avoid or prevent these situations. *The client often manipulates the people around him or her to maintain the status quo. When family begins to interact in a straightforward, honest manner, manipulation is not possible and healing can begin.*²

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide factual information to client/family about the effects of addictive behaviors on the family and what to expect after discharge from program. *Family may have unrealistic expectations about changes that have occurred in therapy, and having information will help them deal more effectively with the difficulties of continuing the changes as they return to their new life without alcohol or substance.*⁵
- Provide information about enabling behavior and addictive disease characteristics for both the user and non-user who is codependent. *Education is a prime ingredient in treatment of addiction and can assist family members to deal realistically with these issues.*⁶
- Discuss importance of restructuring life activities, work, and leisure relationships. *Previous lifestyle and relationships supported the substance use, requiring change to prevent relapse.*⁷
- Encourage family to refocus celebrations to exclude substance use. *Because celebrations often include the use of alcohol, this is one area where change can be made that can reduce the risk of relapse.*⁷
- Provide support for family members; encourage participation in group work. *Support is essential to changing client and family behaviors. Participating in group provides an opportunity to practice new skills of communication and behavior.*⁵
-  Encourage involvement with/refer to self-help groups, Al-Anon, AlaTeen, Narcotics Anonymous, and family therapy groups. *Regular attendance at a group can provide support; help client see how others are dealing with similar problems; and learn new skills, such as problem solving, for handling family disagreements.*⁷
- Provide bibliotherapy including reliable Web sites, as appropriate. *Reading provides helpful information for making desired changes, especially when client/family members are dedicated to making change and willing to learn new ways of interacting within the family.*⁷
- Refer to NDs compromised/disabled family Coping and interrupted Family Processes as appropriate for additional interventions.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including history of substance(s) that have been used and family risk factors/safety concerns.
- Family composition and involvement.
- Results of previous treatment involvement.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses of family members to treatment, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

interrupted Family Processes

Taxonomy II: Role Relationships—Class 2 Family Relationships (00060) [Diagnostic Division: Social Interactions],
Approved 1982; Revised 1998; 2017

DEFINITION: Break in the continuity of family functioning which fails to support the well-being of its members

RELATED FACTORS

Changes in interaction with community
Power shift among family members; shift in family values

DEFINING CHARACTERISTICS

Subjective

Changes in relationship pattern
Change in availability for affective responsiveness; decrease in mutual support; decrease in available emotional support; change in intimacy
Changes in expression of conflict with, or isolation from, community resources

Objective

Assigned tasks change; ineffective task completion; change in participation for problem solving; changes in participation for decision making
Change in communication pattern; change in family conflict resolution; power alliance changes
Change in stress-reduction behavior; change in somatization

At Risk Population: Changes in interaction with community; power shift among family members; shift in family roles

Associated Condition: Shift in health status of a family member

Sample Clinical Applications: Chronic illness, cancer, surgical procedures, traumatic injury, substance abuse, Alzheimer's disease, pregnancy, adolescent rebellion, conduct disorder

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Family Functioning: Capacity of a family to meet the needs of its members during developmental transitions
(continues on page 318)

interrupted Family Processes (continued)

Family Normalization: Capacity of a family to develop strategies for optimal functioning when a member has a chronic illness or disability

Family Social Climate: Capacity of a family to provide a supportive milieu as characterized by family member relationships and goals

Family Will (Include Specific Time Frame)

- Express feelings freely and appropriately.
- Demonstrate individual involvement in problem-solving processes directed at appropriate solutions for the situation or crisis.
- Direct energies in a purposeful manner to plan for resolution of the crisis.
- Verbalize understanding of illness/trauma, treatment regimen, and prognosis.
- Encourage and allow affected member to handle situation in own way, progressing toward independence.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Family Process Maintenance: Minimization of family process disruption effects

Family Integrity Promotion: Promotion of family cohesion and unity

Normalization Promotion: Assisting parents and other family members of children with chronic diseases or disabilities in providing normal life experiences for their children and families

NURSING PRIORITY NO. 1 To assess individual situation for causative/contributing factors:

- Determine pathophysiology, illness or trauma, and developmental crisis present. *Identifies areas of need for planning care for this family.*²
- ∞ Identify family developmental stage (e.g., marriage, birth of a child, children leaving home, death of a spouse). *Developmental stage will affect family functioning; for instance, a couple who are newly married will be dealing with issues of learning how to live with each other; children leaving home may result in problems related to “empty-nest syndrome,” or death of a spouse radically changes life for the survivor.*^{2,8}
- Note components of family: parent(s), children, male/female, and extended family available. *Affects how individuals deal with current stressors. Relationships among members may be supportive or strained.*⁶
- Observe patterns of communication in this family. Are feelings expressed? Freely? Who talks to whom? Who makes decisions and for whom? Who visits? What is the interaction between family members? *Identifies not only weakness and areas of concern to be addressed, but also strengths that can be used for resolution of problem(s).*^{6,9}
- Assess boundaries of family members. Do members share family identity and have little sense of individuality? Do they seem emotionally distant and not connected with one another? *These factors are critical to understanding family dynamics and developing strategies for change. Boundaries need to be clear so individual family members are free to be responsible for themselves.*⁶
- Ascertain role expectations of family members. Who is the ill member (e.g., nurturer, provider)? How does the illness affect the roles of others? *Each person may see the situation in his or her own individual manner; clear identification and sharing of these expectations promote understanding. Family members may expect client to continue to perform usual role or may not allow client to do anything (either action can create problems for the ill member). Realistic planning can provide positive sense of self for the client.*^{2,8}
- Determine “family rules” (e.g., adult concerns such as finances, illness, and so on are kept from the children). *Rules may be imposed by adults rather than through a democratic process involving all family members, leading to conflict and angry confrontations. Setting positive family rules with all family members participating can promote a functional family.*^{2,3}

- Identify parenting skills and expectations. *Ineffective parenting and unrealistic expectations may contribute to abuse. Understanding normal responses and progression of developmental milestones may help parent cope with changes necessitated by current crisis.*^{2,3}
- Note energy direction. Are efforts at resolution/problem solving purposeful or scattered? *Provides clues about interventions that may be appropriate to assist client and family in directing energies in a more effective manner.*^{2,9}
- Listen for expressions of despair/helplessness (e.g., “I don’t know what to do”) to note degree of distress. *Such feelings may contribute to difficulty adjusting to situation (e.g., teenage independence, change in health status of household breadwinner, dependence of aging parent on grown child) and ability to cooperate with plan of care or treatment regimen required.*⁴
- 🌐 Note cultural and/or religious beliefs and values affecting perceptions and expectations of family members. *These factors affect client/SO reactions and adjustment to situation and may limit choice of interventions and potential for successful resolution. For example, Arab American family relationships often include nuclear and extended family, with families making collective decisions. Men are expected to be responsible for carrying out decisions. Women are usually delegated care for daily needs of the family, while children may have little independence, and birth control may not be allowed for teenagers.*⁷
- 🏠 Assess support systems available outside of the family. *Having these resources can help the family begin to pull together and deal with current situation and problems they are facing.*²

NURSING PRIORITY NO. 2 To assist family to deal with situation/crisis:

- Deal with family members in a warm, caring, and respectful way. *Provides feelings of empathy and promotes individual’s sense of worth and competence in ability to handle current situation.*²
- Acknowledge difficulties and realities of the situation. *Communicates message of understanding and reinforces that some degree of conflict is to be expected and can be used to promote growth.*³
- Encourage expressions of anger. Avoid taking them personally. *Feelings of anger are to be expected when individuals are dealing with a difficult situation. Appropriate expression enables progress toward resolution of the stages of the grieving process when indicated. Not taking their anger personally maintains boundaries between nurse and family.*^{2,5}
- Emphasize importance of continuous, open dialogue between family members to facilitate ongoing problem-solving. *Promotes understanding and assists family members to maintain clear communication and resolve problems effectively.*^{6,10}
- Provide information, verbal and written, and reinforce as necessary. *Promotes understanding and opportunity to review as needed.*²
- Assist family to identify and encourage their use of previously successful coping behaviors. *Most people have developed effective coping skills that, when identified, can be useful in current situation.*^{6,10}
- Recommend contact by family members on a regular, frequent basis. *Promotes feelings of warmth and caring and brings family closer to one another, enabling them to manage current difficult situation.*²
- 🗣️ Arrange for and encourage family participation in multidisciplinary team conference or group therapy as appropriate. *Participation in family and group therapy for an extended period increases likelihood of success as interactional issues (e.g., marital conflict, “scapegoating” of children) can be addressed and dealt with. Involvement with others can help family members to experience new ways of interacting and gain insight into their behavior, providing opportunity for change.*^{2,5}
- 🗣️ Involve family in social support and community activities of their interest and choice. *Involvement with others outside of family constellation provides opportunity to observe how others handle problems and deal with conflict.*^{2,8}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Encourage use of stress-management techniques (e.g., appropriate expression of feelings, relaxation exercises). *The relaxation response helps members think more clearly, deal more effectively with conflict, and promote more effective relationships to enhance family interactions.*⁴

- Provide educational materials and information. *Learning about the problems they are facing can assist family members in resolution of current crisis.*²
-  Refer to classes (e.g., parent effectiveness, specific disease, or disability support groups; self-help groups; clergy, psychological counseling, or family therapy as indicated). *Can assist family to effect positive change and enhance conflict-resolution skills. Presence of substance abuse problems requires all family members to seek support and assistance in dealing with situation to promote a healthy outcome.*^{2,3} (Refer to ND dysfunctional Family Processes for additional interventions as appropriate.)
- Assist family to identify situations that may lead to fear or anxiety (e.g., diagnosis of chronic debilitating condition, decline in mental functioning of aging spouse/parent, sexually active teenager). (Refer to NDs Anxiety, Fear.) *Promotes opportunity to provide anticipatory guidance.*^{1,5}
- Involve family in mutual goal-setting to plan for the future. *When all members of the family are involved, commitment to goals and continuation of plan are more likely to be maintained.*³
-  Identify community agencies (e.g., Meals on Wheels, visiting nurse, trauma support group, American Cancer Society, Veterans Administration). *Provides both immediate and long-term support.*⁶

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including family composition, developmental stage of family, and role expectations.
- Family communication patterns.
- Cultural or religious beliefs and values.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Each individual's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

readiness for enhanced Family Processes

Taxonomy II: Role Relationships—Class 2 Family Relationships (00159) [Diagnostic Division: Social Interactions],
Approved 2002; Revised 2013

DEFINITION: A pattern of family functioning that is sufficient to support the well-being of family members and can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance:

- Balance between autonomy and cohesiveness
- Communication pattern
- Family resilience, growth and safety of family members
- Respect for family members; maintenance of boundaries between family member
- Interdependence with community

Sample Clinical Applications: Chronic health conditions (e.g., asthma, diabetes mellitus, arthritis, systemic lupus, multiple sclerosis [MS], AIDS), mental health concerns (e.g., depression, attention deficit disorder, Down syndrome)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Family Social Climate: Capacity of a family to provide a supportive milieu as characterized by family member relationships and goals

Family Health Status: Overall health and social competence of a family

Family Resiliency: Capacity of a family to positively adapt and function following significant adversity or crisis

Client Will (Include Specific Time Frame)

- Express feelings freely and appropriately.
- Verbalize understanding of desire for enhanced family dynamics.
- Demonstrate individual involvement in problem solving to improve family communications.
- Acknowledge awareness of and respect for boundaries of family members.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Family Support: Promotion of family values, interests, and goals

Parent Education: Childrearing Family: Assisting parents to understand and promote the physical, psychological, and social growth and development of their toddler, preschool, or school-age child

Normalization Promotion: Assisting parents and other family members of children with chronic illnesses or disabilities in providing normal life experiences for their children and families

NURSING PRIORITY NO. 1 To determine current status of family:

- Determine family composition, such as parent(s), children, male/female, and extended family involved. *Many family forms exist in society today, such as biological, nuclear, single-parent, step-family, communal, and*

- same-sex couple or family. A better way to determine a family may be to determine the attribute of affection, strong emotional ties, a sense of belonging, and durability of membership.*^{1,6}
- Identify participating members of family, such as parent(s), children, male/female, and extended family. *Identifies members of family who need to be involved and taken into consideration in developing plan of care to improve family functioning.*¹
 -   Note stage of family development. *While the North American middle-class family stages may be described as single, young adult, newly married, family with young children, family with adolescents, grown children, and later life, developmental tasks may vary greatly among cultural groups. This information provides a framework for developing a plan to enhance family processes.*¹
 - Ascertain motivation and expectations for change. *Motivation to improve and high expectations can encourage family to make changes that will improve their life. However, unrealistic expectations may hamper efforts.*⁷
 - Observe patterns of communication in the family. Are feelings expressed freely? Who talks to whom? Who makes decisions? For whom? Who visits? When? What is the interaction between family members? *Identifies not only possible weakness or areas of concern to be addressed, but also identifies strengths that can be used for planning improvement in family communication. Effective communication is that in which verbal and non-verbal messages are clear, direct, and congruent.*^{1,2}
 - Assess boundaries of family members. Do members share family identity and have little sense of individuality? Do they seem emotionally connected with one another? *Individuals need to respect one another, and boundaries need to be clear so family members are free to be responsible for themselves.*^{1,3}
 - Identify “family rules” that are accepted in the family. *Families interact in certain ways over time and develop patterns of behavior that are accepted as the way “we behave” in this family. “Functional families” rules are constructive and promote the needs of all family members.*¹
 - Note energy direction. *Efforts at problem-solving, resolution of different opinions, and growth may be purposeful or may be scattered and ineffective.*³
 -  Determine cultural and/or religious factors influencing family interactions. *Expectations related to socio-economic beliefs may be different in various cultures; for instance, traditional views of marriage and family life may be strongly influenced by Roman Catholicism in Italian American and Latino American families. In some cultures, the father is considered the authority figure and the mother is the homemaker. These beliefs may be functional or dysfunctional in any given family and may change with stressors/circumstances (e.g., financial, loss or gain of a family member, personal growth).*^{1,3,7}
 - Note health of married individuals. *Recent reports have determined that marriage increases life expectancy by as much as 5 years.*⁵

NURSING PRIORITY NO. 2 To assist the family to improve family interactions:

- Establish nurse-family relationship. *Promotes a warm, caring atmosphere in which family members can share thoughts, ideas, and feelings openly and in a nonjudgmental manner.*³
- Acknowledge difficulties and realities of individual situation. *Reinforces that some degree of conflict is to be expected in family interactions that can be used to promote growth.*^{1,3}
- Emphasize importance of continuous, open dialogue between family members. *Facilitates ongoing expression of open, honest feelings and opinions and effective problem-solving.*^{1,4}
- Assist family to identify and encourage use of previously successful coping behaviors. *Promotes recognition of previous successes and confidence in own abilities to learn and improve family interactions.*^{2,4}
- Acknowledge differences among family members with open dialogue about how these differences have occurred. *Conveys an acceptance of these differences among individuals and helps to look at how they can be used to strengthen the family process.*³
- Identify effective parenting skills already being used and additional ways of handling difficult behaviors that may develop. *Allows the individual family members to realize that some of what has been done already was helpful and helps them to learn new skills to manage family interactions in a more effective manner.*³

NURSING PRIORITY NO. 3 To promote optimum well-being (Teaching/Discharge Considerations):

-  Involve family members in setting goals and planning for the future. *When individuals are involved in the decision making, they are more committed to carrying through on a plan to enhance family interactions as life goes on.*²
- Discuss and encourage use of stress-management techniques. *Relaxation exercises, visualization, and similar skills can be useful for promoting reduction of anxiety and ability to manage stress that occurs in their lives.*¹
- Encourage participation in learning role-reversal activities. *Helps individuals to gain insight and understanding of other person's feelings and point of view.*³
- Provide educational materials and information. *Enhances learning to assist in developing positive relationships among family members.*⁴
- Assist family members to identify situations that may create problems and lead to stress/anxiety. *Thinking ahead can help individuals anticipate helpful actions to handle or prevent conflict and untoward consequences.*⁴
-  Refer to classes or community resources as appropriate. *Family effectiveness and self-help groups, psychotherapy, and religious affiliations can provide new information to assist family members to learn and apply to enhancing family interactions.*⁴

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Assessment findings, including family composition, developmental stage of family, and role expectations.
- Cultural or religious values and beliefs regarding family and family functioning.
- Family communication patterns.
- Motivation and expectations for change.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Educational plan.

Implementation/Evaluation

- Each individual's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to lifestyle and treatment plan.

Discharge Planning

- Long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

Fatigue

Taxonomy II: Activity/Rest—Class 3 Energy Balance (00093) [**Diagnostic Division:** Activity/Rest], Approved 1988; Nursing Diagnosis Extension and Classification Revision 1998; Revised 2017

DEFINITION: An overwhelming sustained sense of exhaustion and decreased capacity for physical and mental work at the usual level.

RELATED FACTORS

Anxiety; depression
Environmental barrier
Increase in physical exertion; physical deconditioning; nonstimulating lifestyle
Malnutrition; sleep deprivation; stressors
Demanding occupation

DEFINING CHARACTERISTICS

Subjective

Insufficient energy; impaired ability to maintain usual routines or usual physical activity
Tiredness; nonrestorative sleep pattern
Guilt about difficulty maintaining responsibilities
Alteration in libido
Increase in physical symptoms, rest requirements

Objective

Alteration in concentration
Apathy; lethargy; listlessness; drowsiness
Disinterest in surroundings; introspection
Ineffective role performance

At Risk Population: Demanding occupation

Exposure to negative life events

Associated Condition: Anemia; illness, pregnancy

Sample Clinical Applications: Anemia, hypothyroidism, cancer, multiple sclerosis (MS), Lyme disease, postpolio syndrome, AIDS, chronic renal failure, chronic fatigue syndrome (CFS), depression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Fatigue: Disruptive Effects: Severity of observed or reported disruptive effects of chronic fatigue on daily functioning

Energy Conservation: Personal actions to manage energy for initiating and sustaining activity

Psychomotor Energy: Personal drive and energy to maintain activities of daily living, nutrition, and personal safety

Client Will (Include Specific Time Frame)

- Report improved sense of energy.
- Identify basis of fatigue and individual areas of control.
- Perform ADLs and participate in desired activities at level of ability.
- Participate in recommended treatment program.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Energy Management: Regulating energy use to treat or prevent fatigue and optimize function

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

Nutrition Management: Providing and promoting a balanced intake of nutrients

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify presence of physical and/or psychological conditions (e.g., pregnancy, infectious processes, blood loss, anemia, autoimmune disorders [e.g., MS, lupus, rheumatoid arthritis], trauma, chronic pain syndromes [e.g., arthritis], cardiopulmonary disorders, cancer or cancer treatments, hepatitis, AIDS, major depressive disorder, anxiety states, substance use or abuse). *Important information can be obtained from knowing if fatigue is a result of an underlying condition or disease process (acute or chronic), whether an exacerbating or remitting condition is in exacerbation, and/or whether fatigue has been present over a long time without any identifiable cause.*
- Note diagnosis or possibility of CFS (also sometimes called chronic fatigue immune dysfunction syndrome [CFIDS], or myalgic encephalomyelitis [ME]). *This condition is difficult to characterize, largely because various studies define it differently. Because no direct tests help in diagnosis, it is one of exclusion. CFS has been defined as a distinct disorder (affecting both children and adults) characterized by chronic (often relapsing but always debilitating) fatigue, lasting for at least 6 months (often for much longer), causing impairments in overall physical and mental functioning, and without an apparent etiology.*¹
- ∞ Note client's age, gender, and developmental stage. *Some studies show a prevalence of fatigue in females more than in males, and it occurs most commonly in young to middle-aged adults.*^{1,9,10}
- Assess general well-being—cardiovascular and respiratory status, musculoskeletal strength, emotional health, and nutritional and fluid status. *Underlying conditions (e.g., anemia, heart failure, depression, malnutrition) may be causing or exacerbating fatigue.*
- Note changes in life (e.g., relationship problems, family illness, injury or death; expanded responsibilities or demands of others, job-related conflicts) that can be causing or exacerbating level of fatigue. *Stress may be the result of dealing with disease or situational crises, dealing with the “unknowns,” or trying to meet expectations of others.*² *Also, grief and depression can sap energy and cause avoidance of social and/or physical interactions that could stimulate the mind and body. Note: Persons with AIDS and the elderly are especially prone to this fatigue because they experience significant losses, often on a regular or recurring basis.*^{3,4}
- Assess sleep pattern—hours and quality of sleep. *Sleep disturbance is both a contributor to and a manifestation of fatigue (e.g., a client with chronic pain or depression may be sleeping long periods but not experience refreshing sleep or may not be able to fall or stay asleep).*
- Determine ability to participate in activities and level of mobility. *While many illness conditions negatively affect client's energy and activity tolerance, if the client is not engaged in light to moderate exercise, he or she may simply adjust to more sedentary activities, which can in turn exacerbate deconditioning and debilitation. However, there are certain conditions (e.g., MS, postpolio syndrome) where the client's ability to do things diminishes as he or she does them (e.g., at the beginning of a walk the client feels okay, but fatigue sets in [out of proportion to the activity] and the client is exhausted as if running a marathon).*^{5,6}
- 🧴 Review medication regimen and use. *Many medications have the potential side effect of causing/exacerbating fatigue (e.g., beta blockers, chemotherapy agents, narcotics, sedatives, muscle relaxants, antiemetics, antidepressants, antiepileptics, diuretics, cholesterol-lowering drugs, HIV treatment agents, combinations of drugs and/or substances).*

- Assess psychological and personality factors that may affect reports of fatigue level. *Client with severe or chronic fatigue may have issues affecting desire to be active (or work), resulting in over- or underactivity or concerns of secondary gain from exaggerated fatigue reports.*
- Evaluate aspect of “learned helplessness” that may be manifested by giving up. *Can perpetuate a cycle of fatigue, impaired functioning, and increased anxiety and fatigue.*

NURSING PRIORITY NO. 2 To determine degree of fatigue/impact on life:

- Ask client to describe fatigue, noting particular phrases (e.g., drained, exhausted, lousy, weak, lazy, worn out, whole-body tiredness). *Helpful in clarifying client’s expressions for symptoms and pattern and timing of fatigue, which varies over time and may also vary in duration, unpleasantness, and intensity from person to person.*⁷
- Have client rate fatigue (using 0 to 10 or a similar scale) and describe its effects on ability to participate in desired activities. *Fatigue may vary in intensity and is often accompanied by irritability, lack of concentration, difficulty making decisions, problems with leisure, and relationship difficulties that can add to stress level and aggravate sleep problems.*¹¹
-  Assess severity of fatigue using a recognized scale (e.g., Chalder Fatigue Scale, Functional Assessment of Cancer Therapy Fatigue, Multidimensional Assessment of Fatigue, Piper Fatigue Self-Report Scale, Global Fatigue Index), as appropriate. *In initial evaluations, these scales can help determine manifestation, intensity, duration, and emotional meaning of fatigue. The scales can be used in ongoing evaluations to determine current status and estimate response to treatment strategies.*^{2,7-9,12}
- Measure blood pressure and heart and respiratory rate before and after activity as indicated. *Physiological response to activity (e.g., changes in blood pressure or heart or respiratory rate) may indicate need for interventions to improve cardiovascular health, pulmonary status, and conditioning. (Refer to risk for Activity Intolerance for additional interventions.)*
- Review availability and current use of assistance with daily activities, support systems, and resources.
- Evaluate need for individual assistance or assistive devices. *Certain conditions causing fatigue (e.g., postpolio syndrome) worsen with overuse of weakened muscles. Client may benefit from support and protection provided by braces, canes, power chairs, etc.*^{6,7}

NURSING PRIORITY NO. 3 To assist client to cope with fatigue and manage with individual limitations:

-  Accept reality of client’s fatigue and avoid underestimating effect on quality of life the client experiences. *Fatigue is subjective and often debilitating (e.g., clients with cancer, AIDS, or MS are prone to more frequent episodes of severe fatigue following minimal energy expenditure and require longer recovery period; postpolio clients often display a cumulative effect if they fail to pace themselves and rest when early signs of fatigue are encountered).*^{5,7}
-  Active-listen concerns and encourage expression of feelings. *Provides support to help client deal with very frustrating and taxing situation.*
-  Treat underlying conditions where possible (e.g., manage pain, depression, or anemia; treat infections; reduce numbers of interacting medications) to reduce fatigue caused by treatable conditions.
- Involve client/significant others (SOs)/caregivers(s) in planning care to incorporate their input, choices, and assistance.
- Encourage client to do whatever activity possible (e.g., self-care, sit up in chair, walk for 5 minutes), pacing self and increasing activity level gradually. Schedule activities for periods when client has the most energy, to maximize participation.
- Structure daily routines and establish realistic activity goals with client, especially when depression is a factor in fatigue. *May enhance client’s commitment to efforts and promote sense of self-esteem in accomplishing goals.*
- Instruct client/caregivers in alternate ways of doing familiar activities and methods to conserve energy, such as the following:^{2,3,7-9}

Sit instead of stand during daily care or other activities.

Adjust the level or height of work surface for ergonomic benefit and to prevent bending over.

Carry several small loads instead of one large load.

Use assistive devices (e.g., wheeled walkers or chairs, power lift recliner chairs, stair-climbers).

Plan steps of activity before beginning so that all needed materials are at hand.

Take frequent short rest breaks and return to activity.

Delegate tasks or duties whenever possible.

Combine and simplify activities.

Ask for and accept assistance.

Say “no” or “later.”

- Provide environment conducive to relief of fatigue and avoid temperature and humidity extremes. *Temperature and level of humidity are known to affect exhaustion (especially in clients with MS).*⁵
-  Encourage nutritional foods; refer to a dietitian as indicated. *Nutritionally balanced diet with proteins, complex carbohydrates, vitamins, and minerals may boost energy. Frequent, small meals and simple-to-digest foods are beneficial when combating fatigue. Reduced amounts of caffeine and sugar can improve sleep and energy.*^{3,7}
-  Provide supplemental oxygen as needed. *If fatigue is related to oxygenation/perfusion problems, oxygen may improve energy level and ability to be active.* (Refer to ND Activity Intolerance for additional interventions.)
- Provide diversional activities (e.g., visiting with friends/family, TV/music, doing hobbies or schoolwork). *Participating in pleasurable activities can refocus energy and diminish feelings of unhappiness, sluggishness, and worthlessness, which can accompany fatigue.* (Refer to ND decreased Diversional Activity Engagement for additional interventions.)
- Avoid over/understimulation (cognitive and sensory). *Impaired concentration can limit ability to block competing stimuli and distractions.*
- Assist client/SOs to implement measures to preserve energy over longer periods of time. *Even though the client may continue to experience fatigue, his/her energy level could benefit from such things as (1) planning and organizing work tasks (e.g., delegating, combining activities, simplifying details; spending energy on important/desired tasks); (2) balancing periods of rest and work and resting before fatigue sets in; (3) pacing self and reducing sudden or prolonged strains; (4) limiting work that increases muscle tension and using good body mechanics; and (5) modifying effects of the environment such as temperature extremes and eliminating smoke and harmful fumes.*²
- Recommend or implement routines that promote restful sleep, such as the following:
 - Regular sleep hours at night with beneficial nighttime rituals
 - Short naps during day hours
 - A mild, graded exercise program to include strengthening and stretching movements such as yoga or tai chi
 - Quiet activities in the evening
 - Meditation and/or visualization
 - Warm baths
 Refer to NDs Insomnia and Sleep Deprivation for additional interventions.
-  Instruct in or refer for stress-management skills of visualization, deep breathing, relaxation, and biofeedback to deal with situation, aid in relaxation, and to reduce boredom, pain, and sense of fatigue.
-  Participate in comprehensive rehabilitation program with physical or occupational therapist and/or an exercise or rehabilitation physiologist. *Collaborative program with short-term achievable goals enhances likelihood of success and may motivate client to adopt a lifestyle for enhancement of health.*^{2,7,8}
-  Discuss alternative therapies (e.g., massage, acupuncture, osteopathic or chiropractic manipulations), if appropriate. *Complementary therapies may be helpful in reducing muscle tension and pain to promote relaxation and rest.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Discuss therapy regimen relating to individual causative factors (e.g., physical and/or psychological illnesses) and help client/SO(s) to understand relationship of fatigue to illness. Promotes acceptance of situation, allowing client to focus attention on finding ways to live with fatigue.
- Assist client/SO(s) to develop plan for activity and exercise within individual ability. *Enhances sense of control and commitment to attaining goals.*
- Emphasize necessity of allowing sufficient time to finish activities. *Client is more likely to succeed when he or she does not feel rushed and is allowed to proceed at a measured pace.*
- Instruct client in ways to monitor response to activity and significant signs/symptoms to heed. *Changes in pulse or respiratory rate or development of worsened or unrelenting fatigue is a signal to stop, rest, and then resume activity, possibly modified in some aspect, that will allow the client to proceed.*
- Promote overall health measures (e.g., good nutrition [to include reduced levels of saturated and trans fats, cholesterol, salt and added sugars], adequate fluid intake, appropriate vitamin and iron supplementation).
- Encourage client to develop assertiveness skills and prioritize goals and activities.
- Discuss burnout syndrome when appropriate and actions client can take to change individual situation.
- Assist client to identify appropriate coping behaviors. *Promotes sense of control and improves self-esteem.*
- Identify support groups and resources (e.g., condition-specific groups, reliable Web sites) *to provide information, share experiences, and enhance problem-solving.*
-  Refer to community resources for assistance with routine needs (e.g., Meals on Wheels, homemaker or housekeeper services, yard care, transportation options).
-  Refer to counseling or psychotherapy as indicated *to deal with stressors and effects of condition.*

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Manifestations of fatigue and other assessment findings.
- Degree of impairment and effect on lifestyle.
- Expectations of client/SO relative to individual abilities and specific condition.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs and who is responsible for actions to be taken.
- Specific referrals made.

Fear [Specify focus]

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00148) [Diagnostic Division: Ego Integrity], Approved 1980; Revised 1996, 2000, 2017

DEFINITION: Response to perceived threat that is consciously recognized as a danger.

RELATED FACTORS

Language barrier
 Learned response [e.g., conditioning, modeling from others]
 Response to phobic stimulus
 Separation from support system
 Unfamiliar setting

DEFINING CHARACTERISTICS

Subjective

Apprehensiveness; excitedness; decrease in self-assurance; increase in tension; nausea
 Feelings of alarm, dread, fear, panic, terror

Cognitive: Identifies object of fear; stimulus believed to be a threat

Physiological: Anorexia; fatigue; dry mouth; dyspnea; [palpitations]

Objective

Vomiting; muscle tension; fidgeting; pallor; pupil dilation

Cognitive: Decrease in productivity, learning ability, or problem-solving ability

Behaviors: Increase in alertness; avoidance [or flight] behaviors; attack behaviors; impulsiveness; focus narrowed to the source of fear

Physiological: Diarrhea; increase in perspiration; change in physiological response [e.g., blood pressure, heart rate, respiratory rate, oxygen saturation and end-tidal CO₂]

Associated Condition: Sensory deficit

Sample Clinical Applications: Phobias, hospitalization/diagnostic procedures, diagnosis of chronic or life-threatening condition

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Fear Self-Control: Personal actions to eliminate or reduce disabling feelings of apprehension, tension, or uneasiness from an identifiable source

(continues on page 330)

Fear [Specify focus] (continued)

Coping: Personal actions to manage stressors that tax an individual's resources

Fear Level: Severity of manifested apprehension, tension, or uneasiness arising from an identifiable source

Client Will (Include Specific Time Frame)

- Acknowledge and discuss fears, recognizing healthy versus unhealthy fears.
- Verbalize accurate knowledge of and sense of safety related to current situation.
- Demonstrate understanding through use of effective coping behaviors (e.g., problem solving) and resources.
- Display lessened fear as evidenced by appropriate range of feelings and relief of signs/symptoms (specific to client).

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Anxiety Reduction: Minimizing apprehension, dread, foreboding, or uneasiness related to an unidentified source or anticipated danger

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

NURSING PRIORITY NO. 1 To assess degree of fear and reality of threat perceived by the client:

- Ascertain client's/significant other's (SO's) perception of what is occurring and how this affects life. *Fear is a natural reaction to frightening events, and how client views the event will determine how he or she will react. Fear differs from anxiety in that it is usually unanticipated, is dependent on the termination of the feared object/subject, is often intense, and occurs in self-limiting episodes. Health fears may not be the "fight or flight" type, and may present more like dread and anxiety.*^{1,3,9}
- ∞ Determine client's age and developmental level. *Helps in understanding usual or typical fears experienced by individuals (e.g., toddler has entirely different fears than adolescent or older person with dementia being removed from home/usual living situation).*^{3,11}
- Note ability to concentrate, level of attention, and degree of incapacitation (e.g., "frozen with fear," inability to engage in necessary activities). *Indicative of extent of anxiety or fear related to what is happening and need for specific interventions to reduce physiological reactions. Presence of severe reaction (panic or phobias) requires more intensive intervention.*^{1,4,10}
- Compare verbal and nonverbal responses. *Noting congruencies or incongruencies can help to identify client's misperceptions of situation and what actions may be helpful. Client may be able to verbalize what he/she is afraid of, if asked, providing opportunity to address actual fears.*^{1,3}
- Be alert to signs of denial or depression. *Client may deny existence of problem until overwhelmed and unable to deal with situation. Depression may be associated with fear that interferes with productive life and daily activities.*²
- Identify sensory deficits that may be present, such as vision or hearing impairment. *Affects reception and interpretation. Inability to correctly sense and perceive stimuli leads to misunderstanding, increasing fear.*⁴
- 📊 Measure vital signs and note physiological responses to situation. *Provides baseline information of extent of response for comparison as needed. Stabilization can indicate effectiveness of interventions by diminished response to identified fear. Note: Fear and acute anxiety can both involve sympathetic arousal (e.g., increased heart rate, respirations, and blood pressure, hyperalertness, antidiuresis, dilation of skeletal blood vessels, constriction of gut blood vessels, and a surge of catecholamine release). These responses can be blunted (e.g., heart rate may not be increased if client is taking certain beta-blocking medications) and should subside as the fear state is reduced.*^{6,10}

- Investigate client's reports of subjective experiences (may reflect delusions or hallucinations). *It is important to understand how the client views the situation and identify need for reality orientation and further evaluation.*⁴
- Be alert to and evaluate potential for violence. *Client who is fearful may feel need to protect himself or herself and strike out at closest person. Proactive planning can avert or manage violent behaviors.*⁵
- Assess family dynamics. *Actions and responses of family members may exacerbate or soothe fears of client; conversely, if the client is immersed in illness, whether from crisis or fear, it can take a toll on the family/involved others.*^{1,11} (Refer to NDs Anxiety, readiness for enhanced family Coping, compromised/disabled family Coping, and interrupted Family Processes for additional interventions.)

NURSING PRIORITY NO. 2 To assist client/SOs in dealing with fear/situation:

-  Stay with the very fearful client or make arrangements to have someone else be there. *Provides nonthreatening environment in which the presence of a calm, caring person can provide reassurance that individual will be safe. Sense of abandonment can exacerbate fear.*⁶
- Active-listen client concerns. *Conveys message of belief in competence and ability of client. Promotes understanding of issues when client feels listened to so that problem-solving can begin.*²
- Acknowledge normalcy of fear, pain, and despair and give “permission” to express feelings appropriately and freely. *Feelings are real, and it is helpful to bring them out in the open so they can be discussed and dealt with.*⁶
- Present objective information when available and allow client to use it freely. Avoid arguing about client's perceptions of the situation. *Limits conflicts when fear response may impair rational thinking.*⁶
- Speak in simple sentences and concrete terms and include written materials as appropriate. *Intense state of fear interferes with reception and interpretation of verbal information; supplementing it with written information facilitates understanding and retention of information.*⁴
- Provide opportunity for questions, answering honestly. *Enhances sense of trust and promotes positive nurse-client relationship in which individual can verbalize fears and begin to problem-solve.*¹
-  Manage environmental factors, such as loud noises, harsh lighting, changing person's location without knowledge of family/SO, strangers in care area or unfamiliar people, and high traffic flow, *which can cause or exacerbate stress, especially to very young or to older individuals.*
-  Be truthful with client when painful procedures are anticipated; be present and provide physical contact (e.g., hugging, refocusing attention, rocking a child) as appropriate, *to soothe fears and provide assurance.*
- Modify procedures as possible (e.g., substitute oral for intramuscular medications, combine blood draws or use finger-stick method) *to limit degree of stress and avoid overwhelming a fearful individual.*³
- Promote client control where possible and help client identify and accept those things over which control is not possible. *Life changes and stressful events are viewed differently by each individual. Providing the client with opportunity to make own decision when possible strengthens internal locus of control. Individual with external locus of control may attribute feelings of anxiety and fear to an external source and may perceive it as beyond his or her control.*¹
-  Provide touch, Therapeutic Touch, massage, and other adjunctive therapies as indicated. *Aids in meeting basic human need, decreasing sense of isolation, and assisting client to feel less anxious. Note: Therapeutic touch requires the nurse to have specific knowledge and experience to use the hands to correct energy field disturbances by redirecting human energies to help or heal.*^{2,7}
- Encourage contact with a peer who has successfully dealt with a similarly fearful situation. *Provides a role model, which can enhance sense of optimism. Client is more likely to believe others who have had similar experience(s).*¹

NURSING PRIORITY NO. 3 To assist client in learning to use own responses for problem-solving:

- Acknowledge usefulness of fear for taking care of self. *Provides new idea that can be a motivator to focus on dealing appropriately with situation.*¹

- Explain relationship between disease and symptoms if appropriate. *Providing accurate information promotes understanding of why the symptoms occur, allaying anxiety about them.*¹
- Identify client's responsibility for the solutions while reinforcing that the nurse will be available for help if desired or needed. *Enhances client's sense of control, self-worth, and confidence in own ability, diminishing fear.*⁸
- Determine internal and external resources for assistance (e.g., awareness and use of effective coping skills in the past; SOs who are available for support). *Provides opportunity to recognize and build on resources client/SO may have used successfully in the past.*¹
- Explain actions and procedures within level of client's ability to understand and handle, being aware of how much information client wants to prevent confusion or overload. *Complex and/or anxiety-producing information can be given in manageable amounts over an extended period as opportunities arise and facts are given; individual will accept what he or she is ready for.*⁸
-  Discuss use of anti-anxiety medications and reinforce use as prescribed. *Anti-anxiety agents may be useful for brief periods to assist client to reduce fearful feelings to manageable levels, providing opportunity for initiation of client's own coping skills.*¹

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Support planning for dealing with reality. *Assists in identifying areas in which control can be exercised and those in which control is not possible, enabling client to handle fearful situation or feelings.*¹
- Assist client to learn relaxation, visualization, or guided imagery skills (e.g., imagining a pleasant place, use of music or tapes, deep breathing, meditation, mindfulness). *Promotes release of endorphins and aids in developing internal locus of control, reducing fear and anxious feelings. May enhance coping skills, allowing body to go about its work of healing. Note: Mindfulness is a method of being in the here and now, concentrating on what is happening in the moment.*^{7,8}
-  Encourage regular physical activity. Assist client or refer to physical therapist to develop exercise program within limits of ability. *Provides a healthy outlet for energy generated by feelings and promotes relaxation. Has been shown to raise endorphin levels to enhance sense of well-being.*²
- Provide for and deal with sensory deficits in appropriate manner (e.g., speak clearly and distinctly, use touch carefully as indicated by situation). *Hearing or visual impairments and other deficits can contribute to feelings of fear. Recognizing and providing for appropriate contact can enhance communication, promoting understanding.*⁴
-  Refer to pastoral care, mental healthcare providers, support groups, and community agencies and organizations as indicated. *Provides information, ongoing assistance to meet individual needs, and opportunity for discussing concerns and obtaining further care when indicated.*²

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, noting individual factors contributing to current situation, and source of fear.
- Manifestations of fear and impact on life and ability to function.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to treatment plan, interventions, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

ineffective infant Feeding Pattern

Taxonomy II: Nutrition—Class 1 Ingestion (00107) [Diagnostic Division: Food/Fluid], Submitted 1992; Revised 2006; 2017

DEFINITION: Impaired ability of an infant to suck or coordinate the suck/swallow response resulting in inadequate oral nutrition for metabolic needs.

RELATED FACTORS

Oral hypersensitivity
Prolonged nil per os (NPO) status

DEFINING CHARACTERISTICS

Subjective

[Caregiver reports infant unable to achieve effective suck.]

Objective

Inability to initiate or sustain an effective suck
Inability to coordinate sucking, swallowing, and breathing

At Risk Population: Prematurity

Associated Condition: Neurological delay or impairment; oral hypersensitivity

Sample Clinical Applications: Prematurity, cleft lip/palate, thrush, hydrocephalus, cerebral palsy, fetal alcohol syndrome, respiratory distress, severe developmental delay

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Swallowing Status: Oral Phase: Preparation, containment, and posterior movement of fluids and/or solids in the mouth

Breastfeeding Establishment: Infant: Infant attachment to and sucking from the mother's breast for nourishment during the first 3 weeks of breastfeeding

Hydration: Adequate water in the intracellular and extracellular compartments of the body

(continues on page 334)

ineffective infant Feeding Pattern (continued)

Infant Will (Include Specific Time Frame)

- Display adequate output as measured by sufficient number of wet diapers daily.
- Demonstrate appropriate weight gain.
- Be free of aspiration.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Swallowing Therapy: Facilitating swallowing and preventing complications of impaired swallowing

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

Bottle Feeding: Preparation and administration of fluids to an infant via a bottle

NURSING PRIORITY NO. 1 To identify contributing factors/degree of impaired function:

- Assess infant's suck, swallow, and gag reflexes. *Provides comparative baseline and is useful in determining appropriate feeding method.*
- Note developmental age, structural abnormalities (e.g., cleft lip/palate), mechanical barriers (e.g., endotracheal tube, ventilator). *These factors (infant maturity and structural/mechanical barriers to infant feeding) help to determine plan of care.^{1,2,4,6} Note: Human milk decreases infections in preterm infants, both during hospitalization and after discharge. Human milk is the feeding of choice.*
- Determine level of consciousness, neurological impairment, seizure activity, and presence of pain. *Provides baseline information and identifies areas of special need.^{1,2}*
- Observe parent/infant interactions to determine level of bonding and comfort that could impact stress level during feeding activity.
-  Note type and scheduling of medications. *May cause sedative effect or otherwise impair feeding activity.²*
- Compare birth and current weight and length measurements. *Monitors effectiveness of infant feeding technique.^{1,2,4}*
- Assess signs of stress when feeding (e.g., tachypnea, cyanosis, fatigue, lethargy). *Detects areas of increased need for alternate feeding methods and/or rest periods.¹*
- Note presence of behaviors indicating continued hunger after feeding. *Determines if infant is receiving adequate amount during feeding.^{2,4}*

NURSING PRIORITY NO. 2 To promote adequate infant intake:

-  Determine appropriate method for feeding (e.g., special nipple or feeding device, gavage or enteral tube feeding) and choice of breast milk or formula to meet infant needs. *Individualizes care and maintains infant health status.¹*
- Review early infant feeding cues (e.g., rooting, lip smacking, sucking fingers or hand) versus late cue of crying with parents/caregivers. *Early recognition of infant hunger promotes timely and more rewarding feeding experience for infant and mother.⁵*
- Demonstrate techniques or procedures for feeding. Note proper positioning of infant, "latching-on" techniques, rate of delivery of feeding, and frequency of burping. (Refer to ND ineffective Breastfeeding as appropriate.) *Models appropriate feeding methods and increases parental knowledge base and confidence.²⁻⁴*
- Limit duration of feeding to maximum of 30 minutes based on infant's response (e.g., signs of fatigue) to balance energy expenditure with nutrient intake.
- Monitor caregiver's efforts. Provide feedback and assistance as indicated. *Enhances learning and encourages continuation of efforts.^{2,3}*

-  Refer mother to lactation specialist for assistance and support in dealing with unresolved issues (e.g., teaching infant to suck or a decrease in the mother's milk supply). *Provides resource for future needs and problem solving. Begins pattern of resource utilization.*²⁻⁴
- Emphasize importance of calm/relaxed environment during feeding to *reduce detrimental stimuli and enhance mother/infant's focus on feeding activity.*
- Adjust frequency and amount of feeding according to infant's response. *Prevents infant's frustration associated with under/overfeeding.*
- Advance diet, adding solids or thickening agent as appropriate for age and infant needs. *Provides for infant's nutritional and health needs.*^{2,4}
- Alternate feeding techniques (e.g., nipple and gavage) according to infant's ability and level of fatigue. *Individualizes plan of care to enhance successful feeding.*¹
-  Alter medication or feeding schedules as indicated to minimize sedative effects. *Altered states of function and consciousness interfere with feeding and may lead to choking or aspirating.*¹

NURSING PRIORITY NO. 3 To promote well-being (Teaching/Discharge Considerations):

-  Encourage kangaroo care, placing infant skin-to-skin upright, tummy down, on mother's or father's chest. *Skin-to-skin care increases bonding and may promote stable heart rate, temperature, and respiration in infant.*⁷
- Instruct caregiver in techniques to prevent or alleviate aspiration. *Helps parent/caregiver feel more confident and promotes infant safety.*^{1,4}
- Discuss anticipated growth and development goals for infant, as well as corresponding caloric needs. *Accommodating infant maturity and development helps to individualize and update plan of care.*^{1,2,5}
- Suggest recording infant's weight and nutrient intake periodically. *Monitors effectiveness of infant feeding technique by providing measurable data. Provides positive reinforcement to implementation of plan of care.*^{1,2,4}
-  Recommend participation in classes as indicated (e.g., first aid, infant cardiopulmonary resuscitation). *Increases knowledge base for infant safety and caregiver confidence.*²⁻⁴
-  Refer to support groups (e.g., La Leche League, parenting support groups, stress reduction, other community resources as indicated).
- Provide bibliotherapy including appropriate Web sites for further information.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Type and route of feeding, interferences to feeding and reactions.
- Infant's measurements.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Infant's response to interventions (e.g., amount of intake and output, weight gain, response to feeding) and actions performed.
- Caregiver's involvement in infant care, participation in activities, and response to teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, referrals made, and who is responsible for follow-up actions.

risk for Female Genital Mutilation

Taxonomy II: Safety/Protection—Class 3 Violence (00272) [**Diagnostic Division:** Safety], Approved 2017

DEFINITION: Susceptible to full or partial ablation of the female external genitalia and other lesions of the genitalia, whether for cultural, religious, or any other non-therapeutic reasons, which may compromise health

RISK FACTORS

Lack of family knowledge about impact on physical, reproductive, psychosocial health

At Risk Population: Female gender

Residing in country where practice is accepted; family leaders belong to ethnic group in which practice is accepted

Belonging to family in which any female member has been subjected to practice

Belonging to ethnic group in which practice accepted; favorable attitude of family toward practice

Sample Clinical Applications: Pre/postnatal care, labor and delivery, newborn/well baby care, urinary tract infection (UTI), pelvic inflammatory disease (PID), infertility

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Community Risk Control: Unhealthy Cultural Traditions: Community actions to promote customs, beliefs values, and laws that support member's health and lifestyle modifications within the culture

Health Seeking Behavior: Personal actions to promote wellness, recovery, and rehabilitation

Decision-Making: Ability to make judgements and choose between two or more alternatives

Family/Client Will (Include Specific Time Frame)

- Verbalize understanding of impact of the practice on the health of the child/woman.
- Demonstrate willingness to learn more about the impact of the practice by engaging in conversation with healthcare provider.
- Review information sources about the effect on physical and psychosocial health of the woman.
- Make the decision not to engage in this practice.

Community Will (Include Specific Time Frame)

- Develop resources to eliminate the practice of female genital mutilation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Cultural Brokerage: The deliberate use of culturally competent strategies to bridge or mediate between the patient's culture and the biomedical healthcare system

Decision-Making Support: Providing information and support for a patient who is making a decision regarding healthcare

NURSING PRIORITY NO. 1 To assess knowledge and beliefs of family/client and cultural/ethnic group:

-  Note country of origin of family/client. *Although the practice of female genital mutilation (FGM) has declined in some countries, and is banned in a number of others, some type of procedure routinely continues in various regions of Africa and the Middle East.*³
-  Identify cultural/ethnic beliefs of family/client. *FGM has been practiced for over three centuries and may be associated with strong social pressure to continue the practice to conform to tradition, for group identity, marriageability, and right of inheritance.*^{2,3}
- Determine how client views the practice. *Often women who grow up in a culture that practices FGM view the procedure as “normal,” believing it characterizes womanhood and needs to be done, thereby negatively impacting motivation for change and making it harder to give up custom.*¹
- Ascertain family/client past experiences with practice including health consequences. *Oftentimes, procedure is performed between first week of life and 8 years of age. Some practices are performed before puberty or at widowhood, and reinfibulation (resuturing after delivery or gynecological procedures of the incised scar tissue resulting from infibulation) may be performed after childbirth. Based on personal experiences, family may have limited understanding of associated risks.*²
-  Determine prevalence of custom in community and use of nonmedical providers to perform procedure. *Community may or may not support the custom, and nonmedically prepared providers may be utilized, increasing the risk of serious complications/death. This provides insight into needs of the community.*

NURSING PRIORITY NO. 2 To assist family/client to make informed decision/modify cultural practices:

- Establish rapport with family/client using their terminology in nonjudgmental manner. *Some women do not view procedure as mutilation, referring to it as “cutting” or “circumcision.” Condemning the practice may drive individual(s) away, leading to negative outcome.*²
- Provide information about the types of procedures performed in different areas/countries as appropriate. *There are various forms, such as symbolic pricking/piercing or scraping, cutting or removing part or all of the clitoris, or removing the labia minora and majora and suturing the edges closed with only a small hole remaining for urine and menstrual blood to pass (infibulation).*^{2,3}
- Discuss complications that can occur, especially with nonmedical practitioners. *Poor surgical skills of most practitioners, absence of anesthesia, and unsterile conditions can result in poor quality of life and even death of the woman. The most common initial complications are bleeding, urine retention, genital tissue swelling, severe pain. Midterm risks include pelvic inflammatory disease (PID), vaginal and urinary tract infections; and long-term problems such as dyspareunia (painful sexual intercourse) and infertility can occur. Adverse obstetric outcomes such as postpartum hemorrhage, stillbirth, and cesarean section are not uncommon. Psychologically, these individuals have higher rates of anxiety disorder and posttraumatic stress response.*³
- Provide detailed information in multiple modes, e.g., pamphlets, models, videos, computer programs in individual’s primary language. Obtain interpreter as indicated. *Information necessary to make informed decision may be better understood in family/client’s primary language.*¹
-  Include father/husband in educational sessions. *Studies suggest that men who have been educated regarding consequences are less likely to support the practice while those who have not been educated tend to deny reality of physical and obstetrical risks.*¹
-  Refer to community services if available for assistance with decision-making. *Support groups and/or counseling can provide individual with accurate information, reliable medical care, psychological support.*
-  Support client once she has made informed decision. *If choice is to proceed, encourage a less invasive or symbolic procedure. In the United States, an individual 18 years of age or older has a legal right to freedom of choice for self, but opting for a less radical procedure can reduce risks and enhance well-being.*^{1,3}

-  Refer to competent medical providers who perform genital surgery, as indicated. *If client desires some form of procedure, clinicians who are familiar with the medical sequelae and ramifications of female circumcision will be better able to treat these women knowledgeably and with dignity, while helping them to make a decision not to have the procedure done. Note: Some argue FGM is a violation of human rights and against the physician's oath "to do no harm." However, by default, this may drive client to nonmedical providers or to visit country of origin for procedure.*^{2,3}

NURSING PRIORITY NO. 3 To reduce the incidence of female genital mutilation:

-  Promote the eradication of this practice. *The World Health Organization has declared FGM illegal and the United Nations calls for its elimination by 2030.*¹
- Determine additional factors that influence this social change. *Beyond family attitudes, economic benefits to providers, who are often not medically trained but charge substantial fees, cause them to be reluctant to terminate the practice.*²
- Encourage religious/community leaders to advocate against practice. *These individuals are generally well respected and influential within their communities.*¹
-  Develop community-based educational programs addressing concepts of sexuality, marriage practices, legal rights, and federal laws. *Necessary to shift community attitudes supporting practice. Note: In some countries, such as the United States and Canada, the procedure cannot be performed on minors below the age of 18. In a number of other countries, it is totally illegal, with repercussions for the individual performing the procedure, the client, and on occasion anyone aware of and failing to report that the procedure was performed.*³
- Educate lawmakers of health and well-being consequences of procedure. *Encourages creation of laws banning practice and allocation of financial resources supporting programs at community level.*
-  Assist in developing emergency care resources and referrals to midwives, gynecologist/obstetrician for pregnant women who have had FGM. *Increases opportunity for a successful delivery of a healthy baby and minimizing injury to the woman. Provides opportunity to discuss reconstructive procedure or at least refraining from reinfibulation.*³

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including attitudes/expectations of family/client.
- Religious and cultural/ethnic factors.
- Family/client past experience with practice.
- Community prevalence of custom and providers.
- Available community resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.
- Formulation of community action plan.

Implementation/Evaluation

- Client's/family's responses to interventions, teaching, and actions performed.
- Attainment or progress to desired outcomes.
- Client's/family's decision.
- Community's commitment to change.

Discharge Planning

- Long-term plans, and who is responsible for actions to be taken.
- Specific referrals made.

[deficient hyper/hypotonic Fluid Volume]

DEFINITION: [Decreased intravascular, interstitial, and/or intracellular fluid. This refers to dehydration with changes in sodium.]

[NOTE: NANDA has restricted deficient Fluid Volume to address only isotonic dehydration. For client needs related to dehydration associated with alterations in sodium, the authors have provided this second diagnostic label.]

RELATED FACTORS

[Hypertonic dehydration: uncontrolled diabetes mellitus or insipidus, hyperosmolar hyperglycemic syndrome (HHS), increased intake of hypertonic fluids or IV therapy, inability to respond to thirst reflex, inadequate free water supplementation (high-osmolarity enteral feeding formulas), renal insufficiency or failure]

[Hypotonic dehydration: chronic illness, malnutrition, excessive use of hypotonic IV solutions (e.g., D5W), renal insufficiency]

DEFINING CHARACTERISTICS

Subjective

[Reports of fatigue, nervousness, exhaustion]

[Thirst]

Objective

[Increased urine output, dilute urine (initially), or decreased output, oliguria]

[Weight loss]

[Decreased venous filling; hypotension (postural)]

[Increased pulse rate; decreased pulse volume and pressure]

[Decreased skin turgor; dry skin and mucous membranes]

[Increased body temperature]

[Change in mental status (e.g., confusion)]

[Hemoconcentration; altered serum sodium]

Sample Clinical Applications: Diabetes mellitus, diabetic ketoacidosis, renal failure, conditions requiring IV therapy or enteral feeding, heat exhaustion or stroke, presence of draining wounds or fistulas

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Fluid Balance: Balance of the input and output of fluids in the body

Hydration: Adequate water in the intracellular and extracellular compartments of the body

(continues on page 340)

[deficient hyper/hypotonic Fluid Volume] (continued)

Electrolyte and Acid/Base Balance: Balance of electrolytes and nonelectrolytes in the intracellular and extracellular compartments of the body

Client Will (Include Specific Time Frame)

- Maintain fluid volume at a functional level as evidenced by individually adequate urinary output, stable vital signs, moist mucous membranes, and good skin turgor.
- Verbalize understanding of causative factors and purpose of individual therapeutic interventions and medications.
- Demonstrate behaviors to monitor and correct deficit as indicated when condition is chronic.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Fluid/Electrolyte Management: Regulation and prevention of complications from altered fluid and/or electrolyte levels

Hypovolemia Management: Expansion of intravascular fluid volume in a patient who is volume depleted

Fluid Monitoring: Collection and analysis of patient data to regulate fluid balance

NURSING PRIORITY NO. 1 To assess causative/precipitating factors:

- Note possible medical diagnoses or disease processes *that may lead to fluid deficits: (1) fluid loss (e.g., indwelling tubes, diarrhea, vomiting, fever, excessive sweating, diabetic ketoacidosis; burns, other draining wounds; gastrointestinal obstruction; use of diuretics); (2) limited intake (e.g., extremes of age, limited mobility, client dependent on others for eating and drinking; lack of knowledge related to fluid intake; heat exhaustion or stroke); (3) fluid shifts (e.g., ascites, effusions, burns, sepsis); or (4) environmental factors (e.g., isolation, restraints, very high ambient temperatures, malfunctioning air conditioning).*^{5,14,15}
-  Determine effects of age and gender. Obtain weight and measure subcutaneous fat and muscle mass to ascertain total body water, which is approximately 60% of adult's weight and 75% of infant's weight. Very young and extremely elderly individuals are quickly affected by a fluid volume deficit and are least able to express need. For example, elderly people often have a decreased thirst reflex and/or may not be aware of water needs. Infants/young children and other nonverbal persons cannot describe thirst.^{1,2,15,16} Worldwide, dehydration (secondary to diarrheal illness) is the leading cause of infant and child mortality.^{3,8}
- Evaluate nutritional status, noting current intake, weight changes, problems with oral intake, and use of supplements/tube feedings. *Factors that can negatively affect fluid intake (e.g., impaired mentation, nausea, wired jaws, immobility, insufficient time for meals, lack of finances restricting availability of food).*
-  Collaborate with physician to identify or characterize the nature of fluid and electrolyte imbalance(s). *Dehydration is often categorized according to serum sodium concentration. More than one cause may exist at a given time (e.g., increased loss of salt and water caused by diuretics that leads to decreased fluid intake as a result of lethargy and confusion).*^{5,9,10}
- Be aware of the difference between signs of **hypovolemia** (e.g., poor skin turgor, dizziness on standing, lethargy, delayed capillary refill, sunken eyeballs, fever, weight loss, little or no urine output) and signs of **dehydration** (e.g., lethargy, weakness, irritability, nausea, vomiting, hyperreflexia, potentially progressing to coma), which are symptoms of the effect of elevated sodium (hypernatremia) on the central nervous system. *Note: Dehydration is not always accompanied by hypovolemia, but it is almost always hypernatremic.*^{8,10}
-  Review client's medications, including prescription and over-the-counter drugs, herbals, and nutritional supplements, to identify medications that can alter fluid and electrolyte balance. These may include diuretics, vasodilators, beta blockers, aldosterone inhibitors, angiotensin-converting enzyme (ACE) inhibitors, and

medications that can cause syndrome of inappropriate secretion of antidiuretic hormone (e.g., phenothiazides, vasopressin, some antineoplastic drugs).¹²

NURSING PRIORITY NO. 2 To evaluate degree of fluid deficit:

- Obtain history of usual pattern of fluid intake and recent alterations. *Intake may be reduced because of current physical or environmental issues (e.g., swallowing problems, vomiting, severe heat wave with inadequate fluid replacement) or a behavior pattern (e.g., elderly person refuses to drink water trying to control incontinence).*
-  Assess vital signs, including temperature (often elevated), pulse (elevated), respirations, and blood pressure (may be low). Measure blood pressure (lying, sitting, standing) *to evaluate orthostatic blood pressure* and monitor invasive hemodynamic parameters as indicated (e.g., central venous pressure) *to determine degree of intravascular deficit and replacement needs.*^{7,8}
- Note change in usual mentation, behavior, and functional abilities (e.g., confusion, falling, loss of ability to carry out usual activities, lethargy, dizziness). *These signs indicate either sufficient hypovolemia to impair cerebral perfusion or sufficient dehydration to impair cerebral function.*^{9,10}
-  Observe and measure urinary output hourly or for 24 hours as indicated. Note color *(may be dark because of concentration)* and specific gravity *(high number associated with dehydration with usual range being 1.010 to 1.025).*⁴
- Estimate or measure other fluid losses (e.g., gastric, respiratory, and wound losses) *to more accurately determine fluid replacement needs.*
-  Review laboratory data (e.g., hemoglobin/hematocrit; osmolality, electrolytes [sodium, potassium, chloride, bicarbonate]; blood urea nitrogen, creatinine) *to evaluate body's response to fluid loss and to determine replacement needs. Note: The dehydrated client is not always hypovolemic. An abnormal sodium level is a key marker for salt and water imbalance. For example, in **hypertonic** dehydration, blood tests may reveal osmolality greater than 300 mOsm/kg and sodium greater than 150 meq/L. The hypernatremia is the **result** of dehydration. **Hypotonic** dehydration may reveal osmolality less than 250 mOsm/kg and sodium less than 130 meq/L. Hyponatremia is the **result** of replacing water without sodium.*^{4,11,17}

NURSING PRIORITY NO. 3 To correct/replace fluid losses to reverse pathophysiological mechanisms:

-  Assist with treatment of underlying conditions causing or contributing to dehydration and electrolyte imbalances (e.g., change antibiotics causing diarrhea; treat fever or infection, malnutrition, or severe depression; discontinue medications contributing to dehydration).
-  Administer fluids and electrolytes as indicated. *Fluid used for replacement depends on the (1) type of dehydration present and (2) degree of deficit determined by age, weight, and type of trauma or condition causing the fluid deficit. Multiple fluid resuscitation formulas (e.g., Parkland, Evans, Brooke, Slater, Monafó burn formulas) exist with variations in both the volumes per weight suggested and the type or types of crystalloid or crystalloid-colloid combinations.*^{2,6,9}
-  Establish 24-hr replacement schedule and routes to be used (e.g., IV, PO, tube feeding). *Entire fluid replacement may be done by IV or tube feeding if client is NPO, acutely ill, or severely dehydrated. However, if client is to be rehydrated orally, fluid replacement may be calculated to replace certain amount with meals (e.g., 75% to 80%) with the remainder offered during nonmeal times. Managing oral rehydration in this manner can replace fluids without resorting to IV therapy. These interventions should also be in place to prevent dehydration.*^{2,3,5,6,8}
- Spread fluid intake throughout the day *to prevent periods of uncomfortable thirst and to promote client's ability and interest in ingesting fluids.*
-  Encourage increased intake of water and other fluids based on individual needs (up to 2.5 L/day or amount determined by physician for client's age, weight, and condition).
- Provide a variety of fluids in small frequent offerings, attempting to incorporate client's preferred beverage and temperature (e.g., iced or hot) *to enhance cooperation with regimen.*

- ∞ Suggest intake of foods with a high water content (e.g., popsicles, gelatin, soup, eggnog, watermelon) and/or electrolyte replacement drinks (e.g., Gatorade, Pedialyte) as appropriate. *Variety may stimulate intake.*
- Limit intake of alcohol and caffeinated beverages that tend to exert a diuretic effect.
- Engage client, family, and all caregivers in fluid management plan. *Everyone is responsible for the prevention or treatment of dehydration and should be involved in the planning and provision of adequate fluid on a daily basis.*
- 🧴 Provide nutritionally balanced diet and/or enteral feedings (avoiding use of hyperosmolar or excessively high-protein formulas) and provide adequate amount of free water with feedings.
- Maintain accurate intake and output (I&O), calculate 24-hr fluid balance, and weigh regularly (daily, in unstable client) *in order to monitor and document trends. Note: A 1-pound weight loss reflects fluid loss of about 500 mL in an adult.*⁷

NURSING PRIORITY NO. 4 To promote comfort and safety:

- Change position frequently. Bathe infrequently, using mild cleanser or soap, and provide optimal skin care with suitable emollients *to maintain skin integrity and prevent excessive dryness caused by dehydration.*
- Provide frequent oral care and eye protection *to prevent injury from dryness.* Refer to NDs impaired oral Mucous Membrane Integrity, risk for Dry Mouth, and risk for Dry Eye for related interventions.
- Provide for safety measures when client is confused. (Refer to NDs acute Confusion and chronic Confusion for additional interventions.)
- 🩺 Adjust or discontinue medications (e.g., diuretics, laxatives, steroids, psychotropics, ACE inhibitors) *that may be contributing to dehydration.*^{2,5}
- Observe for sudden or marked elevation of blood pressure, restlessness, moist cough, dyspnea, basilar crackles, and frothy sputum. *Too rapid a correction of fluid deficit may compromise the cardiopulmonary system, causing fluid overload and edema, especially if colloids are used in initial fluid resuscitation.*

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Discuss factors related to occurrence of deficit as individually appropriate. *Early identification of risk factors can decrease occurrence and severity of complications associated with hypovolemia.*⁷
- Recommend drinking more water when exercising or engaging in physical exertion or during hot weather. Suggest carrying a water bottle when away from home as appropriate.
- Identify and instruct in ways to meet specific fluid and nutritional needs.
- ∞ Offer fluids on a regular basis to infants, young children, and the elderly, *who may not sense/or be able to report thirst.*
- ∞ Instruct client/SO(s) in how to monitor color of urine (*dark urine equates with concentration and dehydration*) and/or how to measure and record I&O (*may include weighing or counting diapers in infant/toddler*) as indicated.
- 🩺 Review and instruct in medication regimen and administration. Emphasize need for reporting suspected drug interactions/side effects to healthcare provider. *Facilitates timely intervention to prevent or reduce complications.*
- Instruct in signs and symptoms indicating need for emergent or further evaluation and follow-up.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including factors affecting ability to manage (regulate) body fluids and degree of deficit.
- I&O, fluid balance, changes in weight, urine-specific gravity, and vital signs.
- Results of diagnostic studies or laboratory tests.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to treatment, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

deficient [isotonic] Fluid Volume

Taxonomy II: Nutrition—Class 5 Hydration (00027) [Diagnostic Division: Food/Fluid], Submitted 1978; Revised 1996; 2017

DEFINITION: Decreased intravascular, interstitial, and/or intracellular fluid. This refers to dehydration, water loss alone without change in sodium.

[NOTE: This diagnosis has been structured to address isotonic dehydration (hypovolemia) when fluids and electrolytes are lost in even amounts and excluding states in which changes in sodium occur. For client needs related to dehydration associated with alterations in sodium, refer to deficient Fluid Volume: hyper/hypotonic.]

RELATED FACTORS

Barrier to accessing fluid; insufficient fluid intake; insufficient knowledge about fluid needs

(continues on page 344)

deficient [isotonic] Fluid Volume (continued)

DEFINING CHARACTERISTICS

Subjective

Thirst

Weakness

Objective

Alteration in mental status

Alteration in skin or tongue turgor; dry skin and mucous membranes

Decrease in blood pressure; decrease in pulse pressure and pulse volume; decrease in venous filling

Decrease in urine output

Increase in body temperature and heart rate

Increase in hematocrit and urine concentration

Sudden weight loss

At Risk Population: Extremes of age; extremes of weight; factors influencing fluid needs

Associated Condition: Active fluid volume loss: [e.g., hemorrhage; gastric intubation; acute or prolonged diarrhea; wounds; fistulas; ascites; use of hyperosmotic radiopaque contrast agent]

Compromised regulatory mechanism [e.g., fever, thermoregulatory response; renal tubule damage]

Deviations affecting fluid intake or absorption

Excessive fluid loss through normal or abnormal route

Pharmaceutical agent

Sample Clinical Applications: Traumatic injury, hemorrhage, gastroenteritis (with vomiting and diarrhea), malnutrition, uncontrolled diabetes mellitus, severe burns

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Hydration: Adequate water in the intracellular and extracellular compartments of the body

Fluid Balance: Balance of the input and output of fluids in the body

Blood Loss Severity: Severity of signs and symptoms of internal or external bleeding

Client Will (Include Specific Time Frame)

- Maintain fluid volume at a functional level as evidenced by individually adequate urinary output with normal specific gravity, stable vital signs, moist mucous membranes, good skin turgor, prompt capillary refill, and be free of edema.
- Verbalize understanding of causative factors and purpose of individual therapeutic interventions and medications.
- Demonstrate behaviors to monitor and correct deficit, as indicated.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Fluid/Electrolyte Management: Regulation and prevention of complications from altered fluid and/or electrolyte levels

Hypovolemia Management: Expansion of intracellular fluid volume in a patient who is volume depleted

Shock Prevention: Detecting and treating a patient at risk for impending shock

NURSING PRIORITY NO. 1 To assess causative/precipitating factors:

- Identify relevant diagnoses *that may create a fluid volume depletion (e.g., decreased intravascular plasma volume, such as might occur with rapid blood loss or hemorrhage from trauma; vascular, pregnancy complications, gastrointestinal bleeding disorders); significant fluid (other than blood) loss such as might occur with severe gastroenteritis with vomiting and diarrhea; or extensive burns.*^{1,4,12}
- Note presence of other factors (e.g., laryngectomy or tracheostomy tubes, drainage from wounds and fistulas or suction devices; water deprivation or fluid restrictions; decreased level of consciousness; dialysis; hot/humid climate, prolonged exercise; increased metabolic rate secondary to fever; increased caffeine or alcohol) *that may contribute to lack of fluid intake or loss of fluid by various routes.*
-  Prepare for and assist with diagnostic evaluations (e.g., imaging studies, x-rays) *to locate source of bleeding or cause for hypovolemia.*
-  Determine effects of age, gender, weight, subcutaneous fat and muscle mass (influences total body water [TBW], which is approximately 60% of an adult's weight and 75% of an infant's weight).¹¹ *In general, men have higher TBW than women due to women's higher percentage of body fat and less muscle mass than men, and the elderly's TBW is less than that of a youth. Elderly individuals are often at risk for dehydration because of decreased thirst reflex, impaired renal conservation of water, increased prevalence of chronic conditions, and polypharmacy.*^{2,3,8,9} *Infants/young children and other nonverbal persons cannot describe thirst. Worldwide, dehydration (secondary to diarrheal illness) is the leading cause of infant and child mortality.*⁴

NURSING PRIORITY NO. 2 To evaluate degree of fluid deficit:

-  Estimate or measure traumatic or procedural fluid losses. Note possible routes of insensible fluid losses. Determine customary and current weight. *These factors are used to determine degree of volume depletion and method of fluid replacement. In burn injuries, the body surface area method states that dehydration is related to deficit of TBW and assumes that loss of weight is loss of water.*¹¹
- Assess vital signs, including temperature (often elevated), pulse and respirations (elevated), and blood pressure (may be low). Measure blood pressure (lying/sitting/standing) if appropriate *to evaluate orthostatic blood pressure and monitor invasive hemodynamic parameters as indicated (e.g., central venous pressure [CVP]) to determine degree of intravascular deficit and replacement needs.*^{1,6,7}
- Note presence of dry mucous membranes, poor skin turgor, delayed capillary refill, flat neck veins, and reports of thirst or weakness, child crying without tears, sunken eyeballs (or fontanel in infant), fever, weight loss, and little or no urine output. *Assessment signs of dehydration that client/significant other (SO) may notice. In an acute, life-threatening hemorrhage state, cold, pale, moist skin may be noted reflecting body compensatory mechanisms to profound hypovolemia.*^{1,6,7}
- Note change in usual mentation, behavior, and functional abilities (e.g., confusion, falling, loss of ability to carry out usual activities, lethargy, dizziness). *These signs indicate sufficient dehydration to cause poor cerebral perfusion or can reflect the effects of electrolyte imbalance. In hypovolemic shock state, mentation changes rapidly and client may present in coma.*
- Observe/measure urinary output (hourly/24-hr totals). Note color *(may be dark greenish brown because of concentration)* and specific gravity *(high number associated with dehydration with usual range being 1.010 to 1.025).*^{3,5}
-  Review laboratory data (e.g., hemoglobin/hematocrit, prothrombin time, activated partial thromboplastin time; electrolytes [sodium, potassium, chloride, bicarbonate] and glucose; blood urea nitrogen, creatinine) *to evaluate body's response to bleeding/other fluid loss and to determine replacement needs.*⁵ *Note: In isotonic dehydration, electrolyte levels may be lower, but concentration ratios remain near normal.*³

NURSING PRIORITY NO. 3 To correct/replace losses to reverse pathophysiological mechanisms:

-   Control blood loss (e.g., gastric lavage with room temperature or cool saline solution, drug administration, prepare for surgical intervention).

-  Stop fluid loss (e.g., administer medication to stop vomiting/diarrhea, reduce fever).¹
-  Administer fluids and electrolytes (e.g., blood, isotonic sodium chloride solution, lactated Ringer's solution, albumin, fresh frozen plasma, dextran, hetastarch). *Whether crystalloids (e.g., normal saline) or colloids (e.g., albumin) are best for fluid resuscitation continues to be a matter of discussion. A 2010 large-scale review of studies regarding effects of commonly used resuscitation fluids over the past 50 years supported the conclusion that rapid resuscitation with large-volume crystalloid is deleterious and supported slower, goal-directed resuscitation with low-volume crystalloid.*^{1,7,10}
-  Establish and continually reevaluate 24-hr fluid replacement needs and routes to be used *to prevent peaks and valleys in fluid level and to prevent fluid overload.*⁶
- Control humidity and ambient air temperature as appropriate, especially when major burns are present or in the presence of fever, *to reduce insensible losses.*¹²
- Reduce bedding or clothes and provide a tepid sponge bath.
-  Assist with hypothermia therapy as indicated *to decrease severe fever and elevated metabolic rate.* (Refer to ND Hyperthermia for additional interventions.)
- Maintain accurate intake and output (I&O) and weigh daily. Measure urine-specific gravity. Monitor blood pressure and invasive hemodynamic parameters as indicated (e.g., CVP) *to evaluate effectiveness of resuscitation measures.*

NURSING PRIORITY NO. 4 To promote comfort and safety:

- Change position frequently. Bathe infrequently, using mild cleanser or soap, and provide optimal skin care with emollients *to maintain skin integrity and prevent excessive dryness caused by dehydration.*
- Provide frequent oral care and eye care *to prevent injury from dryness.*
- Change dressings as needed and use adjunct appliances as indicated for draining wounds *to protect skin and to monitor losses for replacement needs.*
-  Administer medications (e.g., antiemetics, antidiarrheals *to limit gastric or intestinal losses*; antipyretics *to reduce fever*). (Refer to NDs Diarrhea and Hyperthermia for additional interventions.)
-  Observe for sudden or marked elevation of blood pressure, restlessness, moist cough, dyspnea, basilar crackles, and frothy sputum. *Too rapid a correction of fluid deficit may compromise the cardiopulmonary system, causing fluid overload and edema, especially if colloids are used in initial fluid resuscitation.*

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-  Discuss factors related to occurrence of fluid deficit as individually appropriate (e.g., reason for hemorrhage, potential for dehydration in children with fever or diarrhea, inadequate fluid replacement when performing strenuous work or exercise, living in hot climate, improper use of diuretics) *to reduce risk of recurrence.*
-  Identify actions (if any) client may take to prevent or correct deficiencies. *Carrying a water bottle when away from home aids in maintaining fluid volume. A client who never takes more than a few sips at a time, even of preferred beverage, may benefit most from being offered frequent small amounts of fluid throughout the day. A client with dementia, on the other hand—one who is able to drink but just forgets—may benefit most from social situations and activities where beverages are served. In cases of mild to moderate dehydration, use of oral solutions (e.g., Gatorade, Rehydralyte), soft drinks, breast milk/formula, or Pedialyte can provide adequate rehydration.*¹¹³
- Instruct client/SO(s) in how to monitor color of urine (dark urine equates with concentration and dehydration) or how to measure and record I&O (may include weighing or counting diapers in infant/toddler).
-  Review medications and interactions and side effects, especially medications that can cause or exacerbate fluid loss (e.g., diuretics, laxatives) and those indicated to prevent fluid loss (e.g., antidiarrheals, anticoagulants).⁶

-  Discuss signs/symptoms indicating need for emergent or further evaluation and follow-up. *Promotes timely intervention.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including degree of deficit and current sources of fluid intake.
- I&O, fluid balance, changes in weight or edema, urine-specific gravity, and vital signs.
- Results of diagnostic studies.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, plan for correction, and who is responsible for actions to be taken.
- Specific referrals made.

excess Fluid Volume

Taxonomy II: Nutrition—Class 5 Hydration (00026) [**Diagnostic Division:** Food/Fluid], Approved 1982; Revised 1996, 2013, 2017

DEFINITION: Surplus intake and/or retention of fluid.

RELATED FACTORS

Excessive fluid intake
Excessive sodium intake

DEFINING CHARACTERISTICS

Subjective

Anxiety
Orthopnea; paroxysmal nocturnal dyspnea

Objective

Alteration in respiratory pattern; adventitious breath sounds; dyspnea
Alteration in blood pressure
Alteration in mental status; restlessness
Intake exceeds output; oliguria
Edema; anasarca; weight gain over short period of time
Jugular vein distention; positive hepatjugular reflex; hepatomegaly
Pulmonary congestion; pleural effusion
Presence of S₃ heart sound
Alteration in pulmonary artery pressure (PAP); increase in central venous pressure (CVP)
Decrease in hemoglobin or hematocrit; azotemia; electrolyte imbalance; alteration in urine-specific gravity

Associated Condition: Compromised regulatory mechanism

Sample Clinical Applications: Congestive heart failure, renal failure, cirrhosis of liver, cancer, toxemia of pregnancy, conditions associated with SIADH (e.g., meningitis, encephalitis, Guillain-Barré syndrome), schizophrenia (where polydipsia is a prominent feature)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Fluid Overload Severity: Severity of signs and symptoms of excess intracellular and extracellular fluids

Fluid Balance: Balance of the input and output of fluids in the body

Electrolyte and Acid/Base Balance: Balance of electrolytes and nonelectrolytes in the intracellular and extracellular compartments of the body

Client Will (Include Specific Time Frame)

- Stabilize fluid volume as evidenced by balanced intake and output (I&O), vital signs within client's normal limits, stable weight, and free of signs of edema.
- Verbalize understanding of individual dietary and fluid restrictions.
- Demonstrate behaviors to monitor fluid status and reduce recurrence of fluid excess.
- List signs that require further evaluation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Hypervolemia Management: Reduction in extracellular or intracellular fluid volume and prevention of complications in a patient who is fluid overloaded

Fluid/Electrolyte Management: Regulation and prevention of complications from altered fluid and/or electrolyte levels

Peritoneal Dialysis [or] Hemodialysis Therapy: Administration and monitoring of dialysis solution into and out of the peritoneal cavity/or management of extracorporeal passage of the patient's blood through a dialyzer

NURSING PRIORITY NO. 1 To assess causative/precipitating factors:

- Note presence of medical conditions or situations (e.g., heart failure, chronic kidney disease, renal or adrenal insufficiency, excessive or rapid infusion of IV fluids, cerebral lesions, psychogenic polydipsia, acute stress, anesthesia, surgical procedures, decreased or loss of serum proteins) *that can contribute to excess fluid intake or retention.*^{1,2}
-  Determine or estimate amount of fluid intake from all sources: oral, intravenous, enteral, or parenteral feedings, ventilator, etc. *Potential exists for fluid overload due to fluid shifts and changes in electrolyte balance. Note: Severely malnourished client can experience significant fluid shifts and electrolyte imbalances after nutritional support is initiated. This potentially lethal disorder, known as refeeding syndrome, usually is associated with parenteral nutrition, but it also can occur with enteral nutrition, oral intake, or dextrose-containing IV fluids.*^{5,11}
- Review nutritional issues (e.g., intake of sodium, potassium, and protein). *Imbalances in these areas are associated with fluid imbalances.*⁵

NURSING PRIORITY NO. 2 To evaluate degree of excess:

-  Compare current weight with admission or previously stated weight. Weigh daily or on a regular schedule, as indicated. *Provides a comparative baseline and evaluates the effectiveness of diuretic therapy when used (i.e., a roughly 1 kilogram [2.2 pounds] change in body weight equates to a 1-liter gain or loss in body fluid volume).*^{7,12} *Note: Volume overload can occur over weeks to months in clients with unrecognized renal failure where lean muscle mass is lost and fluid overload occurs with relatively little change in weight.*⁴
-  Measure vital signs and invasive hemodynamic parameters (e.g., CVP, PAP/pulmonary capillary wedge pressure) if available for critically ill clients. *Pressures may be high because of excess fluid volume or be low if cardiac failure is occurring.*
-  Note presence of tachycardia and irregular rhythms. Auscultate heart tones for S₃, ventricular gallop. *Signs suggestive of heart failure, which results in decreased cardiac output and tissue hypoxia.*
- Auscultate breath sounds for presence of crackles or congestion. Record occurrence of exertional breathlessness, dyspnea at rest, or paroxysmal nocturnal dyspnea. *Indication of pulmonary congestion and potential of developing pulmonary edema that can interfere with oxygen-carbon dioxide exchange at the capillary level.*³
- Note presence and location of edema (e.g., puffy eyelids, swelling ankles and feet if ambulatory or up in chair, sacrum and posterior thighs when recumbent). Determine whether lower extremity edema is new or increasing. *Heart failure and renal failure are associated with dependent edema because of hydrostatic pressures, with dependent edema being a defining characteristic for excess fluid. Generalized edema (e.g., upper extremities and eyelids) is associated with nephrotic syndrome.*²
- Assess for presence of neck vein distention/hepatojugular reflux with head of bed elevated 30 to 45 degrees. *Signs of increased intravascular volume.*⁵
- Measure abdominal girth *to evaluate changes that may indicate increasing fluid retention and edema.*⁵

- Evaluate mentation for restlessness, anxiety, confusion, and personality changes. *Signs of decreased cerebral oxygenation (e.g., cerebral edema) or electrolyte imbalance.*^{1,8}
- Assess appetite; note presence of nausea/vomiting *to determine the presence of problems associated with an imbalance of electrolytes (e.g., glucose, sodium, potassium, or calcium).* Assess neuromuscular reflexes.⁸
- Observe skin and mucous membranes. *Edematous tissues are prone to ischemia and breakdown or ulceration.*
-  Review laboratory data (e.g., blood urea nitrogen/creatinine, hemoglobin/hematocrit, serum albumin, proteins, electrolytes; urine-specific gravity, osmolality, sodium excretion) and chest radiograph. *These tests may be repeated not only to ascertain baseline imbalances, but also to monitor response to therapy.*

NURSING PRIORITY NO. 3 To promote mobilization/elimination of excess fluid:

- Restrict fluid intake as indicated (especially when sodium retention is less than water retention or when fluid retention is related to renal failure).⁵
- Provide for sodium restrictions if needed (as might occur in sodium retention in excess of water retention). *Restricting sodium favors renal excretion of excess fluid and may be more useful than fluid restriction.*¹
-  Set an appropriate rate of fluid intake or infusion throughout 24-hr period. Maintain steady rate of all IV infusions *to prevent exacerbation of excess fluid volume and to prevent peaks and valleys in fluid level.*^{5,9}
-  Administer medications (e.g., diuretics, cardiotonics, plasma or albumin volume expanders) in order to improve cardiac output and kidney function, thereby *reducing congestion and edema if heart failure is the cause of fluid overload.*
- Evaluate edematous extremities *to enhance venous return and prevent further edema formation.*
- Place in semi-Fowler's position when at bedrest as appropriate. *May promote recumbency-induced diuresis and facilitate respiratory effort when movement of the diaphragm is limited/breathing is impaired because of lung congestion.*
-  Prepare for and assist with procedures as indicated (e.g., peritoneal or hemodialysis, ultrafiltration; mechanical ventilation, cardiac resynchronization therapy). *May be done to correct volume overload and electrolyte and acid-base imbalances or to improve cardiac function and support individual during shock state.*^{7,10}

NURSING PRIORITY NO. 4 To maintain integrity of skin and tissues:

- Refer to NDs impaired Oral Mucous Membrane Integrity, impaired or risk for impaired Skin/Tissue Integrity, and risk for Pressure Ulcer for related interventions.

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-   Consult dietitian as needed *to develop dietary plan and identify foods to be limited or omitted:* Review dietary restrictions and safe substitutes for salt (e.g., lemon juice or spices such as oregano). Discuss fluid restrictions and “hidden sources” of fluids (e.g., foods high in water content such as fruits, ice cream, sauces, custard). Use small drinking cup or glass. Avoid salty or spicy foods, as they increase thirst or fluid retention. Suck ice chips, hard candy, or slices of lemon *to help allay thirst.*
- Suggest chewing gum and use of lip balm *to reduce discomforts of fluid restrictions.*
- Instruct client/family in ways to keep track of intake. For example, use a marked water bottle or container; refill as needed.⁵
- Measure output, encourage use of voiding record when it is appropriate, or weigh daily and report gain of more than 2 lb/day (or as indicated by individual situation). *If weight is rising daily, fluid is likely being retained.*⁵

-  Review drug regimen and side effects of agents used to increase urine output or manage hypertension, kidney disease, or heart failure. *Many drugs have an impact on kidney function and fluid balance, especially in the elderly or those with cardiac and kidney impairments.*
- Emphasize need for mobility, frequent position changes, and early/ongoing ambulation *to prevent stasis and reduce risk of tissue injury.*
- Identify “danger” signs requiring notification of healthcare provider *to ensure timely evaluation and intervention.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, noting existing conditions contributing to and degree of fluid retention (vital signs; amount, presence, and location of edema; weight changes).
- I&O, fluid balance.
- Results of laboratory tests and diagnostic studies.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, noting who is responsible for actions to be taken.

risk for deficient Fluid Volume

Taxonomy II: Nutrition—Class 5 Hydration (00028) [**Diagnostic Division:** Food/Fluid], Submitted 1978; Revised 2010, 2013; 2017

DEFINITION: Susceptible to experiencing decreased intravascular, interstitial, and/or intracellular fluid volumes, which may compromise health.

RISK FACTORS

Barrier to accessing fluid

Insufficient fluid intake

Insufficient knowledge about fluid needs

At Risk Population: Extremes of age; extremes of weight; factors influencing fluid needs

Associated Condition: Active fluid volume loss: [e.g., hemorrhage; gastric intubation; acute or prolonged diarrhea; wounds; fistulas; ascites; use of hyperosmotic radiopaque contrast agent]

Compromised regulatory mechanism [e.g., fever, thermoregulatory response; renal tubule damage]

Deviations affecting fluid intake or absorption

Excessive fluid loss through normal or abnormal route

Pharmaceutical agent

Sample Clinical Applications: Conditions with fever, diarrhea, nausea, vomiting; irritable bowel syndrome, draining wounds, dementia, depression, eating disorders

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Fluid Balance: Balance of the input and output of fluids in the body

Client Will (Include Specific Time Frame)

- Maintain fluid volume at a functional level as evidenced by individually adequate urinary output with normal specific gravity, stable vital signs, moist mucous membranes, good skin turgor, and prompt capillary refill.

Sample NOC linkages:

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Knowledge: Disease Process: Extent of understanding conveyed about a specific disease process and potential complications

Client/Caregiver Will (Include Specific Time Frame)

- Identify individual risk factors and appropriate interventions.
- Demonstrate behaviors or lifestyle changes to prevent development of fluid volume deficit.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Fluid Monitoring: Collection and analysis of patient data to regulate fluid balance

Hemodynamic Regulation: Optimization of heart rate, preload, afterload, and contractility

Teaching: Disease Process: Assisting the patient to understand information related to a specific disease process

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note possible conditions/processes *that may lead to fluid deficits (of any type)*: (1) fluid loss (e.g., indwelling tubes, diarrhea, vomiting, fever, excessive sweating, diabetic ketoacidosis; burns, other draining wounds; gastrointestinal obstruction; use of diuretics); (2) limited intake (e.g., extremes of age, limited mobility, client dependent on others for eating and drinking; lack of knowledge related to fluid intake; heat exhaustion or stroke); (3) fluid shifts (e.g., ascites, effusions, burns, sepsis); or (4) environmental factors (e.g., isolation, restraints, very high ambient temperatures, malfunctioning air conditioning).^{3,6,7}
-  Determine effects of age, gender, weight, and subcutaneous fat/muscle mass. *These factors affect the ratio of lean body mass to body fat, influencing total body water (TBW). In general, men have higher TBW than women due to women's higher percentage of body fat and less muscle mass than men; the elderly's TBW is known to decline. Elderly individuals are often at risk for dehydration because of reduced water intake (often to less than 1 L/day), decreased thirst reflex, impaired renal conservation of water, increased prevalence of chronic conditions, and polypharmacy.^{1,10,11} Infants, children, and developmentally delayed individuals cannot verbalize or self-manage thirst. Worldwide, dehydration (secondary to diarrheal illness) is the leading cause of infant and child mortality.^{2,6}*
-  Assess older client's "hydration habits" to determine best approach if client has potential for dehydration. *Note: A recent study identified four categories of nursing home residents: (1) Can drink (client is functionally capable of consuming fluids, but doesn't for any number of reasons); (2) can't drink (frailty or dysphagia makes this client incapable of consuming fluids safely); (3) won't drink (client may fear incontinence or may have never in life consumed many fluids); and (4) end of life.⁷*
- Evaluate nutritional status, noting current food intake, type of diet (e.g., client is NPO or is on a restricted or pureed diet), and *factors that can negatively affect fluid intake (e.g., impaired mentation, nausea, wired jaws, immobility, insufficient time for meals, lack of finances restricting availability of food).*
- Review client's medications, including prescription, over-the-counter (OTC) drugs, herbals, and nutritional supplements *to identify medications that can alter fluid and electrolyte balance. These may include diuretics, vasodilators, beta blockers, aldosterone inhibitors, angiotensin-converting enzyme blockers, and medications that can cause syndrome of inappropriate secretion of antidiuretic hormone (e.g., phenothiazides, vasopressin, some antineoplastic drugs).⁸*
- Refer to NDs [deficient hyper/hypotonic Fluid Volume] or deficient [isotonic] Fluid Volume for additional interventions.

NURSING PRIORITY NO. 2 To prevent occurrence of deficit:

- Compare current fluid intake to fluid goal. Monitor intake and output balance, if indicated, being aware of changes in intake or output, as well as insensible losses, *to ensure accurate picture of fluid status.^{1,3}*
- Assess skin and oral mucous membranes *for signs of dehydration, such as dry skin and mucous membranes, poor skin turgor, delayed capillary refill, and flat neck veins.*
- Monitor vital signs for changes (e.g., orthostatic hypotension, tachycardia, fever) *that may cause or be the effect of dehydration.³*
- Weigh client and compare with recent weight history. Perform serial weights to determine trends.
-  Review laboratory data (e.g., hemoglobin/hematocrit, osmolality, electrolytes [e.g., sodium and potassium], blood urea nitrogen/creatinine) as indicated *to evaluate fluid and electrolyte status.^{2,3} Note: Faes et al. (2007) state that "three forms of dehydration can be distinguished on the basis of plasma tonicity: hypertonic, isotonic, and hypotonic dehydration. Hypertonic dehydration is easy to diagnose by laboratory tests (e.g., serum sodium levels >150 mmol/L or serum osmolality >300 mOsm/L), but neglects the frequently occurring isotonic and hypotonic dehydration. Isotonic dehydration results from a balanced loss of water and electrolytes (e.g., by vomiting and diarrhea) and hypotonic dehydration results when loss of electrolytes exceeds water loss (e.g., by overuse of diuretics)."*¹¹

- Offer a variety of fluids and water-rich foods and make them available throughout the day if client is able to take oral fluids. Assist/remind client to drink, as needed. Determine individual fluid needs and establish replacement over 24 hours *to increase client's daily fluid intake*.⁹
-  Administer medications as appropriate (e.g., antiemetics, antidiarrheals, antipyretics) *to stop or limit fluid losses*. *Note: Some practitioners recommend avoidance of antidiarrheal agents (high incidence of side effects including lethargy, respiratory depression, and coma) or OTC antiemetics (due to side effects including drowsiness and this impaired oral rehydration)*.^{2,3}
-  Provide nutritionally balanced diet and/or enteral feedings when indicated (avoiding use of hyperosmolar or excessively high-protein formulas) and provide adequate amount of free water with feedings.⁹
-  Provide supplemental IV fluids as indicated.
-  Encourage oral intake.^{3-6,8}

Provide water and other fluids to a minimum amount daily (up to 2.5 L/day or amount determined by health-care provider for client's age, weight, and condition).

Offer fluids between meals and regularly throughout the day.

Allow adequate time for eating and drinking at meals.

Provide fluids in manageable cup, bottle, or with drinking straw.

Ensure that immobile or restrained client is assisted.

Encourage a variety of fluids in small frequent offerings, attempting to incorporate client's preferred beverage and temperature (e.g., iced or hot).

Limit fluids that tend to exert a diuretic effect (e.g., caffeine, alcohol, high-glucose drinks).

Promote intake of foods with a high water content (e.g., popsicles, gelatin, soup, eggnog, watermelon) or electrolyte replacement drinks (e.g., Smartwater, Gatorade, Pedialyte), as appropriate.

Encourage client to increase fluids when engaged in physical exertion (such as when working outside or actively participating in sports) during hot weather.

-  Review diet orders to remove any nonessential fluid and salt restrictions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-   Discuss individual risk factors or potential problems and specific interventions *to reduce risk of heat injury and dehydration (e.g., proper clothing and bedding for infants and elderly and proper clothing for outdoor workers, athletes during hot weather; use of room cooler or fan for comfortable ambient environment; frequent intake of fluid [not just when feeling thirsty])*.⁵
-  Review appropriate use of medications and inform client of side effects or interactions of medications *that have potential for causing or exacerbating dehydration*.
- Encourage client/caregiver to maintain diary of fluid intake, number and amount of voidings, and estimate of other fluid losses (e.g., wounds, liquid stools) as necessary *to determine replacement needs*.
- Engage client, family, and all caregivers in fluid management plan. *Enhances cooperation with regimen and achievement of goals*.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including individual risk factors influencing fluid needs or requirements.
- Baseline weight, vital signs.
- Results of laboratory tests.
- Specific client fluid needs and preferences.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

risk for imbalanced Fluid Volume

Taxonomy II: Nutrition—Class 5 Hydration (00025) [Diagnostic Division: Food/Fluid], Approved 1998; Revised 2008, 2013, 2017

DEFINITION: Susceptible to a decrease, increase, or rapid shift from one to the other of intravascular, interstitial, and/or intracellular fluid, which may compromise health. This refers to body fluid loss, gain, or both.

RISK FACTORS

To Be Developed

Associated Condition: Apherisis; treatment regimen

Ascites; intestinal obstruction; pancreatitis; sepsis

Burn injury; trauma

Sample Clinical Application: Major surgical procedures, renal dialysis, conditions requiring IV therapy or parenteral or enteral nutrition, heart failure with use of diuretic therapy

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Fluid Balance: Water balance in the intracellular and extracellular compartments of the body

Fluid Overload Severity: Severity of excess fluids in the intracellular and extracellular compartments of the body

(continues on page 356)

risk for imbalanced Fluid Volume (continued)

Risk Control: Personal actions to prevent, eliminate, or reduce modifiable health threats

Client/Caregiver Will (Include Specific Time Frame)

- Demonstrate adequate fluid balance as evidenced by stable vital signs, palpable pulses of good quality, normal skin turgor, moist mucous membranes, individual appropriate urinary output, lack of excessive weight fluctuation (loss or gain), and no edema present.
- Identify individual risk factors and appropriate interventions.
- Demonstrate behaviors or lifestyle changes to prevent development of fluid imbalance.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Fluid Monitoring: Collection and analysis of patient data to regulate fluid balance

Intravenous (IV) Therapy: Administration and monitoring of IV fluids and medication

Hypervolemia Management: Reduction in extracellular and/or intracellular fluid volume and prevention of complications in a patient who is fluid overloaded

NURSING PRIORITY NO. 1 To determine risk/contributing factors:

- Note presence of conditions associated with fluid imbalance (e.g., diabetes insipidus; hyperosmolar nonketotic syndrome; intestinal obstruction; heart, pancreatitis, sepsis, kidney, or liver failure).
-  Note current treatment modalities, including (1) major invasive procedures (e.g., surgery, dialysis), (2) use or overuse of certain medications (e.g., heparin, diuretics), (3) use of IV fluids without a delivery device, and (4) plasmapheresis (i.e., apheresis) therapy. *These modalities can cause/exacerbate fluid imbalances and must be monitored for complications. Note: Therapeutic apheresis refers to extracorporeal therapies used in treatment of a variety of neurological, renal, hematological, and other systemic diseases caused by circulating toxic agents that cannot be cleared by other means. This may be a first-line therapy for conditions (e.g., Guillain-Barre syndrome, myasthenia gravis; therapeutic drug removal) or as a second-line therapy in conjunction with other therapies (e.g., multiple sclerosis unresponsive to steroids).⁷⁻⁹*
-  Note client's age, current level of hydration, and mentation. *Provides information regarding ability to tolerate fluctuations in fluid level and risk for creating or failing to respond to a problem (e.g., confused client may have inadequate intake, disconnect tubings, or readjust IV flow rate; infant or child may be unable to self-monitor or manage).¹*

NURSING PRIORITY NO. 2 To prevent fluctuations/imbalances in fluid levels:

-  Measure and record intake:
Include all sources (e.g., oral, IV, antibiotic additives, liquids with medications).
- Measure and record output:
Monitor urine output (hourly, or as often as needed). Report urine output less than 30 mL/hr or 0.5 mL/kg/hr *because it may indicate deficient fluid volume or cardiac or kidney failure.*
Observe color of all excretions *to evaluate for bleeding.*
Estimate volume or measure emesis when vomiting.
Measure or estimate amount of liquid stool; weigh diapers or continence pads when indicated.
-  Inspect dressing(s), weigh dressings, estimate blood loss in surgical sponges, and count dressings or pads saturated per hour. *Note: Small losses can be life-threatening to pediatric clients.²*
Measure output from drainage devices (e.g., gastric, wound, chest).

Estimate or calculate insensible fluid losses to include losses in replacement calculations. *Note: Losses from diffusion through skin and via respiratory tract are estimated at about 700 mL/24 hr in adults at ambient temperature,³ while a diaphoretic episode requiring a full linen change may represent a fluid loss of as much as 1 L.⁵*

Calculate 24-hr fluid balance (noting intake greater than output, or output greater than intake).

- Weigh daily or as indicated, using same scale and clothing, and evaluate changes as they relate to fluid status. *Provides for early detection and prompt intervention as needed.*

- Monitor vital signs:

Evaluate vital signs at rest and with activities. *Blood pressure and heart and respiratory rate often increase initially when either volume deficit or fluid excess is present.⁵*

 Evaluate hemodynamic pressures when available. *Central venous pressure and pulmonary artery wedge pressure may be used in critically ill clients to determine fluid balance and fluid volume responsiveness and to guide administration of vasoactive medications. Note: Numerous studies in recent years have weighed the benefits of invasive monitoring for the purpose of evaluating fluid status (and thus cardiac output response to fluid challenge). Research is ongoing into alternate ways and less invasive ways to perform this assessment (including the use of bioelectrical impedance, which tracks the phase of the electrical currents traversing the chest).^{2,10,11}*

- Maintain IVs on volumetric infusion pumps and rapid infusion devices, as appropriate, to deliver fluids accurately at desired rates to prevent either under/overinfusion.⁵
- Assess for peripheral or dependent edema, adventitious breath sounds, and distended neck veins. *Clinical signs of fluid excess. Note: Intravascular volume depletion can be present at the same time as extravascular fluid excess (seen as edema) is present, so hypertension or hypotension could be found.^{4,5}*
- Note increased lethargy or reports of dizziness, weakness, and muscle cramping. *Electrolyte imbalances (e.g., sodium, potassium, magnesium, calcium) may be present.^{5,6}*
-  Review laboratory data (e.g., electrolytes, hemoglobin/hematocrit) and chest radiograph to determine changes indicative of electrolyte and/or fluid imbalance and fluid needs.^{5,6}
- If fluid volume deficit is possible:
 -  Anticipate fluid replacement needs (e.g., need for blood or plasma transfusion in client with major trauma; planned surgery where blood and fluid loss can be expected; major burn injury; person with heat stroke; vomiting, diarrhea, or inability to take fluids).⁵
 -  Establish and promote oral intake, incorporating beverage preferences when possible. Administer IV fluids (e.g., crystalloids, colloids, blood or blood components) to support fluid management.^{4,5}
 -  Administer medications (e.g., antidiarrheals, antiemetics, agents to reduce blood loss or promote clotting) as indicated to reduce fluid loss.^{4,5}
- Refer to NDs [deficient hypertonic/hypotonic Fluid Volume], deficient [isotonic] Fluid Volume, and risk for deficient Fluid Volume for additional interventions.
- If fluid volume excess is possible:
 - Maintain fluid/sodium restrictions when needed. Offer small amounts of fluid over a 24-hr period.
 -  Administer medications (e.g., diuretics, cardiotonics) to assist in management of fluid excess or edema.^{4,5}
 -  Assist with or prepare for procedures (e.g., dialysis, apheresis, ultrafiltration, pacemaker, cardiac assist device) to correct fluid overload situation^{8,9} and monitor for complications associated with fluid imbalances.

Refer to ND excess Fluid Volume for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Engage client, family, and all caregivers in fluid management plan. *Enhances cooperation with regimen and achievement of goals.⁵*
- Discuss individual risk factors or potential problems and specific interventions to prevent or limit fluid imbalance and complications.
- Instruct client/significant other in how to measure and record I&O as appropriate.

-  Review and instruct in medications or nutritional regimen (e.g., enteral, parenteral) *to alert to potential complications and ways to manage.*
- Identify signs and symptoms indicating need for prompt evaluation or follow-up by primary healthcare provider *for timely intervention and correction.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including individual factors influencing fluid needs or requirements.
- Baseline weight, vital signs.
- Specific client preferences for fluids.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

Frail Elderly Syndrome

Taxonomy II: Health Promotion—Class 2: Health Management (00257) [**Diagnostic Division:** Safety], Approved 2013; Revised 2017

DEFINITION: Dynamic state of unstable equilibrium that affects the older individual experiencing deterioration of one or more domains of health (physical, functional, psychological, or social) and leads to increased susceptibility to adverse health effects, in particular disability.

RELATED FACTORS

Activity intolerance; decrease in energy; decrease in muscle strength; muscle weakness; exhaustion
 Anxiety; depression; sadness
 Average daily physical activity is less than recommended for gender and age; sedentary lifestyle
 Fear of falling; impaired balance; impaired mobility; immobility
 Insufficient social support; social isolation
 Malnutrition; obesity

DEFINING CHARACTERISTICS

***Author Note: NANDA-I has defined a syndrome as “a clinical judgment concerning a specific cluster of nursing diagnoses [NDs] that occur together and are best addressed together and through similar interventions” (Herdman & Kamitsuru, 2018).¹⁶ Defining Characteristics contain these ND titles.

Subjective

Activity intolerance
 Fatigue
 Hopelessness

Objective

Bathing, dressing, feeding, or toileting self-care deficit
 Decreased cardiac output
 Imbalanced nutrition: less than body requirements
 Impaired memory
 Impaired physical mobility; impaired walking
 Social isolation

At Risk Population: Age >70 years; female gender; ethnicity other than Caucasian

Living alone; constricted living space
 Economically disadvantaged; low educational level; social vulnerability
 History of falls; prolonged hospitalization

Associated Condition: Alteration in cognitive functioning; sensory deficit; psychiatric disorder
 Altered clotting process; decrease in serum 25-hydroxyvitamin D concentration; endocrine regulatory dysfunction

Anorexia; sarcopenia; sarcopenic obesity
 Chronic illness; suppressed inflammatory response
 Unintentional loss of 25% of body weight over 1 year; unintentional loss >10 pounds (>4.5 kg) in 1 year
 Walking 15 feet requires >6 seconds (4 meters >5 seconds)

Sample Clinical Applications: Chronic debilitating conditions (e.g., COPD, diabetes, AIDS, Alzheimer’s disease, multiple sclerosis [MS]), cancer, terminal illnesses, major depression

(continues on page 360)

Frail Elderly Syndrome (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Personal Health Status: Overall physical or psychological, social, and spiritual functioning of an adult 18 years or older

Self-Management: Chronic Disease: Personal actions to manage a chronic disease, its treatment, and to prevent disease progression and complications

Will to Live: Desire, determination, and effort to survive

Client/Caregiver Will (Include Specific Time Frame)

- Acknowledge presence of factors affecting well-being.
- Identify corrective/adaptive measures for individual situation.
- Demonstrate behaviors/lifestyle changes necessary to enhance functional status.

Client Will

Look to the future, expressing a sense of control.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Self-Care Assistance: Assisting another to perform activities of daily living

Resiliency Promotion: Assisting individuals, families, and communities in development, use, and strengthening of protective factors to be used in coping with environmental and societal stressors

Refer to NDs Activity Intolerance, risk-prone Health Behavior, chronic Confusion, ineffective Coping, impaired Dentition, risk for Falls, Grieving, risk for Loneliness, imbalanced Nutrition: less than body requirements, Relocation Stress Syndrome, Self-Care deficit [specify], chronic low Self-Esteem, risk for Spiritual Distress, and ineffective Health Management, as appropriate, for additional relevant interventions.

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

-  Identify presence of “frailty syndrome” (FS). *Demonstrated in elderly person by three or more symptoms together: unintentional weight loss (10 or more pounds within the past year), muscle loss and weakness, a feeling of fatigue, slow walking speed, and low levels of physical activity.*¹ *Note: The presence of FS is a predictor for hospitalization, disability, decreasing mobility, falls, and even death.*²
-  Note individual’s age and gender. *Fried’s (2001) research study of more than 5,000 adults found that chances of frailty rose sharply after the age of 85. Also, women are more likely than men to be frail, possibly because women typically outlive men and “start out with less muscle mass than men and, once they lose it, they may cross the frailty threshold more rapidly than men.”*³
- Note presence of physical complaints (e.g., fatigue/exhaustion, unintentional weight loss, muscle weakness, slow walking, inability to participate in usual physical activities) and presence of conditions (e.g., heart disease, undetected diabetes mellitus, dementia, stroke, renal failure, long-term period of being bedridden, terminal conditions). *Note: These factors associated with frailty may or may not be recognized by the client, but may be reported or documented by others.*
-  Evaluate medication regimen. *Medications that cause electrolyte imbalances (e.g., diuretics) can exacerbate weakness. Drugs that slow reaction time (e.g., sedatives, antidepressants) can interfere with balance and coordination, as can alcohol.*⁴

-  Determine nutritional status. *Malnutrition (e.g., weight loss, laboratory abnormalities, and identified micronutrient deficiencies) and factors contributing to failure to eat (e.g., chronic nausea, loss of appetite, no access to food or cooking, poorly fitting dentures, no one with whom to share meals, depression, financial problems) greatly impact health status and quality of life—especially for the elderly individual.*^{2,5–7}
- Assess client's physical and cognitive status to identify tolerance for activity and/or self-care.
- Note client's living situation (e.g., lives alone, lives in facility). *Helps identify environmental risk factors such as risk for falls, problem with food shopping or preparation, depression, etc.*
- Evaluate client's level of adaptive behavior and client/caregiver knowledge and skills about health maintenance, environment, and safety in order to instruct, intervene, and refer appropriately.
- Review with client/significant other (SO) previous and current life situations, including role changes, multiple losses (e.g., death of loved ones, change in living arrangements, finances, independence), social isolation, and grieving to identify psychological stressors that may be affecting current situation.
- Ascertain safety of home environment and persons providing care to identify potential for/presence of neglectful or abusive situations and/or need for referrals.

NURSING PRIORITY NO. 2 To assess degree of impairment:

-   Collaborate with multidisciplinary team to determine severity of client's limitations. *Testing may occur over period of time to identify functional and/or nutritional deficits and may include blood work, physical therapy evaluation, and nutritional studies. Note: Studies have associated certain laboratory indicators with frailty, including (but not limited to) anemia, inflammation, and clotting factors.*^{6,8}
-   Perform nutritional screening and/or refer for comprehensive nutritional assessment. *Studies show that frail person may have weight and muscle loss (sarcopenia) or weight gain/obesity with muscle function impairment and loss of strength (sarcopenic obesity).⁹ Initial evidence indicates that when obesity and muscle impairment coexist, they act synergistically on the risk of developing multiple health-related outcomes.*¹⁰

NURSING PRIORITY NO. 3 To assist client to achieve/maintain general well-being:

-    Assist with treatment of underlying comorbid medical, functional, cognitive, or psychiatric conditions that could positively influence current situation (e.g., resolution of infection, treating anemia, addressing brain injury, delirium, social isolation, depression).¹¹
- Develop plan of action with client/caregiver to meet immediate needs for nutrition, safety, and self-care and facilitate implementation of actions.
-   Administer medications as appropriate. *Studies show that optimized management of congestive heart failure and chronic pulmonary disease or improved glycemic control of diabetes results in improved health status, fewer hospitalizations, and reductions in the physical declines associated with the frailty syndrome.*¹⁵
-   Refer to dietitian or nutritionist to assist in planning meals to meet client's specific nutritional needs (e.g., calories, proteins, vitamins, micronutrients), taste, and abilities. *Plans could include offering client's favorite food(s), attending social events (e.g., ice cream social, happy hour), or participating in family-style meals. In addition, interventions may be geared toward treatment of depression, grief, or loss and cultural or environmental adaptation measures.*^{2,7,12} (Refer to ND imbalanced Nutrition: less than body requirements for additional interventions.)
-   Refer to physical and/or occupational therapist as indicated to improve physical strength, endurance, and stamina. *Note: Studies have supported that exercises (e.g., chair aerobics, stretching, resistance training, walking, tai chi) can improve balance and muscle and core strength, promoting physical function and endurance and reducing risk of falls.*^{2,11}
- Discuss individual concerns about feelings of loss/loneliness and relationship between these feelings and current decline in well-being. Note desire or willingness to change situation. *Motivation or lack thereof can facilitate—or impede—achieving desired outcomes.*¹²

- Explore mental strengths and successful coping skills the individual has previously used and apply to current situation. Refine or develop new strategies, as appropriate. *Incorporating these into problem-solving builds on past successes.*¹³
- Assist client to develop goals for dealing with life or illness situation. Involve SO in long-range planning. *Promotes commitment to goals and plan, thereby maximizing outcomes.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-   Assist client/SO(s) to identify and/or access useful community resources (e.g., support groups, Meals on Wheels, social worker, home care or assistive care, placement services). *Enhances coping, assists with problem solving, and may reduce risks to client and caregiver.*
- Encourage client to talk about positive aspects of life and to keep as physically active as possible to *reduce effects of dispiritedness (e.g., “feeling low,” sense of being unimportant, disconnected).*¹⁴
- Promote socialization within individual limitations to *provide additional stimulation, reduce sense of isolation.*
- Offer opportunities to discuss life goals and support client/SO in setting/attaining new goals for this time in his or her life to *enhance hope for the future.*
- Help client explore reasons for living or begin to deal with end-of-life issues and provide support for grieving. *Enhances hope and sense of control, providing opportunity for client to take charge of own future.*^{13,14}
- Assist client/SO/family to understand that frailty commonly occurs near the end of life and cannot always be reversed.¹²
-  Discuss appropriateness of and refer to palliative services or hospice care, as indicated.
-  Refer to pastoral care, counseling, or psychotherapy for *grief work or other issues as needed.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including current weight, dietary pattern, food and eating, perceptions of self, motivation for loss, support and feedback from SOs.
- Perception of losses or life changes.
- Ability to perform activities of daily living, participate in care, and meet own needs.
- Motivation for change, support and feedback from SO(s).

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions and actions performed, general well-being, weekly weight.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Community resources and support groups.
- Specific referrals made.

risk for Frail Elderly Syndrome

Taxonomy II: Health Promotion—Class 2 Health Management (00231) [Diagnostic Division: Safety]. Approved 2013; Revised 2017

DEFINITION: Susceptible to a dynamic state of unstable equilibrium that affects the older individual experiencing deterioration of one or more domain of health (physical, functional, psychological, or social) and leads to increased susceptibility to adverse health effects, in particular disability.

RISK FACTORS

Activity intolerance; decrease in energy; decrease in muscle strength; muscle weakness; exhaustion

Anxiety; depression; sadness

Average daily physical activity is less than recommended for gender and age; sedentary lifestyle

Fear of falling; impaired balance; impaired mobility; immobility

Insufficient social support; social isolation

Malnutrition; obesity

At Risk Population: Age >70 years; female gender; ethnicity other than Caucasian

Living alone; constricted living space;

Economically disadvantaged; low educational level; social vulnerability

History of falls; prolonged hospitalization

Associated Condition: Alteration in cognitive functioning; sensory deficit; psychiatric disorder;

Altered clotting process; decrease in serum 25-hydroxyvitamin D concentration; endocrine regulatory dysfunction

Anorexia; sarcopenia; sarcopenic obesity

Chronic illness; suppressed inflammatory response;

Unintentional loss of 25% of body weight over 1 year; unintentional loss >10 pounds (>4.5 kg) in 1 year;

Walking 15 feet requires >6 seconds (4 meters >5 seconds)

Sample Clinical Applications: Chronic debilitating conditions (e.g., COPD, diabetes, AIDS, Alzheimer’s disease, multiple sclerosis [MS]), cancer, terminal illnesses, major depression)

(continues on page 364)

risk for Frail Elderly Syndrome (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Personal Health Status: Overall physical, psychological, social, and spiritual functioning of an adult 18 years or older

Self-Management: Chronic Disease: Personal actions to manage a chronic disease, its treatment, and prevent disease progression and complications

Client/Caregiver Will (Include Specific Time Frame)

- Identify risk factors that can affect well-being.
- Develop plan to correct/minimize risk factors.
- Engage in behaviors/lifestyle changes necessary to maintain/enhance functional status.

Client Will

- Look to the future, expressing a sense of control.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

Health Education: Developing and providing instruction and learning experiences to facilitate voluntary adaptation of behavior conducive to health in individuals, families, groups, or communities

NURSING PRIORITY NO. 1 To identify client at risk:

-  Assess client upon admission to care for conditions listed in Risk Factors. *Research shows that frailty in elderly person is demonstrated by three or more symptoms together: unintentional weight loss over a year, along with muscle loss and weakness; a feeling of fatigue/exhaustion, along with slow walking speed; and low levels of physical activity.*¹
-  Note individual's age and gender. *Fried's (2001) research study of more than 5,000 adults found that chances of frailty rose sharply after the age of 85. Also, women are more likely than men to be frail, possibly because women typically outlive men and "start out with less muscle mass than men and, once they lose it, they may cross the frailty threshold more rapidly than men."*²
- Refer to ND: Frail Elderly Syndrome for additional assessment interventions.

NURSING PRIORITY NO. 2 To promote wellness (Teaching/Discharge Considerations):

-  Develop plan of action with client/caregiver *to meet immediate needs for safety and self-care.*
-  Assist with treatment of underlying comorbid medical, functional, cognitive, or psychiatric conditions *that could positively influence current situation (e.g., resolution of infection, treating anemia, addressing brain injury, delirium, social isolation, depression).*³
-  Administer medications as appropriate. *Studies show that optimized management of chronic conditions results in improved health status, fewer hospitalizations, and reductions in the physical declines associated with the frailty syndrome.*⁴
-  Refer to dietitian or nutritionist to assist in planning meals to meet client's specific nutritional needs (e.g., calories, proteins, vitamins, micronutrients), taste, and abilities. *Plans could include offering client's favorite food(s), attending social events (e.g., ice cream social, happy hour), or participating in family-style meals. In*

addition, interventions may be geared toward treatment of depression, grief or loss, and cultural or environmental adaptation measures.⁵⁻⁷

-  Refer to physical and/or occupational therapist as indicated to improve physical strength, endurance, and stamina. *Note: Studies have supported that exercises (e.g., chair aerobics, stretching, resistance training, walking, tai chi) can improve balance and muscle and core strength, promoting physical function and endurance and reducing risk of falls.*^{3,5}
- Encourage client to talk about positive aspects of life and to keep as physically active as possible to reduce effects of dispiritedness (e.g., “feeling low,” sense of being unimportant, disconnected).
- Promote socialization to provide additional stimulation and reduce sense of isolation.
-  Assist client/significant others to identify and/or access useful community resources (e.g., support groups, Meals on Wheels, social worker, home care or assistive care, placement services). *Enhances coping, assists with problem solving, and may reduce risks to client and caregiver.*
- Refer to ND Frail Elderly Syndrome for additional interventions as indicated.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Identified risk factors.
- Perception of situation and personal significance.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions and teaching plan.
- Attainment or progress toward desired outcomes.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referral made.

impaired Gas Exchange

Taxonomy II: Elimination and Exchange—Class 4 Respiratory Function (00030) [**Diagnostic Division:** Respiration], Submitted 1980; Revised 1996, 1998 by Nursing Diagnosis Extension and Classification; 2017

DEFINITION: Excess or deficit in oxygenation and/or carbon dioxide elimination at the alveoli-capillary membrane.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Subjective

Dyspnea

Visual disturbance

Headache upon awakening

[Sense of impending doom]

Objective

Confusion

Restlessness; irritability

Somnolence

Abnormal arterial blood gases (ABGs) or arterial pH; hypoxia or hypoxemia; hypercapnia; decrease in carbon dioxide (CO₂) level

Cyanosis; abnormal skin color

Abnormal breathing pattern; nasal flaring

Tachycardia; [dysrhythmias]

Diaphoresis

Associated Condition: Alveolar-capillary membrane changes; ventilation-perfusion imbalance

Sample Clinical Applications: Chronic obstructive pulmonary disease (COPD), asthma, pneumonias, tuberculosis, heart failure, sickle cell anemia, acute respiratory distress syndrome (ARDS), high-altitude pulmonary edema, pulmonary emboli (PE); carbon monoxide poisoning

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Respiratory Status: Gas Exchange: Alveolar exchange of carbon dioxide and oxygen to maintain arterial blood gas concentrations

Tissue Perfusion: Pulmonary: Adequacy of blood flow through pulmonary vasculature to perfuse alveoli/capillary unit

Respiratory Status: Ventilation: Movement of air in and out of the lungs

Client Will (Include Specific Time Frame)

- Demonstrate improved ventilation and adequate oxygenation of tissues by ABGs within client's usual parameters and absence of symptoms of respiratory distress (as noted in Defining Characteristics).
- Verbalize understanding of causative factors and appropriate interventions.
- Participate in treatment regimen (e.g., breathing exercises, effective coughing, use of oxygen) within level of ability and situation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Respiratory Monitoring: Collection and analysis of patient data to ensure airway patency and adequate gas exchange

Oxygen Therapy: Administration of oxygen and monitoring of its effectiveness

Airway Management: Facilitation of patency of air passages

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note presence of factors and conditions that can cause or be associated in some way with gas exchange problems. *Can be related to multiple factors, including anemias, anesthesia, surgical procedures, high altitude, allergic response, altered level of consciousness, anxiety, fear, aspiration, decreased lung compliance, excessive or thick secretions, immobility, infection, medication and drug toxicity or overdose, neuromuscular impairment of breathing pattern, pain, and smoking.*
- Refer to NDs ineffective Airway Clearance and ineffective Breathing Pattern for additional assessment interventions as appropriate.

NURSING PRIORITY NO. 2 To evaluate degree of compromise:

-  Evaluate respirations:
Observe rate, rhythm, and depth. *Provides insight into the work of breathing and adequacy of alveolar ventilation. For example, increasing both rate and depth of respirations increases alveolar ventilation and occurs normally in response to exercise and stressors.^{1,9}*
Note client's reports/perceptions of breathing ease. *Client may report a range of symptoms (e.g., air hunger; shortness of breath with speaking, activity, or at rest).*
Observe for dyspnea on exertion or gasping, changing positions frequently to ease breathing, and tendency to assume three-point position (bending forward while supporting self by placing one hand on each knee) to maximize respiratory effort.
Note use of accessory muscles (e.g., scalene muscles, pectoralis minor, sternocleidomastoids, external intercostal muscles) to assist diaphragm in increasing volume of thoracic cavity, which aids in inspiration.
 Observe infants/young children for nasal flaring and sternal retractions, indicating increased work of breathing or respiratory distress.
Note use of abdominal muscles during expiration (normally a passive process) to reduce thoracic dimensions and overcome airway resistance to expiration.
- Evaluate lungs:
Auscultate and percuss chest, describing presence or absence of breath sounds; note adventitious breath sounds. *Although air may be heard moving through the lung fields, breath sounds may be faint because of decreased airflow or areas of consolidation. In this nursing diagnosis, ventilatory effort is insufficient to deliver enough oxygen or to get rid of sufficient amounts of carbon dioxide. Abnormal breath sounds are indicative of numerous problems (e.g., hypoventilation such as might occur with atelectasis or presence of secretions, improper endotracheal [ET] tube placement, collapsed lung) and must be evaluated for further intervention.^{2,9}*
- Note character and effectiveness of cough mechanism. *Affects ability to clear airways of secretions.*
- Evaluate skin and mucous membrane color, noting areas of pallor or cyanosis, for example, peripheral (nailbeds) versus central (around lips or earlobes) or general duskiness. *Duskiness and central cyanosis are late signs of hypoxemia.⁹*

- Evaluate behavior:

Assess level of consciousness and mentation changes. *Decreased level of consciousness can be an indirect measurement of impaired oxygenation, but it also impairs one's ability to protect the airway, potentially further adversely affecting oxygenation.*

Note somnolence, restlessness, and reports of headache on arising.

Assess energy level and activity tolerance, noting reports or evidence of fatigue, weakness, and problems with sleep that are associated with diminished oxygenation.

- Monitor vital signs:

Measure temperature. *A high fever greatly increases metabolic demands and oxygen consumption.*

Monitor heart rate and rhythm. *Tachycardia and dysrhythmias may be noted as the heart reacts to cardiac ischemia and/or hypoxemia, especially during activity.*

Monitor blood pressure (BP). *BP can be variable, depending on underlying condition and cardiopulmonary response.*

Note increased pulmonary artery or right ventricular wedge pressures in the critically ill client with central lines. *Indicative of increased pulmonary vascular resistance.*

-  Review pertinent diagnostic data (e.g., ABGs, hemoglobin, red blood cells, electrolytes) and chest radiography. Evaluate oxygen and carbon dioxide at bedside by means of pulse oximetry and end-tidal CO₂ monitoring (capnography). Note results of pulmonary function studies where available to evaluate lung mechanics, capacities, and function. *Blood studies are useful in revealing systemic reasons for problems with oxygenation and/or the results of hypoxemia and acid-base imbalances and to determine response to therapies. Point-of-care tools evaluate ventilation by providing breath-to-breath information. Studies have shown that capnography monitoring improves client outcomes through early recognition of hypoventilation, apnea, and airway obstruction, thus preventing hypoxic episodes. Client in respiratory failure typically shows hypoxemia and metabolic acidosis, and is high risk for developing respiratory acidosis.*^{4,6,9,10}

NURSING PRIORITY NO. 3 To correct/improve existing deficiencies:

-  Elevate head of bed or position client appropriately. *Elevation or upright position facilitates respiratory function by gravity; however, client in severe distress will seek position of comfort. In ventilated client, prone position may be implemented in some clients to improve pulmonary perfusion and increase oxygen diffusion.*³
- Provide airway adjuncts and suction as indicated to clear or maintain open airway, when client is unable to clear secretions, or to improve gas diffusion when client is showing desaturation of oxygen by oximetry or ABGs.^{3,5}
- Encourage frequent position changes, deep-breathing exercises or directed coughing, use of incentive spirometer, and chest physiotherapy, as indicated. *Promotes optimal chest expansion, mobilization of secretions, and oxygen diffusion.*³
-  Provide supplemental oxygen (via cannula, mask) using lowest concentration possible dictated by pulse oximetry, ABGs, and client symptoms/underlying condition.
-  Ensure availability of proper emergency equipment, including ET/tracheostomy set and suction catheters appropriate for age and size of infant/child/adult. Avoid use of face mask in elderly emaciated client.
-  Prepare for and assist with intubation and mechanical ventilation. *The decision to intubate and ventilate is made on a clinical diagnosis of respiratory failure, classified as hypoxemic or hypercapnic. Hypoxemic respiratory failure is the most common, associated with acute lung disorders such as pneumothorax, atelectasis, pulmonary edema, pneumonia, ARDS, and smoke inhalation. Hypercapnic respiratory failure can be seen in acute exacerbations of chronic COPD, head trauma, and spinal cord injury.*^{4,11}
-  Monitor and adjust ventilator settings (e.g., FIO₂, tidal volume, inspiratory and expiratory ratio, sigh, positive end-expiratory pressure) as indicated when mechanical support is being used. *The mode of ventilation (volume or pressure) and ventilator settings are determined by the specific needs of the client, which are determined by clinical evaluation and blood gas parameters.*¹¹
- Monitor for carbon dioxide narcosis (e.g., change in level of consciousness, changes in O₂ and CO₂ blood gas levels, flushing, decreased respiratory rate and headaches), which may occur in clients receiving long-term oxygen therapy.⁶

- Maintain adequate fluid intake *for mobilization of secretions* but avoid fluid overload *that may increase pulmonary congestion*.
- Provide psychological support, Active-listen questions and concerns. Address client's/significant other's (SO's) fears and anxiety that may be present. Maintain calm attitude while working with client/SOs. *Anxiety is contagious, and associated agitation can increase oxygen consumption and dyspnea.*
- Encourage adequate rest and limit activities to within client tolerance. Promote a calm, restful environment. *Facilitates relaxation and helps limit oxygen needs and consumption.*³
-  Administer medications as indicated (e.g., inhaled and systemic glucocorticosteroids, antibiotics, bronchodilators, methylxanthines, antitussives/mucolytics, vasodilators). (Medications may be aerosolized or nebulized for enhanced response and limitation of side effects.) *Pharmacological agents are varied and specific to the client but are generally used to prevent and control symptoms, reduce frequency and severity of exacerbations, and improve exercise tolerance.*¹¹
-  Monitor therapeutic and adverse effects or interactions of drug therapy *to determine efficacy and need for change.*
-  Use sedation judiciously *to avoid depressant effects on respiratory functioning.*¹²
-  Minimize blood loss from procedures (e.g., blood draws—especially in neonates/infants, hemodialysis) *to limit effects of anemia and related gas diffusion impairment.*
-  Assist with procedures as individually indicated (e.g., transfusion, phlebotomy, bronchoscopy) *to improve respiratory function/oxygen-carrying capacity.*
-  Keep environment allergen/pollutant free *to reduce irritant effect of dust and chemicals on airways.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Review risk factors, particularly genetic, environmental, and employment-related conditions (e.g., sickle cell anemia, altitude sickness, exposure to toxins), *to help client/SO prevent complications or manage risk factors.*
- Discuss implications of smoking related to the illness or condition. Encourage client and SO(s) to stop smoking and attend cessation programs as necessary *to reduce health risks and/or prevent further decline in lung function.*^{7,12}
- Review oxygen-conserving techniques (e.g., organizing tasks before beginning; sitting instead of standing to perform tasks; eating small meals; performing slower, purposeful movements) *to reduce oxygen demands.*³
- Reinforce need for adequate rest, while encouraging activity and exercise (e.g., upper and lower extremity endurance and strength training, and flexibility) *to decrease dyspnea and improve quality of life.*⁸
- Emphasize the importance of good general nutrition *for improving stamina and reducing the work of breathing.*^{3,8}
-  Refer to dietitian *for nutritional assessment and individual dietary plan as indicated.*^{8,12}
- Instruct in the use of relaxation and stress-reduction techniques as appropriate.
-  Review job description and work activities *to identify need for job modifications or vocational rehabilitation.*³
-  Discuss home oxygen therapy use and instruct in safety concerns as indicated *to ensure client's safety, especially when used in the very young and fragile elderly or when cognitive or neuromuscular impairment is present.*³
-  Identify specific supplier for supplemental oxygen and necessary respiratory devices, as well as other individually appropriate resources, such as home-care agencies, Meals on Wheels, etc., to facilitate independence.³

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including respiratory rate, character of breath sounds; frequency, amount, and appearance of secretions; presence of cyanosis; laboratory findings; and mentation level.
- Conditions that may interfere with oxygen delivery or exchange.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Liters of supplemental oxygen, ventilator settings.
- Teaching plan.

Implementation/Evaluation

- Client's responses to treatment, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for actions to be taken.
- Community resources for equipment and supplies postdischarge.
- Specific referrals made.

dysfunctional Gastrointestinal Motility

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00196) [Diagnostic Division: Elimination], Approved 2008; Revised 2017

DEFINITION: Increased, decreased, ineffective, or lack of peristaltic activity within the gastrointestinal system.

RELATED FACTORS

Anxiety; stressors
Change in water source; unsanitary food preparation
Eating habit change; malnutrition
Sedentary lifestyle; immobility

DEFINING CHARACTERISTICS

Subjective

Absence of flatus
Abdominal cramping, pain
Diarrhea
Difficulty with defecation
Nausea; regurgitation

Objective

Change in bowel sounds
Acceleration of gastric emptying; diarrhea
Distended abdomen
Increase in gastric residual; bile-colored gastric residual
Hard, formed stool
Vomiting

At Risk Population: Aging

Prematurity

Ingestion of contaminated material

Associated Condition: Decrease in gastrointestinal circulation; gastrointestinal reflux disease

Diabetes mellitus; infection

Enteral feedings; food intolerance

Pharmaceutical agent; treatment regimen

Sample Clinical Applications: Abdominal or intestinal surgery, eating disorders, malnutrition, celiac disease, anemia, anxiety disorders, biliary cancer, cholecystectomy, Crohn's disease, irritable bowel syndrome, gastroesophageal reflux disease (GERD), gastritis, pancreatitis, quadriplegia, peritoneal dialysis, botulism, sepsis, multiple organ dysfunction syndrome, radiation therapy

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Gastrointestinal Function: Ability of the gastrointestinal tract to ingest and digest food products, absorb nutrients, and eliminate waste

Knowledge: Treatment Regimen: Extent of understanding conveyed about a specific treatment regimen

Client Will (Include Specific Time Frame)

- Reestablish and maintain normal pattern of bowel functioning.
- Verbalize understanding of causative factors and rationale for treatment regimen.
- Demonstrate appropriate behaviors to assist with resolution of causative factors.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Bowel Management: Establishment and maintenance of a regular pattern of bowel elimination

Tube Care: Gastrointestinal: Management of a patient with a gastrointestinal tube

Nutrition Management: Providing and promoting a balanced intake of nutrients

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note presence of conditions (e.g., congestive heart failure, major trauma, sepsis) affecting systemic circulation and perfusion. *Blood loss or shock can result in hypoperfusion and short- or long-term GI dysfunction.*
- Determine presence of disorders causing localized or diffuse reduction in GI blood flow, such as esophageal varices, GI hemorrhage, pancreatitis, and intraperitoneal hemorrhage, *to identify client at higher risk for ineffective tissue perfusion.*
- Note presence of chronic or long-term disorders, such as GERD, hiatal hernia, inflammatory bowel (e.g., ulcerative colitis, Crohn's disease), malabsorption (e.g., dumping syndrome, celiac disease), and short-bowel syndrome, as may occur after surgical removal of portions of the small intestine. *These conditions are associated with increased, decreased, or ineffective peristaltic activity.*
-  Note client's age and developmental concerns. *Children are prone to infections causing gastroenteritis, manifested by vomiting and diarrhea.¹ Premature or low-birth-weight neonates are at risk for developing necrotizing enterocolitis (NEC). The elderly have concerns associated with decreased motility (e.g., constipation related to slower peristalsis, lack of sufficient fiber and fluid intake, chronic use of laxatives).¹⁸*
- Note lifestyle issues that can affect GI function (e.g., people who regularly engage in competitive sports such as long-distance running, cycling; persons with poor sanitary living conditions; people who travel to areas with contaminated food or water; overeating or intake of foods associated with gastric distress or intestinal distention).⁴
-  Review client's drug regimen. *Medications such as laxatives, antibiotics, anticholesterol agents, opiates, sedatives, and iron preparations may cause or exacerbate intestinal issues. In addition, the likelihood of bleeding increases from use of medications such as NSAIDs, Coumadin, and Plavix.^{2,3}*
- Ascertain whether client is experiencing anxiety; acute, extreme, or chronic stress; or other psychogenic factors present in persons with emotional or psychiatric disorders (including anorexia/bulimia, etc.) *that can affect GI function.^{4,5}*
-   Review laboratory and other diagnostic studies. *Complete blood count may be done to evaluate for bleeding, inflammation, toxicity, and infection. Metabolic panel may reveal hepatic dysfunction, electrolyte imbalances, or low albumin levels. Computed tomography or other scans and abdominal ultrasound can help identify conditions like kidney or gallstones. X-rays may show bowel dilation or obstruction and stool and gas patterns.^{1,9,11,12} Changes in white blood cell count with x-ray evidence of pneumoperitoneum (air in the abdominal cavity) in preterm neonate suggests NEC.¹⁸*

NURSING PRIORITY NO. 2 To note degree of dysfunction/organ involvement:

- Assess vital signs, noting presence of low blood pressure, elevated heart rate, and fever. *May suggest hypoperfusion or developing sepsis. Fever in presence of bright red blood in stool may indicate ischemic colitis.*
-  Ascertain presence and characteristics of abdominal pain. *Pain is a common symptom of GI disorders and can vary in location, duration, and intensity.⁶ Diffuse pain may reflect hypoperfusion of the gastrointestinal tract, which is particularly vulnerable to even small decreases in circulating volume.⁷ Mid-epigastric pain immediately following meals and lasting several hours suggests abdominal angina due to atherosclerotic occlusive disease.¹⁹ Tension pain caused by organ distention may develop in presence of bowel obstruction, constipation, or accumulation of pus or fluid. Inflammatory pain is deep and initially poorly localized, caused by irritation of either the visceral or the parietal peritoneum, as in acute appendicitis. Ischemic pain, the most serious type of visceral pain, has sudden onset, is intense, is progressive in severity, and is not relieved by analgesics. (Most common cause is strangulated bowel.)⁸*
- Investigate reports of pain out of proportion to degree of traumatic injury. *May reflect developing abdominal compartment syndrome.¹²*
- Inspect abdomen, noting contour. *Generalized distention may indicate presence of gas or fluid; local bulge could indicate hernia.⁷ Distention of the bowel may indicate accumulation of fluids (salivary, gastric, pancreatic, biliary, intestinal) and gases formed from bacteria, swallowed air, or any food or fluid the client has consumed.⁹*

- Auscultate abdomen. *Hypoactive bowel sounds may indicate ileus. Hyperactive bowel sounds may indicate early intestinal obstruction or irritable bowel or GI bleeding. Presence of bruit may indicate blood traveling through narrowed arteries such as aorta.*^{9,11}
- Palpate abdomen to note masses, enlarged organs (e.g., spleen, liver, portions of colon), elicitation of pain with touch, and pulsation of aorta.^{9–11}
- Measure abdominal girth and compare with client's customary waist size/belt length to monitor development or progression of distention possibly reflecting intra-abdominal bleeding, infection, or edema associated with toxins.^{10,12}
-  Note frequency and characteristics of bowel movements. *Bowel movements by themselves are not necessarily diagnostic but need to be considered in total assessment because many different manifestations can occur. For example, diarrhea is the cardinal symptom of gastroenteritis, with severity depending on the causative organism. Both diarrhea and constipation can result from medications. Bloody diarrhea may indicate presence of ulcerative colitis, obstruction, or upper or lower gastrointestinal bleeding.*^{1,9,14}
- Note presence of nausea, with or without vomiting, and relationship to food intake or other events, if indicated. *History of nausea and vomiting can provide important information about cause. For example, systemic conditions such as pregnancy, gastroenteritis, cancers, myocardial infarction, hepatitis, systemic infections, drug toxicity are often accompanied by nausea and vomiting. Timing of vomiting may be important, too. For example, vomiting immediately after meals could be indicative of bulimia, or vomiting large amounts several hours after eating can indicate delayed gastric emptying.*⁵
- Evaluate client's current nutritional status, noting ability to ingest and digest food. Inquire about food intolerances. Observe client's reactions to food, such as reluctance or refusal to eat, anorexia, or anxiety—wants to eat but cannot retain food. *Health depends on the intake, digestion, and absorption of nutrients, which both affects and is affected by GI function.*
-   Measure intra-abdominal pressure as indicated. *Tissue edema or free fluid collecting in the abdominal cavity leads to intra-abdominal hypertension, which, if untreated, can cause abdominal compartment syndrome with end-stage organ failure.*¹²

NURSING PRIORITY NO. 3 To correct/improve existing dysfunction:

-   Collaborate in treatment of underlying conditions to correct or treat disorders associated with clients' current GI dysfunction.
-  Maintain GI rest when indicated—NPO, fluids only, and gastric or intestinal decompression—to reduce intestinal bloating and risk of vomiting.
- Measure GI output periodically and note characteristics of drainage to manage fluid losses and replacement needs and electrolyte balance.
-  Administer fluids and electrolytes as indicated to replace losses and to improve GI circulation and function.
- Encourage early ambulation. *Promotes general circulation and stimulates peristalsis and intestinal function.*
-  Collaborate with dietician or nutritionist to provide diet sufficient in nutrients by best possible route—oral, enteral, or parenteral.
- Provide small servings of easily digested food and fluids when oral intake is tolerated.
- Encourage rest after meals to maximize blood flow to digestive system.
-  Manage pain with medications as ordered and nonpharmacological interventions such as positioning, back rub, and heating pad (unless contraindicated) to enhance muscle relaxation and reduce discomfort.⁷
- Encourage client to report changes in nature or intensity of pain as this may indicate worsening of condition, requiring more intensive interventions.
-   Collaborate with physician for medication management. *Oral medications can be absorbed erratically and can change the therapeutic effect or lead to increased side effects of a particular drug.*¹⁵ *Dose modification, discontinuation of certain drugs (e.g., laxatives, opioids, antidepressants, iron supplements), or alternative route of administration may be required over a long period of time to improve client's GI function.*^{14,17}

-  Prepare client for procedures and surgery as indicated. *May require a variety of interventions, including endoscopic procedures, appendectomy, bowel resection with/without ostomy, percutaneous transluminal angioplasty, abdominal-aortic bypass graft, mesenteric revascularization, endarterectomy, etc., to treat problem causing or contributing to severe GI dysfunction.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide information regarding cause of GI dysfunction and treatment plans, utilizing best learning methods for client and including written information and bibliography of other resources for postdischarge learning. *May help client/significant other to manage symptoms in a manner more acceptable to them if this is a long-term issue.*
- Discuss normal variations in bowel patterns *to help alleviate unnecessary concern, initiate planned interventions, or seek timely medical care. This may prevent overuse of laxatives or help client understand when food, fluid, or drug modifications are needed.*¹⁴
- Encourage discussion of feelings regarding prognosis and long-term effects of condition. *Major or unplanned life changes can strain coping abilities, impairing functioning and jeopardizing relationships, and may even result in depression.*
- Discuss value of relaxation and distraction techniques or counseling *if anxiety or other emotional/psychiatric issue is suspected to play a role in GI dysfunction.*⁵
- Identify necessary changes in lifestyle and assist client to incorporate disease management into activities of daily living. *Promotes independence and enhances self-concept regarding ability to deal with change and manage own needs.*
- Review specific dietary changes or restrictions with client. *The client with GI disturbances may need to make various adaptations in food choices and eating habits (e.g., may need to avoid overeating in general, schedule mealtime in relation to activities and bedtime, avoid certain foods [or food element, such as wheat or gluten] and/or alcohol).*
- Suggest healthier variations in preparation of foods, as indicated—broiled instead of fried, spices added to foods instead of salt, addition of higher fiber foods, and use of lactose-free dairy products—*when these factors are affecting GI health.*¹¹
-  Review use of dietary fiber as a means of managing constipation and incontinence. *Studies have shown that supplementation with dietary fiber from psyllium or gum arabic is associated with a decrease in incontinence and improved stool consistency.*¹⁶
- Discuss fluid intake appropriate to individual situation. *Water is necessary to general health and GI function. The individual may need encouragement and instruction about how to take in enough fluids or may need fluid restrictions for certain medical conditions.*
- Recommend maintenance of normal weight, or weight loss if client is obese, *to decrease risk associated with GI disorders such as GERD or gallbladder disease.*
-  Recommend smoking cessation. *Risk for acquiring or exacerbating certain GI disorders (e.g., Crohn's disease) may be increased with smoking. A recent review of relevant studies revealed various deleterious short- and long-term effects of smoking on the GI circulation and organs.*¹³
-  Discuss medication regimen, including reasons for/consequences of failure to take prescribed long-term maintenance therapy (e.g., client with ulcerative colitis may require continuous treatment with 5-aminosalicylates to maintain remission). *Although many reasons are given for failing to take medications as prescribed, including denial of illness, forgetfulness, and costs of prescriptions, nonadherence negatively affects treatment efficacy and client's quality of life.*¹⁷
-  Emphasize importance of avoiding use of NSAIDs (including aspirin), corticosteroids, some over-the-counter drugs, vitamins containing potassium, mineral oil, or alcohol when taking anticoagulants. *These medications can be harmful to GI mucosa and increase risk of bleeding.*⁹
- Refer to NDs Constipation, bowel Incontinence, and Diarrhea for additional interventions, as needed.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, noting nature, extent, and duration of problem; effect on independence and lifestyle.
- Dietary pattern, recent intake, food intolerances.
- Frequency and characteristics of stools.
- Characteristics of abdominal tenderness or pain, precipitators, and what relieves pain.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

risk for dysfunctional Gastrointestinal Motility

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00197) [**Diagnostic Division:** Elimination], Submitted 2008; Revised 2013, 2017

DEFINITION: Susceptible to increased, decreased, ineffective, or lack of peristaltic activity within the gastrointestinal system, which may compromise health.

RISK FACTORS

Anxiety; stressors

Change in water source; unsanitary food preparation

Eating habit change; malnutrition

Sedentary lifestyle; immobility

At Risk Population: Aging

Prematurity

Ingestion of contaminated material

Associated Condition: Decrease in gastrointestinal circulation; gastrointestinal reflux disease

Diabetes mellitus; infection

Enteral feedings; food intolerance

Pharmaceutical agent; treatment regimen

Sample Clinical Applications: Abdominal or intestinal surgery, eating disorders, malnutrition, celiac disease, anemia, anxiety disorders, biliary cancer, cholecystectomy, Crohn's disease, irritable bowel syndrome, GERD, gastritis, pancreatitis, quadriplegia, peritoneal dialysis, botulism, sepsis, multiple organ dysfunction syndrome, radiation therapy

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Gastrointestinal Function: Ability of the gastrointestinal tract to ingest and digest food products, absorb nutrients, and eliminate waste

Knowledge: Treatment Regimen: Extent of understanding conveyed about a specific treatment regimen

Client Will (Include Specific Time Frame)

- Maintain normal pattern of bowel functioning.
- Verbalize understanding of individual risk factors and benefits of managing condition.
- Identify preventive interventions to reduce risk and promote normal bowel pattern.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Bowel Management: Establishment and management of a regular pattern of bowel elimination

Tube Care: Gastrointestinal: Management of a patient with a gastrointestinal tube

Nutrition Management: Providing and promoting a balanced intake of nutrients

NURSING PRIORITY NO. 1 To identify individual risk factors/needs:

- Note presence of conditions affecting systemic circulation and perfusion such as congestive heart failure, major trauma, sepsis, etc. *Blood loss or shock can result in hypoperfusion, and short- or long-term GI dysfunction.*¹

- Determine presence of disorders causing localized or diffuse reduction in GI blood flow (e.g., esophageal varices, intestinal cancer, or obstruction; intestinal surgery; pancreatitis; prior history of bowel obstruction or strangulated hernia; prior abdominal surgery with adhesions) *to identify client at higher risk for changes in peristaltic activity and intestinal dysfunction.*^{2,13}
- ∞ Note client's age and developmental concerns. *Children are prone to infections causing gastroenteritis manifested by vomiting and diarrhea.*¹ *The elderly have problems associated with decreased motility (e.g., constipation is often a concern related to slower peristalsis, lack of sufficient fiber and fluid intake, chronic use of laxatives).*^{3,4} *Premature or low-birth-weight neonates are at risk for developing necrotizing enterocolitis.*⁵
- Assess client's current situation with regard to prior GI history. *Client may have an isolated incident putting him/her at risk (e.g., blunt force trauma to abdomen) or at higher risk for recurrent GI dysfunction associated with history of prior GI problems.*
- Auscultate abdomen *to evaluate peristaltic activity. For example, either hypoactive or hyperactive bowel sounds may indicate developing bowel disorders.*^{9,10}
- Palpate abdomen for masses, enlarged organs (e.g., spleen, liver, portions of colon), and elicitation of pain with touch *that could point to changes in organ size or function.*⁹⁻¹¹
- Note frequency and characteristics of bowel movements. *Bowel movements by themselves are not necessarily diagnostic but need to be considered in total assessment because many different manifestations can occur.*^{1,9,12}
- Ascertain presence and characteristics of abdominal pain. *Pain is a common symptom of GI disorders, with location and type aiding in identifying underlying problems.*⁸
- Assess vital signs for changes in blood pressure, heart rate, or body temperature. *May suggest injury or infection of the GI organs or development of a systemic infection/sepsis.*
- Evaluate client's current nutritional status, noting ability to ingest and digest food. *Health depends on the intake, digestion, and absorption of nutrients, which both affects and is affected by GI function.*
- Note lifestyle issues *that can affect GI function (e.g., people who regularly engage in competitive sports such as long-distance running, cycling), persons with poor sanitary living conditions, people who travel to areas with contaminated food or water, overeating or intake of foods associated with gastric distress or intestinal distention, and anorexia or bulimia.*⁶
- Ascertain whether client is experiencing acute, extreme, or chronic anxiety; stress; or other psychogenic factors present in person with emotional or psychiatric disorders (including anorexia and bulimia), *which can affect GI function.*⁷
- 📋 Review client's drug regimen. *Medications such as laxatives, antibiotics, anticholesterol agents, opiates, sedatives, and iron preparations may cause or exacerbate intestinal issues. In addition, likelihood of bleeding increases from use of medications such as NSAIDs, Coumadin, and Plavix.*^{3,4}
- 🧪 Review laboratory and other diagnostic studies *to identify if conditions or disorders are present that may affect GI system or GI function.*

NURSING PRIORITY NO. 2 To reduce or correct individual risk factors:

- Discuss normal variations in bowel patterns *so client can initiate planned interventions or seek timely medical care. This may prevent complications, such as overuse of laxatives, or help client understand when regular exercise or food, fluid, or drug modifications are needed to improve or maintain GI health.*
- 🤝 Collaborate in treatment of underlying conditions *to correct or treat disorders that could impact GI function.*
- Practice and promote hand hygiene and other infection precautions *to prevent transmission of infections that may cause/spread GI illnesses.*
- 🏠 🚫 Maintain GI rest when indicated (e.g., NPO, fluids only, gastric or intestinal decompression after abdominal surgery) *to reduce intestinal bloating and reduce risk of vomiting.*
- 🏠 🚫 Administer fluids and electrolytes as indicated *to replace losses and to maintain GI circulation and function.*

-  Administer prescribed prophylactic medications (e.g., antiemetics, proton-pump inhibitors, antihistamines, anticholinergics, antibiotics) to reduce potential for GI complications such as bleeding, ulceration of stomach mucosa, and viral diarrheas.
-  Collaborate with dietician or nutritionist to provide diet sufficient in nutrients and provided by best possible route (e.g., oral, enteral, parenteral).^{2,14}
-  Emphasize importance of and assist with early ambulation and ongoing exercise following surgery or other procedures. Assist client with mobility issues and refer to physical therapy as indicated to help reduce GI complications associated with immobility and a sedentary lifestyle.
- Encourage relaxation and distraction techniques if anxiety is suspected to play a role in GI dysfunction.⁷
- Refer to NDs Constipation, bowel Incontinence, Diarrhea, and dysfunctional Gastrointestinal Motility for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review measures to maintain bowel health:
 -  Use of dietary fiber and/or stool softeners. *Studies have shown that supplementation with dietary fiber from psyllium or gum arabic is associated with a decrease in incontinence and improved stool consistency.*^{12,15}
 - Fluid intake appropriate to individual. *Water is necessary to general health and GI function. The individual may need encouragement and instruction about how to take in enough fluids or may need fluid restrictions for certain medical conditions.*
 - Establish or maintain regular bowel evacuation habits, incorporating privacy needs, assistance to bathroom on regular schedule, etc., as indicated.
 - Emphasize benefits of regular exercise in promoting normal GI function.
- Discuss dietary recommendations with client/significant other. *The client with potential for GI disturbances may elect to make adaptations in food choices and eating habits (e.g., to avoid overeating in general, schedule mealtime in relation to activities and bedtime, avoid certain foods and/or alcohol).*
- Instruct in healthier variations in preparation of foods as indicated (e.g., broiled instead of fried, spices added to foods instead of salt, addition of higher fiber foods, lactose-free dairy products) when these factors may affect GI health.
- Recommend maintenance of normal weight, or weight loss if client is obese, to decrease risk associated with GI disorders such as GERD or gallbladder disease.
-  Collaborate with physician in medication management. *Oral medications can be absorbed erratically and can change the therapeutic effect or lead to increased side effects of a particular drug.*¹⁶ Dose modification, discontinuation of certain drugs (e.g., laxatives, opioids, antidepressants, iron supplements), or alternative route of administration may be required over a long period of time to reduce risk of GI dysfunction.^{12,17}
-  Emphasize importance of discussing with physician current and new prescribed medications and/or planned use of certain medications (e.g., NSAIDs [including aspirin], corticosteroids, some over-the-counter drugs, herbals supplements), which can be harmful to GI mucosa.
-  Recommend smoking cessation. *Risk for acquiring or exacerbating certain GI disorders (e.g., Crohn's disease) may be increased with smoking. Note: A recent review of relevant studies reveals various deleterious short- and long-term effects of smoking on GI circulation and organs.*¹⁹
- Review food- and water-borne illnesses and contamination and hygiene issues, as indicated, and make needed follow-up referrals. *Many different types of viruses, bacteria, and parasites can cause GI illnesses. This can affect a household, a day-care center, a college dorm, international travelers, or a whole segment of population. Information may be given to individuals, groups, and/or public in general.*
-  Refer to appropriate resources (e.g., social services, public health services) for follow-up if client is at risk for ingestion of contaminated water or food sources or would benefit from teaching concerning food preparation and storage.
-  Encourage vaccinations. *The Centers for Disease Control and Prevention make recommendations for travelers and/or persons in high-risk areas or situations to receive certain vaccinations. Typhoid vaccine, for*

example, is indicated for travel to areas where a person might be exposed to contaminated food or water. For young children susceptible to severe gastroenteritis, the oral rotavirus vaccine can prevent 85% to 98% of rotavirus gastroenteritis.^{18,20}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, noting specific risk factors.
- Dietary pattern, recent intake, food intolerances.
- Frequency and characteristics of stools.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources and specific referrals made.

[risk for ineffective Gastrointestinal Perfusion]

Taxonomy II: Activity/Rest Class 4: Cardiovascular/Pulmonary Responses (00202) [Diagnostic Division: Circulation], Submitted 2008; Revised 2013

[DEFINITION: Susceptible to decrease in gastrointestinal circulation, which may compromise health.]

[RISK FACTORS]

Abdominal aortic aneurysm; abdominal compartment syndrome

Abnormal prothrombin time (PT); abnormal partial thromboplastin time (PTT); coagulopathy (e.g., sickle cell anemia); anemia; disseminated intravascular coagulopathy; hemodynamic instability

Age >60 years; female gender

Cerebral vascular accident; vascular disease; diabetes mellitus

Gastrointestinal (GI) condition (e.g., ulcer, ischemic colitis or pancreatitis); acute gastrointestinal hemorrhage; gastroesophageal varices

Impaired liver function (e.g., cirrhosis, hepatitis)

Myocardial infarction; decrease in left ventricular performance

Renal disease (e.g., polycystic kidney, renal artery stenosis, failure)

Smoking

Trauma; treatment regimen

Sample Clinical Applications: Gastrointestinal (GI) bleed, atherosclerosis, sickle cell anemia, diabetes, pancreatitis, congestive heart failure (CHF), cirrhosis, hemorrhage shock

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Tissue Perfusion: Abdominal Organs: Adequacy of blood flow through the small vessels of the abdominal viscera to maintain organ function

Gastrointestinal Function: Extent to which foods (ingested or tube-fed) are moved from ingestion to evacuation

Client Will (Include Specific Time Frame)

- Demonstrate adequate tissue perfusion as evidenced by active bowel sounds and absence of abdominal pain, nausea, and vomiting.
- Verbalize understanding of condition, therapy regimen, side effects of medication, and when to contact healthcare provider.
- Engage in behaviors or lifestyle changes to improve circulation (e.g., smoking cessation, diabetic glucose control, medication management).

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

Circulatory Care: Arterial Insufficiency: Promotion of arterial circulation

Gastrointestinal Intubation: Insertion of a tube into the GI tract

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note presence of conditions affecting systemic circulation/perfusion such as heart failure with left ventricular dysfunction, major trauma with hypotension, surgery with major blood loss, septic shock, and so forth. *Blood loss and hypovolemic or hypotensive shock can result in GI hypoperfusion and bowel ischemia.*¹
- Determine presence of disorders such as esophageal varices, pancreatitis, abdominal or chest trauma, increase of intra-abdominal pressure or abdominal hypertension, prior history of bowel obstruction or strangulated hernia, or prior abdominal surgery with adhesions *that could cause local or regional reduction in GI blood flow.*^{2-5,22}
- Identify client with history of bleeding or coagulation disorders, such as prior GI bleed, sickle cell anemia, or other coagulopathies and cancer, *to identify risk for potential bleeding problems complicating current situation (e.g., client having elective surgical procedure) or exacerbation of comorbidities.*
-  Note client's age and gender. *Studies suggest that risk increases with age in both sexes and that risk is higher in men than women when assessing risk for GI bleed and abdominal aortic aneurysm.*^{1,6} *Premature or low-birth-weight neonates are at risk for developing necrotizing enterocolitis.*²¹
-  Investigate reports of abdominal pain, noting location, intensity, duration, and relationship to activities (e.g., eating, lifting heavy objects), trauma, surgery, or acute or chronic conditions causing displacement of abdominal organs accompanied by abdominal distention (e.g., peritonitis, cirrhosis, ascites, etc.). *Many disorders can result in abdominal pain, some of which can include conditions affecting GI perfusion, such as postprandial abdominal angina due to occlusive mesenteric vascular disease, abdominal compartment syndrome, or other potential perforating disorders such as a duodenal or gastric ulcer or ischemic pancreatitis.*^{4,7,8}
-  Review routine medication regimen (e.g., NSAIDs, Coumadin, low-dose aspirin such as used for prophylaxis in certain cardiovascular conditions, corticosteroids). *Likelihood of bleeding increases from use of such medications.*⁹⁻¹¹
- Note history of smoking, *which can potentiate vasoconstriction, or excessive alcohol use or abuse, which can cause general inflammation of the stomach mucosa and potentiate risk of GI bleeding or liver involvement and esophageal varices.*
- Auscultate abdomen to evaluate peristaltic activity. *Hypoactive or absent bowel sounds may indicate intraperitoneal injury and bowel perforation and bleeding. Abdominal bruit can indicate abdominal aortic injury or aneurysm.*⁵
- Palpate abdomen for distension, masses, enlarged organs (e.g., spleen, liver, or portions of colon), elicitation of pain with touch, and pulsation of aorta, *which could identify problem in GI organs or circulation system.*¹²⁻¹⁴
- Percuss abdomen for fixed or shifting dullness over regions that normally contain air. *Can indicate accumulated blood or fluid.*¹⁵
-  Measure and monitor progression of abdominal girth as indicated. *Abdominal distention can reflect bowel problems such as ileus or other bowel obstruction. It may also be indicative of organ failure (e.g., heart, liver, kidney) or organ injury or enlargement/displacement with intra-abdominal fluid and gas accumulation. These conditions can cause or exacerbate GI perfusion problems.*⁸
- Note reports of nausea or vomiting along with problems with elimination. *May reflect hypoperfusion of the GI tract, which is particularly vulnerable to even small decreases in circulating volume.*¹⁶
- Assess client with severe or prolonged vomiting, forceful coughing, lifting and straining activities, or childbirth, *which can result in a tear in the esophageal or stomach wall resulting in hemorrhage.*
- Evaluate stools for color and consistency. Test for occult blood, as indicated. *If bleeding is present, stools may be black or "tarry," currant-colored, or bright red. Consistency can range from normal with occult blood to thick liquid stools.*¹
- Assess vital signs noting sustained hypotension, *which can result in hypoperfusion of abdominal organs.*
- Test gastric suction contents for blood when tube is used to decompress stomach and/or manage vomiting. *Can help in early identification of bleeding complications.*

-  Review laboratory tests and other diagnostic studies (e.g., complete blood count, bilirubin, liver enzymes, electrolytes, stool guaiac; endoscopy, abdominal ultrasound or computed tomography, aortic angiography, paracentesis) *to identify if conditions or disorders are present that may affect GI perfusion and function.*^{8,13}
-   Measure intra-abdominal pressure as indicated. *Tissue edema or free fluid collecting in the abdominal cavity leads to intra-abdominal hypertension, which, if untreated, can cause abdominal compartment syndrome with end-stage organ failure.*²³

NURSING PRIORITY NO. 2 To reduce or correct individual risk factors:

-   Collaborate in treatment of underlying conditions *to correct or treat disorders that could affect GI perfusion.*
-  Administer fluids and electrolytes as indicated *to replace losses and to maintain GI circulation and function.*
-   Administer prescribed prophylactic medications in at-risk clients during illness and hospitalization (e.g., antiemetics, proton-pump inhibitors, antihistamines, anticholinergics, antibiotics) *to reduce potential for stress-related GI complications such as bleeding and ulceration of stomach mucosa.*^{17,18}
-  Maintain gastric or intestinal decompression; when indicated, measure output periodically and note characteristics of drainage.
- Provide small and easily digested food and fluids when oral intake is tolerated.
- Encourage rest after meals *to maximize blood flow to digestive system.*
-  Prepare client for surgery as indicated. *May be a surgical emergency (e.g., gastric resection, bypass graft, mesenteric endarterectomy).*
- Refer to NDs dysfunctional Gastrointestinal Motility, risk for Bleeding, Nausea, and imbalanced Nutrition: less than body requirements for additional interventions.

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Discuss individual risk factors (e.g., family history, obesity, age, smoking, hypertension, diabetes, clotting disorders) and potential outcomes of atherosclerosis (e.g., systemic and peripheral vascular disease conditions). *Information necessary for client to make informed choices about remedial risk factors and commit to lifestyle changes as appropriate to prevent onset of complications or manage symptoms when condition is present.*
- Identify necessary changes in lifestyle and assist client to incorporate disease management into activities of daily living. *Promotes independence and enhances self-concept regarding ability to deal with change and manage own needs.*
-  Encourage client to quit smoking and join smoking-cessation programs or support groups.
- Establish regular exercise program *to enhance circulation and promote general well-being.*¹⁹
- Emphasize importance of routine follow-up and laboratory monitoring as indicated. *Important for effective disease management and possible changes in therapeutic regimen.*
-  Emphasize importance of discussing with primary care provider current and new prescribed medications and/or planned use of certain medications (e.g., anticoagulants, NSAIDs including aspirin; corticosteroids, some over-the-counter drugs, herbal supplements), *which can be harmful to GI mucosa or cause bleeding.*²⁰

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, noting specific risk factors.
- Vital signs, adequacy of circulation.
- Abdominal assessment, characteristics of emesis/gastric drainage and stools.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

Grieving

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00136) [**Diagnostic Division:** Ego Integrity], Approved as anticipatory Grieving 1980; Revised 1996, 2006, 2017

DEFINITION: A normal complex process that includes emotional, physical, spiritual, social, and intellectual responses and behaviors by which individuals, families, and communities incorporate an actual, anticipated, or perceived loss into their daily lives.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Subjective

Anger; pain; distress; suffering; despair; blaming
Alterations in activity level, sleep pattern, dream pattern
Finding meaning in a loss; personal growth
Guilt about feeling relief

Objective

Detachment; disorganization; psychological distress; panic behavior
Maintaining a connection to the deceased
Alterations in immune or neuroendocrine functioning
At Risk Population: Anticipatory loss of significant other or significant object
Death or loss of significant other

Sample Clinical Applications: Cancer, traumatic injuries (e.g., brain or spinal cord), amputation, chronic or debilitating conditions (e.g., renal failure, chronic obstructive pulmonary disease [COPD], multiple sclerosis [MS], amyotrophic lateral sclerosis [ALS]), genetic or birth defects, community disaster

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Grief Resolution: Personal actions to adjust thoughts, feelings, and behaviors to actual or impending loss

Psychosocial Adjustment: Life Change: Adaptive psychosocial response of an individual to significant life circumstance

Caregiver Emotional Health: Emotional well-being of a family care provider while caring for a family member

Client Will (Include Specific Time Frame)

- Identify and express feelings (e.g., sadness, guilt, fear) freely and effectively.
- Acknowledge impact or effect of the grieving process (e.g., physical problems of eating, sleeping) and seek appropriate help.
- Look toward and plan for future 1 day at a time.

Sample **NOC** linkages:

Community Competence: Capacity of a community to collectively problem-solve to achieve community goals

Community Will (Include Specific Time Frame)

- Recognize needs of citizens, including underserved population.
- Activate or develop plan to address identified needs.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Grief Work Facilitation: Assistance with the resolution of a significant loss

Grief Work Facilitation: Perinatal Death: Assistance with the resolution of a perinatal loss

Dying Care: Promotion of physical comfort and psychological peace in the final phase of life

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine circumstances of current situation (e.g., sudden death, prolonged fatal illness, loved one kept alive by extreme medical interventions). *Grief can be anticipatory (mourning the loss of loved one's former self before actual death) or actual. Both types of grief can provoke a wide range of intense and often conflicting feelings. Grief also follows losses other than death (e.g., traumatic loss of a limb, or loss of home by a tornado, loss of known self due to brain injury).*¹¹
- Determine significance of loss to community (e.g., school bus accident with loss of life, major storm with damage to community infrastructure, financial failure of major employer).
- Determine client's perception of anticipated or actual loss and meaning to him or her. "What are your concerns?" "What are your fears? Your greatest fear?" "How do you see this affecting you and your lifestyle?" *Identifying the needs to be addressed and acknowledging the client's responses are integral to planning care.⁹ Some individuals may use anticipatory grieving as a defense against the inevitable loss. While some people may find this helpful when the loss occurs, many people find that intense feelings occur regardless of the period of anticipation.*²
- Ascertain response of family/significant others (SOs) to client's situation/concerns. *Family concerns affect client and need to be listened to and appropriate interventions taken. Problems may arise if family completes grieving prematurely and disengages from the dying member, who then feels abandoned at a time when the support is needed.*²

NURSING PRIORITY NO. 2 To determine current response:

- Note emotional responses, such as withdrawal, angry behavior, and crying. Provide information about normal stages of grieving. *Awareness allows for appropriate choice of interventions because individuals handle grief in different ways. Knowledge promotes understanding of emotional responses.*⁴
- Observe client's body language and check out meaning with the client. Note congruency of body language with verbalizations. *Body language is open to interpretation and needs to be validated so that misinterpretation does not occur. Client may be saying one thing, but often body language is saying something else; identifying incongruencies can provide opportunity for individual to understand self in relation to grieving process.*²
-  Note cultural and religious factors and expectations that may impact client's responses to situation. *Beliefs vary with the individual/community and will affect responses to the situation (e.g., Arab Americans may want to pray in silence or private, African Americans may use faith and healers in conjunction with biomedical resources, groups may congregate at site of disaster or at church to grieve together).*^{5,8}
- Determine impact on general well-being (e.g., increased frequency of minor illnesses, exacerbation of chronic condition, problems with eating, activity level, sexual desire, role performance [e.g., work, parenting]). *Indicators of severity of feelings client is experiencing and need for specific interventions to resolve these issues.*

- Note family communication and interaction patterns. *Dysfunctional patterns of communication such as avoidance, preaching, and giving advice, can block effective communication and isolate family members.*³
- Discuss with client and family/SOs, and others as appropriate plans that need to be made as well as anticipated adjustments and role changes related to the situation. Encourage and answer questions as needed. *This type of discussion will bring concerns out in the open and help with adaptation to the loss.*^{5,11}
-  Determine availability and use of community resources and support groups. *Appropriate use of support can help the individual feel less isolated and can promote feelings of inclusion and comfort.*²
-  Note community plans in place to deal with major loss (e.g., team of crisis counselors stationed at a school to address the loss of classmates, vocational counselors or retraining programs, outreach of services from neighboring communities).

NURSING PRIORITY NO. 3 To assist client/community to deal with situation:

- Provide open environment and trusting relationship. *Promotes a free discussion of feelings and concerns in a safe environment where client can reveal innermost fears and beliefs about anticipated loss.*²
- Use therapeutic communication skills of active-listening, silence, and acknowledgment. Respect client desire or request not to talk. *These skills convey belief in ability of client to deal with situation and develop a sense of competence. Client may not be ready to discuss feelings and situation, and respecting client's own time line conveys confidence.*²
-  Inform children about the anticipated or actual death or loss in age-appropriate language. *Providing accurate information about loss or change in life situation will help the child begin the mourning process.*¹⁰
-  Give permission to child to express feelings about situation and ask questions, being careful to provide honest answers within child's understanding. *Adults may be uncomfortable or upset talking about death or loss, and children may be excluded from adult conversation about what is happening.*¹⁰
-  Provide puppets or play therapy for toddlers/young children. *Young children do not have the ability to express their feelings verbally; use of play may help them express grief and help deal with loss in ways that are appropriate to age.*²
- Permit appropriate expressions of anger, fear. Note hostility toward spiritual power or feelings of abandonment. *Anger is a normal part of the grieving process, and talking about these feelings allows individual to think about them and move on, coming to some resolution regarding the anticipated loss.*² (Refer to ND Spiritual Distress for additional interventions.)
- Provide information about normalcy of individual grief reaction. *Many people are not familiar with grief and are concerned that what they are experiencing is not normal. Letting them know that grief takes many forms and what they are feeling is all right helps them deal with what is happening.*^{6,9}
- Be honest when answering questions, providing information. *Enhances nurse-client relationship, promoting trust and confidence.*²
-  Provide assurance to child that cause for situation is not his or her own doing, bearing in mind age and developmental level. *May lessen sense of guilt and affirm there is no need to assign blame to self or any family member.*²
- Provide hope within parameters of individual situation. *Assisting client to find the positives will help with management of current situation. Do not give false reassurance. Comments such as "Everything will be all right" or "Don't worry" are not helpful and convey lack of understanding to the client.*²
- Review past life experiences and previous loss(es), role changes, and coping skills used, noting strengths and successes. *Useful in dealing with current situation and problem-solving existing needs.*⁴
- Discuss control issues, such as what is in the power of the individual to change and what is beyond control. *Recognition of these factors helps client focus energy for maximal benefit and outcome on what can be done.*⁴
- Incorporate family/SO(s) in problem solving. *Encourages family to support and assist client to deal with situation while meeting needs of family members.*²
- Determine client's status and role in family (e.g., parent, sibling, child) and address loss of family member role. *Client's illness affects usual activities in the role he or she has in the family and inevitably affects all the other family members as responsibilities are taken over by them.*²

- Instruct in use of visualization and relaxation techniques. *These skills can be helpful to reduce anxiety and stress and help client and family members manage grief more effectively.*⁷
-  Use sedatives or tranquilizers with caution. *While the use of these medications may be helpful in the short term, dependence on them may retard passage through the grief process.*^{2,6}
-  Mobilize resources when client is the community. *When anticipated loss affects community as a whole, such as closing of manufacturing plant, impending disaster (e.g., wildfire, hurricane, terrorist concerns), multiple supports will be required to deal with size and complexity of situation. Indeed, when more people are directly or indirectly involved in the anticipated or actual loss, emotions and anxiety tend to be amplified and transmitted, thus complicating the situation.*^{1,12}
-  Encourage community members/groups to engage in talking about event or loss and verbalizing feelings. *Seek out underserved populations to include in process. Increases likelihood that the needs of the entire community are identified and addressed.*
-  Encourage individuals to participate in activities to deal with loss and rebuild community. *Exercising control in a productive manner empowers individuals and promotes rebuilding of life and community.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide information that feelings are okay and are to be expressed appropriately. *Set limits regarding destructive behavior. Talking about feelings can facilitate the grieving process, but destructive behavior can be damaging to self-esteem.*²
- Discuss recurring nature of grief reactions. *On birthdays, major holidays, at times of significant personal events, or anniversary of loss, intense grief reactions may occur for a long time after the loss. If these reactions start to disrupt day-to-day functioning, client may need to seek help.*¹ (Refer to NDs such as ineffective community Coping, complicated Grieving.)
- Encourage continuation of usual activities and schedule and involvement in appropriate exercise program, as appropriate and able. *Promotes sense of control and self-worth, enabling client to feel more positive about ability to handle situation.*²
- Identify and promote involvement of family and social support systems. *A supportive environment enhances the effectiveness of interventions and promotes a successful grieving process.*⁴
- Discuss and assist with planning for future or funeral, as appropriate. *Involving family members in this discussion ensures that everyone knows what is desired and what is planned, thus avoiding unexpected disagreements.*⁴
-  Refer to additional resources, such as pastoral care, counseling or psychotherapy, organized community support groups, as indicated, for both client and family/SO. *Useful for ongoing needs and facilitation of grieving process.*^{2,8}
-  Identify resources and develop community plan to address anticipated large-scale losses. *Preparation for complex challenges facilitates prompt response as needs occur.*
-  Support community efforts to strengthen support and develop plan to foster recovery and growth.

DOCUMENTATION FOCUS

Assessment/reassessment

- Assessment findings, including client's perception of anticipated loss and signs/symptoms that are being exhibited.
- Responses of family/SO(s) or community members, as indicated.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

complicated Grieving

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00135) [Diagnostic Division: Ego Integrity], Approved 1980; Revised 1986, 2004, 2006; 2017

DEFINITION: A disorder that occurs after the death of a significant other, in which the experience of distress accompanying bereavement fails to follow normative expectations and manifests in functional impairment.

RELATED FACTORS

Emotional disturbance
Insufficient social support

DEFINING CHARACTERISTICS

Subjective

Anxiety, anger, disbelief: feeling of emptiness or detachment from others
Feeling dazed or stunned; feeling of shock
Distress about the diseased person; longing or yearning for deceased person
Insufficient sense of well-being; fatigue; mistrust; low levels of intimacy; depression
Nonacceptance of a death; persistent painful memories, distress about the deceased person

Objective

Avoidance of grieving
 Decrease in functioning in life roles
 Excessive stress; separation or traumatic distress
 Experiencing symptoms the deceased experienced
 Preoccupation with thoughts about a deceased person; rumination; searching for the deceased; self-blame

At Risk Population: Death of a significant other

[Loss of significant object (e.g., possessions, job, status, home, parts and processes of body)]

Sample Clinical Applications: Death of significant other, traumatic loss, depression, attempted suicide

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Depression Level: Severity of melancholic mood and loss of interest in life events

Grief Resolution: Personal actions to adjust thoughts, feelings, and behaviors to actual or impending loss

Psychosocial Adjustment: Life Change: Adaptive psychosocial response of an individual to significant life circumstance

Client Will (Include Specific Time Frame)

- Acknowledge presence and impact of dysfunctional situation.
- Demonstrate progress in dealing with stages of grief at own pace.
- Participate in work and self-care and activities, as able.
- Verbalize a sense of progress toward resolution of the grief and hope for the future.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Grief Work Facilitation: Assistance with the resolution of a significant loss

Grief Work Facilitation: Perinatal Death: Assistance with the resolution of a perinatal loss

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

NURSING PRIORITY NO. 1 To determine causative/contributing factors:

- Identify loss that is present. Note circumstances of death such as sudden or traumatic (e.g., fatal accident, homicide; large scale natural disaster), related to socially sensitive issue (e.g., AIDS, gun violence in schools, suicide; sexual assault with murder), or associated with unfinished business (e.g., spouse died during time of crisis in marriage, son has not spoken to parent for years). *These situations can sometimes cause individual to become stuck in grief and unable to move forward with life.*^{11–13}
- Determine significance of the loss to client (e.g., presence of chronic condition leading to divorce or disruption of family unit and change in lifestyle or financial security). *The more complicated or devastating the loss is to the individual, the more likely she or he will have difficulty reaching resolution.*¹⁵
-  Identify cultural or religious beliefs and expectations *that may impact or dictate client's response to loss.*¹⁵
- Ascertain response of family/significant others (SOs) to situation (e.g., sympathetic or urging client to “just get over it”). Assess needs of SO(s). *Response of family members will affect how client is dealing with situation—functional families are supportive or conflict resolving in nature while dysfunctional families tend to be sullen, hostile, or immediate functioning. This information is important for planning care and choosing resources to enable all members to effectively cope with events.*^{6,9}

NURSING PRIORITY NO. 2 To determine degree of impairment/dysfunction:

- Observe for cues of sadness (e.g., sighing, faraway look, unkempt appearance, inattention to conversation, somatic complaints such as exhaustion, headaches). *Indicators of the extent of grief and how individual is dealing with situation.*^{12,14}
- Identify stage of grief being expressed: denial, isolation, anger, bargaining, depression, and acceptance. *Helps to establish how client is dealing with grieving and degree of difficulty client is having adjusting to the death or loss.*¹⁰
- Listen to words and communications indicative of renewed or intense grief (e.g., constantly bringing up death or loss even in casual conversation long after event; outbursts of anger at relatively minor events; expressing desire to die) *indicating person is possibly unable to adjust/move on from feelings of intense grief.*¹² *Note: Complicated grief therapy utilizes the concept of revisiting the loss through storytelling of the death, especially for individuals prone to avoid thinking about the trauma of the loss.*⁶
- Determine level of functioning, ability to care for self, and use of support systems and community resources. *Individual may be incapacitated by depth of loss and be unable to manage day-to-day activities adequately, necessitating intervention and assistance.*¹⁴
- Be aware of avoidance behaviors (e.g., anger; withdrawal; long periods of sleeping or refusing to interact with family; sudden or radical changes in lifestyle; inability to handle everyday responsibilities at home, work, or school; conflict). *Additional indicators of depth of grieving being experienced and need for more intensive support and monitoring to help client deal effectively with death or loss.*¹⁰⁻¹²
- Determine if client is engaging in reckless or self-destructive behaviors (e.g., substance abuse, heavy drinking, promiscuity, aggression) *to identify safety issues.*¹
-  Identify cultural factors and ways individual(s) has dealt with previous loss(es). *Way of expressing self may reflect cultural background and religious beliefs. Understanding cultural expectations will help put current behavior and responses in context and determine the nature and degree of dysfunction.*⁸
-  Perform or refer for psychological testing, as indicated (e.g., Beck's Depression Scale). *Determines degree of depression and possible need for medication.*²

NURSING PRIORITY NO. 3 To assist client/others to deal appropriately with loss:

- Encourage verbalization without confrontation about realities. *It is helpful to listen without correcting misperceptions in the beginning, allowing free flow of expression. Provides opportunity for reflection aiding resolution and acceptance.*²
- Encourage client to choose topics of conversation and refrain from forcing client to “face the facts.” *Talking freely about concerns can help client identify what is important to deal with and how to cope with situation.*⁹
- Active-listen feelings and be available for support or assistance. Speak in a soft, caring voice. *Communicates acceptance and caring, enabling client to seek own answers to current situation.*²
- Encourage expression of anger, fear, and anxiety. (Refer to appropriate NDs.) *These feelings are part of the grieving process, and to accomplish the work of grieving, they need to be expressed and accepted.*⁹
- Permit verbalization of anger with acknowledgment of feelings and setting of limits regarding destructive behavior. *Enhances client safety, promotes resolution of grief process by encouraging expression of feelings that are not usually accepted, and supports self-esteem.*²
- Acknowledge reality of feelings of guilt or blame, including hostility toward spiritual power. Do not minimize loss; avoid clichés and easy answers. (Refer to ND Spiritual Distress.) *Reinforces that feelings are acceptable and allows client to become aware of own thoughts and begin to deal with feelings.*^{1,7}
- Respect the client's needs and wishes for quiet, privacy, talking, or silence. *Individual may not be ready to talk about or share grief and needs to be allowed to make own time line.*²
- Give “permission” to be at this point when the client is depressed. *Assures client that feelings are normal and can be a starting point to deal in a positive manner with loss/death that has occurred.*⁹

- Provide comfort and availability as well as caring for physical needs. *Client needs to know he or she will be supported and helped when not able to care for self.*²
- Reinforce use of previously effective coping skills. Instruct in and encourage use of visualization and relaxation techniques. *Identifying and discussing how client has dealt with loss in the past can provide opportunities in the current situation. Use of these techniques helps client to learn to relax and consider options for dealing with loss.*²
- ∞ Assist SOs to cope with client's response. Include age-specific interventions. *Family/SO(s) may not understand/be intolerant of client's distress and inadvertently hamper client's progress. Family members, including children, may express their feelings in anger, resulting in punishment for behavior that is deemed unacceptable rather than recognized as the basis in grief.*¹⁰
- Include family/SO(s) in setting realistic goals for meeting needs of client and family members. *Involving all members enhances the probability that each member will express their needs and hear what the needs of others are, ensuring a more effective outcome.*²
- Encourage family members to participate in support group or family-focused therapy as indicated. *Technique of family-focused grief therapy focuses on emotional expression of grief and family functioning to strengthen the family's adaptive capacity and promote cohesiveness.*³
- 💊 Use sedatives or tranquilizers with caution. *While the use of these medications may be of limited benefit in the short term, too much dependence on them may retard passage through the grief process.*^{2,4}
- 🗣️📄 Refer to mental health provider for counseling. *Standard individual psychotherapy identifies and addresses symptoms, relationship problems, and their connections to grief. Research suggests the complicated grief therapy technique may be more effective by supporting the idea of dual processing (i.e., alternating attention between the loss and a focus on restoration and the future).*^{6–13}
- Refer to ND Grieving for additional interventions as appropriate.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Discuss with client/SO healthy ways of dealing with difficult situations. *Identifying ways individual(s) has dealt with losses in the past will help identify strengths and successes and what might be useful in the current situation.*²
- 🌐 Have individual(s) identify familial, religious, and cultural factors that have meaning. *One's family of origin has a major impact on what the individuals learn about these issues and how to deal with losses. Identifying and discussing how they affect the current situation may help bring loss into perspective and facilitate grief resolution.*^{5,8}
- Encourage involvement in usual activities, exercise, and socialization within limits of physical ability and psychological state. *Keeping life to a somewhat normal routine can provide individual(s) with some sense of control over events that are not controllable.*
- Suggest client keep a journal of experiences and feelings. *As client writes about what is happening, new insights may occur. Reading over what has been written can help individual see progress that has been made and begin to have hope for the future.*⁹
- Advocate planning for the future as appropriate to individual situation (e.g., staying in own home after death of spouse, returning to sporting activities following traumatic amputation, choice to have another child or to adopt, rebuilding home following a disaster). *Provides a sense of control and purpose and ensures that individual's wishes will be heard and respected.*¹⁰
- Identify volunteer opportunities (e.g., working with children at risk, raising funds for favorite charity, investigating new employment or relocation opportunities, participating in community reorganization or clean-up). *Exercising control in a productive manner empowers individuals and promotes rebuilding of life and community.*
- 🗣️📄 Refer to other resources (e.g., pastoral care, family counseling, psychotherapy, organized support groups—widow's group) as indicated. *Provides additional support to resolve situation and continue grief work.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including meaning of loss to the client, current stage of the grieving process, and responses of family/SOs.
- Cultural or religious beliefs and expectations.
- Availability and use of resources.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for complicated Grieving

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00172) [Diagnostic Division: Ego Integrity], Approved 2004; Revised 2006, 2013; 2017

DEFINITION: Susceptible to a disorder that occurs after the death of a significant other, in which the experience of distress accompanying bereavement fails to follow normative expectations and manifests in functional impairment, which may compromise health.

RISK FACTORS

Emotional disturbance

Insufficient social support

At Risk Population: Death of a significant other

[Loss of significant object (e.g., possessions, job, status, home, parts and processes of body)]

Sample Clinical Applications: Death of significant other, traumatic loss, attempted suicide, depression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Personal Resiliency: Positive adaptation and function of an individual following significant adversity or crisis

Grief Resolution: Personal actions to adjust thoughts, feelings, behaviors to actual or impending loss

Psychosocial Adjustment: Life Change: Adaptive psychosocial response of an individual to significant life circumstance

Client Will (Include Specific Time Frame)

- Acknowledge awareness of individual factors affecting client in this situation.
- Identify emotional responses and behaviors occurring after the death or loss.
- Participate in therapy to learn new ways of dealing with anxiety and feelings of inadequacy.
- Discuss meaning of loss to individual or family.
- Verbalize a sense of beginning to deal with grief process.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Grief Work Facilitation: Assistance with the resolution of a significant loss

Grief Work Facilitation: Perinatal Death: Assistance with the resolution of a perinatal loss

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

NURSING PRIORITY NO. 1 To identify risk/contributing factors:

- Determine loss that has occurred and meaning to client. Note if death was sudden or traumatic (e.g., fatal accident, homicide, large-scale disaster); related to socially sensitive issue (e.g., AIDS, gun violence in schools, suicide, sexual assault with murder); or associated with unfinished business (e.g., spouse died during time of crisis in marriage, son has not spoken to parent for years). *These situations can sometimes cause individual to become stuck in grief and unable to move forward with life.*^{1,2}
- ∞ Ascertain circumstances surrounding loss of fetus, infant, or child (e.g., gestational age of fetus, multiple miscarriages, death due to violence or fatal illness). *Repeated losses and/or violent death can increase client's/ significant other's (SO's) sense of futility and compromise resolution of grieving process.*^{2,7}

-  Meet with both parents following loss of child to determine how they are dealing with the loss together and individually. *Death of a child is often more difficult for parents/family, based on individual values and sense of life un-lived.*²
- Note stage of grief client is experiencing (e.g., denial, anger, bargaining, depression). *Stages of grief may progress in a predictable manner or stages may be random or revisited.*³
-  Assess client's ability to manage activities of daily living and period of time since loss has occurred. *Feelings of overwhelming sadness, exhaustion, and inertia can occur with active grieving, interfering with life activities; however, when they persist and interfere with normal activities, client may need additional assistance.*³
-  Note availability and use of support systems and community resources.
- Listen to words and communications indicative of renewed or intense grief (e.g., constantly bringing up death or loss even in casual conversation long after event, outbursts of anger at relatively minor events, expressing desire to die), *indicating person is possibly unable to adjust or move on from feelings of intense grief.*⁴
-  Identify cultural or religious beliefs and expectations that may impact or dictate client's response to loss. *These factors affect current situation and may help bring loss into perspective and promote grief resolution.*^{2,5}
- Assess status of relationships or marital difficulties and adjustments to loss. *Responses of family/SOs affect how client deals with situation.*⁶

NURSING PRIORITY NO. 2 To assist client to deal appropriately with loss:

- Discuss meaning of loss to client, Active-listen to responses without judgment. *The more complicated or devastating the loss is to the individual, the more likely she or he will have difficulty reaching resolution.*
- Respect client's desire for quiet, privacy, talking, or silence. *Individual may not be ready to talk about or share grief and needs to be allowed to make own time line.*³
- Encourage expression of feelings, including anger, fear, and anxiety. Let client know that all feelings are okay, while setting limits on destructive behavior.^{3,6}
- Acknowledge client's sense of relief when death follows a long and debilitating course. *Sadness and loss are still there, but the death may be a release, or client may feel guilty about having a sense of relief.*
- Assist SOs/family to understand and be tolerant of client's feelings and behavior. *Family members may inadvertently hamper client's progress through grief by expressing their feelings in anger for client behavior they deem unacceptable rather than recognizing the basis is grief.*⁸

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Assist client/SOs to identify successful coping skills they have used in the past. *These can be used in current situation to facilitate dealing with grief.*³
- Support client and family in setting goals for meeting needs of members for moving on beyond the grieving process.
- Encourage resuming involvement in usual activities, exercise, and socialization within physical and psychological abilities. *Keeping life to a somewhat normal routine can provide individual with some sense of control over events that are not controllable.*⁵
- Advocate planning for the future as appropriate to individual situation (e.g., staying in own home after death of spouse, returning to sporting activities following traumatic amputation, choice to have another child or to adopt, rebuilding home following a disaster). *Provides a sense of control and purpose and ensures that individual's wishes will be heard and respected.*⁸
-  Refer to other resources, as needed, such as psychotherapy, family counseling, religious references or pastor, or a grief support group. *Depending upon meaning of the loss, individual may require ongoing support to work through grief.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including meaning of loss to the client, current stage of the grieving process, psychological status, and responses of family/SOs.
- Cultural or religious beliefs, expectations, and rituals.
- Availability and use of resources.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for disproportionate Growth

Taxonomy II: Growth/Development—Class 1 Growth (00113) [Diagnostic Division: Teaching/Learning], Approved 2013

DEFINITION: Susceptible to growth above the 97th percentile or below the 3rd percentile for age, crossing two percentile channels, which may compromise health.

RISK FACTORS

Prenatal

Inadequate maternal nutrition; maternal infection; multiple gestation
Substance abuse; exposure to teratogen
Congenital or genetic disorder

(continues on page 396)

risk for disproportionate Growth (continued)

Individual

Prematurity

Malnutrition; maladaptive feeding behavior by caregiver, or self-feeding; insatiable appetite; anorexia

Infection; chronic illness

Substance abuse (including anabolic steroids)

Environmental

Deprivation, economically disadvantaged

Exposure to violence, natural disasters

Exposure to teratogen; lead poisoning

Caregiver

Presence of abuse (e.g., physical, psychological, sexual)

Mental health issue (e.g., depression, psychosis, personality disorder, substance abuse)

Learning disability; alteration in cognitive functioning

Sample Clinical Applications: Congenital or genetic disorders, prematurity, infection, nutritional problems (malnutrition, anorexia, failure to thrive, excessive intake or obesity), toxic exposures (e.g., lead), abuse or neglect, endocrine disorders, pituitary tumor

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Growth: Normal increase in height and body weight from infancy through adolescence

Weight: Body Mass: Extent to which body weight, muscle, and fat are congruent to height, frame, gender, and age

Client Will (Include Specific Time Frame)

- Receive appropriate nutrition as dictated by individual needs.
- Demonstrate weight and growth stabilizing or progressing toward age-appropriate size.
- Participate in plan of care as appropriate for age and ability.

Sample NOC linkages:

Child Development: [specify age group]: Milestones of physical, cognitive, and psychosocial progression by [specify] months/years of age

Client/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of potential for growth delay or deviation and plan for prevention.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Nutritional Monitoring: Collection and analysis of patient data pertaining to nutrient intake

Teaching: Infant [or] Toddler Nutrition [specify age]: Instruction on nutrition and feeding practices during the first, second, or third years of life

Weight Management: Facilitating maintenance of optimal body weight and percent body fat

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine factors or condition(s) existing that could contribute to growth deviation as listed in Risk Factors, including familial history (e.g., pituitary tumors, Marfan's syndrome, genetic anomalies), prematurity with complications, use of certain drugs or substances during pregnancy, maternal diabetes or other chronic illness, poverty or inability to attend to nutritional issues, eating disorders, etc. *Information essential to developing plan of care.*
- Identify nature and effectiveness of parenting and caregiving activities. *Inadequate, inconsistent caregiving; unrealistic or insufficient expectations; lack of stimulation; inadequate limit setting; and lack of responsiveness indicates problems in parent-child relationship.*⁴
- Note severity and pervasiveness of situation (e.g., individual/significant other showing effects of long-term physical or emotional abuse or neglect versus individual experiencing recent-onset situational disruption or inadequate resources during period of crisis or transition).
-  Evaluate nutritional status. *Overfeeding or malnutrition (protein and other basic nutrients) on a constant basis prevents individual from reaching healthy growth potential, even if no disorder or disease exists. Malnutrition is the most common cause of growth failure worldwide. In industrialized nations, children continue to have nutritional deficiencies that can impair growth or development.*¹²
-  Review results of studies such as skull and hand x-rays; bone scans, such as computed tomography or magnetic resonance imaging; and chest or abdominal imaging to determine bone age and extent of bone and soft tissue overgrowth and the presence of pituitary or other growth hormone-secreting tumor. Note laboratory studies (e.g., growth hormone levels, glucose tolerance, thyroid and other endocrine studies, serum transferrin and prealbumin) to identify pathology.^{8,11,12}
-  Determine cultural, familial, and societal values that may impact situation or parental expectations (e.g., some cultures equate a "plump" baby with a healthy baby; childhood obesity is now a risk for American children and parents are concerned about child's food intake; expectations for "normal growth").¹³
- Assess cognition, awareness, orientation, and behavior of the client/caregiver. *Actions such as withdrawal or aggression and reactions to environment and stimuli provide information for identifying needs and planning care.*¹
- Active-listen concerns about body size and ability to perform competitively (e.g., sports, body building) to ascertain the potential for inappropriate use of anabolic steroids or other drugs.

NURSING PRIORITY NO. 2 To prevent/limit deviation from growth norms:

- Determine chronological age and note reported losses or alterations in functional level. *Provides comparative baseline.*
- Note familial factors (e.g., parent's body build and stature) to help determine individual growth expectations (e.g., when child should attain a certain weight and height) and how the expectations may be altered by child's condition.¹²
- Review expectations for current height and weight percentiles and degree of deviation. Plan for periodic evaluations. *Growth rates are measured in terms of how much a child grows within a specified time. These rates vary dramatically as a child grows (normal growth is a discontinuous process) and must be evaluated periodically over time to ascertain that child has definite growth disturbance. Accelerated or slowed growth rates are rarely normal and warrant further evaluation.*¹
- Investigate deviations in height, weight, and head size. *Deviations may include weight only (increased or decreased) or height (increased or decreased) and head size (disproportionate to rest of body). These deviations may be seen alone or in combination, all requiring additional testing over time to determine cause and effect on child's growth and development. Some are more urgent than others (e.g., small head size is evaluated further/treated as soon as identified, whereas short stature may require a longer evaluation period to determine if developmental problem exists).*¹
- Determine if child's growth is above 97th percentile (very tall and large) for age. *Child should be further evaluated for endocrine disorders or pituitary tumor (could result in gigantism). Other disorders may be*

characterized by excessive weight for height (e.g., hypothyroidism, Cushing's syndrome) and abnormal sexual maturation or abnormal body/limb proportions.^{2,8}

- Determine if child's growth is below third percentile (very short and small) for age. *Child should have further evaluations for failure to thrive related to intrauterine growth retardation, prematurity or very low birth weight, small parents, poor nutrition, stress or trauma, endocrine disorders (e.g., growth hormone or thyroid deficiency), or medical condition (e.g., intestinal disorders with malabsorption; diseases of heart, kidneys; diabetes mellitus). Treatment of underlying condition may alter or improve child's growth pattern.*^{3,9,10}
-  Assist with therapies to treat or correct underlying conditions (e.g., Crohn's disease, cardiac problems, or renal disease), endocrine problems (e.g., hyperpituitarism, hypothyroidism, type 1 diabetes mellitus, growth hormone abnormalities), genetic or intrauterine growth retardation, and infant feeding problems and nutritional deficits.
-  Include nutritionist and other specialists as indicated (e.g., physical or occupational therapist) in developing plan of care. *Helpful in determining specific dietary needs for growth and weight issues as well as child's personal and cultural preferences, issues with foods (e.g., child who is sensory overresponsive may be bothered by food textures, child with posture problems may need to stand to eat, etc.); child may require assistive devices and appropriate exercise and rehabilitation programs.*⁶
-  Note reports of changes in facial features, joint pain, lethargy, sexual dysfunction, or progressive increase in hat, glove, ring, or shoe size in adults, especially after age 40. *Individual should be referred for further evaluation for hyperpituitarism or growth hormone imbalance and acromegaly.*⁸

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide information regarding growth issues, as appropriate, including pertinent reference materials such as books, audiovisual materials, credible Web sites, etc. *Provides opportunity to review data at own pace, enhancing likelihood of retention, and opportunity to make informed decisions.*
-   Discuss with pregnant women and adolescents consequences of substance use or abuse. *Prevention of growth disturbances depends on many factors but includes the cessation of smoking, alcohol, and many drugs that have the potential for causing central nervous system or orthopedic disorders in the fetus.*^{5,7}
-  Refer for genetic screening as appropriate. *There are many reasons for referral, including (and not limited to) positive family history of a genetic disorder (e.g., fragile X syndrome, muscular dystrophy), pregnant female with exposure to toxins or potential teratogenic agents, women older than 35 years at delivery, previous child born with congenital anomalies, history of intrauterine growth retardation, etc.*
- Address parent/caregiver issues (e.g., parental abuse, learning deficiencies, environment of poverty) *where they could impact client's ability to thrive.*
- Promote client lifestyle that prevents or limits complications (e.g., management of obesity, hypertension, sensory or perceptual impairments), regular medical follow-up, nutritionally balanced meals, socialization for age and development, etc., *to enhance functional independence and quality of life.*
- Recommend involvement in regular monitored exercise and/or sports programs *to enhance muscle tone and strength, and appropriate body building.*
-  Review medications being considered (e.g., appetite stimulant, growth hormone, thyroid replacement, anti-depressant), noting potential side effects/adverse reactions *to promote adherence to regimen and reduce risk of untoward responses.*
-  Identify available community resources as appropriate (e.g., public health programs such as the Women, Infants, and Children program; medical equipment suppliers; nutritionist; substance abuse programs; specialists in endocrine problems/genetics).
-  Emphasize importance of periodic reassessment of growth and development (e.g., periodic lab studies to monitor hormone levels, bone maturation, and nutritional status). *Aids in evaluating effectiveness of interventions over time, promotes early identification of need for additional actions, and helps to avoid preventable complications.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, individual needs, current growth status and trends.
- Caregiver's understanding of situation and individual role.
- Cultural or familial values and expectations.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Client's responses to interventions, teaching, and actions performed.
- Caregiver response to teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified long-term needs and who is responsible for actions to be taken.
- Specific referrals made, sources for assistive devices, educational tools.

risk-prone Health Behavior

Taxonomy II: Health Promotion—Class 2 Health Management (00188) [**Diagnostic Division:** Teaching/Learning].
Submitted as impaired Adjustment 1986; Revised 1998; Revised/Renamed 2006, 2008; Revised 2017

DEFINITION: Impaired ability to modify lifestyle and/or actions in a manner that improves the level of wellness.

RELATED FACTORS

Inadequate comprehension; low self-efficacy
Negative perception of health care provider or recommended health care strategy
Social anxiety; insufficient social support; stressors
Smoking; substance misuse/[abuse]

DEFINING CHARACTERISTICS

Subjective

Minimizes health status change
Failure to achieve optimal sense of control

Objective

Failure to take action that prevents health problem
Nonacceptance of health status change

At Risk Population: Family history of alcoholism; economically disadvantaged

Sample Clinical Applications: New diagnosis/life changes for client, Alzheimer's disease, brain injury, personality or psychotic disorders, postpartum depression/psychosis, substance use/abuse

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Acceptance: Health Status: Personal actions to reconcile significant changes in health circumstances

Psychosocial Adjustment: Life Change: Adaptive psychosocial response of an individual to a significant life circumstance

Health Promoting Behavior: Personal actions to sustain or increase wellness

Client Will (Include Specific Time Frame)

- Demonstrate increasing interest or participation in self-care.
- Develop ability to assume responsibility for personal needs when possible.
- Identify stress situations leading to difficulties in adapting to change in health status and specific actions for dealing with them.
- Initiate lifestyle changes that will permit adaptation to present life situations.
- Identify and use appropriate support systems.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

Counseling: Use of an interactive helping process focusing on the needs, problems, or feelings of the patient and significant others to enhance or support coping, problem solving, and interpersonal relationships

Teaching: Disease Process: Assisting the patient to understand information related to a specific disease process

NURSING PRIORITY NO. 1 To assess degree of impaired function:

- Perform a physical and/or psychosocial assessment. *Determines the extent of the limitation(s) of the present condition.*¹
- Listen to the client's perception of inability or reluctance to adapt to situations that are occurring at present. *Perceptions are reality to the client and need to be identified so they may be addressed and dealt with.*³
- Survey (with the client) past and present significant support systems (family, church, groups, organizations). *Identifies helpful resources that may be needed in current situation or change in health status.*²
-  Explore the expressions of emotions signifying impaired adjustment by client/significant others (SOs). *Overwhelming anxiety, fear, anger, worry, passive or active denial can be experienced by the client who is having difficulty adjusting to a change in health or a feared diagnosis.*⁴
-  Note child's interaction with parent/caregiver. *Interactions can be indicative of problems when family is dealing with major health issues and change in family functioning. Development of coping behaviors is limited at this age, and primary caregivers provide support for the child and serve as role models.*⁵
-  Determine whether child displays problems with school performance, withdraws from family/peers, or demonstrates aggressive behavior toward others/self. *Indicators of poor coping and need for specific interventions to help child deal with own health issues or what is happening in the family.*⁶

NURSING PRIORITY NO. 2 To identify the causative/contributing factors relating to the impaired adjustment:

- Listen to client's perception of factors leading to the present dilemma, noting onset, duration, presence or absence of physical complaints, and social withdrawal. *Change often creates a feeling of disequilibrium, and the individual may respond with irrational or unfounded fears. Client may benefit from feedback that corrects misperceptions about how life will be with the change in health status.*⁷
- Note substance use or abuse (e.g., smoking, alcohol, prescription medications, street drugs) that may be used as a coping mechanism, exacerbate health problem, or impair client's comprehension of situation.
-  Identify possible cultural beliefs or values influencing client's response to change. *Different cultures deal with change of health issues, such as cancer, chronic obstructive pulmonary disease, and diabetes mellitus, in different ways (i.e., some cultures may believe they should be quiet and stoic when sick; some may seem passive or expect the family to care for the client; others may be assertive and direct their care more frequently).*¹²
-  Assess affective climate within family system and how it determines family members' response to adjustment to a major health challenge. *Families who are high-strung and nervous may interfere with client's dealing with illness in a rational manner, while those who are more sedate and phlegmatic may be more helpful to the client in accepting the current circumstances.*²
- Determine lack of or inability to use available resources. *The high degree of anxiety that usually accompanies a major lifestyle change often interferes with ability to deal with problems created by the change or loss. Helping client learn to use these resources enables him or her to take control of own illness.*⁸
- Discuss normalcy of anger as life is being changed and encourage channeling anger to healthy activities. *The increased energy of anger can be used to accomplish other tasks and enhance feelings of self-esteem.*²
- Review available documentation and resources to determine actual life experiences (e.g., medical records, statements of SOs, consultants' notes). *In situations of great stress (physical or emotional), the client may not accurately assess occurrences leading to the present situation.*⁹

NURSING PRIORITY NO. 3 To assist client in coping/dealing with impairment:

-  Organize a team conference (including client and ancillary services). *Individuals who are involved and knowledgeable can focus on contributing factors that are affecting client's adjustment to the current situation and can plan for management as indicated.*¹⁰
- Explain disease process or causative factors and prognosis as appropriate, promote questioning, and provide written and other resource materials. *Enhances understanding, clarifies information, and provides opportunity to review information at individual's leisure.*

-   Share information with adolescent's peers with client's permission and involvement when illness or injury affects body image or function. *Peers are primary support for this age group, and sharing information promotes understanding and compassion.*⁵
- Provide an open environment encouraging communication. *Supports expression of feelings concerning impaired function so they can be dealt with realistically.*²
- Use therapeutic communication skills (e.g., Active-listening, acknowledgment, silence, "I" statements). *Promotes open relationship in which client can explore possibilities and solutions for changing lifestyle situation.*¹³
- Acknowledge client's efforts to adjust: "You have done your best." *May reduce feelings of blame or guilt and defensive responses.*¹¹
-  Discuss and evaluate resources that have been useful to the client in adapting to changes in other life situations. *Vocational rehabilitation, employment experiences, and psychosocial support services may be useful in current situation.*¹¹
- Develop a plan of action with client to meet immediate needs (e.g., physical safety and hygiene, emotional support of professionals and SOs) and assist in implementation of the plan. *Provides a starting point to deal with current situation for moving ahead with plan for adjusting to change in life circumstances and for evaluation of progress toward goals.*
-  Reinforce structure in daily life. Include exercise as part of routine. *Routines help the client focus. Exercise improves sense of wellness and enhances immune response.*
- Review with client coping skills used in previous life situations and role changes. *Identifies the strengths that may be used to facilitate adaptation to change or loss that has occurred.*⁸
- Refine or develop new coping strategies as appropriate. *Strengthens skills for dealing with change in health or lifestyle.*
- Identify with and problem-solve the client frustrations in daily care. *Focusing on the smaller factors of concern gives the individual the ability to perceive the impaired function from a less threatening perspective (one-step-at-a-time concept). Also promotes sense of control over situation.*
- Involve SO(s) in long-range planning for emotional, psychological, physical, and social needs. *Change that is occurring when illness is long term or permanent indicates that lifestyle changes will need to be dealt with on an ongoing basis, which may be difficult for client and family to adjust to.*¹²
-  Refer for individual/family counseling as indicated. *May need additional assistance to cope with current situation.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Identify strengths the client perceives in present life situation. Keep focus on the present. *Unknowns of the future may be too overwhelming when diagnosis or injury means permanent changes in lifestyle and long-term management.*
- Assist SOs to learn methods of managing present needs. (Refer to NDs specific to client's deficits.) *Promotes internal locus of control and helps develop plan for long-term needs reflecting changes required by illness or changes in health status.*²
-  Pace and time learning sessions to meet client's needs, providing for feedback during and after learning experiences (e.g., self-catheterization, range-of-motion exercises, wound care, therapeutic communication). *Promotes skill and enhances retention, thereby improving confidence.*¹
-  Refer to other resources in the long-range plan of care. *Long-term assistance may include such elements as home care, transportation alternatives, occupational therapy, or vocational rehabilitation that may be useful for making indicated changes in life and assisting with adjustment to new situation as needed.*²
- Assist client/SO(s) to see appropriate alternatives and potential changes in locus of control. *Often major change in health status results in loss of sense of control, and client needs to begin to look at possibilities for managing illness and what abilities can make life go on in a positive manner.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Reasons for and degree of impairment.
- Client's/SO's perception of the situation.
- Effect of behavior on health status or condition.

Planning

- Plan for adjustments and interventions for achieving the plan and who is involved.
- Teaching plan.

Implementation/Evaluation

- Client responses to the interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Resources that are available for the client and SO(s) and referrals that are made.

deficient community Health

Taxonomy II: Health Promotion—Class 2 Health Management (00215) [Diagnostic Division: Teaching/Learning], Approved 2010

DEFINITION: Presence of one or more health problems or factors that deter wellness or increase the risk of health problems experienced by an aggregate.

RELATED FACTORS

Insufficient access to healthcare providers; insufficient resources [e.g., financial, social, knowledge]
 Insufficient community experts
 Inadequate program budget, outcome data, or evaluation plan
 Inadequate social support or consumer satisfaction with program
 Program incompletely addresses health program

(continues on page 404)

deficient community Health (continued)

DEFINING CHARACTERISTICS

Subjective

[Community members/agencies verbalize overburdening of resources to meet therapeutic needs of all members]

[Community members/agencies verbalize inability to meet therapeutic needs of all members]

Objective

Health problem experienced by aggregates or populations

Program unavailable to prevent, reduce, or eliminate health problem(s) of an aggregate or population

Program unavailable to enhance wellness of an aggregate or population

Risk of hospitalization experienced by aggregates or populations

Risk of physiological or psychological states experienced by aggregates or populations

Sample Clinical Applications: HIV/AIDS, substance abuse, sexually transmitted infections, teen pregnancy, prematurity, acute lead poisoning, influenza, severe acute respiratory syndrome (SARS)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Community Competence: Capacity of a community to collectively problem-solve to achieve community goals

Community Health Status: General state of well-being of a community or population

Community Risk Control: Communicable Disease: Community actions to eliminate or reduce the spread of infectious agents that threaten public health

Community Will (Include Specific Time Frame)

- Identify both strengths and limitations affecting community programs for meeting health-related goals.
- Participate in problem-solving of factors interfering with regulating and integrating community programs.
- Develop plans to address identified community health needs.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Community Health Development: Assisting members of a community to identify a community's health concerns, mobilize resources, and implement solutions

Program Development: Planning, implementing, and evaluating a coordinated set of activities designed to enhance wellness, or to prevent, reduce, or eliminate one or more health problems for a group or community

Health Policy Monitoring: Surveillance and influence of government and organization regulations, rules, and standards that affect nursing systems and practices to ensure quality care of patients

NURSING PRIORITY NO. 1 To identify causative/precipitating factors:

- Determine healthcare providers' understanding, terminology, and practice policies relating to community (populations and aggregate). *Population-based practice considers the broad determinants of health, such as income/ social status, housing, employment/working conditions, social support networks, education, neighborhood*

*safety/violence issues, physical environment, personal health practices and coping skills, cultural customs/values, and community capacity to support family and economic growth.*⁶

- Investigate health problems, unexpected outbreaks or acceleration of illness, and health hazards in the community. *Identifying specific problems allows for population-based interventions emphasizing primary prevention, promoting health, and preventing problems before they occur.*^{2,6,7}
- Evaluate strengths and limitations of community healthcare resources for wellness, illness, or sequelae of illness. *Knowledge of currently available resources and ease of access provide a starting point to determine needs of the community and plan for future needs.*
- Note reports from members of the community regarding ineffective or inadequate community functioning. *Provides feedback from people who live in the community and avail themselves of resources, thus presenting a realistic picture of problem areas.*
-  Determine areas of conflict among members of community. *Cultural or religious beliefs, values, social mores, and lack of a shared vision may limit dialogue or creative problem-solving if not addressed.*^{5,7}
- Ascertain effect of related factors on community. *Issues of safety, poor air quality, lack of education or information, and lack of sufficient healthcare facilities affect citizens and how they view their community—whether it is a healthy, positive environment in which to live or lacks adequate healthcare or safety resources.*¹
- Determine knowledge and understanding of treatment regimen. *Citizens need to know and understand what is being proposed to correct the identified deficiencies before they are willing to be involved and actively support goals of the treatment regimen.*
- Note use of resources available to community for developing and funding programs. *May require creative program planning to utilize/maximize resources to meet multiple needs.*

NURSING PRIORITY NO. 2 To assist community to develop strategies to improve community functioning and management:

- Foster cooperative spirit of community without negating individuality of members/groups. *As individuals feel valued and respected, they are more willing to work together with others to develop a plan for identifying and improving healthcare for the community.*
- Involve community in determining healthcare goals and prioritizing them to facilitate planning process. *The goal is healthy people in a healthy community, and as community members become involved and see that by prioritizing the identified goals, progress can be seen as individuals become healthier and needed services become readily available.*²
-  Link people to needed services and ensure the provision of healthcare to extent possible. Plan together with community health and social agencies to problem-solve solutions identified and anticipated problems and needs. *Interventions may be directed at an entire population within a community, the systems that affect the health of those populations, and/or the individuals and families within at-risk populations. Working together promotes a sense of involvement and control, helping people implement more effective problem-solving.*^{2,3}
-  Identify specific populations at risk or underserved (e.g., chronically ill or disabled persons; elder adults; mentally ill persons; substance abusers; veterans; economically disadvantaged families; rural, migrant, immigrant, and homeless persons; racial and ethnic minorities) to actively involve them in the planning and evaluation processes. *These groups are often marginalized and frequently lack knowledge of available services, may be suspicious or lack interest in available programs, or lack resources to access services. Being part of the solution enhances sense of being heard, empowering these groups and promoting continued participation in the process.*^{3,4,7,8}
-  Network with others involved in educating healthcare providers and healthcare consumers regarding community needs. Create a teaching plan and form a speakers' bureau. Provide accurate information and demonstrate desired action. Present information in a culturally appropriate manner. *Disseminating information to community members regarding value of treatment or preventive programs helps people know and understand the importance of these actions and be willing to support the programs.*^{1,3,7}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- Assist community to develop a plan for continued assessment of community needs and functioning (e.g., access to adequate healthcare; education regarding disease prevention, public health threats, and immunization; local warning system and evacuation plan in event of disaster; emergency contact numbers; planning for community members with special needs [elderly, handicapped, low-income persons]; violence prevention, personal or property protection; water, sanitation, toxic substance management; mobilization of local, state, and national resources). *Promotes proactive approach in planning for the future and continuation of efforts to improve healthy behaviors and necessary services. Note: Networks may be internal to the agency (e.g., with epidemiologists; public health nurses and educators; in-house laboratories; plumbing, electrical, and building inspectors) community-wide (e.g., with nongovernmental organizations, industry, academia, labs), or within the government's public health/environmental protection system (Environmental Protection Agency, the Centers for Disease Control and Protection, other federal agencies; state offices such as State Engineer and Attorney General; local agencies).*^{1,4,7}
- Encourage community to form partnerships within the community and between the community and the larger society. *Aids in long-term planning for anticipated and projected needs and concerns to ensure the quality and accessibility of health services.*¹

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Assessment findings, including members' perceptions of community problems, healthcare resources.
- Community use of available resources.

Planning

- Plan and who is involved in planning process.
- Teaching plan.

Implementation/Evaluation

- Community's response to plan, interventions, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan.

Discharge Planning

- Long-term goals and who is responsible for actions to be taken.
- Specific referrals made.

readiness for enhanced Health Literacy

Taxonomy II: Health Promotion—Class 1 Health Awareness (00262) [**Diagnostic Division:** Teaching/Learning], Approved 2016

DEFINITION: A pattern of using and developing a set of skills and competencies (literacy, knowledge, motivation, culture, and language) to find, comprehend, evaluate, and use health information and concepts to make daily health decisions to promote and maintain health, decrease health risks, and improve overall quality of life, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to obtain sufficient information to navigate the healthcare system

Expresses desire to enhance:

- Ability to read, write, speak, and interpret numbers for everyday health needs
- Awareness of civic and/or government processes that impact public health, and social support for health
- Health communication with healthcare providers
- Knowledge of current determinants of health on social and physical environments
- Personal healthcare decision-making;
- Understanding of healthcare information, customs, and beliefs to make healthcare decisions

Sample Clinical Applications:

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Health Literacy Behavior: Personal actions to obtain, understand, and evaluate information related to health, illness, and available services to make care decisions

Client Will (Include Specific Time Frame)

- Identify personal health needs/goals.
- Identify quality informational resources to enhance knowledge and support decision-making.
- Verbalize understanding of health information received/accessed.
- Make informed healthcare decisions relevant to needs.
- Engage in preventive health practices.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Health Literacy Enhancement: Assisting individuals with limited ability to obtain, process, and understand information related to health and illness

NURSING PRIORITY NO. 1 To determine level of health literacy and motivation for change:

- Determine client's health status and client's perception of how healthy he/she is at this time. *Client may perceive self as healthy when actually the client has some serious symptoms he/she is not aware of or is minimizing.*
- Ascertain current ability and knowledge about own healthcare and healthcare system. *Ability to verbalize health needs, report symptoms, know where to get healthcare and follow guidance from the caregiver is vital in accomplishing health goals. Belief in the ability to accomplish desired action is predictive of performance.³*

-  Determine cultural beliefs that may influence client's view of the healthcare system and the client's own care. *These beliefs can have strong influence on client's desire to change.*⁴
- Active-listen client's concerns and issues that may be affecting client's desire to make changes. *Factors such as health insurance and access to care, family problems, and economic situation may motivate client as well as interfere with plan for change.*
- Determine sources client currently uses to access information and how client actually uses the information. *Sources used vary widely depending on multiple factors such as client's age, language proficiency, accessibility of technology. Individuals may be very adept at getting information but may not know how to use it in the context of their own health, to understand insurance papers, or to pay their bills.*⁴
- Determine the ability of the individual to understand the medical information and instructions the client is given/accessing. *Many adults are challenged by what is termed "low health literacy," a significant number reading at a fifth grade level, economically disadvantaged, elderly, and having a low English proficiency or are non-native speakers of English.*^{3,4}
- Note social factors such as inadequate access to healthcare, educational disparities, and socioeconomic status that can influence client's behavior regarding healthcare. *Access and participation in health resources and education programs are not spread evenly across underserved populations, affecting choice of interventions.*¹

NURSING PRIORITY NO. 2 To assist client to develop plan for change:

-  Provide guidance that fits with client's cultural, dietary, and/or religious values. During interactions with client, be sensitive to body language, mode of dress, gender "rules" (e.g., female shaking hands with male, direct eye contact), and when asking sensitive questions to clarify understanding or dispelling preconceived ideas. *These strategies help put client at ease, enhance trust, and can improve nurse-client relationship.*⁴
- Assist client to develop a plan addressing individual needs/weaknesses. *Identifying specific areas for improvement aids in choice of interventions.*
- Discuss with the client/family what areas of the client's life he/she has control over, such as choosing foods, cooking, safe place to exercise. *Making these decisions promotes sense of self-esteem, helping to improve health practices.*
- Focus energies on promoting informed lifestyle choices, preventive health programs, risk factor modification as appropriate. *Patient self-management relies on these factors to improve health, especially in management of chronic diseases.*¹
- Educate client/family in the use of web portals and public access resource sites as needed. *Persons with limited health literacy are less likely to use these resources, which may be due to ethnic/cultural or racial differences or level of comfort in sharing private health information.*²
- Acknowledge efforts the client is making to maintain consistent positive outcomes of interventions. *These actions improve self-care efforts, patient satisfaction, coping skills, and perceptions of social support.*¹

NURSING PRIORITY NO. 3 To promote optimum health literacy:

- Reduce the use of health industry jargon, provide health materials in several languages and provide interpreters when needed. *These changes will help client to understand the information the client is given.*⁴
- Deliver health information in a clear, engaging, and personally relevant manner. Have client repeat back what you have told him/her. *Can help client to understand, feel empowered, and respected. Provides an opportunity to clarify and correct misunderstandings.*⁴
- Improve print communication by using plain and clear language, organizing ideas clearly, and using logical layout and design. *Facilitates reading and comprehension of potentially complicated consumer health information.*⁴
- Promote client/family involvement in consumer education and health literacy. *Low literacy and numeracy (basic math skills) means that health communication is poorly understood. Individuals who are actively involved in seeking, understanding, and acting on health information learn how to navigate the system for maximum well-being.*¹

- Provide information about other community resources that can enhance learning and improve health literacy. *Programs such as smoking cessation, nutrition/weight loss, healthy exercise provide opportunities for skill training, problem-solving.*¹
- Encourage client to do breast self-examination/mammogram, testicular and prostate exams, regular dental examination, keep immunizations current. *These actions contribute to maintaining wellness and encourage health literacy.*¹
- Assist client to prepare for healthcare encounters—write list of questions, list of all medications taken (prescription, over-the-counter, vitamins/herbals), and obtaining results of diagnostic testing. *Role-playing and collecting necessary information can improve client confidence and facilitate meaningful interaction with provider.*⁴
- Suggest SO/family member accompany client to healthcare appointments as appropriate. *Helpful for writing down/remembering information presented.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Personal health status.
- Goals and motivation for change.
- Pertinent social factors, cultural beliefs, religious values impacting health and use of healthcare system.
- Primary language, literacy/reading level.
- Availability and use of resources/health services.

Planning

- Plan of care and who is involved in planning.
- Individual learning needs.

Implementation/Evaluation

- Response to interventions, teaching and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan.

Discharge Planning

- Short- and long-term needs and who is responsible for actions.
- Available resources, specific referrals made.

ineffective Health Maintenance

Taxonomy II: Health Promotion—Class 2 Health Management (00099) [**Diagnostic Division:** Safety], Approved 1982; Revised 2017

DEFINITION: Inability to identify, manage, and/or seek out help to maintain health.

[Author note: This diagnosis contains components of other NDs. We recommend subsuming health maintenance interventions under the “basic” nursing diagnosis when a single causative factor is identified (e.g., deficient Knowledge [specify], ineffective Health Management, chronic Confusion, impaired Verbal Communication, ineffective Coping, compromised family Coping, risk for delayed Development).]

RELATED FACTORS

Complicated grieving; spiritual distress
 Impaired decision-making
 Ineffective communication skills or coping strategies
 Insufficient resources

DEFINING CHARACTERISTICS

Objective

Absence of adaptive behaviors to environmental changes
 Absence of interest in improving health behaviors; pattern of lack of health-seeking behavior
 Inability to take responsibility for meeting basic health practices; insufficient knowledge about basic health practices
 Insufficient social support

At Risk Population: Developmental delay

Associated Condition: Alteration in cognitive functioning, perceptual disorders; decrease in fine or gross motor skills

Sample Clinical Applications: Chronic conditions (e.g., multiple sclerosis [MS], rheumatoid arthritis, chronic pain), brain injury or stroke, spinal cord injury or paralysis, laryngectomy, dementia, Alzheimer’s disease, developmental delay

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Health Promoting Behavior: Personal actions to sustain or increase wellness

Knowledge: Health Behavior: Extent of understanding conveyed about the promotion and protection of health

Participation in Health Care Decisions: Personal involvement in selecting and evaluating healthcare options to achieve desired outcome

Client Will (Include Specific Time Frame)

- Identify necessary health maintenance activities.
- Verbalize understanding of factors contributing to current situation.
- Assume responsibility for own healthcare needs within level of ability.
- Adopt lifestyle changes supporting individual healthcare goals.

Sample **NOC** linkages:

Risk Detection: Personal actions to identify personal health threats

Social Support: Reliable assistance from others

SO/Caregiver Will (Include Specific Time Frame)

- Verbalize ability to cope adequately with existing situation and provide support and monitoring as indicated.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Health System Guidance: Facilitating a patient's location and use of appropriate health services

Support System Enhancement: Facilitation of support to patient by family, friends, and community

Health Education: Developing and providing instruction and learning experiences to facilitate voluntary adaptation of behavior conducive to health in individuals, families, groups, or communities

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Recognize differing perceptions regarding health issues between healthcare providers and clients. Explore ways to partner. *Awareness that healthcare provider's goals may not be the same as a client's goals can provide opportunities to explore and communicate. Left undone, the door is open for frustration on both sides, affecting client care experience and/or perceived outcome of care. Note: For example, one study found that healthcare staff rated client's self-responsibility as the most important variable (out of 17) while the patients rated it 11th.*^{13,14}
-  Identify health practices and beliefs in client's personal and family history, including health values, religious or cultural beliefs, and expectations regarding healthcare. *Clients and healthcare providers do not always view a health risk in the same way. The client may not view current situation as a problem or may be unaware of routine health maintenance practices and needs. Note: In one study researchers found that information designed to meet unique characteristics of the individual through culturally relevant tailoring increased the adherent rate of interventions significantly.*^{11,12}
-  Note client's age (e.g., very young or elderly age); cognitive, emotional, physical, and developmental status; and level of dependence and independence. *Client's status may range from complete dependence (dysfunctional) to partial or relative independence and determines type of interventions/support needed.*
- Note whether impairment is related to an acute or sudden onset situation or a progressive illness or long-term health problem. *Determines type and intensity and length of time support may be required.*⁴
- Ascertain client's ability and desire to learn. Determine barriers to learning (e.g., can't read, speaks or understands different language, is overcome with stress or grief). *The client may not be physically, emotionally, or mentally capable at present because of current situation or may need information in small, manageable increments.*¹
- Assess communication skills and ability or need for interpreter. Identify support person requiring or willing to accept information. *Ability to understand is essential to identification of needs and planning care. May need to provide the information to another individual if client is unable to comprehend.*⁹
-  Evaluate medication regimen and also for substance use/abuse (e.g., alcohol/other drugs) as indicated. *Can affect client's understanding of information or desire and ability to accept responsibility for self.*⁶
- Note client's desire and level of ability to meet health maintenance needs as well as self-care activities of daily living. *Care may begin with helping client make a decision to improve situation, as well as identifying factors that are currently interfering with meeting needs.*³
-  Note setting where client lives (e.g., long-term/other residential care facility, rural versus urban setting; homebound, or homeless). *Socioeconomic status and geographic location contribute to an individual's ability to achieve or maintain good health.*¹⁰
- Ascertain recent changes in lifestyle. *For instance, a man whose spouse dies and who has no skills for taking care of his own/family's health needs may need assistance to learn how to manage new situation, or a newly unemployed individual without healthcare benefits may require referral to public assistance agencies.*⁸

- Determine level of adaptive behavior, knowledge, and skills about health maintenance, environment, and safety. *Will determine beginning point for planning and intervening to help client learn necessary skills to maintain health in a positive manner.*⁷
- 🏠 Evaluate home environment, as indicated, to note individual adaptation needs (e.g., supplemental humidity, air purifier, change in heating system).¹
- Note client's use of professional services and resources (i.e., appropriate or inappropriate, nonexistent).⁹

NURSING PRIORITY NO. 2 To assist client/caregiver(s) to maintain and manage desired health practices:

- Discuss with client/significant others (SOs) beliefs about health and reasons for not following prescribed plan of care. *Determines client's view about current situation and potential for change. Provides opportunity for discussion about alternate plan of care that client may find more suitable or may help identify a compromise that could improve client's participation in a particular course of treatment.*
- Identify realistic health goals and develop plan with client/SO(s) for self-care. *Allows for incorporating existing disabilities with client's/SO's desires, adapting and organizing care as necessary.*¹
- 🔄 Involve comprehensive specialty health teams when available or indicated (e.g., pulmonary, psychiatric, enterostomal, IV therapy, nutritional support, substance abuse counselors).
- Provide time to active-listen concerns of client/SO(s). *Provides opportunity to clarify expectations and misconceptions.*
- Provide anticipatory guidance to maintain and manage effective health practices during periods of wellness and to identify ways client can adapt when progressive illness or long-term health problems occur.^{9,11}
- Encourage socialization, "buddy system," and personal involvement to enhance support system, provide pleasant stimuli, and limit permanent regression.²
- 🔄 Provide for communication and coordination between healthcare facility teams and community healthcare providers to promote continuation of care and maximize outcomes.²
- 📋 Monitor adherence to prescribed medical regimen to problem-solve difficulties in adherence and alter the plan of care as needed.¹

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Provide information about individual healthcare needs, using client's preferred learning style (e.g., pictures, words, video, Internet). *Can help client to understand own situation and enhance cooperation with the plan of care.*⁸
- ∞ Limit amount of information presented at one time, especially when dealing with elderly or cognitively impaired client. Present new material through self-paced instruction when possible. *Allows client time to process and store new information.*⁸
- Help client/SO(s) prioritize healthcare goals. Provide a written copy to those involved in planning process for future reference/revision as appropriate. *Promotes planning to enable the client to maintain a healthy and productive lifestyle.*¹⁰
- Assist client/SO(s) to develop stress-management skills. *Knowing ways to manage stress helps individual to develop and maintain a healthy lifestyle.*³
- Identify ways to make adaptations in certain circumstances to meet client's changing needs and abilities and environmental concerns.⁵
- Identify signs and symptoms requiring further screening, evaluation, and follow-up. Essential to identify developing problems that could interfere with maintaining well-being.^{10,11}
- 🔄 Make referral as needed for community support services (e.g., homemaker or home attendant, Meals on Wheels, skilled nursing care, community or free clinic, Well-Baby Clinic, senior citizen healthcare activities). *Client may need additional assistance to maintain self-sufficiency.*⁹
- 🔄 Refer to social services as indicated. *May need assistance with financial, housing, or legal concerns (e.g., conservatorship).*²

-  Refer to support groups as appropriate (e.g., senior citizen groups, Alcoholics or Narcotics Anonymous, Red Cross, Salvation Army). *Provides information and help for specific needs or at times of crisis.*⁹
-  Assist with referral for hospice service for client with terminal illness, where indicated. *Will help client and family deal with end-of-life issues in a positive manner.*^{3,4}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including individual abilities, family involvement, and support factors.
- Cultural or religious beliefs, healthcare values, and expectations.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses of client/SO(s) to plan, interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

ineffective family Health Management

Taxonomy II: Health Promotion—Class 2 Health Management (00080) [**Diagnostic Division:** Teaching/Learning],
Submitted 1992; Revised 2013, 2017

DEFINITION: A pattern of regulating and integrating into family processes a program for the treatment of illness and its sequelae that is unsatisfactory for meeting specific health goals.

RELATED FACTORS

Difficulty managing complexity of treatment regimen or healthcare systems
Decisional conflict; family conflicts

DEFINING CHARACTERISTICS

Subjective

Difficulty with prescribed regimen

Objective

Inappropriate family activities for meeting health goal
Acceleration of illness symptoms of a family member
Failure to take action to reduce risk factors; decrease in attention to illness

At Risk Population: Economically disadvantaged

Sample Clinical Applications: Chronic conditions (e.g., chronic obstructive pulmonary disease [COPD], multiple sclerosis [MS], arthritis, chronic pain, substance abuse, end-stage liver or renal failure) or new diagnoses necessitating lifestyle changes

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Family Health Status: Overall health and social competence of family unit

Family Normalization: Capacity of a family to develop strategies for optimal functioning when a member has a chronic illness or disability

Family Participation in Professional Care: Capacity of a family to be involved in decision-making, care delivery, and evaluation of care provided by healthcare personnel

Family Will (Include Specific Time Frame)

- Identify individual factors affecting regulation/integration of treatment program.
- Participate in problem-solving of identified concerns.
- Engage in mutual goal-setting for care/treatment plan.
- Verbalize acceptance of need or desire to change actions to achieve agreed-on outcomes or health goals.
- Demonstrate behaviors/changes in lifestyle necessary to maintain therapeutic regimen.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Family Involvement Promotion: Facilitating participation of family members in the emotional and physical care of the patient

Family Mobilization: Utilization of family strengths to influence patient's health in a positive direction

Health System Guidance: Facilitating a patient's location and use of appropriate health services

NURSING PRIORITY NO. 1 To identify causative/precipitating factors:

- Ascertain family's perception of efforts to date. *Perceptions are more important than facts, and by getting family's point of view, realistic goals can be set and family can look to the future.*²
- Evaluate family functioning and activities, including frequency and effectiveness of family communication, promotion of autonomy, adaptations to meet changing needs, health of home environment and lifestyle, problem-solving abilities, and ties to the community. *Understanding the family and the context in which it lives allows for more personalized support of the family and choosing coping strategies in partnership with the family to meet individualized goals.*⁷
- Note family health goals and agreement of individual members. *Presence of conflict interferes with problem-solving and needs to be addressed before family can move forward to meet goals.*²
- Determine understanding and value of the treatment regimen to the family. *Individual members may misunderstand either the cause of the illness or the prescribed regimen and may disagree with what is happening, thereby promoting dissension within the family group and causing distress for the client.*¹
-  Identify cultural values and religious beliefs affecting view of situation and willingness to make necessary changes. *May influence choice of interventions.*
- Identify availability and use of resources. *Knowing who is available to help and support the family will help in planning care to maximize positive outcomes.*²

NURSING PRIORITY NO. 2 To assist family to develop strategies to improve management of therapeutic regimen:

-  Provide family-centered education addressing management of condition/chronic illness, treatment plan, and self-care needs. *Accurate information helps family make informed decisions, see the connection between illness and treatment, facilitate treatment adherence, and improve client outcomes.*^{3,8}
- Encourage incorporation of care strategies into family's lifestyle. *Assisting family to manage needs on a daily basis can instill confidence, decrease anxiety, and provide a degree of predictability to daily life.*⁸
- Assist family members to recognize inappropriate family activities. Help the members identify both togetherness and individual needs and behavior. *Effective interactions can be enhanced and perpetuated when these factors are identified and used to improve family behaviors.*²
- Make a plan jointly with family members to deal with complexity of healthcare regimen or system and other related factors. *Enhances commitment to plan, optimizing outcomes when family and caregivers work together to plan therapeutic regimen.*^{2,5} *Engaging all family members as able empowers family to build new competencies and shared confidence in own abilities, enabling more effective coping.*⁶
- Identify community resources as needed using the three strategies of education, problem-solving, and resource linking to address specific deficits. *Providing information and helping family members learn effective problem-solving techniques and how to access needed resources can help them deal successfully with the chronically ill family member.*⁴

NURSING PRIORITY NO. 3 To promote wellness as related to future health and well-being of family members (Teaching/Discharge Considerations):

-  Help family identify criteria to promote ongoing self-evaluation of situation and effectiveness and family progress. *Involvement promotes sense of control and provides the opportunity to be proactive in meeting needs.*²
- Assist family to plan for potential problems or complications. *Helping families anticipate likely challenges allows them to plan more effective coping strategies.*⁶
-  Make referrals to and/or jointly plan with other health, social, and community resources. *Problems often are multifaceted, requiring involvement of numerous providers or agencies to plan appropriate regimen to meet family/individual needs.*³
- Encourage involvement in disease/condition support groups. *Family resiliency is gained/supported through contact with other families dealing with similar challenges and from learning from one another.*⁶

- Provide contact person or case manager for one-on-one assistance as needed. *Having a single contact to coordinate care, provide support, and assist with problem-solving maintains continuity and prevents misunderstandings and errors in managing the family's regimen.*¹
- Refer to NDs caregiver Role Strain and ineffective Health Management, as indicated.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including nature of problem and degree of impairment, family values, health goals, and level of participation and commitment of family members.
- Cultural values, religious beliefs.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications of plan of care.

Discharge Planning

- Long-term needs, plan for meeting and who is responsible for actions.
- Specific referrals made.

ineffective Health Management

Taxonomy II: Health Promotion—Class 2 Health Management (00078) [**Diagnostic Division:** Teaching/Learning].
Submitted 1994; Revised 2008; 2017

DEFINITION: Pattern of regulating and integrating into daily living a therapeutic regimen for the treatment of illness and its sequelae that is unsatisfactory for meeting specific health goals.

RELATED FACTORS

Difficulty managing complex treatment regimen or healthcare systems
Decisional conflicts
Excessive demands; family conflict; insufficient social support
Family pattern of healthcare
Inadequate number of cues to action
Insufficient knowledge of therapeutic regimen
Perceived barrier, benefit, susceptibility or seriousness of condition
Powerlessness
Insufficient social support

DEFINING CHARACTERISTICS

Subjective

Difficulty with prescribed regimen

Objective

Failure to include treatment regimen in daily living, or take action to reduce risk factors
Ineffective choices in daily living for meeting health goal
[Unexpected acceleration of illness symptoms; development of avoidable complications]

At Risk Population: Economically disadvantaged

Sample Clinical Applications: Chronic conditions (e.g., cancer, chronic obstructive pulmonary disease [COPD], multiple sclerosis [MS], arthritis, chronic pain, end-stage heart, liver, or renal failure) or new diagnoses necessitating lifestyle changes

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Health Promoting Behavior: Personal actions to sustain or increase wellness

Health Beliefs: Personal convictions that influence health behaviors

Adherence Behavior: Self-initiated actions to promote optimal wellness, recovery, and rehabilitation

Client Will (Include Specific Time Frame)

- Verbalize acceptance of need or desire to change actions to achieve agreed-on health goals.
- Verbalize understanding of factors and blocks involved in individual situation.
- Participate in problem solving of factors interfering with integration of therapeutic regimen.
- Demonstrate behaviors or changes in lifestyle necessary to maintain therapeutic regimen.
- Identify and use available resources.

(continues on page 418)

ineffective Health Management (continued)

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Self-Modification Assistance: Reinforcement of self-directed change initiated by the patient to achieve personally important goals

Health System Guidance: Facilitating a patient's location and use of appropriate health services

Patient Contracting: Negotiating an agreement with an individual that reinforces a specific behavior change

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

-  Determine whether client has acute or chronic illness; note any comorbidities and complexity of care needs. *These factors affect how client views and manages self-care. Client may be overwhelmed, in denial, depressed, or have complications exacerbating care needs. For example, diabetes is considered a biopsychosocial illness, meaning there are not only biological factors, including cause of illness and the toll it takes on the body, but also psychological, social, and economic components for the client dealing with a chronic progressive disease over a long time, usually with comorbidities.¹⁰ Furthermore, people tend to become passive and dependent in long-term, debilitating illnesses and may find it difficult to expend energy to follow through with therapeutic regimen.¹³*
- Ascertain client's knowledge/understanding of condition and treatment needs. *Provides a baseline so planning care can begin where the client is in relation to condition or illness and current regimen.¹*
- Determine client's/family's health goals and patterns of healthcare. *Provides information about current behaviors and misperceptions that may be potential areas of conflict, values, or financial considerations.¹*
-  Identify health practices and beliefs in client's personal and family history, including health values, religious or cultural beliefs, and expectations regarding healthcare. *The client may not view current situation as a problem or be unaware of health management needs. For instance, those from a Hispanic culture may believe the future is in God's hands; or women may delay Pap smears and mammograms because of modesty.¹⁴ In addition, expectations of others may dictate client's adaptation to situation and willingness to modify life. Note: In one study, researchers found that information designed to meet unique characteristics of the individual through culturally relevant tailoring significantly increased adherence rate with interventions.^{1,8,9}*
- Identify client locus of control. *Those with an internal locus of control (e.g., expressions of responsibility for self and ability to control outcomes, such as "I didn't quit smoking") are more likely to take charge of situation, whereas individuals with an external locus of control (e.g., expressions of lack of control over self and environment, such as "Nothing ever works out" or "What bad luck to get lung cancer") may perceive difficulties as beyond his/her control and will look to others or external source to solve his/her problems and take care of them.⁷*
- Identify individual perceptions and expectations of treatment regimen. *Active-listen client's concerns and comments. May reveal client's thinking about regimen, misinformation, unrealistic expectations, or other factors that may be interfering with client's willingness to follow therapeutic regimen.^{1,10,15}*
-  Determine issues of secondary gain for the client/significant others (SOs). *Marital/family concern or attention, school or work issues, or financial considerations may cause client to subconsciously desire to remain ill or disabled, or SO to support the status quo. This can interfere with complying with prescribed treatment plans, prolong recovery time, and create frustrating medical-legal issues.¹¹*
- Review complexity of treatment regimen (e.g., number of expected tasks, such as taking medication several times/day, visiting multiple healthcare providers with treatment or follow-up appointments; abundant, often conflicting information sources). Evaluate how difficult tasks might be for client (e.g., must stop smoking or must follow strict dialysis diet even when feeling well, must manage limitations while remaining active in life roles). *These factors are often involved in lack of participation in treatment plan.¹²*

- Determine who (e.g., client, SO, other) manages the medication regimen and whether individual knows what the medications are and why they are prescribed and any factors that interfere with taking medications or lead to lack of adherence (e.g., depression, active alcohol or other drug use, low literacy, lack of support, lack of belief in treatment efficacy). *Forgetfulness is the most common reason given for not complying with the treatment plan.*¹⁷
- Note availability and use of support systems, resources for assistance and caregiving or respite care services. *Client may not have, be aware of, or know how to access available resources.*⁶

NURSING PRIORITY NO. 2 To assist client/SO(s) to develop strategies to improve management of therapeutic regimen:

- Use therapeutic communication skills to assist client to problem-solve solution(s). *Active-listening promotes accurate identification of the problem, ensuring that problem-solving is directed to the correct solution.*⁷
- Explore client involvement in or lack of mutual goal-setting. *Understanding client's willingness to be involved (or not) provides insight into the reasons for actions and suggests appropriate interventions.*⁷
- Have client identify consequences of current behaviors/ineffective management of condition. *May help client visualize the "cost" of lack of commitment to therapeutic regimen.*
- Use client's locus of control to develop individual plan to adapt regimen. *For client with internal control, encourage client to take control of own care, and for those with external control, begin with small tasks and add as tolerated.*⁷
- Establish graduated goals or modified regimen as necessary. *Specifying steps to take requires discussion and the use of critical-thinking skills to determine how to best reach the agreed-on goals.*⁴ *For example, client with COPD who smokes a pack of cigarettes a day may be willing to reduce that amount but not give up smoking altogether. This choice may improve quality of life, and success with this goal may encourage progression to more advanced goals.*
- Contract with the client for participation in care, as appropriate. *By making a contract, client commits self to therapeutic regimen and is more likely to follow through because of commitment.*⁶
- Accept client's evaluation of own strengths and limitations while working together to improve abilities. State belief in client's ability to cope and/or adapt to situation. *Individuals may minimize own strengths or exaggerate limitations when faced with the difficulties of a chronic illness. By helping in concrete ways, client can begin to accept reality of strengths. Stating your belief in positive terms lets client hear someone else's evaluation and begin to accept that he/she can manage the situation.*³
- Acknowledge individual efforts and capabilities. *Positive reinforcement encourages continuation of desired behaviors and facilitates movement toward attainment of desired outcomes.*^{5,7}
- Provide information and help client to know where and how to find it on own. Reinforce previous instructions and rationale, using a variety of learning modalities, including role-playing, demonstration, written materials, etc. *Incorporating multiple modalities promotes retention of information. Developing client's skill at finding own information encourages self-sufficiency and sense of self-worth.*²

NURSING PRIORITY NO. 3 To promote optimal health (Teaching/Discharge Considerations):

- 🏠 Emphasize importance of client knowledge and understanding of the need for treatment or medication as well as consequences of actions and choices. *Reinforces client's role in success of therapeutic regimen, encouraging continuation of competent behaviors.*¹
- Promote client/caregiver/SO participation in planning and evaluating process. *Enhances commitment to plan and promotes competent self-management, optimizing outcomes.*¹
- Assist client to develop strategies for monitoring symptoms and response to therapeutic regimen. *Promotes early recognition of changes, allowing proactive response.*⁵
- Mobilize support systems, including family/SO(s), social services, financial assistance, etc. *Success of therapeutic regimen is enhanced by using support systems effectively, avoiding or reducing stress and worry of dealing with unresolved problems.*²
- Provide for continuity of care in and out of the hospital or care setting, including long-range plans. *Supports trust and facilitates progress toward goals as client illness is dealt with over time.*^{13,16}

-  Refer to counseling or therapy (group and individual) as indicated. *Client may need additional help to deal with stress and anxiety of chronic condition or illness.*¹
-  Identify home- and community-based nursing services. *These agencies can provide services for assessment, follow-up care, and education in client's home to promote more effective management of therapeutic regimen.*¹

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including underlying dynamics of individual situation, client's perception of problem or needs, locus of control.
- Cultural values or religious beliefs.
- Family involvement and needs.
- Individual strengths and limitations.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, specific referrals made.

readiness for enhanced Health Management

Taxonomy II: Health Promotion—Class 2 Health Management (00162) [**Diagnostic Division:** Teaching/Learning], Approved 2002; Revised 2010, 2013

DEFINITION: A pattern of regulating and integrating into daily living a therapeutic regimen for treatment of illness and its sequelae, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance:

- Management of illness, symptoms, or risk factors
- Management of prescribed regimens
- Immunization/vaccination status
- Choices of daily living for meeting goals

Sample Clinical Applications: Diabetes mellitus, congestive heart failure (CHF), chronic obstructive pulmonary disease (COPD), asthma, multiple sclerosis (MS), systemic lupus, HIV positive, AIDS, premature newborn

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Adherence Behavior: Self-initiated actions to promote optimal wellness, recovery, and rehabilitation

Knowledge: Treatment Regimen: Extent of understanding conveyed about a specific treatment regimen

Participation in Health-Care Decisions: Personal involvement in selecting and evaluating health care options to achieve desired outcomes

Client Will (Include Specific Time Frame)

- Assume responsibility for managing treatment regimen.
- Demonstrate proactive management by anticipating and planning for eventualities of condition or potential complications.
- Identify and use additional resources, as appropriate.
- Remain free of preventable complications and progression of illness and sequelae.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Health System Guidance: Facilitating a patient's location and use of appropriate health services

Health Education: Developing and providing instruction and learning experiences to facilitate voluntary adaptation of behavior conducive to health in individuals, families, groups, or communities

Anticipatory Guidance: Preparation of patient for an anticipated developmental or situational crisis

NURSING PRIORITY NO. 1 To determine motivation for continued growth:

- Ascertain client's beliefs about health and his/her ability to maintain health. *Belief in ability to accomplish desired action is predictive of performance.*
- Verify client's level of knowledge and understanding of therapeutic regimen. Note specific health goals and what measures client has been using to achieve his/her goals. *Provides opportunity to ensure accuracy and completeness of information for future learning.*¹

-  Determine source(s) individuals use when seeking health information and what is done with this information (e.g., incorporated into self-management, used as basis for seeking healthcare). *The manner in which people access and use healthcare information varies widely, with variables including age, race/culture, location, literacy, and computer use. Although the Internet is utilized by many individuals to learn about their health and healthcare needs, studies show that the most common and trusted sources of information are still healthcare professionals. Many people supplement information received from healthcare professionals with information from TV, radio, newspapers, magazines, and family/friends/coworkers.*^{9,10}
- Determine individual's perceptions of adaptation to treatment, anticipated changes, or possible threats to well-being. *How client sees the situation is important to discussing what is happening in regard to the treatment regimen and planning for the future.*¹
- Identify individual's expectations of long-term treatment needs and anticipated changes. *Knowing expectations identifies understanding and acceptance of what is realistic for own situation.*³
-  Determine influence of cultural beliefs on client/caregiver(s) participation in regimen. *These factors influence the way people view health issues and management. For instance, people of Mexican heritage may believe that good health means being free of pain or that their future health is in God's hands; therefore, they may have difficulty adhering to a long-term healthcare regimen.*⁷

NURSING PRIORITY NO. 2 To assist client/SO(s) to develop plan to meet individual needs:

- Active-listen concerns to identify underlying issues (e.g., physical or emotional stressors, external factors such as environmental pollutants or other hazards) *that could impact client's ability to control own health.*
- Identify steps necessary to reach desired health goal(s). *Understanding the process enhances commitment and the likelihood of achieving the goals.*⁴
- Discuss resources presently used by client *to note whether changes can be arranged (e.g., increased hours of home-care assistance, access to case manager to support complex or long-term program). Helps with planning for improved therapeutic regimen.*³
- Accept client's evaluation of own strengths/limitations while working together to improve abilities. *Promotes sense of self-esteem and confidence to continue efforts to manage therapeutic regimen, such as diabetes and MS, more effectively.*⁶
-  Incorporate client's cultural values or religious beliefs that support attainment of health goals. *Problem-solve conflicts to facilitate growth.*
- Provide information and bibliotherapy. Help client/significant others (SOs) identify and evaluate resources they can access on their own. *Promotes sense of confidence in own ability to learn about illness or condition. When referencing the Internet and nontraditional or unproven resources, the individual must exercise some restraint and determine the reliability of the source and information provided before acting on it.*⁵
- Acknowledge individual's efforts, capabilities, and skills to acquire or maintain interpersonal, self-care, and coping skills. *Provides positive reinforcement, encouraging continued progress toward desired goals to enhance therapeutic regimen.*^{3,5,8}

NURSING PRIORITY NO. 3 To promote optimum health management (Teaching/Discharge Considerations):

-  Promote client/caregiver choices and involvement in planning for and implementing added tasks or responsibilities. *Being involved in planning and knowing that he/she can make own choices promotes commitment to program and enhances probability that client will follow through with change.*^{1,8}
- Assist in implementing strategies for monitoring progress and responses to therapeutic regimen. *Promotes proactive problem-solving, enabling client/caregiver to identify problems as they arise and deal appropriately with them so regimen is maintained.*^{1,8}
- Identify additional community resources and support groups. *Provides additional opportunities for role modeling, skill training, anticipatory problem-solving, etc.*^{2,6}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings, including dynamics of individual situation.
- Individual strengths and additional needs.
- Cultural values or religious beliefs.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Short- and long-term needs and who is responsible for actions.
- Available resources, specific referrals made.

impaired Home Maintenance

Taxonomy II: Activity/Rest—Class 5 Self-Care (00098) [Diagnostic Division: Safety], Approved 1980; Revised 2017

DEFINITION: Inability to independently maintain a safe growth-promoting immediate environment.

RELATED FACTORS

Inadequate role model; insufficient support system
 Insufficient family organization or planning
 Insufficient knowledge of home maintenance, neighborhood resources

(continues on page 424)

impaired Home Maintenance (continued)

DEFINING CHARACTERISTICS

Subjective

Difficulty maintaining a comfortable [safe] environment; impaired ability to maintain home
Request for assistance with home maintenance
Excessive family responsibilities

Objective

Unsanitary environment
Pattern of disease or infection caused by unhygienic conditions
Insufficient equipment for maintaining home; insufficient cooking equipment, clothing, or linen

At Risk Population: Financial crisis

Associated Condition: Alteration in cognitive functioning

Sample Clinical Applications: Chronic conditions (e.g., AIDS, multiple sclerosis [MS], rheumatoid arthritis), depression, dementia, developmental delay

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Self-Care: Instrumental Activities of Daily Living [IADLs]: Personal actions to perform activities needed to function in the home or community independently with or without assistive device

Family Functioning: Capacity of a family to meet the needs of its members during developmental transitions

Safe Home Environment: Physical arrangements to minimize environmental factors that might cause physical injury in the home

Client/Caregiver Will (Include Specific Time Frame)

- Identify individual factors related to difficulty in maintaining a safe environment.
- Verbalize plan to eliminate health and safety hazards.
- Adopt behaviors reflecting lifestyle changes to create and sustain a healthy and growth-promoting environment.
- Demonstrate appropriate, effective use of resources.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Home Maintenance Assistance: Helping the patient/family to maintain the home as a clean, safe, and pleasant place to live

Environmental Management: Safety: Monitoring and manipulation of the physical environment to promote safety

Support System Enhancement: Facilitation of support to patient by family, friends, and community

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify presence of or potential for conditions such as diabetes, fractures, spinal cord injury, amputation, MS, arthritis, stroke, Parkinson's disease, dementia, and mental illness, *which can compromise client's/significant other's (SO's) functional abilities in taking care of home.*³

- Note personal or environmental factors (e.g., family member with multiple care tasks, addition of family member(s) [e.g., new baby, ill parent moving in]; substance abuse; poverty/inadequate financial resources; absence of family/support systems; lifestyle of self-neglect; client comfortable with home environment or has no desire for change) *that can contribute to neglect of home cleanliness or repair.*^{2,5}
- Determine problems in the household and degree of discomfort or unsafe conditions noted by client/SO. *Some safety problems may be immediately obvious (e.g., lack of heat, water; need for laundry, garbage disposal, etc.), while other problems may be more subtle and difficult to manage (e.g., lack of sufficient finances for home repairs, lack of knowledge about food storage, indoor air and fire safety, rodent control). Client/SO may need assistance or teaching regarding safety of his/her environment, especially if it is negatively impacting the client's health.*^{2,6}
- Assess client's/SO's level of cognitive, emotional, and physical functioning *to ascertain client's needs and caregiver's capabilities when developing plan of care for preventive, supportive, and therapeutic care.*^{1,2}
- Identify lack of interest or knowledge or misinformation *to determine need for health education/home safety program or other intervention.*
-  Identify support systems available to client/SO(s) *to determine needs and initiate referrals (e.g., companionship, daily care, respite care, homemaking, running errands, meal preparation or meal-service program, financial assistance).*¹
-  Determine financial resources to meet needs of individual situation. *May need referral to social services for funds, necessary equipment, home repairs, transportation, etc.*²

NURSING PRIORITY NO. 2 To help client/SO(s) to create/maintain a safe, growth-promoting environment:

-   Coordinate planning with multidisciplinary team and client/SO as appropriate. *Coordination and cooperation of team improves motivation and maximizes outcomes.*
- Assist client/SO(s) to develop plan for restoring/maintaining a clean, healthful environment. *Activities such as sharing of household tasks or repairs between family members, contract services, exterminators, and trash removal can promote ongoing maintenance.*
- Educate and assist client/family to address lifestyle adjustments that may be required, such as personal/home hygiene practices, elimination of substance abuse or unsafe smoking habits, proper food storage, stress management, etc. *Individuals may not be aware of impact of these factors on their health or welfare; they may be overwhelmed and in need of specific assistance for varying periods of time.*
- Discuss home environment or perform home visit as indicated *to determine client's ability to care for self, to identify potential health and safety hazards, and to determine adaptations that may be needed (e.g., wheelchair-accessible doors and hallways, safety bars in bathroom, safe place for child play, clean water available, working cook stove or microwave, screens on windows).*²
- Assist client/SO(s) to identify and acquire necessary equipment and services (e.g., chair or stair lifts; commode chair; safety grab bar; structural adaptations; service animals; aids for hearing, seeing, mobility; trash removal; cleaning supplies) *to meet individual needs.*³
-  Identify resources available for appropriate assistance (e.g., visiting nurse, budget counseling, homemaker, Meals on Wheels, physical or occupational therapy, social services).²
-  Discuss options for financial assistance with housing needs. *Client may be able to stay in home with minimal assistance or may need significant assistance over a wide range of possibilities, including removal from the home.*²

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Evaluate client at each community contact or before facility discharge *to determine if home maintenance needs are ongoing in order to initiate appropriate referrals.*³
- Discuss environmental hazards *that may negatively affect health or ability to perform desired activities.*

- Discuss long-term plan for taking care of environmental needs (e.g., assistive personnel, specialized controls for electrical equipment, trash removal, and pest control services).⁴
- Provide information necessary for the individual situation. *Helps client/family decide what can be done to improve situation.*³
- Identify ways to access/use community resources and support systems (e.g., extended family, neighbors, church group, seniors program).
- Refer to NDs caregiver Role Strain, compromised family Coping, ineffective Coping, risk for Injury, deficient Knowledge [specify], and Self-Care deficit [specify] for additional interventions as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings include individual (cognitive, emotional, and physical functioning) and environmental factors, specific safety concerns.
- Availability and use of support systems.

Planning

- Plan of care and who is involved in planning; support systems and community resources identified.
- Teaching plan.

Implementation/Evaluation

- Client's/SO's responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made, equipment needs/resources.

Hopelessness

Taxonomy II: Self-Perception—Class 1 Self-Concept (00124) [**Diagnostic Division:** Ego Integrity], Submitted 1986; Revised 2017

DEFINITION: Subjective state in which an individual sees limited or no alternatives or personal choices available and is unable to mobilize energy on own behalf.

RELATED FACTORS

Prolonged activity restriction; social isolation
Deteriorating physiological condition
Chronic stress
Loss of belief in spiritual power or transcendent values

DEFINING CHARACTERISTICS

Subjective

Despondent verbal cues [Believes things will not change]

Objective

Passivity; decrease in verbalization
Decrease in affect, appetite, or response to stimuli
Decrease in initiative; inadequate involvement in care
Alteration in sleep pattern
Turning away from speaker; shrugging in response to speaker; poor eye contact

At Risk Population: History of abandonment

Associated Condition: Deterioration in physiological condition

Sample Clinical Applications: Chronic conditions, terminal diagnoses, infertility

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Depression Self-Control: Personal actions to minimize melancholy and maintain interest in life events

Hope: Optimism that is personally satisfying and life supporting

Quality of Life: Extent of positive perception of current life circumstances

Client Will (Include Specific Time Frame)

- Recognize and verbalize feelings.
- Identify and use coping mechanisms to counteract feelings of hopelessness.
- Involve self in and control (within limits of the individual situation) own self-care and activities of daily living.
- Set progressive short-term goals that develop, foster, and sustain behavioral changes and positive outlook.
- Participate in diversional activities of own choice.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Hope Inspiration: Enhancing the belief in one's capacity to initiate and sustain actions

Emotional Support: Provision of reassurance, acceptance, and encouragement during times of stress

Mood Management: Providing for safety, stabilization, recovery, and maintenance of a patient who is experiencing dysfunctionally depressed or elevated mood

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Review familial/social history and physiological history contributing to current problems. *History of poor coping abilities, disorder of familial relating patterns, emotional problems, language or cultural barriers (leading to feelings of isolation), recent or long-term illness of client or family member, and multiple social and/or physiological traumas to individual or family members can all affect client's feelings of hopelessness.*^{2,5}
- Identify current familial, social, and physical factors contributing to sense of hopelessness. *Issues such as a newly diagnosed chronic/terminal disease, lack of support system, recent job loss, loss of spiritual or religious faith, and recent multiple traumas can result in an individual giving up. Identification of the issues involved in each person's situation is necessary to appropriately plan for care.*²
- Determine client's locus of control (internal or external) and associated cultural factors influencing self-view. Note expressions of responsibility for self versus expressions of lack of control over self and environment. *Individuals view life change and stressful events differently. Those with internal locus of control tend to be more optimistic about their ability to deal with adversity even in the face of current difficulties. Individual with external locus of control may attribute feelings of hopelessness to an external source, perceiving it as beyond his or her control, and will look to others to solve problems and take care of them.*^{2,5}
- Identify coping behaviors and defense mechanisms displayed previously and in current situation as well as client's perception of effectiveness then and now. *It is important to identify client's strengths and encourage their use as client begins to deal with what is currently happening.*²
- Have client describe events that lead to feeling inadequate or having no control. *Identifies sources of frustration and defines problem areas so action can be taken to learn how to deal with them in more positive ways.*⁶
- Discuss problem and duration of alcohol or drug abuse as indicated. *Behavior may be an effort to provide psychological numbing in an attempt to lessen pain of situation or may have preceded and contributed to sense of hopelessness. Client may feel hopeless about stopping behavior and believe that it is impossible.*²
- Determine presence of suicidal ideation, availability of plan, and means to follow through with plan. (Refer to ND risk for Suicide.) *Hopelessness is identified as a central underlying factor in the predisposition to suicide, and the client sees no other way out of a hopeless situation.*⁷
-  Perform physical examination and review results of lab tests and diagnostic studies. *Current situation may be the result of a decline in physical well-being or progression of a chronic condition, or physical symptoms may be associated with effects of depression (e.g., loss of appetite, lack of sleep).*⁷

NURSING PRIORITY NO. 2 To assess level of hopelessness:

- Note behaviors indicative of hopelessness as listed in Defining Characteristics. *Identifies problem areas to be addressed in developing an effective plan of care and suggests possible resources needed.*⁶
- Evaluate and discuss use of defense mechanisms (useful or not). *Identifying behaviors such as increased sleeping, dependence on medications, illness behaviors, eating disorders, denial, forgetfulness, daydreaming, ineffectual organizational efforts, exploiting own goal-setting, and regression can provide accurate information for client to begin changing behavior or inaccurate beliefs.*⁶
-  Evaluate degree of hopelessness using psychological testing such as Beck's Depression Scale. Note client's feelings about life not being worth living and other signs of hopelessness and worthlessness. *Identifying the degree of hopelessness and possible suicidal thoughts is crucial to instituting appropriate treatment to protect client.*¹⁰

NURSING PRIORITY NO. 3 To assist client to identify feelings and to begin to cope with problems as perceived by the client:

- Establish a therapeutic and facilitative relationship showing positive regard for the client. Answer questions truthfully. *Enhances trust so that client may feel safe to disclose feelings, talk openly about concerns, and feel understood and listened to.*^{2,3,10}
- Encourage client to verbalize and explore feelings and perceptions of what is happening. *Talking about feelings of anger, helplessness, powerlessness, confusion, despondency, isolation, and grief (which can lead to a sense*

of hopelessness and the belief that nothing can be done) provides opportunity for reflection and enables client to begin to understand self and that there are actions that can be helpful.³

-  Provide opportunity for children to “play out” feelings (e.g., puppets or art for preschooler, peer discussions for adolescents). Provides insight into perceptions and can give direction for developing coping strategies.²
-  Engage teens and parents in discussions and arrange to do activities with them. Parents can make a difference in their children's lives by being with them, discussing sensitive topics, and going different places with them.^{3,4}
- Express hope to client and encourage significant others and other health-team members to do so as well. Avoid expressions of false hope. Client may not identify positives in own situation and may find it difficult to accept them from others, but will hear them. False reassurances will undermine sense of security.²
- Help client recognize areas in which he or she has control versus those that are not within his or her control. Often the individual who is feeling hopeless is focusing on issues that cannot be changed. When the client begins to focus energy in those areas where he or she has control, a sense of hope can be nurtured.⁶
- Use client's locus of control to develop individual plan of care. Tailoring care to the individual's ability will maximize effectiveness. For instance, client with internal control can take control of own destiny, and those with external control may need to begin with small tasks and add as tolerated, moving toward learning to take more control of personal choices.¹³
- Encourage client to identify short-term goals. Promote activities to achieve goals and facilitate contingency planning. Dealing with situation in manageable steps enhances chances for success, promotes sense of control, and encourages belief that there is hope for resolution of situation/moving forward.⁶
- Discuss current options with client and list actions that can be taken. Correct misconceptions expressed by the client. Encourages use of own actions, validates reality, and promotes sense of control of the situation.²
- Endeavor to prevent situations that might lead to feelings of isolation or lack of control in client's perception. Client will interpret these occurrences as further proof that there is no hope.⁶
-  Promote client control in establishing time, place, and frequency of treatment/therapy sessions. Involve family members in the appointments as appropriate. Allows individual to assume control over own situation, engendering positive feelings of ability to manage what is happening. Involvement of family members provides source of support and encouragement for client.²
- Encourage risk-taking in situations in which the client can succeed. Succeeding in new ventures can improve self-esteem and hope for more successful actions.²
- Help client begin to develop new coping mechanisms. New skills need to be learned and used effectively to counteract hopelessness.³
- Encourage structured and controlled increase in physical activity as tolerated. Promotes the release of endorphins, enhancing sense of well-being.²
- Demonstrate and encourage use of relaxation exercises, guided imagery. Anxious feelings create tension, and learning to relax can help client begin to look at possibilities of feeling more hopeful.⁹
-  Discuss safe use of prescribed antidepressants. May require short-term use to elevate mood while client pursues other therapeutic measures to regain sense of hope.²

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide positive feedback for actions taken to deal with and overcome feelings of hopelessness. Encourages changes in thinking patterns and continuation of desired behaviors.^{10,12}
- Assist client/family to become aware of factors or situations leading to feelings of hopelessness. Helps individuals to identify precipitating events and provides opportunities to avoid or modify situation, promoting sense of control over life.⁸
- Discuss initial signs of hopelessness. Helps client to identify behaviors such as procrastination, increased need for sleep, decreased physical activity, or withdrawal from social or familial activities and how they have affected thinking and ability to deal with current situation. Awareness provides the opportunity to begin to change.⁹
- Facilitate client's incorporation of personal loss. Often prior losses in individual's life result in feelings of hopelessness and lack of control in current events. Hopelessness means a loss of hope rather than just an

absence of hope. Enhancing grief work and promoting resolution of feelings help client to begin to feel hope again and look forward to life.⁹

- Encourage client/family to develop support systems in the immediate community. *Having support nearby provides individuals with assistance and advocacy for moving forward, enabling them to look toward future with hope.^{4,6}*
- Help client to become aware of, nurture, and expand spiritual self. (Refer to ND Spiritual Distress.) *Spiritual needs are an integral part of being human. Acknowledging and learning about spiritual aspect of self can help client look toward the future with hope for improved sense of well-being.¹¹*
- Encourage and facilitate interaction with religious representative or spiritual counselor as indicated. *Client's sense of hopelessness may include the loss of spiritual connectedness, or client may view spiritual being as responsible for current situation.¹*
-  Introduce the client into a support group before the individual therapy is terminated for continuation of therapeutic process. *Provides for a smooth transition so client feels accepted and comfortable in the presence of others.⁶*
-  Emphasize need for continued monitoring of medication regimen by healthcare provider. *Necessary to evaluate effectiveness and prevent or minimize possible side effects. Antidepressant agents are not to be discontinued abruptly without consulting healthcare provider.²*
-  Refer to other resources for assistance as indicated (e.g., clinical nurse specialist, psychiatrist, social services, Alcoholics or Narcotics Anonymous, Al-Anon, or Alateen). *May need additional help to develop hope for the future, sustain efforts for change.²*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including what has been lost in hopelessness, degree of impairment, locus of control, use of coping skills.
- Cultural or religious beliefs and expectations.
- Spiritual concerns.
- Availability and use of resources or support systems.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified long-term needs, client's goals for change, and who is responsible for actions to be taken.
- Specific referrals made.

readiness for enhanced Hope

Taxonomy II: Self–Perception Class 1 Self—Concept (00185) [Diagnostic Division: Ego Integrity], Approved 2006; Revised 2017

DEFINITION: A pattern of expectations and desires for mobilizing energy on one's own behalf, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance: hope; belief in possibilities; congruency of expectation with goal; ability to set achievable goals; problem solving to meet goals

Expresses desire to enhance: sense of meaning in life; connectedness with others; spirituality

Sample Clinical Applications: Any acute or chronic condition, or healthy individual looking to improve well-being

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Hope: Optimism that is personally satisfying and life supporting

Quality of Life: Extent of positive perception of current life circumstances

Personal Well-Being: Extent of positive perception of one's health status

Client Will (Include Specific Time Frame)

- Identify and verbalize feelings related to expectations and desires.
- Verbalize belief in possibilities for the future.
- Discuss current situation and desire to enhance hope.
- Set short-term goals that will lead to behavioral changes to meet desire for enhanced hope.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Hope Inspiration: Enhancing the belief in one's capacity to initiate and sustain actions

Self-Awareness Enhancement: Assisting a patient to explore and understand his/her thoughts, feelings, motivations, and behaviors

Spiritual Growth Facilitation: Facilitation of growth in patient's capacity to identify, connect with, and call upon the source of meaning, purpose, comfort, strength, and hope in their lives

NURSING PRIORITY NO. 1 To determine needs and desire for improvement:

- Review familial and social history to identify past situations (e.g., illness, emotional conflicts, alcoholism) that have led to decision to improve life. *When trials of life have been resolved, individuals may look toward making life better.*¹
- Determine current physical condition of client/significant other (SO). *Treatment regimen and indicators of healing can influence ability and promote positive feelings of hope.*²
- Ascertain client's perception of current state and expectations or goals for the future (e.g., general well-being, prosperity, independence). *Perception is more important than reality in individual's mind and may help client pursue realistic goals for self.*³
-  Identify spiritual beliefs/cultural values that guide or influence client's spirituality and view of self. *Influences sense of hope and connectedness.*⁴
- Determine meaning of life or reasons for living, belief in God or higher power. *Helps client to clarify beliefs and how they relate to desire for improvement in life.*
- Ascertain motivation and expectations for change. Note congruency of expectations with desires for change. *Motivation to improve and high expectations can encourage client to make changes that will improve his or her life. However, presence of unrealistic expectations may hamper efforts.*^{3,4}
- Note degree of involvement in activities and relationships with others. *Interactions with others can promote a sense of connectedness and enjoyment of relationships.*³

NURSING PRIORITY NO. 2 To assist client to achieve goals and strengthen sense of hope:

- Establish a therapeutic relationship, showing positive regard and hopefulness for the client. *Enhances feelings of worth and comfort, inspiring client to continue pursuit of goals.*³
- Help client recognize areas that are in his or her control versus those that are not. *To be most effective, client needs to expend energy in those areas where he or she has control and let the others go.*²
- Assist client to develop manageable short-term goals. *Success at short-term goals can lead to attainment of long-term goals too.*²
- Identify activities to achieve goals and facilitate contingency planning. *Promotes dealing with situation in manageable steps, enhancing chances for success and sense of control.*⁵
- Explore interrelatedness of relationship between unresolved emotions, anxieties, fears, and guilt. *Provides opportunity to address issues that may be limiting individual's ability to improve life situation.*⁵
- Assist client to acknowledge current coping behaviors and defense mechanisms that may hamper moving toward goals. *Allows client to focus on coping mechanisms that are more successful in problem-solving.*³
- Encourage client to concentrate on progress not perfection. *If client can accept that perfection is difficult or not always the desirable outcome, he/she may be able to view accomplishments with pride.*³
- Involve client in care and explain all procedures, answering questions truthfully. *Enhances trust and relationship, promoting hope for a positive outcome.*²
- Express hope to client and encourage SO(s) and other health team members to do so. *Enhances client's sense of hope and belief in possibilities of a positive outcome.*¹
- Identify ways to strengthen sense of interconnectedness or harmony with others to support sense of belonging and connection that promotes feelings of wholeness and hopefulness.¹

NURSING PRIORITY NO. 3 To promote optimum wellness:

-  Demonstrate and encourage use of relaxation techniques, guided imagery, and meditation activities. *Learning to relax can decrease tension, resulting in refreshment of body and mind and enabling individual to perform and think more successfully.*³
- Provide positive feedback for efforts taken to improve situation, growth in use of skills, and learning efforts. *Acknowledges client's efforts as individual is moving forward in learning new skills and reinforces gains.*³
- Explore ways that beliefs give meaning and value to daily living. *As client's understanding of these issues improves, hope for the future is strengthened.*¹

- Encourage life review by client. *Acknowledges own successes, identifies opportunity for change, and clarifies meaning in life.*⁵
- Identify ways for spiritual expression, strengthening spirituality. *There are many options for enhancing spirituality through connectedness with self and others (e.g., volunteering, mentoring, involvement in religious activities).*⁵ (Refer to ND readiness for enhanced Spiritual Well-Being.)
- Encourage client to join groups with similar or new interests. *Expanding knowledge and making friendships with new people will widen horizons for the individual.*
-  Refer to community resources and support groups and spiritual advisor as indicated.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including client's perceptions of current situation, relationships, sense of desire for enhancing life.
- Cultural or spiritual values and beliefs.
- Motivation and expectations for improvement.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified long-term needs, individual goals for change, and who is responsible for actions to be taken.
- Specific referrals made.

risk for compromised Human Dignity

Taxonomy II: Self-Perception—Class 1 Self-Concept (00174) [Diagnostic Division: Ego Integrity], Submitted 2006; Revised 2013

DEFINITION: Susceptible for perceived loss of respect and honor, which may compromise health.

RISK FACTORS

Loss of control over body function; exposure of the body
 Humiliation; invasion of privacy
 Disclosure of confidential information; stigmatization
 Dehumanizing treatment; intrusion by clinician
 Insufficient comprehension of health information
 Limited decision-making experience
 Cultural incongruence

Sample Clinical Applications: Chronic conditions (e.g., multiple sclerosis [MS], stroke, quadriplegia, amyotrophic lateral sclerosis [ALS])

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Client Satisfaction: Protection of Rights: Extent of positive perception of protection of a client's legal and moral rights provided by nursing staff

Client Satisfaction: Cultural Needs Fulfillment: Extent of positive perception of integration of cultural beliefs, values, and social structures into nursing care

Client Will (Include Specific Time Frame)

- Verbalize awareness of specific problem.
- Identify positive ways to deal with situation.
- Demonstrate problem-solving skills.
- Express desire to increase participation in decision-making process.
- Express sense of dignity in situation.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Cultural Brokerage: The deliberate use of culturally competent strategies to bridge or mediate between the patient's culture and the biomedical healthcare system

Patient Rights Protection: Protection of healthcare rights of a patient, especially a minor, incapacitated, or incompetent patient unable to make decisions

Emotional Support: Provision of reassurance, acceptance, and encouragement during times of stress

NURSING PRIORITY NO. 1 To determine individual situation as perceived by client:

- Determine client's perception and specific factors that could lead to sense of loss of dignity. *Human dignity is a totality of the individual's uniqueness—mind, body, and spirit—and all components must be considered.*⁴
- Note names, labels, or items used by staff, friends/family that stigmatize the client. *Human dignity is threatened by insensitive as well as inadequate healthcare and lack of client participation in care decisions.*⁴
-  Identify cultural beliefs or values and degree of importance to client. *Individuals cling to their basic beliefs and values, especially during times of stress, which may result in conflict with current circumstances.*⁷

- Identify client's/significant other's (SO's) healthcare goals and expectations. *Clarifies client's (or SO's/ family's) vision, provides framework for planning care, and identifies possible conflicts.*²
- Note availability of support systems. *Client who feels loved and valued will be able to manage difficult circumstances better when the support of family and friends surrounds individual.*²
- Ascertain response of family/SOs to client's situation. *It is important that family supports and values client to enable him or her to manage situation. If they are not supportive or conflicts arise, client may need to separate self from family members who are negative.*³

NURSING PRIORITY NO. 2 To assist client to deal with situation in positive ways:

- Ask client by what name he or she would like to be addressed. *Name is important to a person's identity and recognizes his or her individuality. Many older people prefer to be addressed in a formal manner (e.g., Mr. or Mrs.).*^{2,7}
- Active-listen feelings, encouraging client to verbalize concerns. Be available for support and assistance. *Can help client to discover underlying reasons for feelings and seek solutions to problems.*⁵
- Respect the client's needs and wishes for quiet, privacy, talking, or silence. *Conveys respect and concern for client's dignity.*³
- Provide for privacy when discussing sensitive or personal issues. *Demonstrates respect for client and promotes sense of safe environment for free exchange of thoughts and feelings.*³
- Use understandable terms when talking to client/family about the medical condition, procedures, and treatments (component of informed consent). *Many people do not understand medical terms and may be hesitant to ask what is meant.*⁶
- ∞ Encourage family/SO(s) to treat client with respect and understanding, especially when the client is older and may be irritable and difficult to deal with. *Everyone should be treated with respect and dignity, regardless of individual abilities or frailty.*⁴
- Include client and family in decision making, especially regarding end-of-life issues. *Helps the individual feel respected or valued and involved in the care process.*²
- ⚙️ Involve facility or local ethics committee as appropriate to facilitate mediation or resolution of conflicts between client/family and staff or client and family members.⁵
- Protect client's privacy when providing personal care and during procedures. *Prevents embarrassment over unnecessary exposure and conveys a message of caring and preserves client dignity.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Discuss client's rights as an individual. *While hospitals and other care settings have a Client's Bill of Rights, a broader view of human dignity is stated in the U.S. Constitution.*^{1,6}
- Assist with planning for the future, taking into account client's desires and rights. *As the client plans for the future, the needs of the self as a human who has dignity are considered and incorporated to preserve that dignity.*⁴
- 🌐 Incorporate familial, religious, and cultural factors that have meaning for client in planning process. *When these issues are addressed and incorporated in plan of care, they add to the feelings of inclusion for the client.*^{4,7}
- ⚙️ Refer to other resources (e.g., pastoral care, counseling, organized support groups, classes), as appropriate. *May need additional assistance to deal with illness/situation.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including individual risk factors, client's perceptions, and concerns about involvement in care.
- Individual cultural or religious beliefs and values, healthcare goals.
- Responses and involvement of family/SOs.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

neonatal Hyperbilirubinemia

Taxonomy II: Nutrition—Class 4 Metabolism (00230) [Diagnostic Division: Safety], Approved 2008; Revised 2010, 2017

DEFINITION: The accumulation of unconjugated bilirubin in the circulation (less than 15 ml/dl) that occurs after 24 hours of life.

RELATED FACTORS

Deficient feeding pattern
 Infant with inadequate nutrition
 Delay in meconium passage

DEFINING CHARACTERISTICS**Objective**

Yellow-orange skin color; yellow sclera, mucous membranes
 Bruised skin
 Abnormal blood profile [e.g., hemolysis; total serum bilirubin in high-risk range on age in hour-specific nomogram]

At Risk Population: ABO incompatibility; blood type incompatibility between mother and infant; Rhesus (Rh) incompatibility

Age ≤7 days; premature infant, or infant with low birthweight; infant who is breastfed
 American Indian or East Asian ethnicity
 Significant bruising during birth
 Maternal diabetes mellitus; populations living at high altitudes

Associated Condition: Prenatal infection; bacterial or viral infection; sepsis
 Infant with liver malfunction, enzyme deficiency; internal bleeding
Sample Clinical Applications: Newborn, premature infant

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Newborn Adaptation: Adaptive response to the extrauterine environment by a physiologically mature newborn during the first 28 days

Infant Will (Include Specific Time Frame):

- Display decreasing bilirubin levels with resolution of jaundice.
- Be free of central nervous system (CNS) involvement or complications associated with therapeutic regimen.

Sample **NOC** linkages:

Knowledge: Treatment Procedure: Extent of understanding conveyed about a procedure required as part of a treatment regimen

Parent/Caregiver Will (Include Specific Time Frame):

- Verbalize understanding of cause, treatment, and possible outcomes of hyperbilirubinemia.
- Demonstrate appropriate care of infant.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Infant Care: Newborn: Provision of care to the infant during the transition from birth to extrauterine life and subsequent period of stabilization

Phototherapy: Neonate: Use of light therapy to reduce bilirubin levels in newborn infants

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Determine infant and maternal blood group and blood type. *ABO incompatibility is more often seen in newborns who have type A blood because of the higher frequency of type A compared to type B in most populations. Incidence figures are difficult to compare because authors of different studies do not use the same definitions for significant neonatal hyperbilirubinemia or jaundice. For example, Woodgate and Jadine (2015) report an estimated 50% of term and 80% of preterm infants develop jaundice, typically 2 to 4 days after birth. However, Munniti (2011) reports that ABO incompatibility generally presents as neonatal jaundice due to a Coombs' positive hemolytic anemia and occurs in 0.5% to 1% of newborns.^{1,2,9}*
-  Note gender, race, and place of birth. *Risk of developing jaundice is higher in males, infants of East Asian or American Indian descent, and those living at high altitudes. Incidence is lower for African American infants.²*
-  Review intrapartal record for specific risk factors, such as low birth weight (LBW) or intrauterine growth retardation, prematurity, abnormal metabolic processes, vascular injuries, abnormal circulation, sepsis, or polycythemia. *The risk of significant neonatal jaundice is increased in LBW or premature infants, presence of congenital infection, or maternal diabetes.² Studies suggest neonates at 36 to 37 weeks' gestation are four to five times more likely to develop hyperbilirubinemia than those born at 40 weeks.³ Also, certain clinical conditions may cause a reversal of the blood-brain barrier, allowing bound bilirubin to separate either at the level of the cell membrane or within the cell itself, increasing the risk of CNS involvement.*

-  Note use of instruments or vacuum extractor for delivery. Assess infant for presence of birth trauma, cephalohematoma, and excessive ecchymosis or petechiae. *Resorption of blood trapped in fetal scalp tissue and excessive hemolysis may increase the amount of bilirubin being released and cause jaundice.*⁷
-  Review infant's condition at birth, noting need for resuscitation or evidence of excessive ecchymosis or petechiae, cold stress, asphyxia, or acidosis. *Asphyxia and acidosis reduce affinity of bilirubin to albumin increasing the amount of unbound circulating (indirect) bilirubin, which may cross the blood-brain barrier, causing CNS toxicity.*²
- Evaluate maternal and prenatal nutritional levels; note possible neonatal hypoproteinemia, especially in the preterm infant. *One gram of albumin carries 16 mg of unconjugated bilirubin; therefore, lack of sufficient albumin (hypoproteinemia) in the newborn increases risk of jaundice.*
- Assess infant for signs of hypoglycemia such as jitteriness, irritability, and lethargy. Obtain heelstick glucose levels as indicated. *Hypoglycemia necessitates use of fat stores for energy-releasing fatty acids, which compete with bilirubin for binding sites on albumin.*
- Determine successful initiation and adequacy of breastfeeding. *Poor caloric intake and dehydration associated with ineffective breastfeeding increase risk of developing hyperbilirubinemia.*¹
- Evaluate infant for pallor, edema, or hepatosplenomegaly. *These signs may be associated with hydrops fetalis, Rh incompatibility, and in utero hemolysis of fetal RBCs.*
-  Evaluate for jaundice in natural light, noting sclera and oral mucosa, yellowing of skin immediately after blanching, and specific body parts involved. Assess oral mucosa, posterior portion of hard palate, and conjunctival sacs in dark-skinned newborns. *Detects evidence/degree of jaundice generally first noted on face and progressing to trunk and then extremities.*^{1,6} *Clinical appearance of jaundice is evident at bilirubin levels greater than 5 mg/dL in the full-term infant. Estimated degree of jaundice is as follows: face, 4 to 8 mg/dL; trunk, 10 to 12 mg/dL; groin, 8 to 16 mg/dL; arms/legs, 11 to 18 mg/dL; and hands/feet, 15 to 20 mg/dL. Note: Yellow underlying pigment may be normal in dark-skinned infants.*^{1,6,7}
-  Note infant's age at onset of jaundice. *Aids in differentiating type of jaundice (i.e., physiological, breast milk induced, or pathological). Physiological jaundice usually appears between the second and third days of life, as excess RBCs needed to maintain adequate oxygenation for the fetus are no longer required in the newborn and are hemolyzed, thereby releasing bilirubin.*^{2,6} *Breast milk jaundice usually appears between the fourth and the seventh days of life, affecting approximately 14% of breastfed infants.*⁶ *Pathological jaundice occurs within the first 24 hours of life or when the total serum bilirubin level rises by more than 5 mg/dL per day.*^{2,7}

NURSING PRIORITY NO. 2 To evaluate degree of compromise:

-  Review laboratory studies, including total serum bilirubin and albumin levels, hemoglobin/hematocrit, and reticulocyte count, *to monitor severity of problem and need for, or effectiveness, of therapy.*² *Note: Excessive unconjugated bilirubin has an affinity for extravascular tissue, including the basal ganglia of brain tissue.*⁷
-  Calculate plasma bilirubin-albumin-binding capacity. *Aids in determining risk of kernicterus and treatment needs.*¹ *When total bilirubin value divided by total serum protein level is less than 3.7, the danger of kernicterus is very low. However, the risk of injury is dependent on factors such as degree of prematurity, presence of hypoxia or acidosis, and drug regimen (e.g., sulfonamides, chloramphenicol).*⁷
- Assess infant for progression of signs and behavioral changes associated with bilirubin toxicity. *Early-stage toxicity involves neurodepression (lethargy, poor feeding, high-pitched cry, diminished or absent reflexes), late-stage hypotonia, and neuro-hyperreflexia (twitching, convulsions, opisthotonos, fever). Behavior changes associated with kernicterus usually occur between the 3rd and 10th days of life and rarely occur prior to 36 hours of life.*
- Evaluate appearance of skin and urine, noting brownish-black color. *An uncommon side effect of phototherapy, particularly in presence of cholestatic jaundice, involves exaggerated pigment changes (bronze baby syndrome), which may occur if conjugated bilirubin levels rise. The changes in skin color may last for 2 to 4 months but are not associated with harmful sequelae.*

NURSING PRIORITY NO. 3 To correct hyperbilirubinemia and prevent associated complications:

- Keep infant warm and dry; monitor skin and core temperature frequently. *Prevents cold stress and the release of fatty acids that compete for binding sites on albumin, thus increasing the level of freely circulating bilirubin.*
- Initiate early oral feedings within 4 to 6 hours following birth, especially if infant is to be breastfed. *Establishes proper intestinal flora necessary for reduction of bilirubin to urobilinogen and decreases reabsorption of bilirubin from bowel by promoting passage of meconium stool.*⁷
-  Encourage frequent breastfeeding—8 to 12 times per day. Assist mother with pumping of breasts as needed to maintain milk production. *Interruption of breastfeeding is rarely necessary unless serum levels reach 20 mg/dL; however, breastfeeding support may increase frequency and efficacy of intake.*^{2,5-7}
-  Administer small amounts of breast milk substitute (L-aspartic acid or enzymatically hydrolyzed casein) for 24 to 48 hours if indicated. *Use of feeding additives is under investigation with mixed results for inhibition of beta-glucuronidase leading to increased fecal excretion of bilirubin.*^{4,5}
-  Apply transcutaneous jaundice meter, as indicated. *Provides noninvasive screening of jaundice, quantifying skin color in relation to total serum bilirubin.*
-  Initiate phototherapy per protocol, using fluorescent bulbs placed above the infant or a fiberoptic pad or blanket (except for newborn with Rh disease). *Primary therapy for neonates with unconjugated hyperbilirubinemia. Three separate processes work to convert bilirubin isomers to water-soluble isomers and the formation of lumirubin. The photoisomers are then excreted in urine, stool, and bile.*²
- Apply eye patches ensuring correct fit during periods of phototherapy to prevent retinal injury. Remove eye covering during feedings or other care activities as appropriate to provide visual stimulation and interaction with caregivers/parents.⁸
- Avoid application of lotion or oils to skin of infant receiving phototherapy to prevent dermal irritation or injury.⁸
- Reposition infant every 2 hours to ensure all areas of skin are exposed to bili light when fiberoptic pad or blanket is not used.⁸
- Cover male groin with small pad to protect from heat-related injury to testes.⁸
- Monitor infant's weight loss, urine output and specific gravity, and fecal water loss from loose stools associated with phototherapy to determine adequacy of fluid intake.² *Note: Infant may sleep for longer periods in conjunction with phototherapy, increasing risk of dehydration if frequent feeding schedule is not maintained.*
-  Administer intravenous immunoglobulin (IVIG) to neonates with Rh or ABO isoimmunization. *Rate of hemolysis in Rh disease or other cases of immune hemolytic jaundice usually exceeds the rate of bilirubin reduction related to phototherapy. IVIG inhibits antibodies that cause red cell destruction, helping to limit the rise in bilirubin levels.*²⁻⁵
-  Administer enzyme induction agent (phenobarbital) as appropriate. *May be used on occasion to stimulate hepatic enzymes to enhance clearance of bilirubin.*²
-  Assist with preparation and administration of exchange transfusion. *Exchange transfusions are occasionally required in cases of severe hemolytic anemia unresponsive to other treatment options or in the presence of acute bilirubin encephalopathy, as evidenced by hypertonia, arching, retrocollis, opisthotonos, fever, and high-pitched cry.*^{1,2} *Procedure removes serum bilirubin and provides bilirubin-free albumin, increasing binding sites for bilirubin, and it treats anemia by providing RBCs that are not susceptible to maternal antibodies.*
- Document events during transfusion, carefully recording amount of blood withdrawn and injected (usually 7–20 mL at a time). *Helps prevent errors in fluid replacement. Amount of blood exchanged is approximately 170 mL/kg of body weight. A double-volume exchange ensures that between 75% and 90% of circulating RBCs are replaced.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide information about types of jaundice and pathophysiological factors and future implications of hyperbilirubinemia. *Promotes understanding, corrects misconceptions, and may reduce fear and feelings of guilt.*

-  Review means of assessing infant status (feedings, intake/output, stools, temperature, serial weights if scale available) and for monitoring increasing bilirubin levels (e.g., observing blanching of skin over bony prominence or behavior changes), especially if infant is to be discharged early. *Enables parents to monitor infant's progress and to recognize signs of increasing bilirubin levels. Note: Persistence of jaundice beyond 2 weeks in formula-fed infant or 3 weeks in breastfed infant requires further evaluation.*⁷
-  Provide parents with 24-hour emergency telephone number and name of contact person, stressing importance of reporting increased jaundice or changes in behavior. *Promotes independence and provides for timely evaluation and intervention. Refer to lactation specialist to enhance or reestablish breastfeeding process.*⁶
-  Arrange appropriate referral for home phototherapy program if necessary. *Lack of available support systems may necessitate use of visiting nurse to monitor home phototherapy program.*
- Provide written explanation of home phototherapy, safety precautions, and potential problems. *Home phototherapy is recommended only for full-term infants after the first 48 hours of life whose serum bilirubin levels are between 14 and 18 mg/dL, with no increase in direct-reacting bilirubin concentration.*
-   Make appropriate arrangements for follow-up testing of serum bilirubin at same laboratory facility. *Treatment is discontinued once serum bilirubin concentrations fall below 14 mg/dL. Untreated or chronic hyperbilirubinemia can lead to permanent damage, such as high-pitch hearing loss, cerebral palsy, or mental retardation.*⁷
- Discuss possible long-term effects of hyperbilirubinemia and the need for continued assessment and early intervention. *Neurological damage associated with kernicterus includes cerebral palsy, mental retardation, sensory difficulties, delayed speech, learning difficulties, and death.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, risk or related factors.
- Adequacy of intake—hydration level, character and number of stools.
- Laboratory results—bilirubin trends.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan and resources provided.

Implementation/Evaluation

- Client's responses to treatment and actions performed.
- Parents' understanding of teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for actions to be taken.
- Community resources for equipment and supplies postdischarge.
- Specific referrals made.

risk for neonatal Hyperbilirubinemia

Taxonomy II: Nutrition—Class 4 Metabolism (00230) [**Diagnostic Division: Safety**], Approved 2010; Revised 2013, 2017

DEFINITION: Susceptible to the accumulation of unconjugated bilirubin in the circulation (less than 15 mg/dl) that occurs after 24 hours of life, which may compromise health.

RISK FACTORS

Deficient feeding pattern

Infant with inadequate nutrition

Delay in meconium passage

At Risk Population: ABO incompatibility; blood type incompatibility between mother and infant; Rhesus (Rh) incompatibility

Age ≤ 7 days; premature infant or infant with low birthweight; infant who is breastfed

American Indian or East Asian ethnicity

Significant bruising during birth

Maternal diabetes mellitus; populations living at high altitudes

Associated Condition: Prenatal infection; bacterial, or viral infection; sepsis

Infant with liver malfunction, enzyme deficiency; internal bleeding

Sample Clinical Applications: Newborn, premature infant

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Newborn Adaptation: Adaptive response to the extrauterine environment by a physiologically mature newborn during the first 28 days

Infant Will (Include Specific Time Frame)

- Be free of signs of hyperbilirubinemia with normal bilirubin level
- Establish effective feeding pattern

Sample **NOC** linkages:

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Parent/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of cause, treatment, and possible outcomes of hyperbilirubinemia.
- Demonstrate appropriate care of infant.

(continues on page 442)

risk for neonatal Hyperbilirubinemia (continued)

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Infant Care: Newborn: Provision of care to the infant during the transition from birth to extrauterine life and subsequent period of stabilization

Lactation Counseling: Assisting in the establishment and maintenance of successful breastfeeding

Bottle Feeding: Preparation and administration of fluids to an infant via a bottle

NURSING PRIORITY NO. 1 To determine individual risk factors:

-  Determine infant and maternal blood group and blood type. *ABO incompatibility is more often seen in newborns who have type A blood because of the higher frequency of type A compared to type B in most populations. Incidence figures are difficult to compare because authors of different studies do not use the same definitions for significant neonatal hyperbilirubinemia or jaundice.*^{1,7}
-  Note gender, race, and place of birth. *Risk of developing jaundice is higher in males, infants of East Asian or American Indian descent, and those living at high altitudes. Incidence is lower for African American infants.*²
-  Review intrapartal record for specific risk factors, such as low birth weight (LBW) or intrauterine growth retardation, prematurity, abnormal metabolic processes, vascular injuries, abnormal circulation, sepsis, or polycythemia. *The risk of significant neonatal jaundice is increased in LBW or premature infants, presence of congenital infection, or maternal diabetes.*² *Studies suggest neonates at 36 to 37 weeks' gestation are four to five times more likely to develop hyperbilirubinemia than those born at 40 weeks.*³ *Also, certain clinical conditions may cause a reversal of the blood-brain barrier, allowing bound bilirubin to separate either at the level of the cell membrane or within the cell itself, increasing the risk of central nervous system (CNS) involvement.*
-  Note use of instruments or vacuum extractor for delivery. Assess infant for presence of birth trauma, cephalohematoma, and excessive ecchymosis or petechiae. *Resorption of blood trapped in fetal scalp tissue and excessive hemolysis may increase the amount of bilirubin being released and cause jaundice.*⁴
- Review infant's condition at birth, noting need for resuscitation or evidence of excessive ecchymosis or petechiae, cold stress, asphyxia, or acidosis. *Asphyxia and acidosis reduce affinity of bilirubin to albumin increasing the amount of unbound circulating (indirect) bilirubin, which may cross the blood-brain barrier, causing CNS toxicity.*²
- Evaluate maternal and prenatal nutritional levels; note possible neonatal hypoproteinemia, especially in preterm infant. *One gram of albumin carries 16 mg of unconjugated bilirubin; therefore, lack of sufficient albumin (hypoproteinemia) in the newborn increases risk of jaundice.*
- Assess infant for signs of hypoglycemia such as jitteriness, irritability, and lethargy. Obtain heelstick glucose levels as indicated. *Hypoglycemia necessitates use of fat stores for energy-releasing fatty acids, which compete with bilirubin for binding sites on albumin.*
- Determine successful initiation and adequacy of breastfeeding. *Poor caloric intake and dehydration associated with ineffective breastfeeding increase risk of developing hyperbilirubinemia.*¹
- Examine infant for pallor, edema, or hepatosplenomegaly. *These signs may be associated with hydrops fetalis, Rh incompatibility, and in utero hemolysis of fetal RBCs.*
-  Evaluate for jaundice in natural light, noting sclera and oral mucosa, yellowing of skin immediately after blanching, and specific body parts involved. Assess oral mucosa, posterior portion of hard palate, and conjunctival sacs in dark-skinned newborns. *Detects evidence/degree of jaundice generally first noted on face and progressing to trunk and then extremities.*^{1,6} *Clinical appearance of jaundice is evident at bilirubin levels greater than 5 mg/dL in full-term infant. Estimated degree of jaundice is as follows: face, 4 to 8 mg/dL; trunk, 10 to 12 mg/dL;*

groin, 8 to 16 mg/dL; arms/legs, 11 to 18 mg/dL; and hands/feet, 15 to 20 mg/dL. Note: Yellow underlying pigmentation may be normal in dark-skinned infants.^{1,4,6}

NURSING PRIORITY NO. 2 To prevent onset of hyperbilirubinemia:

-  Review laboratory studies, including total serum bilirubin and albumin levels, hemoglobin/hematocrit, and reticulocyte count, as indicated.
- Keep infant warm and dry; monitor skin and core temperature frequently. *Prevents cold stress and the release of fatty acids that compete for binding sites on albumin, thus increasing the level of freely circulating bilirubin.*
-  Initiate early oral feedings within 4 to 6 hours following birth, especially if infant is to be breastfed. *Establishes proper intestinal flora necessary for reduction of bilirubin to urobilinogen and decreases reabsorption of bilirubin from bowel by promoting passage of meconium stool.⁴*
-  Encourage frequent breastfeeding—8 to 12 times per day. Assist mother with pumping of breasts as needed to maintain milk production for hospitalized preterm infant. *Breastfeeding support may increase frequency and efficacy of intake.^{2,4,5}*
-  Administer intravenous immunoglobulin (IVIG) to neonates with Rh or ABO isoimmunization. *Rate of hemolysis in Rh disease or other cases of immune hemolytic jaundice usually exceeds the rate of bilirubin reduction related to phototherapy. IVIG inhibits antibodies that cause red cell destruction, helping to limit the rise in bilirubin levels.^{2,5}*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review means of assessing infant status (feedings, intake/output, stools, temperature, serial weights if scale available) and for monitoring increasing bilirubin levels (e.g., observing blanching of skin over bony prominence or behavior changes), especially if infant is to be discharged early. *Enables parents to monitor infant for early signs of increasing bilirubin levels.⁴*
- Provide parents with 24-hour emergency telephone number and name of contact person, stressing importance of reporting signs of jaundice or changes in infant's behavior. *Promotes independence and provides for timely evaluation and intervention.*
-  Refer to lactation specialist as indicated to assist with establishing/enhancing breastfeeding process.
- Review proper formula preparation/storage and demonstrate feeding techniques to meet nutritional and fluid needs.
-  Make arrangements for follow-up testing of serum bilirubin at same laboratory facility.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, risk or related factors.
- Adequacy of intake—hydration level, character and number of stools.
- Laboratory results—bilirubin level.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan and resources provided.

Implementation/Evaluation

- Parents understanding of teaching.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Home care needs and who is responsible for actions to be taken.
- Any referrals made.

Hyperthermia

Taxonomy II: Safety/Protection—Class 6 Thermoregulation (00007) [**Diagnostic Division:** Safety], Submitted 1986; Revised 2013; 2017

DEFINITION: Core body temperature elevated above the normal diurnal range due to failure of thermoregulation.

RELATED FACTORS

Dehydration; increase in metabolic rate
Inappropriate clothing
Vigorous activity

DEFINING CHARACTERISTICS

Objective

Abnormal posturing; seizure
Flushed skin; skin warm to touch; vasodilation
Hypotension; tachycardia; tachypnea; apnea
Irritability; lethargy; stupor; coma
Infant does not maintain suck

At Risk Population: Exposure to high environmental temperature

Decrease in sweat response
Illness, sepsis; trauma; ischemia
Pharmaceutical agent

Sample Clinical Applications: Infectious diseases, head trauma, hyperthyroidism, heat exhaustion or heatstroke, surgical procedure, anesthesia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Thermoregulation: Balance among heat production, heat gain, and heat loss

Thermoregulation: Newborn: Balance among heat production, heat gain, and heat loss during the first 28 days of life

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Maintain core temperature within normal range.
- Be free of complications such as irreversible brain or neurological damage and acute renal failure.
- Identify underlying cause or contributing factors and importance of treatment as well as signs/symptoms requiring further evaluation or intervention.
- Demonstrate behaviors to monitor and promote normothermia.
- Be free of seizure activity.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Temperature Regulation: Attaining and/or maintaining body temperature within a normal range

Fever Treatment: Management of symptoms and related conditions associated with an increase in body temperature mediated by endogenous pyrogens

Malignant Hyperthermia Precautions: Prevention or reduction of hypermetabolic response to pharmacological agents used during surgery

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify underlying cause. *These factors can include **excessive heat production** such as occurs with strenuous exercise, fever, shivering, tremors, convulsions, hyperthyroid state, and infection or sepsis and malignant hyperpyrexia, heatstroke, and sympathomimetic drugs; **impaired heat dissipation** such as occurs with heatstroke, dermatological diseases, burns, and inability to perspire such as occurs with spinal cord injury and certain medications (e.g., diuretics, sedatives, certain heart and blood pressure medications); and **loss of thermoregulation** such as may occur in infections, brain lesions, and drug overdose.*^{1,8,9}
- ∞ Note chronological and developmental age of client. *Infants, young children, and elderly persons are most susceptible to damaging hyperthermia. Environmental factors and relatively minor infections can produce a much higher temperature in infants and young children than in older children and adults. Infants, children, or impaired individuals are not able to protect themselves and cannot recognize and/or act on symptoms of hyperthermia. Elderly persons have age-related risk factors (e.g., poor circulation, inefficient sweat glands, skin changes caused by normal aging, chronic diseases).*^{1-4,9}

NURSING PRIORITY NO. 2 To evaluate effects/degree of hyperthermia:

- +∞ Monitor core temperature by appropriate route (e.g., tympanic, rectal). Note presence of temperature elevation (>98.6°F [37°C]) or fever (100.4°F [38°C]). *Rectal and tympanic temperatures most closely approximate core temperature; however, shell temperatures (oral, axillary, touch) are often measured at home and are predictive of fever. Rectal temperature measurement may be the most accurate but is not always expedient (e.g., client declines, is agitated, has rectal lesions or surgery). Abdominal temperature monitoring may be done in the premature neonate.*¹⁻⁴
- Assess whether body temperature reflects heatstroke. *Defined as body temperature higher than 105°F (40.5°C) that is associated with neurological dysfunction and is potentially life threatening.*^{9,11}
- Assess neurological response, noting level of consciousness and orientation, reaction to stimuli, reaction of pupils, and presence of posturing or seizures. *High fever accompanied by changes in mentation (from confusion to delirium) may indicate septic state or heatstroke.*^{1-3,5}
- Monitor blood pressure and invasive hemodynamic parameters if available (e.g., cardiac output, arterial pressures). *Hyperdynamic state (high central venous pressure, low systemic vascular resistance, tachycardia, elevated blood pressure, which may later fall) can occur, especially in person with preexisting cardiovascular*

disease if heat-related illness (e.g., heatstroke or malignant hyperthermia reaction to anesthesia) has rendered the client critically ill.^{1-3,5}

- Monitor heart rate and rhythm. Tachycardia, dysrhythmias, and electrocardiogram changes are common due to electrolyte and acid-base imbalance, dehydration, specific action of catecholamines, and direct effects of hyperthermia on blood and cardiac tissue.^{1-3,5}
- Monitor respirations. Hyperventilation may initially be present, but ventilatory effort may eventually be impaired by seizures and hypermetabolic state (shock and acidosis).
- Auscultate breath sounds to note presence and progression of adventitious sounds such as crackles (rales), especially when heart failure or pneumonia is present.^{1-3,5}
- Monitor and record all sources of fluid loss such as urine (oliguria or renal failure may occur due to hypotension, dehydration, shock, and tissue necrosis), vomiting and diarrhea, wounds or fistulas, and insensible losses (potentiates fluid and electrolyte losses).^{1-3,5}
- Note presence or absence of sweating. The body attempts to increase heat loss by evaporation, conduction, and diffusion. Evaporation is decreased by environmental factors of high humidity and high ambient temperature as well as body factors producing loss of ability to sweat or sweat gland dysfunction (e.g., spinal cord transection, cystic fibrosis, dehydration, vasoconstriction).^{8,9}
-  Monitor laboratory studies such as arterial blood gases, electrolytes and cardiac and liver enzymes (may reveal tissue degeneration); glucose (hypoglycemia); blood urea nitrogen/creatinine (acute renal failure); and urinalysis (myoglobinuria, proteinuria, and hemoglobinuria can occur as products of tissue necrosis).^{1,11}

NURSING PRIORITY NO. 3 To assist with measures to reduce body temperature/restore normal body/organ function.^{1-3,5,8,9,11}

-   Administer antipyretics, orally or rectally (e.g., acetaminophen, ibuprofen), as ordered. Avoid use of aspirin products in children (may cause Reye's syndrome or liver failure)¹³ or in individuals with a clotting disorder or receiving anticoagulant therapy.
- Promote cooling by means of:
Limiting clothing and dress in lightweight, loose-fitting clothes. Encourages heat loss by radiation and conduction.
Cooling the environment with air-conditioning or fans. Promotes heat loss by convection.
-  Provide cool or tepid sponge baths, spray bottle, or immersion if temperature is greater than 104°F (40°C) (heat loss by evaporation and conduction) or local ice packs, especially in groin and axillae (areas of high blood flow). Note: Immersion in very cold/ice water is good for exertional heatstroke (such as with athletes or military recruits in training) but use with caution in treatment of classic heatstroke (such as in elderly client or client with alcoholism), which has been associated with a high mortality rate.¹² In pediatric clients, alcohol sponge baths are contraindicated because they increase peripheral vascular constriction and central nervous system depression; cold water sponges or immersion can increase shivering, producing heat.¹³
- Keep clothing and linens dry to reduce shivering.
-  Monitor use of hypothermia blanket and wrap extremities with bath towels to minimize shivering. Turn off hypothermia blanket when core temperature is within 1° to 3° of desired temperature to allow for downward drift.
-  Administer medications (e.g., dantrolene, chlorpromazine, diazepam) as ordered, to manage hyperthermia and control shivering and seizures.
-  Assist with internal cooling methods in presence of malignant hyperthermia to promote rapid core cooling.
- Provide hydration:
Offer or force plenty of fluids by appropriate route even if client is not thirsty to replace fluids lost through perspiration and respiration.
Avoid alcohol and caffeinated beverages (increases fluid loss by diuresis).
-  Administer replacement IV fluids and electrolytes to support circulating volume and tissue perfusion and treat acid-base imbalance.

- Promote client safety (e.g., maintain patent airway, padded siderails, quiet environment, mouth care for dry mucous membranes, skin protection from cold when hypothermia blanket is used, observation of equipment safety measures).
- Maintain bedrest to *reduce metabolic demands and oxygen consumption*.
-  Provide supplemental oxygen to *offset increased oxygen demands and consumption*.
-  Administer medications as indicated to treat underlying cause, such as antibiotics (*for infection*), dantrolene (*for malignant hyperthermia*), and beta blockers (*for thyroid storm*).
-  Provide high-calorie diet and enteral or parenteral nutrition to *meet increased metabolic demands*.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Instruct parents in how to measure child's temperature, at what body temperature to give antipyretic medications, and what symptoms to report to physician. *Low-grade fever enhances immune system functioning in presence of infection and is not harmful as long as individual is not dehydrated or susceptible to febrile seizures.³ Fever may be treated at home to relieve the general discomfort and lethargy associated with fever. Fever is reportable, however, especially in infants or very young children with or without other symptoms and in older children or adults, if it is unresponsive to antipyretics and fluids because it often accompanies a treatable infection (viral or bacterial).¹³*
- Review with client/significant other specific cause of hyperthermia. *Helps to identify those factors that client can control (if any), such as correction of underlying disease process (e.g., thyroid suppression medication), ways to protect oneself from excessive exposure to environmental heat (e.g., proper clothing, restriction of activity, scheduling outings during cooler part of day), and understanding of family traits (e.g., malignant hyperthermia reaction to anesthesia is often familial).^{7,9}*
- Discuss importance of adequate fluid intake at all times and ways to improve hydration status when ill or when under stress (e.g., exercise, hot environment).
-  Instruct families/caregivers (of young children, persons who are outdoors in very hot climate, elderly living alone) in dangers of heat exhaustion and heatstroke and ways to manage hot environments. Caution parents to avoid leaving young children in unattended car, emphasizing the extreme hazard to the child in a very short period of time depending on outdoor temperature and humidity, whether the car is parked in direct sunlight, and air and surface temperatures in the car. *Heat injuries can be immediately life threatening. Being aware of environmental hazards and hydration levels can save one's life.^{6,10}*
- Recommend avoidance of hot tubs/saunas as appropriate (e.g., client with cardiac conditions compromised by decreased cardiac output associated with peripheral vasodilation, pregnancy that may affect fetal development or increase maternal cardiac workload).
- Review signs/symptoms of hyperthermia (e.g., flushed skin, increased body temperature, increased respiratory and heart rate; fainting, loss of consciousness, seizures). *Indicates need for prompt intervention.*
-  Identify community resources, especially for elderly clients, to address specific needs (e.g., provision of fans for individual use, location of cooling rooms—usually in a community center—during heat waves, daily telephone contact to assess wellness).

DOCUMENTATION FOCUS

Assessment/Reassessment

- Temperature and other assessment findings, including vital signs and state of mentation.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Specific referrals made and those responsible for actions to be taken.

Hypothermia

Taxonomy II: Safety/Protection—Class 6 Thermoregulation (00006) [**Diagnostic Division:** Safety], Submitted 1986; Revised 1988, 2013, 2017

DEFINITION: Core body temperature below the normal diurnal range due to failure of thermoregulation.

RELATED FACTORS

Alcohol consumption; malnutrition
 Decrease in metabolic rate; inactivity
 Economically disadvantaged
 Excessive conductive, convective, evaporative, or radiative heat transfer
 Low environmental temperature
 Insufficient caregiver knowledge of hypothermia prevention; insufficient clothing

Neonates

Early bathing of newborn; delay in breastfeeding
 Increase in oxygen demand

DEFINING CHARACTERISTICS

Objective

Acrocyanosis, cyanotic nailbeds; peripheral vasoconstriction; hypoxia
 Bradycardia; tachycardia
 Decrease in blood glucose level; hypoglycemia
 Decrease in ventilation

Increase in metabolic rate; increase in oxygen consumption

Peripheral vasoconstriction; shivering; piloerection

Skin cool to touch; slow capillary refill

Neonates

Infant with insufficient energy to maintain sucking; or with insufficient weight gain (<30 g/d)

Irritability

Jaundice, pallor

Respiratory distress; metabolic acidosis

At Risk Population: Economically disadvantaged

Extremes of age

Extremes of weight; increased body surface-to-weight ratio; insufficient supply of subcutaneous fat

High-risk or unplanned out-of-hospital birth

Associated Condition: Damage to hypothalamus; increase in pulmonary vascular resistance (PVR); ineffective vascular control; inefficient nonshivering thermogenesis

Immature stratum corneum

Radiation therapy; trauma

Sample Clinical Applications: Dementia, malnutrition, anorexia nervosa, brain trauma, stroke, endocrine disorders, some surgical procedures (e.g., craniotomy), alcohol intoxication, abuse or neglect, prematurity, near drowning

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Thermoregulation: Balance among heat production, heat gain, and heat loss

Thermoregulation: Newborn: Balance among heat production, heat gain, and heat loss during the first 28 days of life

Client Will (Include Specific Time Frame)

- Display core temperature within normal range.
- Be free of complications such as cardiac failure, respiratory infection or failure, and thromboembolic phenomena.

Sample NOC linkages:

Personal Safety Behavior: Personal actions to prevent unintentional physical injury to self

Client/Caregiver Will (Include Specific Time Frame)

- Maintain safe environment.
- Identify underlying cause or contributing factors that are within caregiver control.
- Verbalize understanding of specific interventions to prevent hypothermia.
- Demonstrate behaviors to monitor and promote normothermia.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Hypothermia Treatment: Heat loss prevention, rewarming, and surveillance of a patient whose core body temperature is abnormally low as a result of noninduced circumstances

Temperature Regulation: Attaining or maintaining body temperature within a normal range

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note underlying cause, for example, (1) **decreased heat production** such as occurs with hypopituitary, hypoadrenal, and hypothyroid conditions, and hypoglycemia and neuromuscular inefficiencies seen in extremes of age; (2) **increased heat loss** (e.g., exposure to cold weather, winter outdoor activities; cold water drenching or immersion; improper clothing, shelter, or food for conditions; vasodilation from medications, drugs, or poisons; skin-surface problems such as burns or psoriasis; fluid losses, dehydration; surgery, open wounds, exposed skin or viscera; multiple rapid infusions of cold solutions or transfusions of banked blood; overtreatment of hyperthermia); and (3) **impaired thermoregulation**. The hypothalamus is sensitive to blood temperature changes of as little as 0.5°C and also reacts to nerve impulses received from nerve endings in the skin. Hypothalamus failure might occur with central nervous system (CNS) trauma or tumor; intracranial bleeding or stroke; toxicological and metabolic disorders; and Parkinson's disease and multiple sclerosis.^{1,2}
- ∞ Note contributing factors: **age of client** (e.g., premature neonate, child, elderly person), **concurrent or coexisting medical problems** (e.g., brainstem injury, CNS trauma; near drowning, sepsis, hypothyroidism), **other factors** (e.g., alcohol or other drug use or abuse, homelessness), **nutrition status** (e.g., thin, tall person loses heat easier than short stature, overweight person), and **living condition and relationship status** (e.g., aged or cognitive impaired client living alone).^{1,2,6}

NURSING PRIORITY NO. 2 To prevent further decrease in body temperature:

- 🏠 **Mild-to-moderate hypothermia: 1–6**
- Remove wet clothing and bedding.
- Add layers of clothing and wrap in warm blankets.
- Increase physical activity if possible.
- Provide warm liquids after shivering stops if client is alert and can swallow.
- Provide warm nutrient-dense food (carbohydrates, proteins, fats) and fluids (hot, sweet liquids are easily digestible and absorbable).
- Avoid alcohol, caffeine, and tobacco to prevent vasodilation, diuresis, or vasoconstriction, respectively.
- Place in warm ambient temperature environment and protect from drafts; provide external heat sources.
- ∞ 📄 Provide barriers to heat loss, as well as active rewarming for newborns, especially preterm and/or low-birth-weight infants, monitoring temperature closely. Measures might include use of protective hats, open radiant warmer or Isolette, and/or heating blanket. Note: Wariki and Mori's study (2010) found that plastic wraps or bags were effective in reducing heat losses in infants less than 28 weeks' gestation. Stockinet caps were not effective in reducing heat losses. Skin-to-skin care was shown to be effective in reducing the risk of hypothermia when compared to conventional incubator care for infants. The transwarmer mattress reduced the incidence of hypothermia on admission to NICU in very low-birth-weight infants.⁷
- 🏠 **Severe hypothermia: 1–6**
- Remove client from causative or contributing factors.
- Dry the skin, cover with blankets or vapor barrier, and provide shelter with warm ambient temperature; use radiant lights.
- Warm the person's trunk first, not hands and feet. Warming extremities first can cause shock.
- Avoid immersing in warm water or applying hot objects or excessive pressure directly to skin (e.g., uninsulated hot water bottles, blood pressure cuffs, etc.).
- Keep individual lying down. Avoid jarring (can trigger an abnormal heart rhythm).

NURSING PRIORITY NO. 3 To evaluate effects of hypothermia:

- + Measure core temperature with low register thermometer (measuring below 34.4°C [94°F]).
- Assess respiratory effort (rate and tidal volume are reduced when metabolic rate decreases and respiratory acidosis occurs).
- Auscultate lungs, noting adventitious sounds. Pulmonary edema, respiratory infection, and pulmonary embolus are potential complications of hypothermia.

- Monitor heart rate and rhythm. *Cold stress reduces pacemaker function, and bradycardia (unresponsive to atropine), atrial fibrillation, atrioventricular blocks, and ventricular tachycardia can occur. Ventricular fibrillation occurs most frequently when core temperature is 27.7°C (82°F) or below.*^{1,2,4}
- Monitor blood pressure, noting hypotension. *Can occur due to vasoconstriction, and shunting of fluids as a result of cold injury effect on capillary permeability.*
- Measure urine output. *Oliguria or renal failure can occur due to a low flow state and/or following hypothermic osmotic diuresis.*
- Note CNS effects (e.g., mood changes, sluggish thinking, amnesia, complete obtundation) and peripheral CNS effects (e.g., paralysis—30.9°C [87.7°F]; dilated pupils—below 30°C [86°F]; flat electroencephalogram—20°C [68°F]).^{1,2,4}
-  Monitor laboratory studies such as arterial blood gases (*respiratory and metabolic acidosis*), electrolytes (*hyperkalemia initially, followed by hypokalemia after hypothermia-induced diuresis*), complete blood count (*increased hematocrit, decreased white blood cell count*), cardiac enzymes (*myocardial infarct may occur owing to electrolyte imbalance, cold stress catecholamine release, hypoxia, or acidosis*), coagulation profile (*late hypothermia associated with increased prothrombin time and partial prothrombin time*), and glucose (*hyperglycemia occurs initially, followed by hypoglycemia*), as well as pharmacological profile (*for toxicology [alcohol/other drugs]; possible cumulative drug effects*).²

NURSING PRIORITY NO. 4 To restore normal body temperature/organ function:

-  Assist with surface warming. Cover head, neck, and thorax, leaving extremities uncovered as appropriate to maintain peripheral vasoconstriction. Note: Do not institute surface rewarming prior to core rewarming in severe hypothermia (*causes afterdrop of temperature by shunting cold blood back to heart, in addition to rewarming shock as a result of surface vasodilation*).¹⁻⁴
-  Assist with core rewarming measures, such as warmed IV solutions and warm-solution lavage of body cavities (gastric, peritoneal, bladder) or cardiopulmonary bypass if indicated to normalize core temperature. Rewarm no faster than 1°F to 2°F per hour to avoid sudden vasodilation, increased metabolic demands on heart, and hypotension (*rewarming shock*).²
- Protect skin and tissues by repositioning, applying lotion or lubricants, and avoiding direct contact with heating appliance or blanket. *Impaired circulation can result in severe tissue damage.*
- Keep client quiet; handle gently to reduce potential for fibrillation in cold heart.²
-  Provide cardiopulmonary resuscitation as necessary, with compressions initially at one-half the normal heart rate. *Severe hypothermia causes slowed conduction, and cold heart may be unresponsive to medications, pacing, and defibrillation.*^{2,4,5}
-  Maintain patent airway. Assist with intubation if indicated. Provide heated, humidified oxygen when used.
-  Turn off warming blanket when temperature is within 1°F to 3°F of desired temperature to accommodate drift and avoid hyperthermia situation.
-  Administer IV fluids with caution to prevent overload as the vascular bed expands.² *Cold heart is slow to compensate for increased volume.*
-  Avoid vigorous pharmacological therapy. *As rewarming occurs, organ function returns, correcting endocrine abnormalities, and tissues become more receptive to the effects of drugs previously administered, creating risk for overdose.*
-  Perform range-of-motion exercises, provide support hose or sequential compression device, reposition, encourage coughing and deep-breathing exercises, and avoid restrictive clothing or restraints to reduce effects of circulatory stasis.
-  Provide well-balanced, high-calorie diet or feedings to replenish glycogen stores and nutritional balance.

NURSING PRIORITY NO. 5 To promote wellness (Teaching/Discharge Considerations):

-  Review specific risk factors or causes of hypothermia. Note that hypothermia can be accidental or intentional (e.g., when induced-hypothermia therapy is used after cardiac arrest or brain injury), requiring interventions to protect client from adverse affects.⁵

- Identify factors that client can control (if any), such as protection from environment and adequate heat in home, layering of clothing and blankets, minimizing heat loss from head with hat or scarf, appropriate cold weather clothing, avoidance of alcohol or other drugs if anticipating exposure to cold, potential risks for future hypersensitivity to cold, etc.
- Discuss signs/symptoms of early hypothermia (e.g., changes in mentation, somnolence, impaired coordination, slurred speech) *to facilitate recognition of problem and timely intervention. Information may be especially important if client works or plays outdoors (e.g., camping, skiing, hiking).*^{1,2}
-  Identify assistive community resources, as indicated (e.g., social services, emergency shelters, clothing suppliers, food bank, public service company, financial resources). *Individual/significant other may be in need of numerous resources if hypothermia was associated with inadequate housing, homelessness, or malnutrition.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings, noting degree of system involvement.
- Graph temperature.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for each action.
- Specific referrals made.

risk for Hypothermia

Taxonomy II: Safety/Protection—Class 6 Thermoregulation (00253) [**Diagnostic Division:** Safety], Approved 2013; Revised 2017

DEFINITION: Susceptible to a failure of thermoregulation that may result in a core body temperature below the normal diurnal range, which may compromise health.

RISK FACTORS

Alcohol consumption; malnutrition
 Decrease in metabolic rate; inactivity
 Economically disadvantaged
 Excessive conductive, convective, evaporative, or radiative heat transfer
 Low environmental temperature
 Insufficient caregiver knowledge of hypothermia prevention; insufficient clothing

Neonates

Early bathing of newborn; delay in breastfeeding
 Increase in oxygen demand

At Risk Population: Economically disadvantaged

Extremes of age

Extremes of weight; increased body surface-to-weight ratio; insufficient supply of subcutaneous fat

High-risk or unplanned out-of-hospital birth

Associated Condition: Damage to hypothalamus; increase in pulmonary vascular resistance (PVR); ineffective vascular control; inefficient nonshivering thermogenesis

Immature stratum corneum

Radiation therapy; trauma; radiation therapy

Sample Clinical Applications: Dementia, malnutrition, anorexia nervosa, brain trauma, stroke, endocrine disorders, some surgical procedures (e.g., craniotomy), alcohol intoxication, abuse or neglect, prematurity, near-drowning

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Thermoregulation: Balance among heat production, heat gain, and heat loss

Thermoregulation: Newborn: Balance among heat production, heat gain, and heat loss during the first 28 days of life

Client Will (Include Specific Time Frame)

- Display core temperature within normal range.
- Be free of complications such as cardiac failure, respiratory infection or failure, and thromboembolic phenomena.

Sample **NOC** linkages:

Risk Control: Hypothermia: Personal actions to understand, prevent, eliminate, or reduce the threat of low body temperature

Client/Caregiver Will (Include Specific Time Frame)

- Maintain safe environment.
- Identify underlying cause or contributing factors that can be controlled.

(continues on page 454)

risk for Hypothermia (continued)

- Verbalize understanding of specific interventions to prevent hypothermia.
- Demonstrate behaviors to monitor and promote normothermia.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Temperature Regulation: Attaining or maintaining body temperature within a normal range

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

NURSING PRIORITY NO. 1 To assess risk factors:

- Note presence of risk factors as related to current situation, for example (1) **decreased heat production**, such as occurs with hypopituitary, hypoadrenal, and hypothyroid conditions, and hypoglycemia and neuromuscular inefficiencies seen in extremes of age; (2) **increased heat loss** (e.g., exposure to cold weather, winter outdoor activities; cold water drenching or immersion; improper clothing, shelter, or food for weather conditions; problems such as could occur with burns; fluid losses, dehydration; surgery, open wounds, exposed skin or viscera); and (3) **impaired thermoregulation** as might occur with central nervous system trauma or tumor, intracranial bleeding or stroke, toxicological and metabolic disorders, and Parkinson's disease and multiple sclerosis.^{1,2}
- ∞ Note age of client (e.g., premature neonate, child, elderly person) and other associated conditions, such as nutrition status (e.g., thin, tall person loses heat easier than short stature, overweight person) and living condition and relationship status (e.g., aged or cognitively impaired client living alone or homeless alcoholic).¹⁻³
- Measure core temperature with low-register thermometer (measuring below 94°F [34.4°C]) to identify client approaching hypothermia range as listed in Risk Factors.
- Monitor for change in vital signs and mental status.

NURSING PRIORITY NO. 2 To prevent hypothermia (Teaching/Discharge Considerations):

- 🏠 Review specific risk factors or causes of hypothermia to assist client/caregivers in identifying safety concerns.
- Identify factors that client can control (if any), such as protection from environment and adequate heat in home, layering clothing and blankets, minimizing heat loss from head with hat or scarf, appropriate cold weather clothing, avoidance of alcohol or other drugs if anticipating exposure to cold, potential risks for future hypersensitivity to cold, etc.
- Discuss signs/symptoms of early hypothermia (e.g., changes in mentation, somnolence, impaired coordination, slurred speech) to facilitate recognition of problem and timely intervention. Information may be especially important if client works or plays outdoors (e.g., camping, skiing, hiking).^{1,2}
- 🤝 Identify assistive community resources, as indicated (e.g., social services, emergency shelters, clothing suppliers, food bank, public service company, financial resources). Individual/significant other may be in need of numerous resources if risk for hypothermia is associated with inadequate housing, homelessness, or malnutrition.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risks identified.
- Available resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, identifying who is responsible for each action.
- Specific referrals made.

risk for perioperative Hypothermia

Taxonomy II: Safety/Protection—Class 6 Thermoregulation (00254) [**Diagnostic Division:** Safety], Approved 2013; Revised 2017

DEFINITION: Susceptible to an inadvertent drop in core body temperature below 36°C (96.8°F) occurring 1 hour before to 24 hours after surgery, which may compromise health.

RISK FACTORS

Excessive conductive, convective, or radiative heat transfer

Low environmental temperature

At Risk Population: American Society of Anesthesiologists (ASA) Physical Status classification score >1

Low body weight

Low preoperative temperature (<36°C [96.8°F])

Associated Condition: Cardiovascular complications; diabetic neuropathy

Combined regional and general anesthesia; surgical procedure

Sample Clinical Applications: Surgical procedures where therapeutic hypothermia is not planned

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Thermoregulation: Balance among heat production, heat gain, and heat loss

Client Will (Include Specific Time Frame)

- Display core temperature within normal range.
- Be free of complications such as cardiac failure, respiratory infection or failure, thromboembolic phenomena, and delayed healing.

(continues on page 456)

risk for perioperative Hypothermia (continued)

Sample **NOC** linkages:

Risk Control: Hypothermia: Personal actions to understand, prevent, eliminate, or reduce the threat of low body temperature

Care Provider Will (Include Specific Time Frame)

- Identify client condition/situations that may lead to problems with temperature regulation.
- Engage in protective actions to control body temperature.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Temperature Regulation: Perioperative: Attaining and maintaining desired body temperature throughout the surgical event

NURSING PRIORITY NO. 1 To identify risk factors affecting current situation:

-  Ascertain type of surgical procedure client is having. *Helps in identifying elements of risk. For example, some procedures carry higher risk of hypothermia (e.g., laparoscopic abdominal procedure with carbon dioxide insufflation; large volume liposuction; extensive surgical procedure of any sort with prolonged exposure of body surfaces and long period of anesthesia).*¹⁻³
- Assess client conditions/comorbidities (e.g., diabetes, impaired skin and tissue integrity, respiratory, cardiac, vascular, neurological disorders) *that may place client at higher risk for perioperative complications, including hypothermia.*⁴
-  Note client's body type and age. *Very thin, malnourished, or dehydrated individuals, as well as those who are very young or elderly, are more susceptible to perioperative hypothermia. The body's ability to regulate temperature may lessen with age.*^{5,6}
-  Note client's medication regimen. *Medications including some vasodilators, antipsychotics, and sedatives can impair the body's ability to regulate its temperature.*⁶

NURSING PRIORITY NO. 2 To maintain appropriate body temperature/prevent hypothermia complications:

-   Measure client's temperature preoperatively and confirm that continuous monitoring of temperature is occurring during procedure. Report preoperative temperature below ideal range to surgical team/anesthesiologist.
-   Implement preventive warming techniques in the operating room. *Evidence supports commencement of active warming preoperatively and monitoring it throughout the intraoperative period. Single strategies such as forced-air warming are more effective than passive warming (e.g., blankets from a warmer); however, combined strategies, including preoperative commencement, use of warmed fluids plus forced-air warming, and other active strategies, were more effective in vulnerable groups.*¹³
-  Consider administering warmed IV fluids. *A large-scale study published in 2015 reported that use of warmed intravenous fluids (kept at temperatures between 37°C [98.6°F] and 41°C [105.8°F]) kept the core temperature of study participants about half a degree warmer than that of participants given room temperature intravenous fluids at 30, 60, 90, and 120 minutes and at the end of surgery. Warmed intravenous fluids also further reduced the risk of shivering compared with room temperature intravenous fluids.*⁷
-  Use heated blankets from warming cabinet. *Note: While easy to use and effective, blankets on top of client can limit access to surgical site. Also, adding too many layers of warmed cotton blankets is ineffective in raising the patient's body temperature. The first blanket can reduce heat loss by 33%, but adding another blanket only adds another 18% reduction in heat loss. Adding three or more blankets adds no further warming.*⁸

-  Use conductive warming devices. *One type of warming pad is an electrical resistive/conductive device that warms underneath the client's body. The anesthesiologist can select one of five preset temperatures. Because the client is warming from underneath, blankets need not be placed on top, allowing for greater surgical access.*⁹
-  Provide forced-air warming blanket. *Warm air is pumped through a hose into a disposable blanket that covers the client. Heat transfer results from the movement of warm air across the surface of the patient's skin, which allows forced-air blankets to transfer more heat at a lower temperature. Note: Recent studies show some evidence that forced air warming increases body temperature by 0.5° to 1° compared with extra insulation (mostly reflective blankets in these studies).*^{7,13–15}
-  Use warm water garment or mattress. *Research has shown that circulating water garments and energy transfer pads warm about 50% better than forced air because they warm both over and under the body. Note: Care must be exercised when the mattress is used, as the heat of the fluid mattress combined with body weight and static position increases the risk of pressure ulcers or necrosis.*^{10,11}
-  Increase operating room temperature, as indicated. *It is currently thought that optimal operating room temperatures for the client should be no less than 20°C (68°F) to reduce risk of hypothermia complications while still providing comfortable environment for scrubbed personnel under surgical lights. Recovery room temperatures of 20°C to 24°C (68°F to 75°F) may be ideal for rewarming client.*¹²

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings, noting degree of system involvement.
- Graph temperature.

Planning

- Plan of care.

Implementation/Evaluation

- Responses to interventions and actions performed.
- Attainment of desired outcome(s).
- Modifications to plan of care.

risk for complicated Immigration Transition

Taxonomy II: Coping/Stress Tolerance—Class 1 Posttrauma Responses (00260) [Diagnostic Division: Social Interaction], Approved 2016

DEFINITION: Susceptible to experiencing negative feeling (loneliness, fear, anxiety) in response to unsatisfactory consequences and cultural barriers to one's immigration transition, which may compromise health.

RISK FACTORS

Available work below educational preparation

Cultural barriers or insufficient social support in host country; insufficient knowledge about process to access resources in host country

Unsanitary or overcrowded housing; multiple nonrelated persons within household

Language barriers in host country

Overt discrimination; abusive landlord

Parent-child conflicts related to enculturation in host country

At Risk Population: Forced migration; unfulfilled expectations of immigration; illegal status in host country

Hazardous work conditions with inadequate training; labor exploitation

Precarious economic situation

Separation from family and friends in home country

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Relocation Adaptation: Adaptive and behavioral response of a cognitively intact individual to a required change in living environment

Quality of Life: Extent of positive perception of current life circumstances

Hope: Optimism that is personally satisfying and life supporting

Client Will (Include Specific Time Frame)

- Verbalize understanding of current situation.
- Develop plan to address identified issues.
- Engage in activities to overcome issues impacting transition to new life.
- Express optimism about outcome of transition.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Relocation Stress Reduction: Assisting the individual to prepare for and cope with movement from one environment to another

Coping Enhancement: Facilitation of cognitive and behavioral efforts to manage perceived stressors, changes, or threats that interfere with meeting life demands and roles

Hope Inspiration: Enhancing the belief in one's capacity to initiate and sustain actions

NURSING PRIORITY NO. 1 To determine underlying dynamics of individual situation:

- Ascertain circumstances of migration, nature of the involuntary move and acculturation since arrival. *These individuals/families face multiple consequences and barriers that are specific to their situation and require unique solutions.*¹

-   Note age of immigrants. *A growing number of older people are immigrating and face economic disadvantages. Midlife women who immigrate show more depressive symptoms than nonimmigrants.^{2,3} Young children are more likely to have health rated as “poor” or “fair,” and their health tends to decline more rapidly as they age versus native born children.⁴*
- Determine primary language and ability to speak, read, and understand the language of the host country. *Acculturation is slowed when dominant language of the host country is not understood by client/family members.¹*
- Note level of stress being experienced (e.g., anxiety, difficulty sleeping, changes in eating habits, depression, hopelessness). *Difficulties encountered with relocation can impair coping and general well-being.*
- Identify current coping strategies and past skills used. *Bringing to mind previous situations where the individual functioned successfully can help client to use these skills in the current situation and provides opportunity to learn new skills.¹*
- Determine financial situation and access to and use of available resources. *Provides insight for client/family needs and possible options to lessen stressors and facilitate integration in the new environment.¹*

NURSING PRIORITY NO. 2 To promote integration of immigrants into new environment:

- Obtain services of an interpreter, bilingual written materials/videos as indicated. *May be needed for clients to adequately understand plan of care and what is needed to improve their situation.¹*
- Allow sufficient time for discussions, information exchanges, and teaching. *Lack of/weak language skills may impede communications. If client feels rushed he/she may falsely indicate understanding.*
- Identify resources for English as second language (ESL) classes, if needed/desired. *Learning dominant language of the host country can facilitate self-actualization by improving opportunities for employment, continuing education, and meeting needs of family members.*
- Designate a primary or ‘family nurse,’ as appropriate, who can coordinate the team aiding the family. *Additional services can empower the family to develop a well-functioning daily life and adaptation to their new environment.¹*
- Make home visits as appropriate, noting family communication pattern/interactions, conflicts, safety concerns. *Provides opportunity to observe client/family in more relaxed surrounding, identify issues to be addressed, answer questions, and impart needed information.¹*
- Discuss changes from previous life to new circumstances and expectations for the future. *Acculturation is a complex social and psychological process implying cultural learning and behavioral adaptation to a nonnative country.¹*
-  Identify cultural differences/value conflicts and similarities. *Transition is complicated when long-held beliefs/values and traditional family roles are in conflict with those of host country. Recognizing and addressing conflicts while accepting that differences will exist allows client to build on similarities facilitating adaptation.*
- Provide useful resources as desired for immigrants to learn new lifestyle, i.e., food, dress, language, and manner of interacting. *Can assist in efforts to “blend in” and relate to others.¹*
- Encourage participation in community activities, sporting events, neighborhood gatherings, governmental affairs as interested. *Provides opportunity to socialize and learn various aspects of new society, facilitating adjustment to new life.¹*
-  Assist immigrants, especially seniors, to navigate the problems of income, public benefits, and other means of managing living in a new country. *While these problems affect most immigrants, seniors are a growing proportion of immigrants with all the resultant problems of managing how to survive on lower incomes.³*
-  Identify cultural/religious resources, ethnic organizations, support groups. *Provides mentors in new culture that may be able to introduce immigrants to local business, engage in religious practices, and visit other facilities where immigrants can find support and guidance as they progress toward acculturation.*

NURSING PRIORITY NO. 3 To assist immigrants to enhance quality of life in new situation:

- Encourage client/family to identify positives in life to build on. *Assists client/family to find hope for the future.*
- Identify community resources/programs such as emergency housing, utilities, transportation, nutrition assistance program (food stamps)/ pantries, clothing/home goods assistance. *Helps to provide basic necessities to enable client/family to begin to settle into their new home.*¹
-  Refer to vocational counselor/resources as indicated. *Helpful for evaluating marketable skills, developing resume, preparing for interview, obtaining additional education as appropriate to gain employment and provide for family.*
-  Provide assistance with health/behavioral issues that may occur, identifying healthcare and counseling resources available to client/family. *The changes incurred with the transition from the old to the new country markedly increase stressors, impacting role performance of family members and family cohesiveness, negatively affecting both physical and psychological well-being of client/family.*²

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings regarding immigrant's circumstances.
- Immigrant's perception of what has happened, specific stressors.
- Language(s) spoken, fluency with language of host country.
- Perceived cultural barriers.
- Safety concerns.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan of care.

Discharge Planning

- Long-term needs and goals, and who is responsible for actions to be taken.
- Specific referrals made.

ineffective Impulse Control

Taxonomy II: Perception/Cognition—Class 4 Cognition (00222) [**Diagnostic Division:** Ego Integrity], Approved 2010; Revised 2017

DEFINITION: A pattern of performing rapid, unplanned reactions to internal or external stimuli without regard for the negative consequences of these reactions to the impulsive individual or to others.

RELATED FACTORS

Hopelessness; mood disorder
Smoking; substance use/[abuse]

DEFINING CHARACTERISTICS

Subjective

Inability to save money or regulate finances
Asking personal questions despite discomfort of others

Objective

Acting without thinking
Sensation seeking; sexual promiscuity
Inappropriate sharing of personal details; overly familiar with strangers
Irritability; temper outbursts
Gambling addiction
Violent behavior

Associated Condition: Alteration in development or cognitive functioning
Organic brain disorder; personality disorder

Sample Clinical Applications: Eating disorders, addictions—substance/sexual, bipolar disorders, dementia, attention deficit hyperactivity disorder (ADHD), oppositional defiant disorder, traumatic brain injury, Down syndrome, Asperger's syndrome

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Impulse Self-Control: Self-restraint of compulsive or impulsive behaviors

Mood Equilibrium: Appropriate adjustment of prevailing emotional tone in response to circumstances

Self-Management: Autism Spectrum Disorder Management: Personal actions to manage autism, use positive behavior practices, its treatment, and to prevent complications

Client Will (Include Specific Time Frame)

- Acknowledge problem with impulse control.
- Identify feelings that precede desire to engage in impulsive actions.
- Verbalize desire to learn new ways of controlling impulsive behavior.
- Participate in anger management therapy.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Impulse Control Training: Assisting the patient to mediate impulsive behavior through application of problem-solving strategies to social and interpersonal situations

Anger Control Assistance: Facilitation of the expression of anger in an adaptive, nonviolent manner

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Investigate causes/individual factors that may be involved in client's situation. *Impulse disorders are a group of mental health disorders generally believed to be the result of biological, social, and psychological factors. It is theorized that unbalanced neurotransmitters in the brain may be a cause, as well as the hormone imbalances implicated in violent and aggressive behavior.*^{1-4,7,9}
- Evaluate for underlying neurological conditions. *Presence of traumatic brain injury, strokes, brain tumors, etc., may result in poor impulse control, affecting therapeutic choices.*¹¹
- Explore individual's inability to control actions. *Healthy people are aware of an impulse and are able to make a decision about whether to follow the urge. The key differentiation between healthy impulsiveness and an impulse disorder is the negative consequences that follow.*^{1,7,9}
- Note negative consequences incurred by client's impulsive actions, such as repeat detentions or suspensions from school, loss of employment, financial ruin, arrests/convictions, and civil litigation. *Regardless of the form of the impulsive disorder—predisposition to rapid unplanned reactions (e.g., ADHD, bipolar, substance use, explosive behavior) or impaired ability to resist impulses (e.g., compulsive buying, kleptomania, pathological gambling, pyromania)—individuals with poor control engage in the activity even if they know that there will be negative consequences.*^{1-3,7,9,10}
- Ascertain degree of anxiety client experiences when having an impulse to act on the desire. *Not acting on the impulse creates intense anxiety or arousal in the individual. Engaging in the behavior produces release of the anxiety and possibly pleasure or gratification. This may be followed by remorse, regret, or conversely, satisfaction.*^{1-3,7}
- Identify behaviors indicative of ADHD for further evaluation. *This diagnosis needs to be made by a physician based on reports of behaviors of inattention, hyperactivity, and impulsivity by multiple sources (e.g., parent, teachers, employer) in more than one setting and lasting at least 6 months.*⁴
- Evaluate for co-occurring psychiatric conditions. *The presence of comorbidities has treatment implications and, if left untreated, will complicate and/or limit successful outcomes for impulse control therapy.*^{4,7,9}

NURSING PRIORITY NO. 2 To assist client to develop strategies to manage impulsive behaviors:

-  Collaborate with treatment of condition, as indicated. *Individuals with impulsive control disorders do not necessarily present for treatment. Those with kleptomania, fire starters, and compulsive gamblers usually come to the attention of court authorities and may be referred for mental health services.*^{1-5,7,9}
- Encourage client to make the decision to change and set personally achievable goals. *Making this decision can enable the client to enter therapy and be willing to stay with the program.*^{2,4,7}
- Encourage client to identify negative consequences of behavior by expressing own feelings and anxieties regarding the adverse impact on his/her life. *Helps individual begin to understand problems of impulsive behavior.*⁷
- Help client take responsibility and control in situation. *Recognizing own control over impulsive behavior can help client begin to manage problems.*^{3,4,7}
-  Develop a treatment plan for child with ADHD in conjunction with the parents, teachers, and physician. *Medications and behavioral therapy can be helpful, along with monitoring the child and setting goals that are realistic and achievable.*⁴
-  Organize a routine schedule for the child with Autism spectrum disorder. *Deficits in cognitive functioning make it difficult for the child to see the big picture, process information, see the consequences of an action, and understand the concept of time.*^{5,6}
-  Plan for problem with “melt downs,” tantrums, or rage in children with Autism spectrum disorder. *These children do not recognize feelings, and parents and caregivers need to maintain a calm manner, remove child in a nonpunitive fashion, move closer, redirect, etc. These actions are calming; however, the child may begin acting out and need to go to a safe room where he or she can regain control.*^{5,6}
- Discuss issue of hypersexuality. *It can be difficult to determine whether this term applies to an individual because people have differing definitions for what is too much sexual behavior.*⁸

-  Determine use of medications. *No specific medications have been approved by the FDA for use with impulse control disorders, but some medications such as selective serotonin reuptake inhibitor (SSRI) antidepressants are being used successfully.*^{1,4,7}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Involve in cognitive/behavioral therapy. *Having client identify behavioral patterns that result in negative consequences or harmful effects for self or others allows the individual to recognize and avoid these situations and use techniques that facilitate self-restraint.*^{3-5,7}
- Discuss the use of exposure therapy. *This helps the client build up a tolerance for the trigger situation while using self-control.*^{3,7}
- Encourage client to become involved in group or community activities. *Provides opportunity to learn new social skills and feel better about self.*⁷

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including type of situation involved in client's loss of control.
- Negative consequences incurred due to behavior.
- Client awareness of consequences of actions.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Individual teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Any modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

bowel Incontinence

Taxonomy II: Elimination and Exchange—Class 2 Gastrointestinal Function (00014) [**Diagnostic Division:** Elimination], Approved 1975; Revised 1998, 2017

DEFINITION: Involuntary passage of stool.

RELATED FACTORS

Incomplete emptying of the bowel
 Inadequate dietary habits
 Difficulty with toileting self-care
 Environmental factor [e.g., inaccessible bathroom]
 Generalized decline in muscle tone; immobility;
 Laxative abuse

DEFINING CHARACTERISTICS

Subjective

Inability to expel formed stool despite recognition of rectal fullness
 Bowel urgency; inability to delay defecation
 Inability to recognize rectal fullness

Objective

Constant passage of soft stool
 Fecal staining
 Does not recognize or inattentive to urge to defecate

Associated Condition: Abnormal increase in abdominal or intestinal pressure; colorectal lesion; dysfunctional rectal sphincter; impaired reservoir capacity

Alternation in cognitive functioning; upper or lower motor nerve damage

Chronic diarrhea; impaction

Pharmaceutical agent

Sample Clinical Applications: Hemorrhoids, rectal prolapse, anal/gynecological surgery, childbirth injuries/uterine prolapse, spinal cord injury (SCI), stroke, multiple sclerosis (MS), ulcerative colitis, dementia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Bowel Continence: Control of passage of stool from the bowel

Bowel Elimination: Formation and evacuation of stool

Neurological Status: Ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli

Client Will (Include Specific Time Frame)

- Verbalize understanding of causative or controlling factors.
- Identify individually appropriate interventions.
- Participate in therapeutic regimen to control incontinence.
- Establish and maintain as regular a pattern of bowel functioning as possible.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Bowel Incontinence Care: Promotion of bowel continence and maintenance of perineal skin integrity

Bowel Incontinence Care: Encopresis: Promotion of bowel continence in children

Bowel Training: Assisting the patient to train the bowel to evacuate at specific intervals

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Determine type of bowel incontinence present, as possible: (1) *loss of anal sphincter control (such as might occur with sphincter trauma)*, (2) *stool seepage (as may occur with fistula and prolapse)*, or (3) *poor bowel control (as might occur with inflammatory bowel disease, following intestinal surgery; chronic constipation with weakening musculature; laxative abuse, parasitic infection, toxins)*.⁸
-  Note client's age and gender. *Bowel incontinence is more common in children, women of childbirth age, and elderly adults (difficulty responding to urge in a timely manner, problems walking or undoing zippers, decrease of maximum squeeze pressure); it is more common in boys than girls, but more common in elderly women than elderly men.*^{1,2,7}
-  Review medication regimen, including over-the-counter drugs. *Laxative abuse and drugs with a side effect of diarrhea (e.g., antibiotics) or constipation (e.g., sedatives, hypnotics, opioids, muscle relaxants) may impact bowel control.*
-  Review diagnostic studies. *Pelvic and/or anal ultrasound may be used to identify structural abnormalities; endoscopy may be used to visualize lower gastrointestinal tract; manometry may be used to measure pressure and strength of anal muscles; and nerve studies may be used to check for nerve damage. Blood tests and stool cultures may be done to identify presence of bacteria and toxins.*^{1-3,5,6}

NURSING PRIORITY NO. 2 To determine current pattern of elimination:

-  Ascertain timing and characteristic aspects of incontinent occurrence, noting preceding or precipitating events. *Helps to identify patterns or worsening trends. Interventions are different for a sudden acute accident than for chronic long-term incontinence problems. Note: Client may have passive incontinence and be unaware that stool is being passed (related to poorly functioning sphincter muscle) or urge incontinence in which the individual is aware but unable to prevent passage of stool (sphincter muscle normal). Problem may have been present for a long time, either because of client/caregiver sense of embarrassment or failure to realize that effective treatment may be available.*^{2,5}
-  Determine stool characteristics, including **consistency** (may be liquid, hard formed, or hard at first and then soft), **amount** (may be a small amount of liquid or entire solid bowel movement), and **frequency**. *Provides information that can help differentiate type of incontinence present and provides comparative baseline for response to interventions.*
-  Note where bowel accidents occur and what client is experiencing at the time. *Changes in usual routines or surrounding environment, general health condition, and the addition of emotional stressors can cause or exacerbate incontinence behaviors.*⁵

NURSING PRIORITY NO. 3 To promote control/management of incontinence:

-  Assist in treatment of underlying conditions. *While incontinence is a symptom and not a disease, appropriate treatment can often correct the problem or at least improve the client's quality of life.*²
-  Administer medications, as indicated, such as stool softeners or bulk formers and laxatives (*may be used when the cause is constipation*) or antidiarrheals, including cholinergics (*may be used to decrease intestinal secretions and bowel motility if diarrhea is cause for incontinence*).^{1,2}
-  Establish a toileting program as early as possible *to maximize success of program and preserve comfort and self-esteem.*^{1-5,7}

Take client to the bathroom or place on commode or bedpan at specified intervals, taking into consideration individual needs and incontinence patterns.

Use the same type of facility for toileting as much as possible.

Make sure bathroom is safe for impaired person (good lighting, support rails, good height for getting onto and up from stool).

Provide time and privacy for elimination.

Demonstrate techniques and assist client/caregiver to practice contracting abdominal muscles, leaning forward on commode *to increase intra-abdominal pressure during defecation*, and left to right abdominal massage *to stimulate peristalsis*.

- Encourage and instruct client/caregiver in providing diet high in natural bulk and fiber, with fruits, vegetables, grains, and reduced fatty foods. Identify and eliminate problem foods *to avoid diarrhea, constipation, or gas formation.*²
-  Adjust enteral feedings and/or change formula, as indicated, *to reduce diarrhea effect.*⁷
- Encourage adequate fluid intake (at least 2,000 mL/d) within client's need and tolerance, including fruit juices *to help manage constipation*. Encourage warm fluids after meals *to promote intestinal motility*. Avoid caffeine and alcohol *to reduce diarrhea.*⁷
-  Recommend walking and a regular exercise program, pelvic floor exercises, and biofeedback, as individually indicated, *to improve abdominal and pelvic muscles and strengthen rectal sphincter tone.*^{2,7}
- Encourage or provide perineal care with frequent gentle cleansing and use of emollients after incontinent stools *to reduce excoriation of skin.*⁶
- Provide incontinence aids or pads until control is obtained. Change pads frequently *to reduce incidence of skin rashes or breakdown.*⁶
- Refer to ND Diarrhea *if incontinence is due to uncontrolled diarrhea* and ND Constipation *if incontinence is due to impaction.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Review and encourage continuation of successful interventions as individually identified.
-  Instruct in use of suppositories or laxatives or stool softeners, when indicated, *to stimulate timed defecation.*
- Identify foods (e.g., daily bran muffins or prunes) *that promote soft stool consistency and bowel regularity*. Recommend avoidance of problem foods dependent on individual reactions.
-  Refer client/caregivers to outside resources when condition is long term or chronic *to obtain care assistance and emotional support and respite.*
- Encourage scheduling of social activities within time frame of bowel program, as indicated (e.g., avoid a 4-hr excursion with no access to appropriate facilities if bowel program requires toileting every 3 hr), *to maximize social functioning and success of bowel program.*

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Current and previous pattern of elimination, physical findings, character of stool, actions tried.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's/caregiver's responses to interventions, teaching, and actions performed.
- Changes in pattern of elimination, characteristics of stool.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Identified long-term needs, noting who is responsible for each action.
- Specific bowel program at time of discharge.

functional urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00020) [**Diagnostic Division:** Elimination], Approved 1986; Revised 1998; 2017

DEFINITION: Inability of usually continent person to reach the toilet in time to avoid unintentional loss of urine.

RELATED FACTORS

Alteration in environmental factor
Weakened supporting pelvic structure

DEFINING CHARACTERISTICS**Subjective**

Sensation of need to void

Objective

Voiding prior to reaching toilet; time required to reach toilet is too long after sensation of urge
Completely empties bladder
Early morning urinary incontinence

(continues on page 468)

functional urinary Incontinence (continued)

Associated Condition: Alteration in cognitive functioning; impaired vision; neuromuscular impairment; psychological disorder

Sample Clinical Applications: Diabetes mellitus, congestive heart failure (CHF) (diuretic use), arthritis, bladder prolapse or cystocele, stroke; dementia; depression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Urinary Elimination: Collection and discharge of urine

Urinary Continence: Control of elimination of urine from the bladder

Self-Care: Toileting: Personal actions to toilet self independently with or without assistive device

Client/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of condition and identify interventions to prevent incontinence.
- Alter environment to accommodate individual needs.
- Report voiding in individually appropriate amounts.
- Void at acceptable times and places.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Prompted Voiding: Promotion of urinary continence through the use of timed verbal toileting reminders and positive social feedback for successful toileting

Urinary Habit Training: Establishing an individual toileting schedule to preempt involuntary bladder emptying for persons with limited cognitive or physical ability

Self-Care Assistance: Toileting: Assisting another with elimination

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- ∞ Identify or differentiate client with functional incontinence (e.g., bladder and urethra are functioning normally, but client either cannot get to toilet or fails to recognize need to urinate in time to get to the toilet) from other types of incontinence. *Many causes are transient and reversible but can often occur in elderly hospitalized client. Note: A mnemonic to help remember the functional contributors to incontinence is as follows: DIAPPERS: D—delirium; I—infection (urinary); A—atrophic urethritis or vaginitis; P—pharmacological agents; P—psychiatric illness; E—excess urine output (due to excess fluid intake, alcoholic or caffeinated beverages, diuretics, peripheral edema, congestive heart failure, metabolic disorders such as hyperglycemia or hypercalcemia); R—reduced mobility; S—stool impaction.*⁵
- Determine if client is voluntarily postponing urination. *Often the demands of the work setting (such as restrictions on bathroom breaks, working alone [e.g., pharmacist, nurse, teacher], or demands of the job [heavy workload and unable to find time for a bathroom break]) make it difficult for individuals to go to the bathroom when the need arises, resulting in frequent urinary tract infections and incontinence.*^{1,5}
- Evaluate cognition. *Delirium or acute confusion or psychosis can affect mental status—orientation to place, recognition of urge to void, or its significance.*^{1,5}
- Note presence and type of functional impairments (e.g., poor eyesight, mobility difficulties, dexterity problems, self-care deficits) *that can hinder ability to get to bathroom.*⁴
- Identify environmental conditions that interfere with timely access to bathroom or successful toileting process. *Unfamiliar surroundings, poor lighting, improperly fitted chair walker, low toilet seat, absence of safety bars, and travel distance to toilet may affect self-care ability.*

- Review medical history for conditions known to increase urine output or alter bladder tone. *For example, diabetes mellitus, prolapsed bladder, and multiple sclerosis can affect frequency of urination and ability to hold urine until individual can reach the bathroom.*¹
-  Note use of medications or agents that can increase urine formation. *Diuretics, alcohol, and caffeine are several substances that can increase amount and frequency of voiding.*
-  Test urine for presence of glucose. *Hyperglycemia can cause polyuria and overdistention of the bladder, resulting in problem with continence.*

NURSING PRIORITY NO. 2 To assess degree of interference/disability:

- Determine the frequency and timing of continent and incontinent voids. Note time of day or night when incontinence occurs, as well as timing issues (e.g., difference between the time it takes to get to bathroom and remove clothing and involuntary loss of urine). *Information will be used to plan program to manage incontinence.*²
- Initiate voiding diary. Note time of day or night when incontinence occurs as well as timing issues (e.g., difference between the time it takes to get to bathroom and remove clothing and involuntary loss of urine).
- Measure or estimate amount of urine voided or lost with incontinent episodes to help determine options for managing problem.
- Ascertain effect on lifestyle (including socialization and sexuality) and self-esteem. *There is a general belief that incontinence is an inevitable result of aging and that nothing can be done about it. However, individuals with incontinence problems are often embarrassed, withdraw from social activities and relationships, and hesitate to discuss the problem—even with their healthcare provider.*¹

NURSING PRIORITY NO. 3 To assist in treating/preventing incontinence:

- Remind client to void when needed and schedule voiding times (e.g., cognitive decline, client who ambulates slowly because of physical limitations) to reduce incontinence episodes and promote comfort.^{4,6}
-  Administer prescribed diuretics in the morning. *The effect of these medications diminishes by bedtime, thus resulting in fewer nighttime voidings.*
-  Reduce or eliminate use of hypnotics, if possible. *Client may be too sedated to recognize or respond to urge to void.*^{3,5}
- Provide means of summoning assistance and respond immediately to summons. *Ready placement of a call light when hospitalized or a bell in the home setting enables client to obtain toileting help, as needed. Quick response to summons can promote continence.*³
-  Use night lights to mark bathroom location. *Elderly person may become confused upon arising and be unable to locate bathroom in the dark. Lighting will facilitate access, reducing the possibility of accidents.*³
- Provide cues such as adequate room lighting, signs, and color coding of door. *Assists disoriented client to find the bathroom.*
- Remove throw rugs and excess furniture in travel path to bathroom. *Reduces risk of falls and facilitates access to bathroom.*
- Adapt clothes for quick removal. *Velcro fasteners, full skirts, crotchless panties or no panties, and suspenders or elastic waists instead of belts on pants facilitate toileting once urge to void is noted.*³
- Provide raised toilet seat or easily accessible bedside commode, urinal, or bedpan as indicated. *Facilitates toileting when individual has difficulty with movement.*¹
- Schedule voiding on regular time schedule (e.g., every 2–3 hr). Encourage client to resist ignoring urge to urinate or have a bowel movement. *Emptying bladder on a regular schedule or when feeling urge reduces risk for incontinence. Since urge to void may be difficult to differentiate from urge to defecate, advise client to respond to urge.*^{1,6}
- Assist client to assume normal anatomic position for ease of complete bladder emptying.³
- Restrict fluid intake 2 to 3 hr before bedtime. *May reduce need to waken to void during the night.*^{1,6}

-  Include physical or occupational therapist in determining ways to alter environment, appropriate assistive devices. *Useful in meeting individual needs of client.*
-  Refer to urologist or continence specialist as indicated for interventions such as pelvic floor strengthening exercises, biofeedback techniques, vaginal weight training. *May be useful/needed to meet individual needs of client.*

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Discuss with client/significant other need for prompted and scheduled voidings *to manage continence when client is unable to respond immediately to urge to void.*¹
- Suggest limiting intake of coffee, tea, and alcohol. *Diuretic effect of these substances impacts voiding pattern and can contribute to incontinence.*¹
- Maintain positive regard when incontinence occurs. *Reduces embarrassment associated with incontinence, need for assistance, and use of bedpan.*
- Promote participation in developing long-term plan of care. *Encourages involvement in follow-through of plan, thus increasing possibility of success and confidence in own ability to manage program.*
- Refer to NDs reflex/stress/urge urinary Incontinence for additional interventions, as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Current elimination pattern, assessment findings, and effect on lifestyle and self-esteem.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

overflow urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00176) [**Diagnostic Division:** Elimination], Approved 2006; Revised 2017

DEFINITION: Involuntary loss of urine associated with overdistention of the bladder.

RELATED FACTORS

Fecal impaction

DEFINING CHARACTERISTICS

Subjective

Involuntary leakage of small volume of urine
Nocturia

Objective

Bladder distention
High post-void residual volume

Associated Condition: Bladder outlet or urethral obstruction; detrusor external sphincter dyssynergia; detrusor hypocontractility

Severe pelvic organ prolapse

Treatment

Sample Clinical Applications: Uterine or bladder prolapse, benign prostatic hypertrophy, diabetes mellitus, multiple sclerosis (MS), spinal cord injury (SCI), Parkinson's disease; pelvic urinary stones

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Urinary Continence: Control of elimination of urine from the bladder

Urinary Elimination: Collection and discharge of urine

Knowledge: Disease Process: Extent of understanding conveyed about a specific disease process and potential complications

Client Will (Include Specific Time Frame)

- Verbalize understanding of causative factors and appropriate interventions for individual situation.
- Demonstrate techniques or behaviors to alleviate or prevent overflow incontinence.
- Void in sufficient amounts with no palpable bladder distention, experience no postvoid residuals greater than 50 mL, and have no dribbling or overflow.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Urinary Incontinence Care: Assistance in promoting continence and maintaining perineal skin integrity

Urinary Catheterization: Intermittent: Regular periodic use of a catheter to empty the bladder

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Review client's history for (1) bladder outlet obstruction (e.g., prostatic hypertrophy, urethral stricture, urinary stones or tumors), (2) nonfunctioning detrusor muscle (i.e., sensory or motor paralytic bladder due to

- underlying neurological disease), or (3) atonic bladder that has lost its muscular tone (i.e., chronic overdistention) to identify potential for or presence of conditions associated with overflow incontinence.^{5,6}
-  Note client's age and gender. Urinary incontinence due to overflow bladder is more common in older men because of the prevalence of obstructive prostate gland enlargement. However, age and sex are not factors in other conditions affecting overflow bladder incontinence, such as nerve damage from diseases such as diabetes, alcoholism, Parkinson's disease, MS, or spina bifida.^{1,5,6}
 -  Review medication regimen for drugs that can cause or exacerbate retention and overflow incontinence (e.g., anticholinergics, calcium channel blockers, psychotropics, anesthesia, opiates, sedatives, alpha and beta blockers, antihistamines, neuroleptics).^{2,4,5}

NURSING PRIORITY NO. 2 To determine degree of interference/disability:

- Note client reports of symptoms common to overflow incontinence:^{3,5,6}
Feeling no need to urinate, while simultaneously losing urine; frequent leaking or dribbling.
Feeling the urge to urinate but not being able to.
Feeling as though the bladder is never completely empty.
Passing a dribbling stream of urine, even after spending a long time at the toilet.
Frequently getting up at night to urinate.
-  Prepare for or assist with urodynamic testing (e.g., uroflowmetry to assess urine speed and volume; cystometrogram to measure bladder pressure and volume; bladder scan to measure retention or postvoid residual, leak point pressure).^{1,5}

NURSING PRIORITY NO. 3 To assist in treating/preventing overflow incontinence:

-  Collaborate in treatment of underlying conditions (e.g., medications or surgery for prostatic hypertrophy or severe pelvic prolapse; use of medications, to relax urinary sphincter; altering dose or discontinuing medications contributing to retention). *If the underlying cause of the overflow problem can be treated or eliminated, client may be able to return to normal voiding pattern.*
-  Collaborate with physician regarding client's medications (e.g., anticholinergics, antidepressants, antipsychotics, sedatives, narcotics, alpha-adrenergic blockers) that could be discontinued or altered to reduce/limit their effects on cognition and/or innervation and function of the bladder.⁹
-  Administer medications, as indicated. Anticholinergics (e.g., oxybutinin [Ditropan]) or β_3 blockers (e.g., mirabegron [Myrbetriq]) are often used to reduce bladder spasms that are impeding urine outflow. For some men with an enlarged prostate, treatment with an alpha-adrenergic blocker (e.g., finasteride [Proscar], tamsulosin [Flomax]) can help relax the muscle at the base of the urethra and allow urine to pass from the bladder.^{5,9}
-  Administer stool softeners, laxatives, enema/other treatments as indicated. Chronic constipation is a factor in weakening muscles that control urination. Fecal impaction can be a cause of urinary retention and overflow incontinence, especially in elderly clients.⁶
-  Demonstrate and encourage use of gentle massage over bladder (Credé's maneuver). *May facilitate bladder emptying when cause is detrusor weakness.*
-  Implement intermittent or continuous catheterization. Bladder catheterization may be a temporary measure or a permanent solution for overflow incontinence. Short-term use may be required while acute conditions are treated (e.g., infection, surgery for enlarged prostate); long-term use is required for permanent conditions (e.g., SCI or other neuromuscular conditions resulting in permanent bladder dysfunction). Note: Sterile intermittent catheterization is preferred when possible in overflow incontinence to promote the return to normal bladder emptying and to reduce risk of infection and other complications associated with long-term indwelling catheter.^{5,7,8,10}
- Refer to NDs urge urinary Incontinence, stress urinary Incontinence, and [acute/chronic] Urinary Retention for additional interventions.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Identify and continue client's successful self-management of incontinence, where possible. *Continuation of successful strategies (e.g., allowing plenty of time for voiding, double voiding, self-catheterization) can reduce risk of recurrence/failure of continence.*
- Establish regular schedule for bladder emptying whether voiding or using catheter.
- Emphasize need for adequate fluid intake, including use of acidifying fruit juices or ingestion of vitamin C to discourage bacterial growth and stone formation.
-  Instruct client/significant others in clean intermittent self-catheterization techniques to prevent reflux or increased renal pressures and to enhance independence.
-  Review signs/symptoms of complications requiring prompt medical evaluation to promote timely intervention and prevent complications.

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Current elimination pattern, assessment findings, and effect on lifestyle and sleep.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

reflex urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00018) [**Diagnostic Division:** Elimination], Submitted 1986; Revised 1998, 2017

DEFINITION: Involuntary loss of urine at somewhat predictable intervals when a specific bladder volume is reached.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Subjective

Absence of urge to void, or of voiding sensation

Sensation of urgency to void without voluntary inhibition of bladder contraction

Sensations associated with bladder fullness

Objective

Predictable pattern of voiding

Inability to voluntarily inhibit or initiate voiding

Incomplete emptying of bladder with lesion above pontine micturition center

Associated Condition: Neurological impairment above levels of sacral or pontine micturition centers

Sample Clinical Applications: Spinal cord injury (SCI), multiple sclerosis (MS), bladder or pelvic cancer, Parkinson's disease, dementia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Urinary Contenance: Control of the elimination of urine from the bladder

Neurological Status: Autonomic: Ability of the autonomic nervous system to coordinate visceral and hemostatic function

Urinary Elimination: Collection and discharge of urine

Client Will (Include Specific Time Frame)

- Verbalize understanding of condition or contributing factors.
- Establish bladder regimen appropriate for individual situation.
- Demonstrate behaviors or techniques to manage condition and prevent complications.
- Void at acceptable times and places.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Urinary Incontinence Care: Assistance in promoting continence and maintaining perineal skin integrity

Urinary Catheterization: Intermittent: Regular periodic use of a catheter to empty the bladder

NURSING PRIORITY NO. 1 To assess degree of interference/disability:

- Identify pathology of problem (e.g., pelvic cancer, central nervous system disorder, SCI, stroke, Parkinson's disease, diabetes with bladder neuropathy, brain tumor) *that results in either hypotonic or spastic neurogenic*

bladder, thereby affecting bladder storage, emptying, and control. *Note: The causes of reflex incontinence are often mixed (e.g., most people with reflex incontinence experience symptoms of urinary frequency, urgency, and nocturia). In this situation, the bladder empties urine as it fills.*^{3-5,7-9}

- Ascertain whether client experiences any sense of bladder fullness or awareness of incontinence. *Individuals with reflex incontinence have little, if any, awareness of need to void. Loss of sensation of bladder filling can result in overfilling, inadequate emptying (retention), and/or constant dribbling.*^{5,8,9} (Refer to NDs [acute/chronic] Urinary Retention and overflow urinary Incontinence for additional interventions.)
- Review voiding diary, if available, or record frequency and time of urination. Compare timing of voidings, particularly in relation to certain factors (e.g., liquid intake and medications). *Aids in targeting interventions to meet individual situation.*¹
- Measure amount of each voiding during assessment phase. *Incontinence often occurs once a specific bladder volume is reached and may indicate need for insertion of a permanent or intermittent catheter.*^{2,8}
-  Determine postvoid residual volume (via handheld bladder scan) in client with incomplete emptying or on scheduled catheterization to evaluate for urinary retention when attempting toilet training, to establish schedule for intermittent catheterization, and to avoid unnecessary catheterization.⁶ *Note: Often the bladder is not completely emptied because there is no voluntary control of the bladder.*⁸
-  Refer to urologist or appropriate specialist for testing. *Urinalysis, ultrasound, radiographs, and urine flowmetry are standard to measure urine flow. A urodynamic evaluation measuring bladder capacity, pressure, and rate of urinary flow may also be indicated.*

NURSING PRIORITY NO. 2 To assist in managing incontinence:

- Evaluate client's ability to manipulate or use urinary collection device or catheter. *Type and degree of neurological impairment (i.e., SCI, MS, dementia) may interfere with client's ability to be self-sufficient.*⁷
-  Collaborate in treatment of underlying cause or management of incontinence. *Of all the types of urinary incontinence, reflex incontinence is probably the most difficult to treat; however, this condition may be treated with medications, neuromodulation (electrical stimulation of specific nerves to influence the nerve circuit that controls urination), bladder surgery, or indwelling bladder catheters. Note: In recent years, intradetrusor injections of onabotulinumtoxinA (Botox) have transformed the management of neurogenic detrusor overactivity, and neuromodulation (controlled stimulation of the peripheral or central nervous system with electricity) offers promise for managing both storage and voiding dysfunction.*⁸⁻¹⁰
- Involve client/significant other/caregiver in creating plan of care to develop mutually agreed-upon goals and ensure individual needs are met, enhancing commitment to plan.¹⁻⁸
- Encourage minimum of 1,500 to 2,000 mL of fluid intake daily. *Reduces risk of bladder and kidney infection/stone formation.*
- Remind or assist client to go to toilet before the expected time of incontinence *in an attempt to stimulate the reflexes for voiding.*¹
- Set alarm to awaken during night, if necessary, to maintain catheterization schedule or use external catheter or collection device, as appropriate. *Developing a regular time to empty the bladder may prevent urinary retention or overflow incontinence during the night.*
-  Implement continuous or intermittent catheterization schedule, if condition indicates, to prevent bladder overdistention and detrusor muscle damage. *Note: Experience has shown that intermittent catheterization is preferable to indwelling catheters in young persons (both male and female) with SCI. It is also a valuable alternative for individuals with chronic urinary retention due to an obstructed, weak, or nonfunctioning bladder.*^{1,4,7}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Encourage continuation of regularly timed bladder program. *May be able to establish a schedule that takes advantage of whatever ability remains, even though the neurological impairment is affecting bladder sensation.*

- Suggest use of incontinence pads/pants during day and with social contact, if appropriate. *Depending on client's activity level, amount of urine loss, manual dexterity, and cognitive ability, these devices provide security and comfort and protect the skin and clothing from urine leakage, reduce odor, and are generally unnoticeable under clothing.*^{7,8}
- Emphasize importance of perineal care following voiding and frequent changing of incontinence pads, if used. *Maintains cleanliness and prevents skin irritation or breakdown and odor.*^{7,8}
- Encourage limited intake of coffee, tea, and alcohol, as well as avoidance of citrus foods, artificial sweeteners, tomatoes, and spicy foods. *Diuretic effect of these beverages may affect predictability of voiding pattern, and the acidic, spicy, or highly sweet substances can irritate the bladder.*¹¹
- Instruct in proper care of catheter and cleaning techniques when used. *Reduces risk of infection.*^{7,8}
- Review signs/symptoms of urinary complications and need for medical follow-up. *Provides immediate attention preventing exacerbation of problem or extension of infection into kidneys.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Findings including degree of disability and effect on lifestyle.
- Availability of resources or support person.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to treatment plan, interventions, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources, equipment needs and sources.

risk for urge urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00022) [**Diagnostic Division:** Elimination], Approved 1998; Revised 2008, 2013, 2017

DEFINITION: Susceptible to involuntary passage of urine occurring soon after a strong sensation or urgency to void, which may compromise health.

RISK FACTORS

Alcohol consumption; caffeine intake

Fecal impaction; involuntary sphincter relaxation

Ineffective toileting habits

Associated Condition: Atrophic urethritis or vaginitis

Bladder infection; decrease in bladder capacity

Impaired bladder contractility; detrusor hyperactivity with impaired bladder contractility

Treatment regimen

Sample Clinical Applications: Abdominal trauma/surgery, pelvic inflammatory disease (PID); pregnancy; childbirth; pelvic surgery; obesity; enlarged prostate, prostate surgery; recurrent urinary tract infections (UTIs), diabetes, stroke, multiple sclerosis, Parkinson's disease, spinal cord injury

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Urinary Continence: Control of elimination of urine from the bladder

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Identify individual risk factors and appropriate interventions.
- Demonstrate behaviors or lifestyle changes to prevent development of problem.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Urinary Bladder Training: Improving bladder function for those with urge incontinence by increasing the bladder's ability to hold urine and the patient's ability to suppress urination

Urinary Habit Training: Establishing an individualized toileting schedule to preempt involuntary bladder emptying for persons with limited cognitive or physical ability

Self-Care Assistance: Toileting: Assisting another with elimination

NURSING PRIORITY NO. 1 To assess potential for developing incontinence:

- Note presence of diagnoses often associated with urgent voiding (e.g., UTI; pregnancy; pelvic or gynecological surgery; prostatitis, or prostate surgery; obesity; bladder tumors or stones; nerve damage from conditions such as diabetes, stroke, Parkinson's, MS; certain cancers, including the bladder and prostate; recent or lengthy use of indwelling urinary catheter). *Such conditions can affect bladder capacity; pelvic, bladder, or urethral musculature tone; and/or innervation.*^{1-3,10}
- Ask client about urgency (more than just normal desire to void). *Urgency (also called overactive bladder [OAB]) is a sudden, compelling need to void that is difficult to defer, can occur frequently (e.g., eight or more times in 24 hr), and may be accompanied by leaking or urge incontinence.*¹¹⁻¹⁴
- Note factors that may affect ability to respond to urge to void in a timely manner. *Impaired mobility, use of sedation, or cognitive impairments may result in client failing to recognize need to void or moving too slowly to make it to the bathroom, with subsequent loss of urine.*^{2,10}

- Determine use or presence of bladder irritants. *A significant intake of alcohol, caffeine, acidic or spicy food, and fluids can result in increased output or urge symptoms and contribute to the possibility of incontinence.*⁵
-  Review client's medications for affect on bladder function, such as beta blockers and cholinergic drugs (*can increase detrusor tone*); neuroleptics, antidepressants, sedatives, and opiates (*can cause detrusor relaxation*); muscle relaxants and psychoactive drugs (*can cause sphincter relaxation*); and diuretics (*can increase urine production*).⁷
- Measure amount of urine voided, especially noting amounts less than 100 mL or greater than 550 mL, to determine bladder capacity and effectiveness of bladder contractions to facilitate emptying.⁶
-  Prepare for and assist with appropriate testing (e.g., urinalysis, noninvasive bladder scanning, urine culture, urine and serum glucose, voiding cystometrograms). *Accurate assessment and diagnosis can determine voiding pattern and identify pathology that may lead to the development of incontinence.*^{2,4,8}

NURSING PRIORITY NO. 2 To prevent occurrence of problem:

-  Assist in treatment of underlying conditions that may contribute to urge incontinence. *Urgency symptoms may resolve with treatment of medical problem (e.g., UTI; recovery from pelvic surgery, childbirth, or pelvic trauma; use of estrogen-based oral or topical products for atrophic vaginitis; etc.).*
- Record intake along with frequency and degree of urgency of voiding. *May reveal developing incontinence problem when need to void is more frequent and urgent relative to normal fluid intake.*
- Ascertain client's awareness and concerns about developing problem and whether lifestyle is affected (e.g., daily activities, socialization, sexual patterns). *Provides information regarding the degree of concern client is experiencing and need for preventive measures to be instituted.*
- Regulate liquid intake at prescheduled times (with and between meals). *Promotes a predictable voiding pattern to establish a bladder-training program to prevent incontinence.*⁴
- Establish schedule for voiding (habit training) based on client's usual voiding pattern. *Can successfully reduce risk for incontinence.*
- Manage bowel elimination to prevent continence problems associated with constipation or fecal impaction.
- Provide assistance or devices, as indicated, for clients who are mobility impaired. *Providing means of summoning assistance and placing bedside commode, urinal, or bedpan within client's reach can promote sense of control in self-managing voiding.*⁵
-  Encourage regular pelvic floor strengthening exercises (Kegel exercises or use of vaginal cones). *Can improve pelvic musculature tone and strength, preventing or halting incontinence. Note: Studies reveal a positive effect on urge incontinence using a combination of behavioral interventions (including pelvic muscle exercises) and medications in older women.*^{4,6,9}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Provide information to client/significant other about potential for urge incontinence (also called OAB) and lifestyle measures to prevent development of incontinence, as individually indicated.
- Recommend limiting intake of coffee, tea, and alcohol. *These substances have an irritating effect on the bladder and may contribute to incontinence.*¹⁰
- Suggest wearing loose-fitting or especially adapted clothing. *Facilitates response to voiding urge, especially in elderly or infirm individuals, enabling them to reach the toilet without loss of urine.*⁶
- Emphasize importance of perineal care after each voiding. *Reduces risk of ascending infection and incontinence-related dermatitis.*⁵
- Identify signs/symptoms indicating urinary complications and need for medical follow-up care. *Helps client be aware and seek intervention in a timely manner to prevent more serious problems from developing.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including specific risk factors and pattern of voiding.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs and who is responsible for actions to be taken.
- Specific referrals made.

stress urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00017) [**Diagnostic Division:** Elimination], Approved 1986; Revised 2006; 2017

DEFINITION: Sudden leakage of urine with activities that increase intra-abdominal pressure.

RELATED FACTORS

Weak pelvic floor muscles

DEFINING CHARACTERISTICS

Subjective

Involuntary leakage of small volume of urine [e.g., with sneezing, laughing, coughing, on exertion]

(continues on page 480)

stress urinary Incontinence (continued)

Objective

Involuntary leakage of small volume of urine in the absence of detrusor contraction or an overdistended bladder

Associated Condition: Degenerative changes in pelvic floor muscles

Increase in intra-abdominal muscles

Intrinsic urethral sphincter deficiency

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Urinary Continence: Control of elimination of urine from the bladder

Symptom Control: Personal actions to minimize perceived adverse changes in physical and emotional functioning

Client Will (Include Specific Time Frame)

- Verbalize understanding of condition and interventions for bladder conditioning.
- Demonstrate behaviors or techniques to strengthen pelvic floor musculature.
- Remain continent even with increased intra-abdominal pressure.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Pelvic Muscle Exercise: Strengthening and training the levator ani and urogenital muscles through voluntary, repetitive contraction to decrease stress, urge, or mixed types of urinary incontinence

Urinary Incontinence Care: Assistance in promoting continence and maintaining perineal skin integrity

Urinary Habit Training: Establishing an individualized toileting schedule to preempt involuntary bladder emptying for persons with limited cognitive or physical ability

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Identify physiological causes of increased intra-abdominal pressure (e.g., obesity, gravid uterus; repeated heavy lifting [occupational risk]), contributing history (e.g., multiple births, bladder or pelvic trauma/fractures), surgery (e.g., radical prostatectomy, bladder or other pelvic surgeries that may damage sphincter muscles), and participation in high-impact athletic or military field activities (particularly women). *Identification of specifics of individual situation provides for developing an accurate plan of care.*^{2,6,7}
- Assess for urine loss (usually in small amounts) with coughing, sneezing, or sports activities; relaxed pelvic musculature and support, noting inability to start and stop stream while voiding; and bulging of perineum when bearing down. *Severity of symptoms may indicate need for more specialized evaluation.*
- ∞ Note client's sex and age. *Note: The majority of clients with stress urinary incontinence are women, although men who undergo surgical prostatectomy may also experience it. Although pregnancy and childbirth are known to cause stress incontinence in younger women, it is also common in older women, possibly related to loss of estrogen and weakened muscles in the pelvic organs.*¹¹
- 📋 Review client's medications (e.g., alpha-blockers, angiotensin-converting enzyme inhibitors, loop diuretics) for those that may cause or exacerbate stress incontinence. *Note: The urge incontinence effect with these agents is usually transient.*^{1,7}
- 📋 Assess for mixed incontinence (consisting of two or more kinds of incontinence), noting whether bladder irritability, reduced bladder capacity, or voluntary overdistention is present. *The most common*

combinations are urge with stress incontinence and urge or stress with functional incontinence. These impact treatment choices.^{1,11} (Refer to NDs urge and reflex urinary Incontinence; [acute/chronic] Urinary Retention.)

NURSING PRIORITY NO. 2 To assess degree of interference/disability:

- Observe voiding patterns, time and amount voided, and note the stimulus provoking incontinence. Review voiding diary if available. *Provides information that can help determine type of incontinence and type of treatment indicated.*
-  Prepare for and assist with testing or refer to urology specialist as indicated. *Diagnosing urinary incontinence often requires comprehensive evaluation (e.g., measuring bladder filling and capacity, leak-point pressure, rate of urinary flow, pelvic ultrasound, cystogram/other scans) to differentiate stress incontinence from other types.*¹⁻¹²
- Determine effect on lifestyle (including daily activities, participation in sports or exercise and recreation, socialization, sexuality) and self-esteem. *Untreated incontinence can have emotional and physical consequences. Client may limit or abstain from sports or recreational activities. Urinary tract infections, skin rashes, and sores can occur. Self-esteem is affected, and the client may suffer from depression and withdraw from social functions.*⁶
- Ascertain methods of self-management. *Client may already be limiting liquid intake, voiding before any activity, or using undergarment protection.*
-  Perform bladder scan to determine postvoid residuals as indicated. *Presence of volumes greater than 200 mL (or 150 mL in elder clients) suggests incomplete emptying of bladder, requiring further evaluation.*⁸

NURSING PRIORITY NO. 3 To assist in treating/preventing incontinence:

-  Implement nonsurgical treatment techniques:
 -  Keep a voiding diary, as indicated. *The use of a frequency/volume chart is helpful in bladder training. A review of urine output in relation to fluid intake record can reveal need to modify fluid intake in client who is resistant to fluid management efforts. The contribution of dietary items that may precipitate incontinence may become obvious after reviewing the voiding log.*¹²
 - Practice timed voidings (e.g., 3-hr intervals during the day) to keep bladder relatively empty.
 - Extend time between voidings to 3- to 4-hr intervals. *May improve bladder capacity and retention time.*¹²
 - Limit use of coffee, tea, and alcohol. *Diuretic effect of these substances may lead to bladder distention, increasing likelihood of incontinence.*⁴
 - Encourage weight loss as indicated to reduce pressure on intra-abdominal and pelvic organs.¹
 - Void before physical exertion such as exercise or sports activities to reduce potential for incontinence.⁹
 - Encourage regular pelvic floor strengthening exercises (Kegel exercises). *These exercises involve tightening the muscles of the pelvic floor and need to be done numerous times throughout the day.*²
 - Avoid or limit heavy lifting and high-impact aerobics or sports to decrease incontinence associated with elevated intra-abdominal pressures.⁴
 - Incorporate “bent-knee sit-ups” into exercise program. *Increasing abdominal muscle tone can help relieve stress incontinence.*³
-  Assist with medical treatment of underlying urological condition, as indicated. *Stress incontinence may be treated with surgical intervention (e.g., bladder neck suspension, pubovaginal sling to reposition bladder and strengthen pelvic musculature; prostate surgery) and nonsurgical therapies (e.g., behavioral modification, pelvic muscle exercises, medications, use of pessary, vaginal cones; electrical stimulation; biofeedback).*^{7,9,11}
-  Administer medications, as indicated, such as tolterodine (Detrol), oxybutynin (Ditropan), fesoterodine (Toviaz), darifenacin (Enablex), solifenacin (VESIcare), trospium (Sanctura). *May improve bladder tone and capacity and increase effectiveness of bladder sphincter and proximal urethra contractions.*^{1,5,11}

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Suggest use of incontinence pads or undergarments as needed. *Considering client's activity level, amount of urine loss, physical size, manual dexterity, and cognitive ability to determine specific product choices best suited to individual situation and needs may be necessary when leakage continues to occur in spite of other measures.*
- Emphasize importance of perineal care following voiding and frequent changing of incontinence pads. Recommend application of oil-based emollient. *Prevents infection and protects skin from irritation.*
- Discuss participation in incontinence management for activities such as heavy lifting and strenuous sports activities that increase intra-abdominal pressure. *Substituting swimming or other low-impact exercises may help reduce frequency of incontinence and maintain active life.*
-  Recommend or refer for behavioral training, as indicated. *An important part of pelvic floor biofeedback therapy is consistent practice of the pelvic floor muscle exercises at home. With biofeedback, an individual can learn to stop using the incorrect muscles and start using the correct ones.*^{10,11}

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Findings including pattern of incontinence and physical factors present.
- Effect on lifestyle and self-esteem.
- Client understanding of condition.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, actions performed, and changes that are identified.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, referrals, and who is responsible for specific actions.
- Specific referrals made.

urge urinary Incontinence

Taxonomy II: Elimination and Exchange—Class 1 Urinary Function (00019) [**Diagnostic Division:** Elimination], Approved 1986; Revised 2006; 2017

DEFINITION: Involuntary passage of urine occurring soon after a strong sense of urgency to void.

RELATED FACTORS

Alcohol consumption; caffeine intake
Fecal impaction; involuntary sphincter relaxation
Ineffective toileting habits

DEFINING CHARACTERISTICS

Subjective

Urinary urgency; involuntary loss of urine with bladder contractions or spasms
Inability to reach toilet in time to avoid urine loss

Associated Condition: Atrophic urethritis or vaginitis

Bladder infection; decrease in bladder capacity

Impaired bladder contractility; detrusor hyperactivity with impaired bladder contractility

Treatment regimen

Sample Clinical Applications: Abdominal trauma/surgery, pelvic inflammatory disease (PID); pregnancy; childbirth; pelvic surgery; obesity; enlarged prostate, prostate surgery; recurrent urinary tract infections (UTIs), diabetes, stroke, multiple sclerosis, Parkinson's disease, spinal cord injury

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Urinary Continence: Control of elimination of urine from the bladder

Cognition: Ability to execute complex mental processes

Self-Care: Toileting: Personal actions to toilet self independently with or without assistive device

Client Will (Include Specific Time Frame)

- Verbalize understanding of condition.
- Demonstrate behaviors or techniques to control or correct situation.
- Report increase in interval between urge and involuntary loss of urine.
- Void every 3 to 4 hr in individually appropriate amounts.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Urinary Bladder Training: Improving bladder function for those with urge incontinence by increasing the bladder's ability to hold urine and the patient's ability to suppress urination

Urinary Habit Training: Establishing an individualized toileting schedule to preempt involuntary bladder emptying for persons with limited cognitive or physical ability

Urinary Incontinence Care: Assistance in promoting continence and maintaining perineal skin integrity

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Note presence of conditions often associated with urgent voiding (e.g., UTI; pregnancy; pelvic or gynecological surgery; prostatitis or prostate surgery; obesity; bladder tumors or stones; nerve damage from conditions such as diabetes, stroke, Parkinson's, MS; certain cancers, including the bladder and prostate; recent or lengthy use of indwelling urinary catheter) *affecting bladder capacity, pelvic musculature tone, or innervation.*^{7,8,13}
- Ask client about urgency (more than just normal desire to void). *Urgency (also called overactive bladder [OAB]) is a sudden, compelling need to void that is difficult to defer; can occur frequently (e.g., eight or more times in 24 hr), and may be accompanied by leaking or urge incontinence.*^{6-8,13}
- Note factors that may affect ability to respond to urge to void in timely manner. *Impaired mobility, use of sedation, or cognitive impairments may result in client failing to recognize need to void or moving too slowly to make it to the bathroom, with subsequent loss of urine.*
- Determine use or presence of bladder irritants. *A significant intake of alcohol, caffeine, acidic or spicy food, and fluids can result in increased output or urge symptoms and can contribute to the possibility of incontinence.*⁵
-  Review client's medications for affect on bladder function, such as beta blockers and cholinergic drugs (*can increase detrusor tone*); neuroleptics, antidepressants, sedatives, and opiates (*can cause detrusor relaxation*); muscle relaxants and psychoactive drugs (*can cause sphincter relaxation*); and diuretics (*can increase urine production*).¹⁵
- Assess for cloudy, odorous urine associated with acute, painful urgency symptoms. *Incontinence often reflects presence of infection.*¹
-  Test urine for glucose. *Presence of glucose in urine causes polyuria, resulting in overdistention of the bladder and inability to hold urine until reaching the bathroom.*²
-  Assist with appropriate diagnostic testing (e.g., pre/postvoid bladder scanning; pelvic examination for strictures, impaired perineal sensation or musculature; urinalysis, uroflowmetry voiding pressures; cystoscopy, cystometrogram) *to determine anatomic and functional status of bladder and urethra.*^{2,3,8}
- Assess for concomitant stress or functional incontinence. *Older women often have a mix of stress and urge incontinence, whereas individuals with dementia or disabling neurological disorders tend to have urge and functional incontinence.* (Refer to NDs stress/functional urinary Incontinence for additional interventions.)

NURSING PRIORITY NO. 2 To assess degree of interference/disability:

- Measure amount of urine voided, especially noting amounts less than 100 mL or greater than 550 mL. *Bladder capacity may be impaired, or bladder contractions facilitating emptying may be ineffective.* (Refer to ND [acute/chronic] Urinary Retention.)
- Record frequency of voiding during a typical day and typical night. *Maintaining a voiding diary identifies degree of difficulty being experienced by client.*^{2,4}
- Note length of warning time between initial urge and loss of urine. *Overactivity or irritability shortens the length of time between urge and urine loss and helps clarify the type of incontinence.*
- Ascertain if client experiences triggers (e.g., sound of running water, putting hands in water, seeing a restroom sign, "key-in-the lock" syndrome).⁸
- Ascertain effect on lifestyle including daily activities, sleep, socialization, sexuality, and self-esteem. *There is a considerable impact on the quality of life of individuals with an incontinence problem, affecting socialization and view of themselves as sexual beings and sense of self-esteem.*²

NURSING PRIORITY NO. 3 To assist in treating/preventing incontinence:

-  Implement continence management interventions:
 -  Establish voiding schedule (habit and bladder training) based on client's usual voiding pattern. *Bladder retraining program is often successful in the control of urge incontinence. Note: One review of multiple studies revealed a strongly positive effect on continence using a combination of behavioral interventions*

(including pelvic muscle exercises) and medications in older women. However, it appears that clients have difficulty sustaining the effort of behavioral modification, and thus the positive effect is lost.^{1,4,9,14}

Recommend consciously delaying voiding by using distraction (e.g., slow, deep breathing), self-statements (e.g., “I can wait”), and contracting pelvic muscles when exposed to triggers. *Behavioral techniques for urge suppression.*^{2,9}

 Combine pelvic floor strengthening exercise with biofeedback, as appropriate. *Enhances effectiveness of training and success at controlling incontinence.*^{4,9}

Instruct client to tighten pelvic floor muscles before arising from bed. *Helps prevent loss of urine as abdominal pressure changes.*^{4,13}

Set alarm to awaken during night, if indicated. *May be useful in maintaining continence during training schedule.*⁴

Manage fluid intake (e.g., increase fluid intake to 1,500 to 2,000 mL/d or as indicated) *to prevent dehydration and promote good urine flow*⁴ (e.g., *reduce fluid intake if indicated*). *Note: Too much water can also increase bladder irritation, so amount of intake needs to be determined by individual response.*¹²

Regulate liquid intake at prescheduled times, and limit fluids 2 to 3 hr prior to bedtime. *Promotes a predictable voiding pattern and can help limit nocturia.*

Modify diet, as indicated (e.g., reduce acidic/citrus juices, chocolate and caffeine-containing drinks, carbonated beverages, spicy foods, artificial sweeteners), *to reduce bladder irritants.*¹²

Suggest limiting intake of coffee, tea, and alcohol *to reduce diuretic effect, urge symptoms, and nighttime incontinence.*¹²

Manage bowel elimination *to prevent continence problems associated with constipation or fecal impaction.*

- Offer assistance to cognitively impaired client (e.g., prompt client or take to bathroom on regularly timed schedule) *to reduce frequency of incontinence episodes and promote comfort.*
- Provide assistance or devices, as indicated, for clients who are mobility impaired. *Providing means of summoning assistance and placing bedside commode, urinal, or bedpan within reach helps to avoid unintended loss of urine and promotes sense of control over situation.*⁴
-  Collaborate in treating underlying cause. *Urgency symptoms may resolve with treatment of medical problem (e.g., infection; recovery from surgery, childbirth, or pelvic trauma) or may be resistant to resolution (e.g., incontinence associated with neurogenic bladder).*
-   Refer to specialist or treatment program, as indicated, for additional or specialized interventions (e.g., biofeedback, use of vaginal cones, electronic stimulation therapy). *Significant reduction in incontinence episodes is reported with use of combined therapies (e.g., electronic stimulation therapy plus pelvic muscle exercises).*^{12–14}
-  Administer medications (e.g., antibiotics, antimuscarinics [oxybutynin (Ditropan), tolterodine (Detrol), solifenacin (VESIcare)]) *to reduce incidence of UTIs and reduce voiding frequency and urgency by blocking overactive detrusor contractions.*^{6,10,13}
-  Discuss possible surgical interventions. *Urinary incontinence surgery includes a variety of procedures, from minimally invasive injections of bulking agents to major surgical interventions to change position of or enlarge the bladder, add support to weakened pelvic muscles, replace the urinary sphincter, or implant a sacral nerve stimulator that acts as a bladder pacemaker.*^{2,11,13}

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Provide information to client/significant others (SOs) about potential for urge incontinence (also called overactive bladder [OAB]) and lifestyle measures to prevent or limit incontinence.
- Encourage comfort measures (e.g., use of incontinence pads or adult briefs, wearing loose-fitting or especially adapted clothing) *to prepare for or manage urge incontinence symptoms over the long term as well as to enhance sense of security and confidence in abilities to be socially active.*⁵
- Emphasize importance of perineal care after each voiding. *Prevents skin irritation and reduces potential for bladder infection and incontinence-related dermatitis.*⁵

- Identify signs/symptoms indicating urinary complications and need for medical follow-up care. *Helps client be aware of and seek intervention in a timely manner to prevent more serious problems from developing.*⁴

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including pattern of incontinence, effect on lifestyle and self-esteem.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for Infection

Taxonomy II: Safety/Protection—Class 1 Infection (00004) [**Diagnostic Division:** Safety], Submitted 1986; Revised 1986, 2013, 2017

DEFINITION: Susceptible to invasion and multiplication of pathogenic organisms, which may compromise health.

RISK FACTORS

Alteration in skin integrity; stasis of body fluid
 Inadequate vaccination
 Insufficient knowledge to avoid exposure to pathogens
 Malnutrition; obesity
 Smoking

At Risk Population: Exposure to disease outbreak

Associated Condition: Alteration in pH of secretions; decrease in ciliary action; decrease in hemoglobin; leukopenia

Chronic illness; immunosuppression; suppressed inflammatory response
 Invasive procedure

Sample Clinical Applications: Immune suppressed conditions (e.g., HIV positive, AIDS, cancer), chronic obstructive pulmonary disease (COPD), long-term use of steroids (e.g., asthma, rheumatoid arthritis, systemic lupus erythematosus [SLE]), diabetes mellitus, malnutrition, surgical or invasive procedures, substance abuse, burns, pregnancy/preterm labor

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Infection Management: Extent of understanding conveyed about infection, its treatment, and the prevention of disease progression and complications

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Infection Severity: Severity of signs and symptoms of infection

Client Will (Include Specific Time Frame)

- Verbalize understanding of individual causative or risk factor(s).
- Identify interventions to prevent or reduce risk of infection.
- Demonstrate techniques and lifestyle changes to promote safe environment.
- Achieve timely wound healing, be free of purulent drainage or erythema, and be afebrile.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Infection Protection: Prevention and early detection of infection in a patient at risk

Infection Control: Minimizing the acquisition and transmission of infectious agents

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

NURSING PRIORITY NO. 1 To determine risk/contributing factors:

- Assess for presence of host-specific factors that affect immunity.^{1,7-9}

 **Extremes of age:** *Newborns and the elderly are more susceptible to disease and infection than the general population. Studies reported by the Centers for Disease Control and Prevention (CDC) in 2015 showed that between 1 and 3 million infections occur annually in nursing homes and assisted living facilities.*^{1,18}

Presence of underlying disease: *Client may have disease that directly impacts immune system (e.g., cancer, AIDS, autoimmune disorder) or may be weakened by prolonged disease conditions (e.g., diabetes, kidney disease, heart failure) or treatments.*

 **Certain treatment settings/modalities:** *Client in acute/critical-care setting and/or on mechanical ventilation may have a prolonged exposure to risk factors for infection, including problems with breathing and circulation, GI motility disorders, and use of analgesics and sedatives, causing a higher rate of acquired infections. Note: The National and State Healthcare-Associated Infections Progress Report (2015) to the CDC reported progress in prevention of some healthcare-associated infections. For example, catheter-associated urinary tract infection (CAUTI) (decreased by 43% between 2014 and 2015. However, in that same time frame, central line-associated bloodstream infections (CLABSI) increased over 21%.*^{17,20}

Lifestyle: *Personal habits or living situations, such as persons sharing close quarters and/or equipment (e.g., college dorm, group home, long-term care facility, day care, correctional facility); persons/groups with inadequate vaccination protection; and IV drug use, shared needles, and unprotected sex can increase susceptibility to infections.*

Nutritional status: *Malnutrition weakens the immune system; elevated serum glucose levels (e.g., administration of total parenteral nutrition or poorly controlled diabetes mellitus) provide growth media for pathogens.*

Trauma: *Loss of skin or mucous membrane integrity or invasive surgical or diagnostic procedures; premature rupture of amniotic membranes; urinary catheterizations; and parenteral injection, sharps, and needlesticks are common paths of pathogen entry.*

 **Certain medications:** *Steroids and chemotherapeutic agents directly affect the immune system. Long-term or improper antibiotic treatment can disrupt body's normal flora and result in increased susceptibility to antibiotic-resistant organisms.*

Presence or absence of immunity: *Natural immunity may be acquired as a result of development of antibodies to a specific agent following infection, preventing recurrence of specific disease (e.g., chicken pox). Active immunization (via vaccination; e.g., measles, polio) and passive immunization (e.g., antitoxin or immunoglobulin administration) can prevent certain communicable diseases.*

 **Environmental exposure:** *May be accidental or intentional. Exposure can occur in different ways, such as use of specific microorganisms (in laboratories, biotechnological industries, acts of bioterrorism). Accidental exposure can result from exposure to contaminants arising from commonplace processes (e.g., waste water recycling) or through animal contact (e.g., agriculture, animal food processing) and through contact with humans (e.g., healthcare, education, mass transit, close contact living, etc.).*²¹

-  **Observe skin/tissues surrounding injuries** (e.g., knife cuts, toe injuries, insect or animal bites); also inspect insertion sites of invasive lines, sutures, surgical incisions, and wounds. *Redness, warmth, swelling, pain, and red streaks are signs of developing localized infection that may have systemic implications if treatment is delayed.*^{4,5,9,12}
-  **Assess and document skin conditions around insertions of orthopedic pins, wires, and tongs.** *Direct connection to bone increases the risk of infections in bone sites that can lead to osteomyelitis, bone loss, and long-term delays of healing.*^{4,5,9,12}
-  **Review laboratory values** (e.g., white blood cell count and differential, blood, urine, sputum, or wound cultures) *to identify presence of pathogens and treatment options.*
- Refer to NDs risk for Aspiration, risk for Contamination, risk for urinary tract Injury, risk for impaired Oral Mucous Membranes, and risk for impaired Skin or Tissue Integrity for related assessments and interventions.

NURSING PRIORITY NO. 2 To reduce/correct existing risk factors:

Healthcare environment

- Practice and emphasize constant and proper hand-washing techniques (using antibacterial soap and running water) before and after all care contacts and after contact with items likely to be contaminated. Wear gloves where appropriate to minimize contamination of hands and discard after each client. Wash hands after glove removal. Instruct client/significant others (SOs)/visitors to wash hands, as indicated. *This is a first-line defense against healthcare-associated infections (HAIs).*^{1,10}
- Provide a clean, well-ventilated environment (may require turning off central air-conditioning and opening window for good ventilation, room with negative air pressure, etc.).
- Post visual alerts in healthcare settings instructing clients/SOs to inform healthcare providers if they have symptoms of respiratory infections or influenza-like symptoms. *Can limit or prevent transmission to and from client and may reveal additional cases.*^{1,3,6,7,10}
- Monitor client's visitors/caregivers for respiratory illnesses. Offer masks and tissues to client/visitors who are coughing or sneezing *to limit exposures and reduce cross-contamination.*¹
- Encourage parents of sick children to keep them away from childcare settings and school until afebrile for 24 hr.
- Provide for isolation as indicated (e.g., contact, droplet, and airborne precautions). Educate staff in infection-control procedures. *Reduces risk of cross-contamination.*^{1,13}
- Emphasize proper use of personal protective equipment by staff/visitors as dictated by agency policy *for particular exposure risk (e.g., airborne, droplet, splash risk), including mask or respiratory filter of appropriate particulate regulator; gowns, aprons, head covers, face shields, and protective eyewear.*^{1,3,8}
- Include information in preoperative teaching about ways *to reduce potential for postoperative infection (e.g., respiratory measures to prevent pneumonia, wound or dressing care, avoidance of others with infection).*^{4,14}
- Encourage early ambulation, deep breathing, coughing, position changes, and early removal of endotracheal and/or nasal or oral feeding tubes *for mobilization of respiratory secretions and prevention of aspiration and respiratory infections.*^{10,11}
- Monitor and assist with use of adjuncts (e.g., respiratory aids such as incentive spirometry) *to prevent pneumonia.*^{10,11}
- Maintain adequate hydration and electrolyte balance *to prevent imbalances that would predispose to infection.*
- Provide or encourage balanced diet, emphasizing proteins to feed the immune system. *Immune function is affected by protein intake; the balance between omega-6 and omega-3 fatty acid intake; and adequate amounts of vitamins A, C, and E and the minerals zinc and iron. A deficiency of these nutrients puts the client at an increased risk of infection.*
- Handle and properly package tissue and fluid specimens.^{1,2}
- Administer prophylactic antibiotics and immunizations as indicated.
- Assist with medical procedures (e.g., wound or joint aspiration, incision and drainage of abscess, bronchoscopy) as indicated.
- Administer and monitor medication regimen (e.g., antimicrobials, drip infusion into osteomyelitis, subcutaneous clonidine, topical antibiotics) and note client's response *to determine effectiveness of therapy and presence of side effects.*

Medical devices

- Maintain sterile technique for invasive procedures (e.g., IV, urinary catheter, tracheostomy care, pulmonary suctioning).^{1,2}
- Use disposable equipment whenever possible. Disinfect or sterilize reusable equipment and surfaces according to manufacturer recommendations.¹⁻³
- Dispose of needles and sharps in approved containers *to reduce risk of needlestick or sharps injury.*^{1,3}
- Choose proper vascular access device based on anticipated treatment duration and solution or medication to be infused and best available aseptic insertion techniques; cleanse incisions and insertion sites daily/per facility protocol with appropriate solution *to reduce potential for catheter-related bloodstream infections.*¹²

- Maintain appropriate hang times for parenteral solutions (IVs, additives, nutritional solutions) *to reduce opportunity for contamination and bacterial growth.*
-  Assist with monitoring client on ventilator for signs of bacterial infections and wean from mechanical ventilator as soon as possible *to reduce risk of ventilator-associated pneumonia.*¹³
- Fill bubbling humidifiers or nebulizers with sterile water—not distilled or tap water. Use heat and moisture exchangers instead of a heated humidifier with mechanical ventilator.^{11,13}

Skin/Tissues

- Change surgical or other wound dressings as needed or indicated, using proper technique for changing and disposing of contaminated materials.^{1,3,4,14,19}
-  Cleanse incisions and insertion sites as indicated with appropriate antimicrobial topical or solution *to prevent growth of bacteria.*^{4,19}
- Separate touching surfaces of excoriated skin (e.g., in herpes zoster, burns, weeping dermatitis) and apply appropriate skin barriers. Use gloves when caring for open lesions *to minimize autoinoculation or transmission of viral diseases.*⁴
-  Perform or instruct in daily mouth care. Include use of antiseptic mouthwash for individuals in acute or long-term care settings *at high risk for healthcare-associated infections, especially in client on a ventilator.*^{13,22}
- Provide regular urinary catheter and perineal care when client requires assistance with these actions. *Reduces risk of ascending urinary tract infection.*
- Cover perineal and pelvic region dressings or casts with plastic when using bedpan *to prevent contamination when wound is in perineal or pelvic region.*
-  Discuss routine or preoperative antiseptic body shower or scrubs when indicated (e.g., orthopedic, plastic surgery) *to reduce bacterial colonization.*^{10,19}

Community

- Recommend individuals/staff isolate self at home when ill *to prevent spread of infection to others, including coworkers.*^{1,6}
- Alert infection control officer/proper authorities to presence of specific infectious agents and number of cases as required. *Provides for case finding and helps curtail outbreak.*^{6,16}
- Group/cohort individuals with same diagnosis or exposure as resources require. *Limited resources (as may occur with an outbreak or epidemic) may dictate a wardlike environment, but need for regular precautions to control spread of infection still exists.*⁶
-  Encourage contacting healthcare provider for prophylactic therapy as indicated following exposure to individuals with infectious disease (e.g., tuberculosis, hepatitis, influenza).

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review individual nutritional needs, appropriate exercise program, and need for rest *to enhance immune system function and healing.*^{5,6}
- Instruct client/SO(s) in techniques to protect the integrity of skin, care for lesions, temperature measurement, and prevention of spread of infection in the home setting. *Provides basic knowledge for self-help and self-protection.*^{2,5}
-  Emphasize necessity of taking medications such as antivirals or antibiotics as directed (e.g., dosage and length of therapy). *Premature discontinuation of treatment when client begins to feel well may result in return of infection and potentiate drug-resistant strains.*¹⁵
-  Discuss importance of not taking antibiotics prescribed for another person or using “leftover” drugs unless specifically instructed by healthcare provider. *Inappropriate use can lead to development of drug-resistant strains or secondary infections.*⁵
-  Discuss the role of smoking and secondhand smoke in respiratory infections and in postoperative healing. Refer to smoking cessation programs as indicated.¹⁹
- Promote safer-sex practices and reporting sexual contacts of infected individuals *to prevent the spread of HIV or other sexually transmitted infections.*^{1,5,15}

-  Encourage high-risk persons, including healthcare workers, to have influenza and pneumonia vaccinations *to reduce individual risk as well as help prevent spread of flu and viral pneumonias to others.*^{1,6,16}
-  Promote childhood immunization program. Encourage adults to update immunizations as appropriate.⁷
-  Discuss precautions with client engaged in international travel and refer for immunizations *to reduce incidence and transmission of global infections.*⁸
-  Review use of prophylactic antibiotics if appropriate (*e.g., before dental work for clients with history of rheumatic fever; heart valve replacements*).⁵
- Identify resources available to the individual (*e.g., substance abuse or rehabilitation, needle-exchange program as appropriate; available or free condoms*).
- Provide information and involve in appropriate community and national education programs *to increase awareness of and prevention of communicable diseases.*^{1,5,6}
- Refer to NDs ineffective Health Maintenance and impaired Home Maintenance for additional interventions as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors that are present, including recent and current antibiotic therapy.
- Wound and/or insertion sites, character of drainage or body secretions.
- Signs/symptoms of infectious process.

Planning

- Plan of care, specific interventions, and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for Injury

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00035) [**Diagnostic Division:** Safety], Approved 1978, Revised 2013; 2017

DEFINITION: Susceptible to physical damage due to environmental conditions interacting with the individual's adaptive and defensive resources, which may compromise health.

RISK FACTORS

Compromised nutritional source; malnutrition
 Exposure to pathogen or toxic chemical; nosocomial agent
 Immunization level within community
 Insufficient knowledge of modifiable factors
 Physical barrier
 Unsafe mode of transport

At Risk Population: Extremes of age
 Impaired primary defense mechanisms

Associated Condition: Abnormal blood profile; tissue hypoxia
 Alteration in cognitive or psychomotor functioning
 Alteration in sensation; effector or sensory integration dysfunction
 Autoimmune or immune dysfunction; biochemical dysfunction

Sample Clinical Applications: Burns, seizure disorder, dementia, AIDS, influenza, cataracts, glaucoma, Parkinson's disease, substance abuse, malnutrition, developmental delay, para/quadruplegia, neuropathy.

[Note: In reviewing this ND, it is apparent there is much overlap with other diagnoses. We have chosen to present generalized interventions. Although there are commonalities to injury situations, we suggest that the reader refer to other primary diagnoses as indicated, such as risk for Bleeding; risk for acute Confusion; chronic Confusion; risk for Contamination; risk for Falls; ineffective Health Maintenance; impaired Home Maintenance; risk for Infection; impaired physical Mobility; impaired/risk for impaired Parenting; ineffective Protection; risk for Poisoning; impaired/risk for impaired Skin/Tissue Integrity; Rape-Trauma Syndrome; risk for Pressure Ulcer; ineffective Tissue Perfusion [specify]; risk for Trauma; risk for self and other-directed Violence; Wandering for additional interventions.]

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Physical Injury Severity: Severity of signs and symptoms of injuries to the body

Client Will (Include Specific Time Frame)

- Be free of injury.

Sample NOC linkages:

Personal Safety Behavior: Personal actions to prevent unintentional physical injury to self

Risk Control [specify]: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats [e.g., alcohol/drug use, altered visual function, sun exposure]

Client/Caregivers Will (Include Specific Time Frame)

- Verbalize understanding of individual factors that contribute to possibility of injury.
- Demonstrate behaviors, lifestyle changes to reduce risk factors and protect self from injury.
- Modify environment as indicated to enhance safety.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Surveillance: Purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

Environmental Management: Safety: Monitoring and manipulation of the physical environment to promote safety

NURSING PRIORITY NO. 1 To evaluate degree/source of risk inherent in the individual situation:

- Identify client at risk (e.g., acute illness, surgery, trauma; chronic illness conditions with weakness, immunosuppression, abnormal blood profiles, or prolonged immobility; acute or chronic confusion, dementia, head injury; use of multiple medications; use of alcohol or other drugs; mental illness, emotional lability; cultural, familial, and socioeconomic factors adversely affecting lifestyle and home; exposure to environmental chemicals or other hazards).
-  Perform thorough assessments regarding safety issues when planning for client care and discharge. *Failure to accurately assess and intervene or refer regarding these issues can place the client at needless risk and creates negligence issues for the healthcare practitioner. Note: Research has identified 34 safe practices that evidence shows can work to reduce or prevent adverse events and medical errors regarding client safety, including (and not limited to) adequate numbers of nursing personnel; ensuring that written documentation of the client's preference for life-sustaining treatments is prominently displayed in chart; evaluating each person upon admission, and regularly thereafter, for the risk of developing pressure ulcers; employing clinically appropriate strategies to prevent malnutrition; vaccinating healthcare workers against influenza to protect both them and clients; and standardizing methods for labeling, packaging, and storing medications.*¹⁴
-  Note age, developmental stage, and gender. *Children, young adults, elderly persons, and men are at greater risk for injury, which may reflect client's ability or desire to protect self and influences choice of interventions or teaching.*^{15,16}

- Evaluate developmental level, decision-making ability, level of cognition, competence, and independence. *Determines client's/significant other's (SO's) ability to attend to safety issues.*
- Assess mood, coping abilities, and personality styles (i.e., temperament, aggression, impulsive behavior, level of self-esteem). *May result in carelessness or increased risk-taking without consideration of consequences.*^{1,2}
- Evaluate individual's emotional and behavioral response to violence in surroundings (e.g., neighborhood, television, peer group). *May affect client's view of and regard for own or others' safety.*^{1,2,15}
-   Assess muscle strength and gross and fine motor coordination to identify risk for falls. *Note: The frequency of falls increases with age and frailty level. Risk factors for falls lie in four categories: (1) biological, (2) behavioral, (3) environmental, and (4) socioeconomic. In each of these areas, some risk factors can be modified to decrease fall risk. Protective factors for falls in older age are related to behavioral change and environmental modification.*¹⁷
- Observe client for signs of injury and ascertain age of injury (e.g., old or new bruises, history of fractures, frequent absences from school or work). Determine potential for abusive behavior by intimate partner/family members/peers. *Client or care providers may require further evaluation or investigation for abuse; prevention strategies may be indicated.*^{5,7}
- Ascertain knowledge of safety needs and injury prevention and motivation to prevent injury in home, community, and work settings. *Information may reveal areas of misinformation, lack of knowledge, and need for teaching.*⁶
- Note socioeconomic status and availability and use of resources.

NURSING PRIORITY NO. 2 To assist client/caregiver to reduce or correct individual risk factors:

-   Provide healthcare within a culture of safety (e.g., adherence to nursing standards of care and facility safe-care policies) to prevent errors resulting in client injury, to promote client safety, and to model safety behaviors for client/SO. *Note: A culture of safety encompasses the following elements: shared beliefs and values about the healthcare delivery system; recruitment and training with patient safety in mind; organizational commitment to detecting and analyzing patient injuries and near misses; open communication regarding patient injury results, both within and outside the organization; and the establishment of a just culture.*¹⁴
Practice hand hygiene at all times and device safety when client has IV lines and catheters to prevent health-care-associated infections and potential for bloodborne pathogens.
-  Administer medications and infusions using the “6 rights” system (right client, right medication, right route, right dose, right time, right documentation).⁸
Inform and educate client/SO regarding all treatments and medications.
Adhere to measures to prevent blood clots, especially in client with abnormal blood profile, surgical procedures, or immobility.
Monitor environment for potentially unsafe conditions or hazards, modify as needed.
-   Prevent falls:^{6,9}
 - Orient or reorient client to environment, as needed.
 - Place confused elderly client or young child near nurses' station to provide for frequent observation.
 - Instruct client/SO to request assistance, as needed; make sure call light is within reach and client knows how to operate.
 - Utilize bed/chair alarms that alert when client is trying to get up alone.
 - Maintain bed or chair in lowest position with wheels locked. Provide covered cribs for enclosed bed or wall bed on floor, where indicated.
 - Provide seat raisers for chairs and use stand-assist, repositioning, or lifting devices as indicated to prevent injury to both client and care providers.
 - Ensure that all floors are clear of tripping hazards and that pathway to bathroom is unobstructed and properly lighted.
 - Place assistive devices (e.g., walker, cane, glasses, hearing aid) within reach and ascertain that client is using them appropriately.
 - Safety-lock exit and stairwell doors when client can wander away.

- Avoid use of restraints as much as possible when client is confused. *Restraints can increase client's agitation and risk of entrapment and death.*
- Provide client/SO information regarding client's specific disease or condition and consequences of continuing unhealthy behaviors (e.g., increase in oral cancer among teenagers using smokeless tobacco; fetal alcohol syndrome or neonatal addiction in prenatal women using tobacco, alcohol, or other drugs) *to enhance decision making and clarify expectations and individual needs.*
- Review consequences of previously determined risk factors that client is reluctant to modify. *Many consequences could occur, such as oral cancer in teenager using smokeless tobacco; occurrence of spontaneous abortion, fetal alcohol syndrome, or neonatal addiction in prenatal woman using drugs; fall related to failure to use assistive equipment; toddler getting into medicine cabinet; binge drinking while skiing; health and legal implications of illicit drug use; and working too many hours for safe operation of machinery or vehicles.*
-  Determine if risk-prone behavior is occurring or likely to occur *to initiate appropriate wellness counseling and referrals.*
- Review client's history of immunization and understanding of the importance of immunization to self/family. Refer to ND readiness for enhanced Health Management *to determine changes or adaptations that may be desired/required.*
- Review client's level of physical activity in his or her lifestyle *to determine changes or adaptations that may be required by current situation.*
-  Refer to physical or occupational therapist as appropriate *to identify high-risk tasks; conduct site visits; select, create, and modify equipment or assistive devices; and provide education about body mechanics and musculoskeletal injuries in addition to providing therapies as indicated.*⁶
-   Perform home assessment and recommend actions (or take steps) to correct unsafe conditions, such as:^{1-4,8,9,13,14}
 - locking up medications and poisonous substances;
 - using window grates or locks and safety gates at top and bottom of stairs *to prevent young children from falling;*
 - installing handrails on stairs/steps, ramps, and bathtub safety products (e.g., grab bars/handles, nonskid mats or stickers);
 - using electrical outlet covers or lockouts;
 - locking exterior doors *to prevent confused individual from wandering off while SO is engaged in other household activities;*
 - removing matches, smoking materials, and knobs from the stove *so young children or confused individuals do not turn on burner and leave it unattended;*
 - properly placing lights, alarms (e.g., fire, carbon monoxide, and intruder), and fire extinguishers;
 - discussing safe use of oxygen; and
 - obtaining medical alert device or home monitoring service.
-  Review specific employment concerns or worksite issues and needs (e.g., ergonomic chairs and workstations, properly fitting safety equipment and footwear, regular use of safety glasses or goggles and ear protectors, safe storage of hazardous substances, number of hours worked per shift/week).
- Demonstrate and encourage use of techniques to reduce or manage stress and vent emotions such as anger and hostility. *Identifying and dealing with emotions appropriately enables individual to maintain control of behavior and avoid possibility of violent outbursts.*^{2,5,7}
- Discuss importance of self-monitoring of factors that can contribute to occurrence of injury (e.g., fatigue, anger, irritability). *Client/SO may be able to modify risk through monitoring of actions or postponement of certain actions, especially during times when client is likely to be highly stressed.*
-  Encourage participation in self-help programs, such as assertiveness training, anger management, and positive self-image *to enhance self-esteem.*
-  Review expectations caregivers have of children, cognitively impaired, and/or elderly family members. Discuss concerns about discipline practices.¹³
-  Discuss need for and sources of supervision (e.g., before- and after-school programs, elderly day care).

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Identify individual needs and resources for safety education (e.g., home hazard information, fall prevention, water safety [including burns or drowning hazards], firearm safety, cardiopulmonary resuscitation/first aid).^{3,10,11}
- Emphasize importance of correct use of baby gates, cabinet door locks, child safety seats, car seat belts, bicycle or other helmets, regular use of sports safety equipment, etc.
-  Provide instruction or refer to classes for back safety and proper use of injury-prevention devices. Recommend use of ergonomic bed and chair as appropriate.
- Provide telephone numbers and other contact numbers as individually indicated (e.g., doctor, 911, poison control, police, elder advocate).
- Provide bibliotherapy including written resource lists and reliable Web sites *for later review and self-paced learning*.
-  Refer to professional resources as indicated (e.g., counseling or psychotherapy, budget counseling, substance recovery, anger management, parenting classes).
-   Refer to or assist with community education programs *to increase awareness of safety measures and resources available to the individual. Note: Many evidence-based programs are being implemented nationally to promote safe environments for children, adolescents, and adults. These may include (and are not limited to) education about bullying and Internet safety issues, suicide prevention, use of helmets when riding bicycles or skateboarding, drowning prevention, gun safety, substance abuse, and intimate partner violence and anger management.*^{2-5,7,9,11,12}
- Promote community awareness about the problems of the design of buildings, equipment, transportation, and workplace practices that contribute to accidents.⁴
- Identify community resources, neighbors, or friends to assist elderly or handicapped individuals in providing such things as structural maintenance, removal of snow and ice from walks and steps, etc.
- Identify emergency escape plans and routes for home and community *to be prepared in the event of natural or human-caused disaster (e.g., fire, hurricane, earthquake, toxic chemical release).*⁴

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual risk factors, noting current physical findings (e.g., bruises, cuts).
- Client's/caregiver's understanding of individual risks and safety concerns.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans for discharge needs, lifestyle and community changes, and who is responsible for actions to be taken.
- Specific referrals made.

risk for corneal Injury

Taxonomy II: Safety/Protection—Class 5 Physical Injury (00245) [Diagnostic Division: Safety], Submitted: 2013; Revised 2017

DEFINITION: Susceptible to infection or inflammatory lesion in the corneal tissue that can affect superficial or deep layers, which may compromise health.

RISK FACTORS

Exposure of the eyeball

Insufficient knowledge of modifiable factors

At Risk Population: Prolonged hospitalization

Associated Condition: Blinking <5 times per minute; periorbital edema

Glasgow Coma Scale <6

Oxygen therapy; tracheostomy; intubation; mechanical ventilation

Pharmaceutical agent

Sample Clinical Applications: Any condition where client is unable to protect self from drying of eye tissues, including facial or general trauma or surgery; mechanical ventilation; brain injury, CVA; neurological conditions such as Parkinson's disease, Bell's palsy; diabetic retinopathy; lupus; rheumatoid arthritis

(continues on page 498)

risk for corneal Injury (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client/Caregiver Will (Include Specific Time Frame)

- Identify/monitor personal risk factors.
- Engage in risk control strategies.

Sample NOC linkage:

Dry Eye Severity: Severity of signs and symptoms of insufficient tears

Client Will (Include Specific Time Frame)

Be free of discomfort or damage to corneal tissues.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk reduction strategies for an individual or group

Eye Care: Prevention or minimization of threats to eye or visual integrity

NURSING PRIORITY NO. 1 To identify causative/precipitating factors related to risk:

- Obtain history of eye conditions when assessing client concerns overall. Listen for reports of eye pain, foreign body sensation, light sensitivity (photophobia), and blurred vision. *These symptoms can be associated with corneal injury and, if present, require further evaluation and possible treatment.*¹
-  Note presence of conditions (e.g., recent neurological event, facial trauma or burns; use of contact lenses, failure to use safety glasses in high-risk employment situation) or treatment environments (e.g., intubated client on mechanical ventilation; use of therapeutic hypothermia; sedated, anesthetized, or obtunded client with absent blink reflex) *to identify client at high risk for corneal injury. Note: It has been reported that 60% of sedated/paralyzed patients on mechanical ventilation in intensive care units have incomplete closure of the eyelids (lagophthalmos), predisposing them to corneal dryness and inflammation.*^{2,3}
- Obtain history of events from client/others when trauma (e.g., facial blunt force trauma, car crash with airbag deployment, accidental or intentional gun shot wounds; accidents with fireworks or hot metal) has occurred. *Eye injury (including corneal abrasions and lacerations) may not be immediately discovered but should be suspected.*⁴
-  Evaluate current drug regimen, noting pharmaceutical agents (e.g., topical drugs, preservatives in eye drops; beta blockers, antihistamines, phenothiazides; diuretics, steroids, sedatives, neuromuscular blocking agents, antiparkinsonian agents, topical anesthetics) *that can contribute to dry eye, thereby increasing risk of corneal inflammation or injury in high-risk clients.*⁵

NURSING PRIORITY NO. 2 To promote eye health/comfort:

-  Refer for diagnostic evaluation and interventions as indicated. *A standard eye exam and visual acuity testing may be performed, and other diagnostic studies (e.g., radiography, computed tomography, magnetic resonance imaging) may be indicated to locate foreign bodies or associated orbital, cranial, or facial trauma.*⁴

-  Assist in/refer for treatment of underlying conditions that might be affecting corneal health.
-  Perform routine assessment of eyes and preventive interventions in critically ill client:^{2,7,8}
Evaluate client's ability to maintain eyelid closure on daily basis and as needed.
Perform actions to maintain eyelid closure in client that cannot do it for self (e.g., taping).
-  Perform eye care (e.g., cleaning with saline-soaked gauze, administration of eye-specific lubricant, where indicated).
- Observe for developing complications.
-  Ascertain that client undergoing anesthesia has proper eye protection (e.g., lubricant, eyelids taped, goggles), especially when placed in prone position. *The cornea is easily abraded because of reduced lacrimation during anesthesia, if face masks are improperly applied, or if surgical drapes are manipulated while the eyes remain open. In some positions, such as prone, a significant amount of pressure can be applied to the eyes.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Criteria):

-  Instruct high-risk client/caregivers in self-management interventions *to prevent corneal inflammation symptoms*.^{1,5,6,9}
Avoid rubbing eyes with fingers or harsh cloths.
Protect eyes from blowing air or oxygen; discuss benefit of redirecting air flow.
Wear protective eyewear in situations or sports where objects may fly into eyes or face.
Wear protective eyewear that gives 180-degree protection while using a grinding wheel or hammering on metal.
Wear sunglasses that block ultraviolet radiation when in bright sunlight or under sunlamps.
Follow prescribed wear time for contact lenses.
Add moisture to indoor air, especially in winter, to *reduce corneal irritation associated with dryness*.
Blink repeatedly for a few seconds when using computer for any length of time *to prevent dryness and help spread tears evenly over eye*.
-  Instruct in use of eye drops or ointments as indicated *to prevent inflammation/infection or to protect corneal surface*.
-  Refer to appropriate healthcare provider concerning glasses, contact lenses, or other safety eyewear and offer information about suppliers.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors identified.
- Client concerns or difficulty making and following through with plan.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward outcomes.

Discharge Planning

- Referrals to other resources.
- Long-term need and who is responsible for actions.

risk for urinary tract Injury

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00250) [Diagnostic Division: Safety], Approved 2013; Revised 2017

DEFINITION: Susceptible to damage of the urinary tract structures from use of catheters, which may compromise health.

RISK FACTORS

Confusion

Deficient patient or caregiver knowledge regarding care of urinary catheter

Obesity

At Risk Population: Extremes of age

Associated Condition: Anatomical variation in the pelvic organs; detrusor sphincter dyssynergia

Long-term use of urinary catheter; multiple catheterizations

Impaired cognition; medullary injury; condition preventing ability to secure catheter [e.g., burn, trauma, amputation]

Use of large-caliber urinary catheter; retention balloon inflated to ≥ 30 mL

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Physical Injury Severity: Severity of signs and symptoms of injuries to the body

Client Will (Include Specific Time Frame)

- Be free of injury.

Sample NOC linkages:

Personal Safety Behavior: Personal actions to prevent unintentional physical injury to self

Knowledge: Treatment Procedure: Extent of understanding conveyed about a procedure required as part of a treatment regimen

Client/Caregivers Will (Include Specific Time Frame)

- Verbalize understanding of individual factors that contribute to possibility of injury.
- Demonstrate behaviors and lifestyle changes to reduce risk factors and protect from injury.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Urinary Catheterization: Insertion of a catheter into the bladder for temporary or permanent drainage of urine

Urinary Catheterization: Intermittent: Regular periodic use of a catheter to empty the bladder

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Identify conditions potentially affecting client need for/response to catheterization (e.g., acute illness, presence of infection, surgery, trauma including skin and tissue problems; chronic illness, including neurological conditions with paralysis or weakness; prolonged immobility; acute or chronic confusion, dementia, sedation, or use of multiple medications affecting mental acuity). *These conditions could require indwelling catheter for varying lengths of time with attendant potential for complications. Risk factors include longer duration of catheterization, bacterial colonization of the drainage bag, errors in catheter care, catheterization late in the hospital course, and immunocompromised or debilitated states. Note: About 80% of hospital-acquired urinary tract infections (UTIs) are related to urethral catheterization.*¹
-  Determine type of catheterization client is likely to require. *Client might require one-time or intermittent, long-term single catheterization for any number of reasons (e.g., relief of acute urinary retention, management of voiding issues associated with multiple sclerosis or spinal cord injury). These procedures may be done by either the client or a caregiver. Indwelling urinary catheters are generally used when longer-term urinary management issues are expected. Use of indwelling catheter should be limited to (1) urinary retention, (2) close monitoring of urine output in critically ill patients, (3) fluid challenge in patients with acute renal insufficiency, (4) open wound in sacral or perineal area in client with urinary incontinence, and (5) comfort care in terminally ill client.*^{2,3}
-  Note client's age, developmental level, decision-making ability, level of cognition, competence, and independence. *Determines client's/significant other's (SO's) ability to attend to safety issues and influences choice of interventions or teaching about catheterization.*
-  Check for allergies to latex and select appropriate catheter (e.g., coated). *Latex allergic reactions are implicated in the development of urethritis and urethral stricture or anaphylaxis. Materials that are commonly used for the long term (such as silver alloy or hydrogel coated) may be used to overcome irritation and microscopic lacerations or stricture development associated with latex.*^{4,5}

NURSING PRIORITY NO. 2 To reduce potential for complications:

-  Avoid catheterization when possible. Refer to NDs pertaining to impaired urinary Elimination and Incontinence for related interventions. *Studies have shown that urinary catheters often are placed unnecessarily, remain in use without physician awareness, and are not removed promptly when no longer needed.*^{2,6,7}
-  Perform catheterization using best practices:
Use strict aseptic technique when inserting indwelling catheter (clean technique may be implemented for long-term intermittent catheterization). *Note: The Centers for Disease Control and Prevention's 2009 recommendations stated, "In the acute care hospital setting, insert urinary catheters using aseptic technique and sterile equipment," but "In the non-acute care setting, clean (i.e., non-sterile) technique for intermittent*

catheterization is an acceptable and more practical alternative to sterile technique for patients requiring chronic intermittent catheterization.”⁸

 Select the smallest bore catheter possible that will allow for adequate drainage, using size guidelines. *Appropriate selection of catheter size will help reduce the likelihood of bladder spasm. Adult sizes are typically 14 Fr or 16 Fr. Guidelines are available for each pediatric age group from neonate (5–6 Fr) to adolescent (10, 12, 14 Fr). Note: Large-size catheters (18 Fr or larger) can increase erosion of the bladder neck and urethral mucosa, cause the formation of strictures, and impede adequate drainage of periurethral gland secretions.*^{3,9–11}

Ascertain good urine is established before inflating balloon. *Ensures that catheter has been correctly inserted into the bladder. Note: If the balloon is opened before catheter is completely inserted into the bladder, bleeding, damage, and even rupture of the urethra can occur.*¹³

Inflate balloon, using correct amount of sterile liquid (usually 10 cc, but check actual balloon size). *Balloon size is relevant to levels of bladder irritation. Although balloons are thin walled to reduce irritation to the bladder, it is still important to use the smallest size possible, usually with a 5- to 10-mL capacity. The use of 30-mL balloons is not recommended.*^{12,13}

 Secure catheter to thigh or abdomen, as indicated. Inspect the skin underneath the securement device with each reapplication to monitor for irritation or dermatitis. *Catheter/tubing can be held in place with adhesive tapes, safety pins, sutures, or nonadhesive devices. Latex-free nonadhesive products secure with a soft hook-and-loop closure strap. There are many reasons for this intervention, including (1) reducing bladder irritability/spasms, (2) preventing metal erosion or inflammation, (3) managing discomfort related to catheter movement and traction, (4) preventing inadvertent migration of balloon from bladder into urethra or accidental removal of catheter, (5) avoiding obstruction of urine flow secondary to catheter kinking, and (6) preventing retention of urine and risk for catheter-associated UTIs. [Note: Studies continue to report that catheter securement practices are inadequate in spite of guidelines. One small study published in 2016 reported that the overall prevalence of catheter securement was only 18%, although 87% of those were secured correctly. Securement policies and products were in place and available.]*^{14–19}

 Position the collection bag level to facilitate gravity drainage of the bladder and to prevent reflux of urine into the bladder. *Note: A Belly Bag® abdominal drainage bag may be chosen over affixing tubing to leg in some instances (e.g., extremity trauma such as burns or amputation). The bag fastens around the waist by means of a woven belt with a quick release buckle. An anti-reflux valve behind the catheter port prevents reflux urine flow.*^{13,18}

 Perform ongoing evaluation of catheter function and monitor color and characteristics of urine to assess for developing complications. *A properly maintained closed drainage system and unobstructed urine flow are essential for prevention of urinary tract infection.*⁵

- Ascertain if client is experiencing discomfort or pain (e.g., bladder spasms). *Bladder spasms are caused by the irritation of the bladder, bladder neck, or urethral mucosa. Spasms are a distressing complication but are usually self-limiting when procedure is followed (e.g., proper size and insertion of catheter; appropriate size and inflation of balloon). Note: Contractions may intensify when large indwelling urinary catheters with large-capacity balloons are inserted.*^{10,19,20}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Instructions):

-  Review individual needs regarding catheter self-management with client/SO²¹ to reduce risk of complications:

Always wash hands before and after handling catheter.

Make sure that urine is flowing out of the catheter into collection bag.

Keep urine collection bag below level of bladder.

Make sure that catheter tubing does not get twisted or kinked.

Check for inflammation or signs of infection (e.g., pus or irritated, swollen, red, or tender skin) in the area around the catheter.

Clean the area around the catheter twice a day using soap and water. Dry with clean towel afterward.

Do not apply powder or lotion to the skin around the catheter.

Do not tug or pull on the catheter.

Follow physician instructions regarding catheter cleaning and/or replacement (if long-term indwelling), frequency of catheterization (if intermittent).

- Instruct client/caregiver in techniques to protect the integrity of skin. Refer to NDs risk for impaired Skin/Tissue Integrity and risk for Pressure Ulcer for related interventions.
-  Instruct client/caregiver in reportable problems, such as leaking, sediment in urine, absence of urine, presence of pain, etc. *In a review of 37 studies regarding catheter problems, between 90% and 100% of patients who undergo long-term catheterization developed bacteriuria. About 80% of nosocomial (healthcare-associated) UTIs were related to urethral catheterization; only 5% to 10% are related to genitourinary manipulation. Minor complications were also common. For example, the frequency of urine leakage occurred in approximately 52% in short-term catheterization.*^{22,23}
- Identify resources available to the individual (e.g., urinary catheters, samples and supplies, and various types of assistance and support).

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors, noting current physical findings.
- Client's/caregiver's understanding of individual risks and safety concerns.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Individual responses to interventions, teaching, and actions performed.
- Specific actions and changes that are made.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term plans for discharge needs, lifestyle and community changes, and who is responsible for actions to be taken.
- Specific referrals made.

Insomnia

Taxonomy II: Activity/Rest—Class 1 Sleep/Rest (00095) [Diagnostic Division: Activity/Rest], Approved 2006: Revised 2017

DEFINITION: A disruption in amount and quality of sleep that impairs functioning.

RELATED FACTORS

Alcohol consumption

Anxiety; depression; fear; grieving

Average daily physical activity is less than recommended for gender and age; frequent naps; inadequate sleep hygiene

Environmental barrier [e.g., ambient noise, daylight/darkness exposure, ambient temperature/humidity, unfamiliar setting]

Physical discomfort; stressors

DEFINING CHARACTERISTICS

Subjective

Alteration in sleep pattern; nonrestorative sleep pattern, difficulty initiating sleep or maintaining sleep state; early awakening

Compromised health status; decrease in quality of life; increase in accidents

Dissatisfaction with sleep; sleep-disturbance producing next-day consequences

Objective

Alteration in concentration

Alteration in mood/affect

Increase in absenteeism

Associated Condition: Hormonal change; pharmaceutical agent

Sample Clinical Applications: Chronic pain, substance use or abuse, hyperthyroidism, pulmonary diseases (e.g., COPD, asthma), sleep apnea, restless leg syndrome, depression, Alzheimer's disease, senile dementia, anxiety disorders, bipolar disorders, pregnancy—prenatal or postnatal period

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Fatigue Level: Severity of observed or reported prolonged generalized fatigue

Sleep: Natural periodic suspension of consciousness during which the body is restored

Rest: Quality and pattern of diminished activity for mental and physical rejuvenation

Client Will (Include Specific Time Frame)

- Verbalize understanding of sleep impairment.
- Identify individually appropriate interventions to promote sleep.
- Adjust lifestyle to accommodate chronobiological rhythms.
- Report improvement in sleep or rest pattern.
- Report increased sense of well-being and feeling rested.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Sleep Enhancement: Facilitation of regular sleep/wake cycles

Relaxation Therapy: Use of techniques to encourage and elicit relaxation for the purpose of decreasing undesirable signs and symptoms such as pain, muscle tension, or anxiety

Environmental Management: Manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Identify presence of factors that can contribute to insomnia (e.g., chronic pain, arthritis, dyspnea; movement disorders; dementia; obesity; pregnancy, menopause; psychiatric disorders); metabolic diseases (e.g., hyperthyroidism and diabetes); prescribed and over-the-counter (OTC) drugs; alcohol, stimulant, or other recreational drug use; circadian rhythm disorders (e.g., shift work, jet lag); environmental factors (e.g., noise, no control over thermostat, uncomfortable bed); major life stressors (e.g., grief, loss, finances).^{1-5,9,10}
-  Note client age. *Increased sleep latency (time required to fall asleep), decreased sleep efficiency, and increased awakenings are common in the elderly. Two primary sleep disorders that increase with age are sleep apnea and periodic limb movements in sleep.*^{2,9}
-  Observe parent-infant interactions and provision of emotional support. Note mother's sleep-wake pattern. *Lack of knowledge of infant cues or problem relationships may create tension interfering with sleep. Structured sleep routines based on adult schedules may not meet child's needs.*⁶
- Ascertain presence and frequency of enuresis, incontinence, or need for frequent nighttime voidings, thus interrupting sleep.^{2,9}
-  Assist with or review psychological assessment, noting individual and personality characteristics if *anxiety disorders or depression could be affecting sleep.*^{2,8,9,13}
- Determine recent traumatic events in client's life (e.g., a death in family, loss of job). *Physical and emotional trauma often affects client's sleep patterns and quality for a short period of time. This disruption can become long term and require more intensive assessment and intervention.*^{2,3}
-  Review client's medication regimen, including prescription (e.g., beta blockers [e.g., metoprolol, propranolol], sedative antidepressants [e.g., amitriptyline], sedative neuroleptics [e.g., chlorpromazine, clozapine]; other antidepressants [e.g., fluoxetine]; steroids, antihypertensives, bronchodilators, weight-loss drugs, thyroid preparations, sedatives), OTC products (e.g., decongestants), and herbal remedies. *Use or timing may be interfering with falling asleep or staying asleep requiring adjustments such as change in dose or time medication is taken or choice of drug prescribed.*^{7,9,10}

- Note caffeine and alcohol intake. *May interfere with falling asleep or duration and quality of sleep.*
-  Assist with diagnostic testing (e.g., polysomnography, daytime multiple sleep latency testing, actigraphy, full-night sleep studies) to determine cause and type of sleep disturbance. *Note: Insomnia is a clinical diagnosis. Diagnostic studies are indicated principally for clarification of comorbid disorders.*¹⁴

NURSING PRIORITY NO. 2 To determine sleep pattern and dysfunction(s):

- Review sleep diary (where available); observe or obtain feedback from client/significant others (SOs) regarding client's sleep problems, usual bedtime, rituals or routines, number of hours of sleep, time of arising, and environmental needs to determine usual sleep pattern and provide comparative baseline.
- Listen to subjective reports of sleep quality (e.g., client never feels rested or feels excessively sleepy during day). *Provides opportunity to address misconceptions or unrealistic expectations and plan for interventions.*
-  Determine type of insomnia (e.g., transient, short term, chronic). *Transient episodes are occasional restless nights caused by such factors as jet lag, first night in a new bed, and so forth. Short-term insomnia lasts a few weeks and arises from temporary stressful experience, such as pressures at work, loss of job, and death in family, and usually resolves over time as client adapts to stressor. Chronic insomnia lasts for more than 6 months and can be caused by many physical and psychological factors as well as use/misuse of medications and drugs.*^{9,13}
-  Investigate whether client snores and in what position(s) this occurs. Also determine if obese individual experiences loud periodic snoring, along with unusual nighttime activities (e.g., sitting upright, sleepwalking), and morning headaches, sleepiness, and/or depression. *Sleep studies may need to be done to rule out obstructive sleep disorder.*^{2,4,14}
- Note alteration of habitual sleep time, such as change of work pattern or rotating shifts or change in normal bedtime (hospitalization). *Helps identify circumstances that are known to interrupt sleep patterns resulting in mental and physical fatigue, affecting concentration, interest, energy, and appetite.*⁵
- Observe physical signs of fatigue (e.g., restlessness, hand tremors, thick speech, drowsiness).
-   Assist with diagnostic testing (e.g., electroencephalogram, electrooculogram, electromyogram; psychological assessment/testing, chronological chart). *Polysomnography tests (the three electrical tests noted above) are performed in a sleep laboratory to measure several parameters of sleep, including brain wave activity, eye movement, and leg muscle tone. These tests may be performed after initial clinical evaluation or symptom management fails to discover or resolve a particular sleep disturbance or point to appropriate interventions and treatments.*^{1,2,4}

NURSING PRIORITY NO. 3 To assist client to establish optimal sleep/rest patterns:

-  Collaborate in treatment of underlying medical and psychiatric problem (e.g., obstructive sleep apnea, pain, gastroesophageal reflux disease, lower urinary tract infection/prostatic hypertrophy; depression, bipolar disorder; complicated grief).
-  Assist client with implementing measures to manage sleep problems when in facility care:^{9,11,14}
 - Arrange care to provide for uninterrupted periods of rest. *Allows for longer periods of sleep, especially during night.*
 - Provide quiet environment and comfort measures (e.g., back rub, washing hands and face, cleaning and straightening sheets). *Promotes relaxation and readiness for sleep.*
 -  Administer pain medications (if required) 1 hr before sleep to relieve discomfort and take maximum advantage of analgesic and sedative effect.
 -  Discuss and implement effective age-appropriate bedtime rituals (e.g., going to bed at same time each night, drinking warm milk, rocking, story reading, cuddling, favorite blanket or toy) to enhance client's relaxation, reinforce that bed is a place to sleep, and promote sense of security for child or confused elder.^{6,9}
- Limit fluid intake in evening if nocturia is a problem to reduce need for nighttime elimination. Suggest avoiding chocolate and caffeinated or alcoholic beverages, especially prior to bedtime. *Substances known to impair falling asleep or staying asleep. Alcohol may help individual fall asleep, but ensuing sleep is fragmented.*⁶

- Explore other sleep aids (e.g., warm bath or milk, light protein snack before bedtime, soothing music, favorite TV show). *Nonpharmaceutical aids may enhance falling asleep free of concern of medication side effects such as morning hangover or drug dependence.*
-   Develop behavioral program for insomnia, such as:^{1-5,9,10,14,15}
 - establishing regular sleeping and waking-up time, and maintaining a routine at bedtime and arising;
 - thinking relaxing thoughts when in bed;
 - avoiding napping in the daytime;
 - exercising daily, but not immediately before bedtime;
 - avoiding heavy meals at bedtime;
 - using bed only for sleeping or sex;
 - wearing comfortable, loose-fitting clothing to bed;
 - refraining from reading or watching TV in bed;
 - getting out of bed if not asleep in 15 to 30 min and participating in relaxing activity until sleepy;
 - getting up at the same time each day—even on weekends and days off;
 - getting adequate exposure to bright light during day; and
 - individually tailoring a stress-reduction program, music therapy, and/or relaxation routine.
- Recommend and assist with implementing program to “reset” sleep clock (chronotherapy when client has delayed sleep-onset insomnia). *These sleep-wake problems are common among shift workers and airplane travelers. Shift workers can benefit by adhering to a set routine and ensuring that noises and interruptions are kept to a minimum. Those who travel across time zones can benefit by adjusting their sleep time to match the time zone of their arrival and avoiding caffeine and alcohol.*⁵
-   Use barbiturates or other sleeping medications sparingly. *Research indicates long-term use of these medications, especially in the absence of cognitive behavioral therapy (CBT), fails to show long-term benefit and can actually induce sleep disturbances.*¹⁶
-  Encourage routine use of continuous positive airway pressure therapy when indicated to obtain optimal benefit of treatment for sleep apnea.
-  Monitor effects of therapeutic use of amphetamines or stimulants (such as may be used for attention deficit disorder or narcolepsy). *Use of these medications can induce or potentiate sleep disturbances.*⁷
-  Administer and monitor effects of prescribed medications to promote sleep (e.g., benzodiazepines such as zolpidem [Ambien], zaleplon [Sonata], eszopiclone [Lunesta]), antidepressants (e.g., trazodone [Desyrel], nefazodone [Serzone]), and melatonin agonists (e.g., ramelteon [Rozerem]). *Many medications may be tried to manage insomnia. While most are effective in the short term, many lose effectiveness over time. The client may have adverse side effects or develop tolerance and misuse the drug. Many drug regimens are most effective when combined with CBT, in which the client can be weaned off medications at some point.*^{9,14}
-   Refer to sleep specialist as indicated or desired. *Follow-up evaluation and intervention may be needed when insomnia is having a serious impact on client’s quality of life, productivity, and safety (e.g., on the job, at home, on the road). Note: Studies show that the most effective treatment for primary insomnia is CBT. Techniques are used to ameliorate factors that perpetuate or exacerbate chronic insomnia, such as poor sleep habits, hyperarousal, irregular sleep schedules, inadequate sleep hygiene, and misconceptions about sleep and the consequences of insomnia.*^{2,12,16}

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Assure client that occasional sleeplessness should not threaten health. *Knowledge that occasional insomnia is universal and usually not harmful may promote relaxation and relief from worry, which can perpetuate the problem.*⁴
- Assist client to develop individual program of relaxation. Demonstrate techniques (e.g., biofeedback, self-hypnosis, visualization, progressive muscle relaxation). *Methods that reduce sympathetic response and decrease stress can help induce sleep, particularly in persons suffering from chronic and long-term sleep disturbances.*³
-  Encourage participation in regular exercise program during day to aid in stress control and release of energy. *Note: Exercise at bedtime may stimulate rather than relax client and actually interfere with sleep.*²

- Investigate use of environmental sleep aids (e.g., sleep mask, darkening shades or curtains, earplugs, monotonous sounds [white noise]) *to block out ambient light and noise.*
- Assist individuals with insomnia associated with shift work to develop individual schedule *to take advantage of peak performance times as identified in chronobiological chart.*
- Recommend midmorning nap if one is required. *Napping, especially in the afternoon, can disrupt normal sleep patterns.*
- Assist client to deal with grieving process if grief is causing or exacerbating insomnia. (Refer to ND Grieving.)

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including specifics of sleep pattern (current and past) and effects on lifestyle and level of functioning.
- Medications, interventions, and previous therapies tried.
- Results of testing.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

deficient Knowledge

Taxonomy II: Perception/Cognition—Class 4 Cognition (00126) [**Diagnostic Division:** Teaching/Learning], Approved 1980; Revised 2017

DEFINITION: Absence of cognitive information related to specific topic or its acquisition.

RELATED FACTORS

Insufficient information; insufficient knowledge of resources
 Insufficient interest in learning
 Misinformation presented by others

DEFINING CHARACTERISTICS

Subjective

Insufficient knowledge

Objective

Inaccurate follow-through of instruction or performance on a test
 Inappropriate behavior
 [Development of preventable complication]

Associated Condition: Alteration in cognitive functioning or memory

Sample Clinical Applications: Any newly diagnosed disease or traumatic injury, progression of or deterioration in a chronic condition

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: [specify—78 choices]: Extent of understanding conveyed about a specific disease process, its treatment, the promotion and protection of health, maintaining optimal health, etc.

Information Processing: Ability to acquire, organize, and use information

Client Satisfaction: Teaching: Extent of positive perception of instruction provided by nursing staff to improve knowledge, understanding, and participation in care

Client Will (Include Specific Time Frame)

- Participate in learning process.
- Identify interferences to learning and specific action(s) to deal with them.
- Exhibit increased interest and assume responsibility for own learning by beginning to look for information and ask questions.
- Verbalize understanding of condition or disease process and treatment.
- Identify relationship of signs/symptoms to the disease process and correlate symptoms with causative factors.
- Perform necessary procedures correctly and explain reasons for the actions.
- Initiate necessary lifestyle changes and participate in treatment regimen.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Teaching: Individual: Planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs

Learning Facilitation: Promoting the ability to process and comprehend information

Learning Readiness Enhancement: Improving the ability and willingness to receive information

NURSING PRIORITY NO. 1 To assess readiness to learn and individual learning needs:

- Ascertain level of knowledge, including anticipatory needs. *Learning needs can include many things (e.g., disease cause and process, factors contributing to symptoms, procedures for symptom control, needed alterations in lifestyle, ways to prevent complications). Client may or may not ask for information or may express inaccurate perceptions of health status and needed behaviors to manage self-care.*¹
- Engage in active listening. *Conveys expectation of confidence in client's ability to determine learning needs and best ways of meeting them.*⁵
- Determine client's ability and readiness and barriers to learning. *Client may not be physically, emotionally, or mentally capable at this time and may need time to work through and express emotions before learning.*¹
- Be alert to signs of avoidance. *May need to allow client to suffer the consequences of lack of knowledge before client is ready to accept information.*¹
- Identify significant others (SOs)/family members requiring information. Providing appropriate information to others can provide reinforcement for learning, as everyone will understand what is to be expected.⁴

NURSING PRIORITY NO. 2 To determine other factors pertinent to the learning process:

-   Note personal factors (e.g., age, developmental level, gender, social and cultural influences, religion, life experiences, level of education, emotional stability) *that affect ability and desire to learn and assimilate new information, take control of situation, and accept responsibility for change.*^{2,11}
- Determine blocks to learning, including (1) language barriers (e.g., can't read or write, speaks or understands a different language than that spoken by teacher); (2) physical factors (e.g., cognitive impairment, sensory deficits [e.g., aphasia, dyslexia, hearing or vision impairment]); (3) physical constraints (e.g., acute illness, activity intolerance, impaired thought processes); (4) complexity of material to be learned (e.g., caring for colostomy, giving own insulin injections); (5) forced change in lifestyle (e.g., smoking cessation); or (6) have stated no need or desire to learn. *Many factors affect the client's ability and desire to learn, and his or her expectations of the learning process must be addressed if learning is to be successful.*^{1,11}
- Assess the level of the client's capabilities and the possibilities of the situation. *May need to assist SO(s) or caregivers to learn by introducing one new idea, by building on previous information, by finding pictures to demonstrate an idea, etc., to adapt teaching to client's specific needs.*⁶

NURSING PRIORITY NO. 3 To assess the client's/SO's motivation:

- Identify motivating factors for the individual (e.g., client needs to stop smoking because of advanced lung cancer, client wants to lose weight because family member died of complications of obesity). *Motivation may be negative (e.g., smoking causes lung cancer) or positive (e.g., client wants to promote health/prevent disease). Provides information that can guide content specific to client's situation and motivations.*^{3,12}
- Provide information relevant only to the situation. *Reducing the amount of information at any one given time helps to keep the client focused and prevents client from feeling overwhelmed.*⁴
- Provide positive reinforcement rather than negative reinforcers (e.g., criticism and threats). *Enhances cooperation and encourages continuation of efforts.*⁵

NURSING PRIORITY NO. 4 To establish priorities in conjunction with client:

- Determine client's most urgent need from both client's and nurse's viewpoints. *Identifies whether client and nurse are together in their thinking and provides a starting point for teaching and outcome planning for optimal success.*⁶
- Discuss client's perception of need. *Takes into account the client's personal desires/needs and values/beliefs, providing a basis for planning appropriate care.*⁶
- Differentiate "critical" content from "desirable" content. *Identifies information that must be learned now as well as content that could be addressed at a later time. Client's emotional state may preclude hearing much of what is presented, and by only providing what is essential, client may hear it.*³

NURSING PRIORITY NO. 5 To determine the content to be included:

- Identify information that needs to be remembered (cognitive) at client's level of development and education. *Enhances possibility that information will be heard and understood.*⁶
- Identify information having to do with emotions, attitudes, and values (affective). *The affective learning domain addresses a learner's emotions toward learning experiences, and attitudes, interest, attention, awareness, and values are demonstrated by affective behaviors. Knowing the client's affective state enhances learning possibilities.*^{7,12}
- Identify psychomotor skills that are necessary for learning. *Psychomotor learning involves both cognitive learning and muscular movement. The phases for learning these skills are cognitive (what), associative (how), and autonomous (practice to automaticity). Learners need to know what, why, and how they will learn. For example, if papers need to be typed, the psychomotor skill will be touch typing. The individual will learn touch typing finger placement and how to type smoothly and rhythmically.*⁸

NURSING PRIORITY NO. 6 To develop learner's objectives:

- State objectives clearly in learner's terms to meet learner's (not instructor's) needs. *Understanding why the material is important to the learner provides motivation to learn.*⁸
- Identify outcomes (results) to be achieved. *Understanding what the outcomes will be helps the client realize the importance of learning the material, providing the motivation necessary to learning.*⁸
- Recognize level of achievement, time factors, and short-term and long-term goals. *Learning progresses in stages. Stage 1: unconsciously unskilled where we don't know that we don't know. Stage 2: consciously unskilled, we know that we don't know and start to learn. Stage 3: consciously skilled, we know how to do it but need to think and work hard to do it. Stage 4: we become unconsciously skilled, where the new skills are easier and even seem natural.*⁹
- Include the affective goals (e.g., reduction of stress). *The learner's emotional behaviors affect the learning experience and need to be actively addressed for maximum effectiveness.*⁷

NURSING PRIORITY NO. 7 To identify teaching methods to be used:

- Determine client's/SO's method of accessing information and preferred learning mode (e.g., auditory, visual, kinesthetic; group classes, one-to-one instruction, online) and include in teaching plan. *Using multiple modes of instruction facilitates learning and enhances retention, especially when faced with a stressful situation, illness, or new treatment regimen.*^{3,10}
- Involve the client/SO(s) by using age-appropriate materials tailored to client's interest and literacy skills (e.g., interactive programmed books, questions, dialogue, audio/visual materials). *Accesses familiar mental images at client's developmental level to help individual learn more effectively.*^{3,12,13}
- Involve others who have same problems, needs, or concerns. *Group presentations and support groups provide role models and opportunity for sharing of information to enhance learning.*
- Use team and group teaching as appropriate.

NURSING PRIORITY NO. 8 To facilitate learning:

- Provide mutual goal-setting and learning contracts. *Clarifies expectations of teacher and learner.*
- Provide written information/guidelines and self-learning modules for client to refer to as necessary. *Reinforces learning process.*
- Pace and time learning sessions and learning activities to individual's needs. Involve and evaluate effectiveness of learning activities with client. *Client statements, questions, comments provide feedback about ability to grasp information being presented.*
- Provide an environment that is conducive to learning to limit distractions and allow client to focus on the material presented.

- Be aware of factors related to teacher in the situation (e.g., vocabulary, dress, style, knowledge of the subject, and ability to impart information effectively) *that may affect client's reaction to teacher or ability to learn from this individual.*
- Begin with information the client already knows and move to what the client does not know, progressing from simple to complex. *Can arouse interest and limit sense of being overwhelmed.*¹²
- Deal with the client's anxiety or other strong emotions. Present information out of sequence, if necessary, dealing first with material that is most anxiety producing *when the anxiety is interfering with the client's learning process.*
- Provide active role for client in learning process, including questions and discussion. *Promotes sense of control over situation.*
- Have client paraphrase content in own words, perform return demonstration, and explain how learning can be applied in own situation *to enhance internalization of material and to evaluate learning.*³
- Provide for feedback (positive reinforcement) and evaluation of learning and acquisition of skills. *Validates current level of understanding and identifies areas requiring follow-up.*⁵
- Be aware of informal teaching and role modeling that takes place on an ongoing basis. *Answering specific questions and reinforcing previous teaching during routine contacts or care enhances learning on a regular basis.*¹
- Assist client to use information in all applicable areas (e.g., situational, environmental, personal). *Enhances learning to promote better understanding of situation or illness.*¹

NURSING PRIORITY NO. 9 To promote wellness (Teaching/Discharge Considerations):

-  Provide access information for contact person *to answer questions and validate information after discharge.*¹
- Identify available community resources and support groups *to assist with problem-solving, provide role models, and support personal growth/change.*⁴
- Provide additional learning resources (e.g., bibliography, reliable Web sites, audio/visual media), as appropriate. *May assist with further learning and promote learning at own pace.*⁷

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, learning style, and identified needs; presence of learning blocks (e.g., hostility, inappropriate behavior).

Planning

- Plan for learning, methods to be used, and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses of the client/SO(s) to the learning plan and actions performed.
- How the learning is demonstrated.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Additional learning and referral needs.

readiness for enhanced Knowledge [Specify Level]

Taxonomy II: Perception/Cognition—Class 4 Cognition (00161) [**Diagnostic Division:** Teaching/Learning], Approved 2002; Revised 2013

DEFINITION: A pattern of cognitive information related to a specific topic, or its acquisition, which can be strengthened.

DEFINING CHARACTERISTICS

Subjective

Expresses desire to enhance learning

Sample Clinical Applications: As a health-seeking behavior, the patient may be healthy, or this diagnosis can occur in any clinical condition

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: [specify—78 choices]: Extent of understanding conveyed about a specific disease process, its treatment, the promotion and protection of health, maintaining optimal health, etc.

Information Processing: Ability to acquire, organize, and use information

Client Satisfaction: Teaching: Extent of positive perception of instruction provided by nursing staff to improve knowledge, understanding, and participation in care

Client Will (Include Specific Time Frame)

- Exhibit responsibility for own learning by seeking answers to questions.
- Verify accuracy of informational resources.
- Verbalize understanding of information gained.
- Use information to develop individual plan to meet healthcare needs/goals.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Teaching: Individual: Planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs

Learning Facilitation: Promoting the ability to process and comprehend information

Learning Readiness Enhancement: Improving the ability and willingness to receive information

NURSING PRIORITY NO. 1 To develop plan for learning:

- Verify client's level of knowledge about specific topic. *Provides opportunity to ensure accuracy and completeness of knowledge base for future learning.*⁴
- Determine motivation and expectation for learning. *Provides insight useful in developing goals and identifying information needs.*⁴
- Assist client to identify learning goals and measurable outcomes. *Helps to frame or focus content to be learned. Provides motivation for learning and a measure to evaluate learning process.*^{5,8}
- Ascertain preferred methods of learning (e.g., auditory, visual, interactive, or "hands-on"). *Identifies best approaches for the individual to facilitate learning process.*⁵
-  Note personal factors (e.g., age and developmental level, gender, social and cultural influences, religion, life experiences, level of education) *that may impact learning style, choice of informational resources, willingness to take control of situation, accept responsibility for change.*²
- Determine challenges to learning, such as language barriers (e.g., client cannot read, speaks or understands language other than that of care provider, dyslexia), physical factors (e.g., sensory deficits such as vision or hearing impairments, aphasia), physical stability (e.g., acute illness, activity intolerance), or difficulty of material to be learned. *Identifies special needs to be addressed if learning is to be successful.*⁶

NURSING PRIORITY NO. 2 To facilitate learning:

-  Provide information in varied formats appropriate to client's learning style (e.g., audiotapes, print materials, videos, classes or seminars, online). *Use of multiple formats increases learning and retention of material.*³
- Provide information about additional or outside learning resources (e.g., bibliotherapy, pertinent Web sites). *Promotes ongoing learning at own pace.*⁷
- Discuss ways to verify accuracy of informational resources. *Encourages independent search for learning opportunities while reducing likelihood of acting on erroneous or unproven data that could be detrimental to client's well-being.*⁴
-  Identify available community resources and support groups. *Provides additional opportunities for role modeling, skill training, anticipatory problem-solving, etc.*¹
- Be aware of and discuss informal teaching and role modeling that takes place on an ongoing basis. *Incongruencies in community or peer role models and support group feedback and print advertisements, popular music, and videos may exist, creating questions and potentially undermining learning process.*⁴

NURSING PRIORITY NO. 3 To enhance optimum wellness:

-  Assist client to identify ways to integrate and use information in all applicable areas (e.g., situational, environmental, personal). *Ability to apply or use information increases desire to learn and retention of information.*⁵
- Encourage client to journal, keep a log, or graph as appropriate. *Provides opportunity for self-evaluation of effects of learning, such as better management of chronic condition, reduction of risk factors, and acquisition of new skills.*^{6,9}

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings, learning style and identified needs, presence of challenges to learning.
- Motivation and expectations for learning.

Planning

- Plan for learning, methods to be used, and who is involved in the planning.
- Educational plan.

Implementation/Evaluation

- Responses of the client/significant other(s) to the educational plan and actions performed.
- How the learning is demonstrated.
- Attainment or progress toward desired outcome(s).
- Modifications to lifestyle or treatment plan.

Discharge Planning

- Additional learning and referral needs.

Latex Allergy Reaction

Taxonomy II: Safety/Protection—Class 5 Defensive Processes (00041) [**Diagnostic Division:** Safety], Approved 1998; Revised 2006, 2017

DEFINITION: A hypersensitive reaction to natural latex rubber products.

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Subjective

Life-Threatening Reactions Within 1 Hour of Exposure:

Chest tightness

Type IV Reactions Occurring ≥ 1 hour After Exposure:

Discomfort reaction to additives

Skin irritation

Gastrointestinal Characteristics: Abdominal pain; nausea

Orofacial Characteristics: Itching; nasal congestion

Generalized Characteristics: Generalized discomfort; total body warmth

Objective

Life-Threatening Reactions Within 1 Hour of Exposure:

Contact urticaria progressing to generalized symptoms

Edema [e.g., lips, throat, tongue, uvula]

(continues on page 516)

Latex Allergy Reaction (continued)

Dyspnea; wheezing; bronchospasm; respiratory arrest

Hypotension; syncope; myocardial infarction

Type IV Reactions Occurring ≥ 1 Hour After Exposure:

Eczema; skin irritation and/or redness

Orofacial Characteristics: Erythema; periorbital edema; rhinorrhea, tearing of the eyes

Generalized Characteristics: Skin flushing; generalized edema; restlessness

At Risk Population: Frequent exposure to latex product; history of latex reaction

History of allergy, or food allergy, or poinsettia plant allergy

History of asthma

History of surgery during infancy

Associated Condition: Hypersensitivity to natural latex rubber protein; multiple surgical procedures

Sample Clinical Applications: Multiple allergies, neural tube defects (e.g., spina bifida, myelomeningocele), multiple surgeries at early age, chronic urological conditions (e.g., neurogenic bladder, exstrophy of bladder), spinal cord trauma

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Allergic Response: Localized: Severity of localized hypersensitive immune response to a specific environmental (exogenous) antigen

Allergic Response: Systemic: Severity of systemic hypersensitive immune response to a specific environmental (exogenous) antigen

Knowledge: Treatment Regimen: Extent of understanding conveyed about a specific treatment regimen

Client Will (Include Specific Time Frame)

- Be free of signs of hypersensitive response.
- Verbalize understanding of individual risks and responsibilities in avoiding exposure.
- Identify signs/symptoms requiring prompt intervention.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Latex Precautions: Reducing the risk of a systemic reaction to latex

Allergy Management: Identification, treatment, and prevention of allergic responses to food, medications, insect bites, contrast material, blood, or other substances

Environmental Management: Manipulation of the patient's surroundings for therapeutic benefit, sensory appeal, and psychological well-being

NURSING PRIORITY NO. 1 To assess contributing factors:

-  Identify persons in high-risk categories such as (1) those with history of certain food allergies (e.g., banana, avocado, chestnut, kiwi, papaya, peach, nectarine); (2) prior allergies, asthma, and skin conditions (e.g., eczema and other dermatitis); (3) those occupationally exposed to latex products (e.g., healthcare workers, police, firefighters, emergency medical technicians [EMTs], food handlers, hairdressers, cleaning staff, factory workers in plants that manufacture latex-containing products); and (4) those with neural tube defects (e.g., spina bifida) or congenital urological conditions requiring frequent surgeries and/or catheterizations (e.g., exstrophy of the bladder). *Note: Studies have shown that while latex allergy is present in <1% of the general population, it is found in 8% to 17% of healthcare workers, and up to 68% of children with spina bifida.*^{7,15,16}

- Question client regarding latex allergy upon admission to healthcare facility, especially when procedures are anticipated (e.g., laboratory, emergency department, operating room, wound care management, 1-day surgery, dentist). *Basic safety information to help healthcare providers prevent/prepare for safe environment for client and themselves while providing care.*^{2,4,7}
- Discuss history of exposure, e.g., client works in environment where latex is manufactured or latex gloves are used frequently, child was blowing up balloons (may be an acute reaction to the powder), use of condoms (may affect either partner), or individual requires frequent catheterizations. *Finding cause of reaction may be simple or complex but often requires diligent investigation and history-taking from multiple sources.*
-  Administer or note presence of positive skin-prick test, when performed. *Sensitive, specific, and rapid test but should be used with caution in persons with suspected sensitivity, as it carries risk of anaphylaxis.*¹⁰
-  Perform challenge or patch test, if appropriate, to identify specific allergens in client with known type IV hypersensitivity. *Note: Emergency department diagnosis and management depend on the history and physical examination as the following tests are not available in a useful time frame.*¹⁰
-  Note response to radioallergosorbent test or enzyme-linked latex-specific IgE. *Performed to measure the quantity of IgE antibodies in serum after exposure to specific antigens and has generally replaced skin tests and provocation tests, which are inconvenient, often painful, and/or hazardous to the client. Note: These tests are useful in nonemergent evaluations.*^{1,10,11}

NURSING PRIORITY NO. 2 To take measures to reduce/limit allergic response/avoid exposure to allergens:

-  Ascertain client's current symptoms, noting rash, hives, and itching; red, teary eyes; and edema, diarrhea, nausea, and feeling of faintness. *Baseline for determining where the client is along a continuum of symptoms so that appropriate treatments can be initiated. Note: The most severe reactions tend to occur with latex proteins contacting internal tissues during invasive procedures and when they touch mucous membranes of the mouth, vagina, urethra, or rectum.*^{7,9,12}
 - Determine time since exposure (e.g., immediate or delayed onset such as 24–48 hr).
 - Assess skin (usually hands but may be anywhere) for dry, crusty, hard bumps and horizontal cracks caused by irritation from chemicals used in/on the latex item (e.g., latex or powder used in latex gloves, condoms). *Dry, itchy rash (contact irritation) is the most common response and is not a true allergic reaction but can progress to a delayed type of allergic contact dermatitis with oozing blisters and spread in a way similar to poison ivy.*^{2,12}
 -  Assist with treatment of contact dermatitis/type IV reaction:
Wash affected skin with mild soap and water.
Avoid latex gloves where possible; wear cotton glove liners where latex gloves must be used.
Wash hands between glove changes and after each glove removal.
 Avoid powder, oil-based salves or lotions when using latex gloves. *Note: Powdered latex gloves are associated with higher amounts of aerosolized latex particles in the air. Those concerned with managing risks should minimize concentration of latex protein in the air in order to reduce respiratory and eye symptoms.*⁵
 Consider application of topical ointments such as corticosteroid, and antihistamine.
Inform client that the most common cause is latex gloves but that many other products contain latex and could aggravate condition.
 -  Monitor closely for signs of systemic reactions (e.g., difficulty breathing or swallowing; wheezing; hoarseness; stridor; hypotension; tremors; chest pain; tachycardia; dysrhythmias; edema of face, eyelids, lips, tongue, and mucous membranes). *Type IV response can progress to type I anaphylaxis. A systematic review of studies found that a type I allergic reaction may be immediate in sensitized individuals and that acute treatment must be carried out in a latex-free environment.*¹⁴
- Note behavior such as agitation, restlessness, and expressions of fearfulness in the presence of above-listed symptoms. *Indicative of severe allergic response that can result in anaphylactic reaction and lead to respiratory or cardiac arrest.*⁶

-  Administer treatment, as appropriate, if severe or life-threatening reaction occurs:
 Stop treatment or procedure, if needed.
 Support airway and administer 100% oxygen or mechanical ventilation, if needed.
-  Administer emergency medications and treatments per protocol (e.g., antihistamines, epinephrine, corticosteroids, IV fluids).
- Educate care providers in ways to prevent inadvertent exposure (e.g., post latex precaution signs in client's room, document allergy to latex in chart, routinely monitor client's environment for latex-containing products and remove them promptly) and be prepared for emergency treatment measures should they be needed.
- Ascertain that latex-safe environment (e.g., surgical suite, hospital room) and products are available according to recommended facility guidelines and standards, including equipment and supplies (e.g., powder-free, low-protein latex products) and latex-free items (e.g., gloves, syringes, catheters, tubings, tape, thermometers, electrodes, oxygen cannulas, underpads, storage bags, diapers, feeding nipples), as appropriate.^{2,9,10,13}
-   Notify physicians, colleagues, and medical products suppliers of client's condition (e.g., pharmacy so that medications can be prepared in latex-free environment, home-care oxygen company to provide latex-free cannulas). Users of latex gloves and purchasers should be aware that the risk of developing latex allergy is highest with the use of **powdered** latex gloves and that examination gloves may contain more latex allergen than surgical gloves.⁵
- Encourage client to wear medical ID bracelet to alert providers to condition if client is unresponsive.^{3,4,7}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Learning):

-  Instruct in signs of reaction and emergency treatment needs. *Reactions range from skin irritation to anaphylaxis. Reaction may be gradual but progressive, affecting multiple body systems, or may be sudden, requiring lifesaving treatment. Allergy can result in chronic illness, disability, career loss, hardship, and death. There is no cure except complete avoidance of latex.*
- Emphasize the critical importance of taking immediate action for type I reaction to limit life-threatening symptoms.
- Demonstrate equipment and injection procedure and recommend client carry auto-injectable epinephrine to provide timely emergency treatment, as needed.
- Emphasize necessity of informing all new care providers of hypersensitivity to reduce preventable exposures.
- Instruct client/family/significant other (SO) that latex exposure occurs through contact with skin or mucous membrane, by inhalation, parenteral injection, or wound inoculation.
- Instruct client/SO to survey and routinely monitor environment for latex-containing products and replace as needed.
- Provide printed lists or Web sites for identifying common household products that may contain latex (e.g., carpet backing, hoses, rubber grip utensils, diapers, undergarments, shoes, toys, pacifiers, computer mouse pads, erasers, rubber bands, etc.) and where to obtain latex-free products and supplies.^{4,7}
-  Provide resource and assistance numbers for emergencies. *When allergy is suspected or the potential for allergy exists, protection must begin with identification and removal of possible sources of latex.*
-   Provide work site review, where indicated, and recommendations to prevent exposure. *Latex allergy can be a disabling occupational disorder. Education about the problem promotes prevention of allergic reaction, facilitates timely intervention, and helps nurse to protect clients, latex-sensitive colleagues, and themselves.*^{3,4}
-  Recommend full medical work-up for client presenting with hand dermatitis, especially if job tasks include use of latex.⁸
-  Contact suppliers to verify that latex-free equipment, products, and supplies are available, including (but not limited to) low-allergen or powder-free synthetic gloves, airways, masks, stethoscope tubings, IV tubing, tape, thermometers, urinary catheters, stomach and intestinal tubes, electrodes, oxygen cannulas, pencil erasers, wrist name bands, and rubber bands.⁷
- Ascertain that procedures are in place to identify and resolve problems with medical devices relevant to allergic reactions or glove performance.⁴

- Advise client to be aware of potential for related food allergies (e.g., bananas, kiwis, melons, tomatoes, avocados, nuts). *These foods can trigger a latex-like allergic reaction because the proteins in them mimic latex proteins as they break down in the body.*
-  Refer to resources, including, but not limited to, ALERT (Allergy to Latex Education & Resource Team, Inc.), Latex Allergy News, Spina Bifida Association, National Institute for Occupational Safety and Health, Kendall's Healthcare Products (Web site), and Hudson RCI (Web site), *for further information about common latex products in the home, latex-free products, and assistance.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings including type and extent of symptoms.
- Pertinent history of contact with latex products and frequency of exposure.

Planning

- Plan of care and interventions and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge needs, specific referrals made, and additional resources available.

risk for Latex Allergy Reaction

Taxonomy II: Safety/Protection—Class 5 Defensive Processes (00042) [**Diagnostic Division:** Safety], Submitted 1998; Revised 2006, 2013, 2017

DEFINITION: Susceptible to a hypersensitivity to natural latex rubber products, which may compromise health.

RISK FACTORS

To Be Developed

At Risk Population: Frequent exposure to latex product; history of latex reaction

History of allergy, or food allergy, or poinsettia plant allergy

History of asthma

History of surgery during infancy

Associated Condition: Hypersensitivity to natural latex rubber protein; multiple surgical procedures

Sample Clinical Applications: Multiple allergies, neural tube defects (e.g., spina bifida, myelomeningocele), multiple surgeries at early age, chronic urological conditions (e.g., neurogenic bladder, exstrophy of bladder), spinal cord trauma

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Allergic Response: Localized: Severity of localized hypersensitive immune response to a specific environmental (exogenous) antigen

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Knowledge: Health Behavior: Extent of understanding conveyed about the promotion and protection of health

Client Will (Include Specific Time Frame)

- Identify and correct potential risk factors in the environment.
- Demonstrate appropriate lifestyle changes to reduce risk of exposure.
- Identify resources to assist in promoting a safe environment.
- Recognize need for and seek assistance to limit response or complications.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Latex Precautions: Reducing the risk of a systemic reaction to latex

Allergy Management: Identification, treatment, and prevention of allergic responses to food, medications, insect bites, contrast material, blood, or other substances

Risk Identification: Analysis of potential risk factors, determination of health risks, and prioritization of risk-reduction strategies for an individual or group

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

-  Identify persons in high-risk categories such as (1) those with history of certain food allergies (e.g., banana, avocado, chestnut, kiwi, papaya, peach, nectarine), (2) those with asthma or skin conditions (e.g., eczema), (3) those occupationally exposed to latex products (e.g., healthcare workers, police/firefighters, emergency medical technicians [EMTs], food handlers, hairdressers, cleaning staff, factory workers in plants that manufacture latex-containing products), and (4) those with neural tube defects (e.g., spina bifida) or congenital

urological conditions requiring frequent surgeries and/or catheterizations (e.g., exstrophy of the bladder). *Most latex allergies are diagnosed by a detailed client history plus physical examination. Note: Studies have shown that while latex allergy is present in <1% of the general population, it is found in 8% to 17% of healthcare workers and in up to 68% of children with spina bifida.*^{2,10–12} *Note: The most severe reactions tend to occur with latex proteins contacting internal tissues during invasive procedures and when they touch mucous membranes of the mouth, lungs, vagina, urethra, or rectum.*^{2,5–7}

- Question client regarding latex allergy upon admission to each healthcare facility, especially when procedures are anticipated (e.g., new physician/healthcare provider, laboratory, emergency department, operating room, wound care management, 1-day surgery, dentist). *Current information indicates that natural latex is found in thousands of medical supplies; however, most manufacturers are now using synthetic latex for products, and new synthetic latex is under development. These products are associated with fewer allergic reactions among individuals who are sensitive to natural latex.*^{1,2}

NURSING PRIORITY NO. 2 To assist in correcting factors that could lead to latex allergy:

- Ascertain that facilities have established policies and procedures. *Promotes awareness in the workplace to address safety and reduce risk to workers and clients.*³
- Create latex-safe environments in care setting (e.g., substitute nonlatex products, such as natural rubber gloves, polyvinyl chloride (PVC) IV tubing, latex-free tape, thermometers, electrodes, oxygen cannulas). *Reduces risk of exposure.*^{8,9}
- Promote good skin care when latex gloves may be preferred/required for barrier protection (e.g., in specific disease conditions such as HIV or during surgery). Use powder-free gloves, change gloves frequently, and wash hands immediately after glove removal; refrain from use of oil-based hand cream. *Reduces dermal and respiratory exposure to latex proteins that bind to the powder in gloves.*^{2,4}
- 🏠 Discuss necessity of avoiding latex exposure. Recommend or assist high-risk client/family to survey environment and remove any medical or household products containing latex. *Avoidance of latex is the only way to prevent the allergic reaction.*²
- 🗣️ Provide worksite review, where indicated, and recommendations to prevent exposure. *Latex allergy can be a disabling occupational disorder. Education about the problem promotes prevention of allergic reaction, facilitates timely intervention, and helps nurse to protect clients, latex-sensitive colleagues, and themselves.*^{1,4}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

- 🏠 Instruct client/caregivers about types of potential reactions. *Reaction may be gradual and progressive (e.g., irritant contact rash with gloves); can be progressive, affecting multiple body systems; or may be sudden and anaphylactic, requiring lifesaving treatment.*^{1,3}
- Identify measures to take if reactions occur and ways to avoid exposure to latex products *to reduce risk of injury and provide for prompt intervention.* (Refer to ND Latex Allergy Reaction.)
- 🗣️ Refer to allergist for testing as appropriate. *Testing may include the challenge test with latex gloves, a skin patch test, or a blood test for IgE.*
- Encourage client to wear medical ID bracelet/necklace and emphasize the importance of informing all new care providers of hypersensitivity *to reduce preventable exposures.*^{1,4}
- Refer to resources (e.g., Latex Allergy News, National Institute for Occupational Safety and Health, Kendall's Healthcare Products [Web site], Hudson RCI [Web site]) *for further information about common latex products in the home, latex-free products, and assistance.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, pertinent history of contact with latex products, and frequency of exposure.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

sedentary Lifestyle

Taxonomy II: Health Promotion—Class 1 Health Awareness (00168) [Diagnostic Division: Activity/Rest], Approved 2004

DEFINITION: A habit of life that is characterized by a low physical activity level.

RELATED FACTORS

Insufficient interest in, motivation, or resources [e.g., time, money, companionship, facilities] for physical activity

Insufficient training for physical exercise

Insufficient knowledge of health benefits associated with physical exercise

DEFINING CHARACTERISTICS**Subjective**

Preference for activity low in physical activity

Objective

Average daily physical activity is less than recommended for gender and age

Physical deconditioning

Sample Clinical Applications: Chronic or debilitating conditions (e.g., arthritis, multiple sclerosis [MS], chronic obstructive pulmonary disease [COPD], heart failure, paralysis), chronic pain, obesity, depression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Knowledge: Prescribed Activity: Extent of understanding conveyed about physical activity by a health professional for a specific condition

Exercise Participation: Personal actions to perform a self-planned, structured, and repetitive regimen to maintain or advance the level of fitness and health

Client Will (Include Specific Time Frame)

- Verbalize understanding of importance of regular exercise to general well-being.
- Identify necessary precautions, safety concerns, and self-monitoring techniques.
- Formulate and implement realistic exercise program with gradual increase in activity.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Exercise Promotion: Facilitation of regular physical activity to maintain or advance to a higher level of fitness and health

Teaching: Prescribed Exercise: Preparing a patient to achieve or maintain a prescribed level of exercise

Self-Modification Assistance: Reinforcement of self-directed change initiated by the patient to achieve personally important goals

NURSING PRIORITY NO. 1 To assess precipitating/etiological factors:

- Identify client's specific condition(s) (e.g., obesity, depression, MS, arthritis, Parkinson's disease, surgery, hemiplegia or paraplegia, chronic pain, brain injury) *that may contribute to immobility or the onset and continuation of inactivity or sedentary lifestyle.*
- ∞ Assess client's age, developmental level, motor skills, ease and capability of movement, and posture and gait. *Determines type and intensity of needed interventions related to activity.*¹
- Determine client's current weight and body mass index (BMI); note dietary habits. *If client is overweight and BMI is not in healthy range, a weight-loss program should be suggested along with exercise. Note: In general, BMI is considered a reliable measure of body fat for men and women. However, changes in body composition and stature that occur with aging can influence the reliability of BMI as a marker of body fat.*^{8,12}
- Assess physical capabilities to participate in exercise/activities, noting attention span, physical limitations and tolerance, level of interest or desire, and safety needs. *Identifies barriers that need to be addressed.*^{1,6}
- Review usual activities and work requirements/environment. *Absence of regular exercise and the presence of a stressful job with little physical exercise increases likelihood of deconditioning. Note: In 2008, the World Health Organization (WHO) reported that globally, around 31% of adults (aged 15 and over) were insufficiently active.*^{7,8}
- Note emotional and behavioral responses to problems associated with a self- or condition-imposed sedentary lifestyle. *Feelings of disinterest, frustration, and powerlessness may impede attainment of goals.*²
- Determine family dynamics and support provided by family/friends. *Major lifestyle change may require support of others to achieve and maintain goals or client may be at increased risk of slipping back into "old" ways.*⁸
- Ascertain availability of resources (e.g., finances for gym membership, transportation, exercise facility or gym at work site, proximity of walking trail or bike path, safety of neighborhood for outdoor activity).

NURSING PRIORITY NO. 2 To motivate and stimulate client involvement:

-  Establish therapeutic relationship, acknowledging reality of situation and client's feelings. *Changing a life-long habit can be difficult, and client may feel discouraged with body and hopeless to turn situation into a positive experience.*²
-  Ascertain client's perception of current activity and exercise patterns, impact on life, and cultural expectations of client/others. *Helps to determine whether or not client perceives need for change and potential limitations in choices for activities.*⁸
- Discuss client's stated motivation for change. *Concerns of client/significant others (SOs) regarding threats to personal health/longevity or acceptance by teen peers may be sufficient to cause client to initiate change; however, client must want to change for himself or herself in order to sustain change.*^{4,8}
- Review necessity for and benefits of regular exercise. *Research confirms that exercise has benefits for the whole body (e.g., can boost energy, enhance coordination, reduce muscle deterioration, improve circulation, lower blood pressure, produce healthier skin and a toned body, prolong youthful appearance). Regular exercise has also been found to boost cardiac fitness in both conditioned and out-of-shape individuals. Conversely, studies continue to demonstrate the prevalence of reduced physical activity. Sociocultural changes (e.g., increased reliance on automobiles and other modern conveniences) have reduced the need to be physically active. Computers and television have promoted a sedentary lifestyle for adults and children, whose opportunities for physical activity have been further diminished because of academic pressures, overscheduling, and safety concerns for out-of-doors play. Suburban living has produced long commutes to work, and technological advances have resulted in more people working in occupations that require no physical activity.*^{4,13}
- Counsel client regarding individual health risks. *Focuses attention on own situation and helps prioritize needs, making change more manageable.*⁸
- Involve client, SO/parent, or caregiver in developing exercise plan and goals to meet individual needs, desires, and available resources. *Also increases commitment to program and successful attainment of goals.*
- Introduce activities at client's current level of functioning, progressing to more complex activities, as tolerated. *Reduces likelihood of overwhelming client at the beginning and maintains interest over time.*
-  Recommend mix of age- and gender-appropriate activities or stimuli (e.g., movement classes, walking, hiking, jazzercise, swimming, biking, skating, bowling, golf, weight training). *Activities need to be personally meaningful for client to derive the most enjoyment and to sustain motivation to continue with program.*^{2,6}
- Encourage change of scenery (indoors and outdoors where possible) and periodic changes in the personal environment when client is confined inside.

NURSING PRIORITY NO. 3 To promote optimal level of function and prevent exercise failure:

-  Assist with treatment of underlying condition impacting participation in activities to maximize function within limitations of situation. Refer to dietitian for weight-loss program, as indicated.
-  Collaborate with physical medicine specialist or occupational or physical therapist in providing active or passive range-of-motion exercises and isotonic muscle contractions. *Techniques such as gait training, strength training, and exercise to improve balance and coordination can be helpful in rehabilitating client.*¹
- Schedule ample time to perform exercise activities balanced with adequate rest periods.¹
- Provide for safety measures as indicated by individual situation, including environmental management and fall prevention. (Refer to ND risk for Falls.)
- Reevaluate ability/commitment periodically. *Changes in strength or endurance signal readiness for progression of activities or possibly to decrease exercise if overly fatigued. Wavering commitment may require change in types of activities and/or the addition of a workout buddy to reenergize involvement.*^{2,5}
- Discuss discrepancies in planned and performed activities with client aware and unaware of observation. Suggest methods for dealing with identified problems. *May be necessary when client is using avoidance or controlling behavior or is not aware of own abilities due to anxiety or fear.*^{2,5}

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Educate client/SO about benefits of physical activity as it relates to client's particular situation. *Many studies have shown the health benefits of physical activity in the setting of chronic illness (e.g., it increases function in arthritis, improves glycemic control in type 2 diabetes, and can enhance quality of life).*^{10,11}
- Review components of physical fitness: (1) muscle strength and endurance, (2) flexibility, (3) body composition (muscle mass, percentage of body fat), and (4) cardiovascular health. *Fitness routines need to include all elements to attain maximized benefits and prevent deconditioning.*^{4,5,7}
- Instruct in safety measures, as individually indicated (e.g., warm-up and cool-down activities; taking pulse before, during, and after activity; adequate intake of fluids, especially during hot weather or strenuous activity; wearing reflective clothing when jogging or reflectors on bicycle; locking wheelchair before transfers; judicious use of medications; supervision, as indicated).¹
- Recommend keeping an activity or exercise log, including physical and psychological responses and changes in weight, endurance, and body mass. *Provides visual evidence of progress or goal attainment and encouragement to continue with program.*^{2,6}
- Encourage client to involve self in exercise as part of wellness management for the whole person.^{3,6}
-  Encourage parents to set a positive example for children by participating in exercise and engaging in an active lifestyle.^{3,6}
- Identify community resources, charity activities, and support groups. *Community walking/hiking trails, sports leagues, etc., provide free/low-cost options. Activities such as 5k walks for charity, participation in Special Olympics, or age-related competitive games provide goals to work toward. Note: Some individuals may prefer solitary activities; however, most individuals enjoy supportive companionship when exercising.*^{3,4}
- Discuss alternatives for exercise program in changing circumstances (e.g., walking the mall during inclement weather, using exercise facilities at hotel when traveling, water aerobics at local swimming pool, joining a gym).
- Promote individual participation in community awareness of problem and discussion of solutions. *Physical inactivity (and associated diseases) is a major public health problem that affects large numbers of people in all regions of the world. Recognizing the problem and future consequences may empower the global community to develop effective measures to promote physical activity and improve public health.*⁷
-  Promote community goals for increasing physical activity, such as school-based physical education; the Sports, Play, and Active Recreation for Kids program; a “buddy” system or contracting for specific physical activities; and the Physician-Based Assessment and Counseling for Exercise, to address national concerns about obesity and major barriers to physical activity, such as time constraints, lack of training in physical activity, behavioral change methods, and lack of standard protocols.^{3,6,7,9}

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings, including level of function and ability to participate in specific or desired activities, motivation for change.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge and long-term needs, noting who is responsible for each action to be taken.
- Specific referrals made.
- Sources of and maintenance for assistive devices.

risk for impaired Liver Function

Taxonomy II: Nutrition—Class 4 Metabolism (0000178) [**Diagnostic Division:** Food/Fluid], Approved 2006; Revised 2008, 2013, 2017

DEFINITION: Susceptible to a decrease in liver function, which may compromise health.

RISK FACTORS

Substance misuse/[abuse]

Associated Condition: Human immunodeficiency virus (HIV) coinfection; viral infection

Pharmaceutical agent

Sample Clinical Applications: Hepatitis, HIV, substance abuse, drug overdose (acetaminophen), Epstein-Barr infection

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Knowledge: Disease Process: Extent of understanding conveyed about a specific disease process

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Liver Function: Ability of the liver to manufacture, store, alter, and secrete substances essential for metabolism and other body functions

Client Will (Include Specific Time Frame)

- Verbalize understanding of individual risk factors that contribute to possibility of liver damage/failure.
- Demonstrate behaviors, lifestyle changes to reduce risk factors and protect self from injury.
- Be free of signs of liver failure as evidenced by liver function studies within normal range, and absence of jaundice, hepatic enlargement, or altered mental status.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Risk Identification: Analysis of potential risk factors, determination of health risk, and prioritization of risk reduction strategies for an individual or group

Infection Protection: Prevention and early detection of infection in a patient at risk

Substance Use Treatment: Care of patient and family members demonstrating dysfunction as a result of substance abuse or dependence

NURSING PRIORITY NO. 1 To identify individual risk factors/needs:

- Determine presence of disease condition(s), noting whether problem is acute (e.g., viral hepatitis, acetaminophen overdose) or chronic (e.g., alcoholic cirrhosis). *Influences choice of interventions.*
-  Note client history of known/possible exposure to virus, bacteria, or toxins *that can damage liver*.^{1-5,12,13}
Works in high-risk occupation (e.g., performs tasks that involve contact with blood, blood-contaminated body fluids, other body fluids, or sharps). *Carries high risk for exposure to hepatitis B and C.*
Injects drugs, especially if client shared a needle; received tattoo or piercing with an unsterile needle.
Received blood or blood products prior to 1989.
Ingested contaminated food or water or experienced poor sanitation practices by food service workers. *Poses risk for exposure to enteric viruses (hepatitis A and E).*
Close contact (e.g., lives with or has sex with infected person or carrier; infant born to infected mother).
Regular exposure to toxic chemicals (e.g., carbon tetrachloride cleaning agents, bug spray, paint fumes, tobacco smoke).
Uses prescription drugs (e.g., sulfonamides, phenothiazines, isoniazid).
Ingests certain herbal remedies or megadoses of vitamins.
Uses alcohol with medications (including over-the-counter [OTC] medications).
Consumes alcohol heavily and/or over long period of time.
Ingested acetaminophen (accidentally, as may occur when client takes too large a dose or has several medications containing acetaminophen over time, or intentionally, as may occur with suicide attempt).
Travels internationally to or emigrates from countries such as Africa, Southeast Asia, Korea, China, Vietnam, Eastern Europe, Mediterranean countries, or the Caribbean (*where hepatitis is endemic*).
-  Review results of laboratory tests (e.g., liver function studies, such as hepatic function panel including alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase; bilirubin, gamma-glutamyl transferase, lactic acid dehydrogenase, albumin, total protein and prothrombin time; drug levels, hepatitis screening tests and titers) and other diagnostic studies (e.g., ultrasonography, CT scanning, MRI imaging) *that indicate presence of hepatotoxic condition and need for medical treatment*.^{6,15}

NURSING PRIORITY NO. 2 To assist client to reduce or correct individual risk factors:

-  Assist with medical treatment of underlying condition (e.g., hepatitis, alcoholism, drug overdose) *to support organ function and minimize liver damage.*
-  Educate client/significant other on way(s) to prevent exposure to or incidence of hepatitis infections and limit damage to liver.^{4,9,17}
Practice safer sex (e.g., avoid multiple-partner sex, wear condoms, avoid sex with partners known to be infected).
Wash hands well after using the bathroom or changing soiled diapers.
Avoid injecting drugs or sharing needles.
Avoid sharing razors, toothbrushes, or nail clippers.
Make sure needles and inks are sterile for tattooing and body piercing.

Use proper precautions and appropriate protective equipment when working in high-risk occupations (e.g., healthcare, police and fire departments, emergency services, day-care services, chemical manufacturing) *where most at risk for inhalation of toxins or needlesticks or body fluid exposures.*

Avoid tap water and practice good hygiene and sanitation when traveling internationally.

Use harsh cleansers and aerosol products in well-ventilated room; wear mask and gloves, cover skin, and wash well afterward. *Chemicals can reach the liver through skin and destroy liver cells.*

Obtain vaccinations when appropriate. *Some hepatitis strains (e.g., A and B) are preventable, thus minimizing risk of liver damage.*

-  Discuss safe use and concerns about client's medication regimen (e.g., acetaminophen, NSAIDs, herbal or vitamin supplements, phenobarbital, cholesterol-lowering drugs such as statins, certain antibiotics [e.g., sulfonamides, isonicotinyl hydrazine], certain cardiovascular drugs [e.g., amiodarone, hydralazine], certain antidepressants [e.g., tricyclics]) *known to cause hepatotoxicity, either alone or in combination or in overdose situation. Note: Many OTC and prescription medicines, even "natural" or herbal remedies, contain chemicals that can harm the liver over time. Very high doses of certain pain relievers (e.g., acetaminophen) can cause liver failure.*⁶⁻⁹
-  Encourage client to read labels, especially when taking acetaminophen for pain, to determine strength of medication, note safe number of doses over 24 hr, and become familiar with "hidden" sources of acetaminophen (e.g., Nyquil, Vicodin). Limit alcohol intake *to avoid or reduce risk of liver damage. Note: Studies have demonstrated that alcoholic clients may develop severe, even fatal, toxic liver injury after ingestion of standard therapeutic doses of acetaminophen.*^{5,13,14}
-  Emphasize importance of responsible drinking (e.g., men should limit alcohol to no more than two drinks/day, and women, one drink/day) or avoid alcohol altogether when indicated (if client has any kind of liver disease) *to reduce incidence of cirrhosis and severity of liver damage or failure.*^{4,11}
-  Encourage smoking cessation. *The additives in cigarettes pose a challenge to the liver by reducing its ability to eliminate toxins.*¹⁵
- Encourage client with liver dysfunction to avoid fatty foods. *Fat interferes with normal function of liver cells and can cause additional damage and permanent scarring to liver cells when they can no longer regenerate.*⁸
-  Refer to nutritionist, as indicated, for dietary needs, including calories, proteins, vitamins, and trace minerals *to promote healing and limit effects of deficiencies. Note: A balanced diet for liver health includes proteins, fruits, and vegetables and is low in cholesterol, fats, carbohydrates, and simple sugars.*^{16,17}
- Discuss signs/symptoms (e.g., increased abdominal girth; rapid weight loss or gain; increased peripheral edema; dyspnea, fever; blood in stool or urine; excess bleeding of any kind; jaundice) *that warrant prompt notification of healthcare provider for evaluation and treatment of severe liver dysfunction and possible organ failure.*⁹
-  Refer to specialist or liver treatment center, as indicated. *May be beneficial for client with chronic liver disease when decompensating, for client with hepatitis and other coexisting disease condition (e.g., HIV), or for client with intolerance to treatment due to side effects.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Emphasize importance of hand hygiene, use of bottled water, and avoidance of fresh produce and raw meat/seafood *if client is traveling to area where hepatitis A is endemic or food/waterborne illness is a risk.*¹⁰
- Instruct in measures including protection from blood or other body fluids and sharps safety, safer-sex practices, avoiding needle sharing, and body tattoos and piercings *to prevent occupational and nonoccupational exposures to hepatitis.*
-  Discuss need for vaccination, as indicated (e.g., healthcare and public safety worker, children under 18, international traveler, recreational drug user, men who have sex with other men, client with clotting disorders or liver disease, anyone sharing household with an infected person) *to prevent exposure and transmission of blood or body fluid hepatitis and limit risk of liver injury.*¹⁰
-  Discuss appropriateness of prophylaxis immunizations. *Although the best way to protect against hepatitis B and C infections is to prevent exposure to viruses, postexposure prophylaxis should be initiated promptly*

to prevent or limit severity of infection, especially in persons with close contact with infected individual or in client with compromised immune system.¹¹

-  Provide information regarding availability of gamma globulin, immune serum globulin, hepatitis B immune globulin, and HB vaccine (Recombivax HB, Engerix-B) through the health department or family physician.
-  Emphasize necessity of follow-up care (in client with chronic liver disease) to monitor liver function and effectiveness of interventions and importance of adherence to therapeutic regimen to prevent or minimize permanent liver damage.
-  Refer to community resources for immunizations/drug/alcohol treatment program, as indicated.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including individual risk factors.
- Results of laboratory tests and diagnostic studies.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, plan for follow-up, and who is responsible for actions to be taken.
- Specific referrals made.

risk for Loneliness

Taxonomy II: Comfort—Class 3 Social Comfort (00054) [Diagnostic Division: Social Interaction], Approved 1994; Revised 2006, 2013

DEFINITION: Susceptible to experiencing discomfort associated with a desire or need for more contact with others, which may compromise health.

RISK FACTORS

Affectional or emotional deprivation

Physical or social isolation

Sample Clinical Applications: Debilitating conditions (e.g., multiple sclerosis [MS], chronic obstructive pulmonary disease [COPD], renal failure), cancer, AIDS; major depression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Loneliness Severity: Severity of emotional, social, or existential signs and symptoms of isolation

Social Involvement: Social interactions with persons, groups, or organizations

Client Will (Include Specific Time Frame)

- Identify individual difficulties and ways to address them.
- Engage in desired social activities.
- Report involvement in interactions or relationships that client views as meaningful.

Sample NOC linkages:

Knowledge: Parenting: Extent of understanding conveyed about provision of a nurturing and constructive environment for a child from 1 year through 17 years of age

Parent Will (Include Specific Time Frame)

- Provide infant/child with consistent and loving caregiving.
- Participate in programs for adolescents and families.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Socialization Enhancement: Facilitation of another person's ability to interact with others

Hope Inspiration: Enhancing the belief in one's capacity to initiate and sustain actions

Family Integrity Promotion: Promotion of family cohesion and unity

NURSING PRIORITY NO. 1 To identify causative/precipitating factors:

- Differentiate between ordinary loneliness and a state of constant sense of dysphoria. *This influences the type of and intensity of interventions.*³
-   Note client's age and duration of problem—that is, situational (e.g., leaving home for college) or chronic. *Adolescents may experience lonely feelings related to the changes that are happening as they become adults. Elderly individuals incur multiple losses associated with aging, loss of spouse, decline in physical health, and changes in roles, thus intensifying feelings of loneliness.*^{3,11}

- Determine degree of distress, tension, anxiety, and restlessness present. Note history of frequent illnesses, accidents, and crises. *Identifies somatic complaints that can result from loneliness. Individuals under stress tend to have more illnesses and accidents related to inattention and anxiety.*⁶
- Note presence and proximity of family/significant others (SOs). *Loneliness may not be related to being alone, but knowing that family is available can help with planning care. Client may be estranged from other family members or they may not be willing to be involved with client.*^{1,6}
- Discuss with client whether there is a person(s) in his or her life who is trustworthy and who will listen with empathy to the feelings that are expressed. *Identifying someone in the individual's life who can fill this role can help client talk about and understand feelings.*¹
- Determine how individual perceives and deals with solitude. *Client may see being alone as positive, allowing time to pursue own interests, or may view solitude as sad and long for lost people, lifestyle pattern, or events.*^{6,12}
-  Review issues of separation from parents as a child or loss of SO(s)/spouse. *Early separation from parents often affects the individual as other losses occur throughout life, leading to feelings of inadequacy and inability to deal with current situation.*^{6,12}
- Assess sleep and appetite disturbances and ability to concentrate. *Feelings of loneliness often accompany depression, and identifying whether client is adequately taking care of self is important to planning care.*⁷
- Note expressions of “yearning” for an emotional partnership. *For example, widows and widowers are particularly prone to feelings of loneliness. Going from being part of a couple to being alone is a difficult transition, and these feelings are indicative of a desire to return to the couple state.*⁷
- Assess feelings of loneliness in client who is receiving palliative/hospice care. *These individuals often feel alienated and lonely as they face the end of their life and may need additional socialization to help them feel valued.*⁵

NURSING PRIORITY NO. 2 To assist client to identify feelings and situations in which he or she experiences loneliness:

-  Establish therapeutic nurse-client relationship. *Provides a sense of connection with someone, thereby enabling client to feel free to talk about feelings of loneliness and current situation that is related to these feelings.*¹
- Discuss individual concerns about feelings of loneliness and relationship between loneliness and lack of SOs. Note desire and willingness to change situation. *Motivation or lack thereof can facilitate or impede achieving desired outcomes. Often feelings of loneliness arise from underlying depression related to loss, thus affecting individual's coping abilities.*⁷
- Support expression of negative perceptions of others and whether client believes they are true. *Provides opportunity for client to clarify reality of situation and recognize own denial. Individual's view of the world is colored by feelings of loneliness and depression.*¹
- Accept client's expressions of loneliness as a primary condition and not necessarily as a symptom of some underlying condition. *Provides a beginning point, which will allow the client to look at what loneliness means in life without having to search for deeper meaning.*^{1,2}

NURSING PRIORITY NO. 3 To assist client to become involved:

-  Discuss reality versus perception of situation. Have client identify people with whom he or she interacts on a regular basis. *Provides opportunity for reality check and beginning to understand own feelings of loneliness related to what is happening in own life.*^{2,12}
-  Discuss importance of emotional bonding (attachment) between infants/young children, parents/caregivers, as appropriate. *Understanding the importance of attachment provides parents with information that will help them take measures to ensure that this bonding occurs.*²

-  Involve in classes such as assertiveness, language and communication, and social skills. *Addressing individual needs will enhance socialization and provide client with the skills to become involved in social activities, thus promoting self-confidence and alleviating feelings of loneliness.*^{3,8,10}
- Role-play situations that are new or are anxiety provoking for client. *Practicing new situations helps develop self-confidence and provides client with information about what to expect and how to deal with the unexpected in a positive manner.*²
- Discuss positive health habits, including personal hygiene, and exercise activity of client's choosing. *Improves feelings of self-esteem, thus enabling client to feel more confident in social situations.*⁷
- Identify individual strengths and areas of interest that client identifies and is willing to pursue. *Provides opportunities for involvement with others to develop new social skills.*^{7,10}
-  Encourage attendance at support groups (e.g., therapy, separation or grief, religious). *Participating in these activities can meet individual needs and help client begin to deal with feelings of loneliness.*⁷
- Help client establish plan for progressive involvement, beginning with a simple activity, such as calling an old friend or speaking to a neighbor, and then leading to more complicated interactions and activities. *Taking small steps promotes success, and confidence is gained as each step is taken, thus helping the client to be more involved and to resolve feelings of loneliness.*⁷
- Provide opportunities for interactions in a supportive environment (e.g., have client accompanied as in a "buddy system") during initial attempts to socialize. *Helps reduce stress, provides positive reinforcement, and facilitates successful outcome.*⁷

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Let client know that loneliness can be overcome. *While it is up to the individual to begin to feel good about self, hearing that loneliness doesn't have to be permanent, can provide hope in early days.*^{4,12}
- Encourage involvement in special interest groups (e.g., computers, bird watchers) or charitable services (e.g., serving in a soup kitchen, youth groups, animal shelter). *Becoming involved with others takes focus off of self and own concerns, promotes feelings of self-worth, and encourages client to again be an active part of society.*⁷
- Suggest volunteering for church committee or choir, attending community events with friends and family, becoming involved in political issues or campaigns, or enrolling in classes at local college or continuing education programs, as able. *When client is willing to become involved in these kinds of activities, perception of loneliness fades into the background, and even though individual may still be lonely, the sense of loneliness is not so pervasive.*⁷
-  Refer to appropriate counselors for help with relationships, social skills, or other identified needs. *May provide additional assistance to help client deal with feelings of loneliness and isolation.*⁹
- Refer to NDs Anxiety, Hopelessness, and Social Isolation for additional interventions, as appropriate.

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, including client's perception of problem, availability of resources or support systems.
- Client's desire and commitment to change.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs, plan for follow-up, and who is responsible for actions to be taken.
- Specific referrals made.

risk for disturbed Maternal-Fetal Dyad

Taxonomy II: SexualityClass 3 Reproduction (00209) [**Diagnostic Division:** Safety], Approved 2008; Revised 2013, 2017

DEFINITION: Susceptible to disruption of the symbiotic maternal-fetal dyad as a result of comorbid or pregnancy-related conditions, which may compromise health.

RISK FACTORS

Inadequate prenatal care
 Presence of abuse [e.g., physical, psychological, sexual]
 Substance abuse

Associated Condition: Alteration in glucose metabolism; treatment regimen
 Compromised fetal oxygen transport; pregnancy complication

Sample Clinical Applications: High-risk pregnancy, prenatal substance abuse, gestational hypertension, maternal diabetes mellitus, prenatal hemorrhage, prenatal infection, premature dilatation of cervix, abdominal trauma, domestic violence

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Maternal Status Antepartum: Extent to which maternal well-being is within normal limits from conception to the onset of labor

Fetal Status Antepartum: Extent to which fetal signs are within normal limits from conception to the onset of labor

Prenatal Health Behavior: Personal actions to promote a healthy pregnancy and a healthy newborn

(continues on page 534)

risk for disturbed Maternal-Fetal Dyad (continued)

Client Will (Include Specific Time Frame)

- Verbalize understanding of individual risk factors or condition(s) that may impact pregnancy.
- Engage in necessary alterations in lifestyle and daily activities to manage risks.
- Participate in screening procedures as indicated.
- Identify signs/symptoms requiring medical evaluation or intervention.
- Display fetal growth within normal limits and carry pregnancy to term.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

High-Risk Pregnancy Care: Identification and management of a high-risk pregnancy to promote healthy outcomes for mother and baby

Surveillance: Late Pregnancy: Purposeful and ongoing acquisition, interpretation, and synthesis of maternal-fetal data for treatment, observation, or admission

NURSING PRIORITY NO. 1 To identify individual risk/contributing factors:

- Review history of previous pregnancies for presence of complications, such as premature rupture of membranes (PROM), placenta previa, miscarriage or pregnancy losses due to premature dilation of the cervix, preterm labor and deliveries, previous birth defects, hyperemesis gravidarum, or repeated urinary tract or vaginal infections.^{22,23}
- Obtain history about prenatal screening and amount and timing of care. *Prenatal screening can detect inherited and congenital abnormalities long before birth, providing opportunities for informed parental decisions, such as repair of abnormality in utero or helping mother understand a procedure. Lack of prenatal care or late prenatal care may be result of ignorance of or fear about pregnancy or the result of inadequate finances or other support and can place both mother and fetus at risk.*^{9,23}
- Note conditions potentiating vascular changes and reduced placental circulation (e.g., diabetes, gestational hypertension, cardiac problems, smoking) or those that alter oxygen-carrying capacity (e.g., asthma, anemia, Rh incompatibility, hemorrhage). *Extent of maternal vascular involvement and reduction of oxygen-carrying capacity have a direct influence on uteroplacental circulation and gas exchange.*^{8,10}
-  Note maternal age. *Maternal age above 35 years is associated with increased risk of placental separation or abruptio placentae, spontaneous abortions, preterm delivery or stillbirths, fetal chromosomal abnormalities and malformations, and intrauterine growth retardation (IUGR). The most common maternal complications in this age group are gestational hypertension and gestational diabetes. In pregnant adolescents (younger than 15) the most common high-risk conditions include gestational hypertension, anemia, labor dysfunction, cephalopelvic disproportion and low birth weight, and preterm delivery.*^{2,5,8,11,14,23}
-  Ascertain current and past dietary patterns and practices. *Client may be malnourished, underweight or obese (weight less than 100 lb or greater than 200 lb), or may reveal preconception eating disorders that can have a negative impact on fetal organ development, especially brain tissue in the early weeks of pregnancy.*^{1,3,15,23}
- Assess for severe, unremitting nausea and vomiting, especially when it persists after the first trimester. *Hyperemesis gravidarum places mother at risk for substantial weight loss and fluid and electrolyte imbalances and exposes the developing fetus to acidotic state and malnutrition. Development of hyperemesis gravidarum may require hospitalization.*^{14,19,23}
- Note history of exposure to teratogenic agents and infectious diseases (e.g., tuberculosis, influenza, measles); high-risk occupations; exposure to toxic substances such as lead, organic solvents, and carbon monoxide; use of certain over-the-counter or prescription medications; and substance use or abuse (including illicit drugs and alcohol).^{4,6,7,14,18}

-  Identify family or cultural influences in pregnancy. Family history may include multiple births, congenital diseases, generational abuse, or lack of support or finances. Cultural background may identify health risks associated with nationality (e.g., sickle cell anemia in people of African descent or Tay-Sachs disease in people of Eastern European Jewish ancestry) or religious practices (e.g., exclusion of dairy products, no maternal immunizations for rubella), which can impact health of mother or fetal development.^{11,14}
-  Review laboratory studies. Low hemoglobin suggests anemia, which is associated with hypoxia. Blood type and Rh group may reveal incompatibility risks and elevated serum glucose seen in gestational diabetes mellitus (GDM), elevated liver function studies suggest hypertensive liver involvement, and drop in platelet count may be associated with gestational hypertension and HELLP (hemolysis, elevated liver enzymes, and low platelet) syndrome. Nutritional studies may reveal decreased levels of serum proteins, electrolytes, minerals, and vitamins essential to maternal health and fetal development.^{8,9,15,23}
-  Review vaginal, cervical, or rectal cultures and serology results. May reveal presence of sexually transmitted infections, a virus of the TORCH group (e.g., toxoplasmosis, other, rubella, cytomegalovirus, herpes simplex), or Listeria; identify active or carrier state of hepatitis, HIV.^{12,13,22}
-  Assist in screening for and identifying genetic or chromosomal disorders. Disorders such as phenylketonuria or sickle cell anemia necessitate special treatment to prevent negative effects on fetal growth.¹¹
- Investigate current home situation. May have history of unstable relationship or inadequate/lack of housing, which affects safety as well as general well-being.²⁰

NURSING PRIORITY NO. 2 To monitor maternal/fetal status:

-  Weigh client and compare current weight with pregravid weight. Have client record weight between visits. Underweight clients are at risk for anemia, inadequate protein/calorie intake, vitamin or mineral deficiencies, and gestational hypertension. Overweight women are at risk for possible changes in the cardiovascular system that create risks for development of gestational hypertension, GDM, and hyperinsulinemia of the fetus, resulting in macrosomia. Research indicates increased risk of fetal distress and cesarean delivery. A sudden weight gain of 2 or more pounds in a week may indicate gestational hypertension.^{3,8,15,23}
- Assess fetal heart rate (FHR), noting rate and regularity. Have client monitor fetal movement daily as indicated. Tachycardia in a term infant may indicate a compensatory mechanism to reduced oxygen levels and/or presence of sepsis. A reduction in fetal activity occurs before bradycardia.²³
-  Test urine for presence of ketones. Indicates inadequate glucose utilization and breakdown of fats for metabolic processes.^{10,23}
-  Provide information and assist with procedures as indicated, for example:^{9,14,23}
 - Amniocentesis:** May be performed for genetic purposes or to assess fetal lung maturity. Spectrophotometric analysis of the fluid may be done to detect bilirubin after 26 weeks gestation.
 - Ultrasonography:** Assesses gestational age of fetus and detects presence of multiples or fetal abnormalities. Locates placenta (and amniotic fluid pockets before amniocentesis, if performed), and monitors clients at risk for reduced/inadequate placental perfusion (such as adolescents; clients older than 35 years; clients with diabetes, gestational hypertension, cardiac/kidney disease, anemia, or respiratory disorders).
 - Biophysical profile:** Assesses fetal well-being through ultrasound evaluation to measure amniotic fluid index, FHR and nonstress test reactivity, fetal breathing movement, body movement (large limbs), and muscle tone (flexion and extension).
 - Contraction stress test (CST):** A positive CST with late decelerations indicates a high-risk client/fetus with possible reduced uteroplacental reserves.
- Screen for abuse during pregnancy. Prenatal abuse is correlated with a low maternal weight gain, infections, anemia, delay in seeking prenatal care until the third trimester, and preterm delivery.²⁰
-  Screen for preterm uterine contractions, which may or may not be accompanied by cervical dilatation. Occurs in 6% to 7% of all pregnancies and may result in delivery of a preterm infant if tocolytic management is not successful in reducing uterine contractility and irritability.²¹

NURSING PRIORITY NO. 3 To maintain or improve maternal and fetal well-being:

- Instruct client in reportable symptoms and monitor for unusual symptoms at each prenatal visit (e.g., vaginal bleeding, headache along with blurred vision and ankle swelling, faintness, persistent vomiting). *Provides opportunity for early intervention in event of developing complications.*^{15,23}
-  Assist in treatment of underlying medical condition(s) that have potential for causing maternal or fetal harm.¹⁰
- Assess perceived impact of complication on client and family members. Encourage verbalization of concerns. *Family stress often occurs in an uncomplicated pregnancy, and it is amplified in a high-risk pregnancy where concerns focus on the health of both the client and the fetus. Family is strengthened if all members have a chance to express fears openly and work cooperatively.*²³
- Facilitate positive adaptation to situation through active listening, acceptance, and problem solving. *Helps in successful accomplishment of the psychological tasks of pregnancy, although the high-risk couple may remain ambivalent as a self-protective mechanism against possible loss of the pregnancy or fetal death.*²³
- Develop dietary plan with client that provides necessary nutrients (calories, protein, vitamins, and minerals) to create new tissue and to meet increased maternal metabolic needs.^{16,18}
- Promote fluid intake of at least 2 qt of noncaffeinated fluid per day. *Prevents dehydration, which may compromise optimal uterine and placental functioning and increase uterine irritability, which could potentiate premature labor.*
-  Encourage client to participate in individually appropriate adaptations and self-care techniques, such as scheduling rest periods two to three times a day, avoiding overexertion or heavy lifting, or maintaining contact with family and daily life if bedrest is required. *Medical problems necessitating special therapy or restrictions at home or hospitalization significantly disrupt normal routines and cause stress. Preventive problem-solving promotes participation in own care and enhances self-confidence, sense of control, and client/couple satisfaction.*^{23,25}
-  Review medication regimen. *Prepregnancy treatment for chronic conditions may require alteration for maternal/fetal safety.*
- Review availability and use of resources. *Presence or absence of supportive resources can make the difference for the client and family in being able to manage the situation.*
-  Administer Rh immune globulin (RhIgG) to client at 28 weeks gestation in Rh-negative clients with Rh-positive partners or following amniocentesis, if indicated. *RhIgG helps reduce incidence of maternal isoimmunization in nonsensitized mothers and helps prevent erythroblastosis fetalis and fetal red blood cell (RBC) hemolysis.*^{23,24}
- Encourage modified or complete bedrest as indicated. *Activity level may need modification, depending on symptoms of uterine activity, cervical changes, or bleeding. Side-lying position increases renal and placental perfusion, which is effective in preventing supine hypotensive syndrome.*²³ *Note: Bedrest may result in generalized weakness, raising safety concerns when client is out of bed.*
-  Provide supplemental oxygen as appropriate. *Increases the oxygen available for fetal uptake, especially in presence of severe anemia or sickle cell crisis or when maternal/fetal circulation is compromised.*
-  Prepare for and assist with intrauterine fetal exchange transfusion as indicated by titers (Kleihauer-Betke test). *If excess fetal RBC hemolysis occurs, transfusion into fetal peritoneal cavity with Rh O-negative blood replaces hemolyzed RBCs when fetus is determined at risk of dying before 32 weeks gestation.*²⁴

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Emphasize the normalcy of pregnancy, focus on pregnancy milestones, and count down to birth. *Avoids or limits perception of sick role and promotes sense of hope that modifications or restrictions serve a worthwhile purpose.*²³
- Discuss implications of preexisting condition and possible impact on pregnancy. *Pregnancy may have no effect or may reduce or exacerbate severity of symptoms of chronic conditions. Repeat sickle cell crises predispose client and fetus to increased mortality and morbidity rates. Client with multiple sclerosis or spinal cord injury may have decreased ability to sense uterine contractions or presence of labor, necessitating closer monitoring.*¹⁰
- Provide information about risks of weight reduction during pregnancy and about nourishment needs of client and fetus. *Prenatal calorie restriction and resultant weight loss may result in nutrient deficiency or ketonemia, with negative effects on fetal central nervous system and possible IUGR.*¹⁸

-  Encourage smoking cessation, refer to community program or support group as indicated. *Severe adverse effects of smoking on the fetus may be reduced if mother quits smoking early in pregnancy, and pregnancy outcomes can still be improved if mother stops smoking as late as 32 weeks gestation.*¹⁷
- Help client/couple plan restructuring of roles or activities necessitated by complication of pregnancy. *Education, support, and assistance in maintenance of family integrity help foster growth of its individual members and reduce stress that the client may feel from her dependent role.*²³
- Encourage client to demonstrate new behaviors or therapeutic techniques. *During pregnancy, control of condition may require specific modified or new behaviors. Demonstration allows accurate assessment of learning.*
- Recommend client assess uterine tone and presence of contractions for 1 hour once or twice a day as indicated to monitor uterine irritability or early indication of premature labor.²¹
-  Encourage close monitoring of blood glucose levels, as appropriate. *Clients with type 1 or insulin-dependent diabetes mellitus generally need to check blood glucose levels 4 to 12 times/day because insulin needs may increase two to three times above pregravid baseline.*¹⁰
- Demonstrate technique and specific equipment used when FHR monitoring is done in the home setting. *Provides opportunity for more detailed information regarding fetal well-being in a less stressful environment. Enhances sense of active involvement.*
-  Identify danger signals requiring immediate notification of healthcare provider (e.g., PROM, preterm labor, vaginal drainage or bleeding). *Recognizing risk situations encourages prompt evaluation and intervention, which may prevent or limit untoward outcomes.*^{21,22}
- Review availability and use of resources. *Presence or absence of supportive resources can make the difference for the client and family in being able to manage the situation.*²²
-  Refer to community service agencies (e.g., visiting nurse, social service) or resources, such as Sidelines. *Community supports may be needed for ongoing assessment of medical problem, family status, coping behaviors, and financial stressors. Note: Sidelines is a national support group for high-risk pregnant women.*
-  Refer for counseling if family does not sustain positive coping and growth. *May be necessary to promote growth and to prevent family disintegration.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Assessment findings, weight, signs of pregnancy, and safety concerns.
- Specific risk factors, comorbidities, and treatment regimen.
- Results of screening laboratory tests and diagnostic studies.
- Participation in prenatal care.
- Cultural beliefs and practices.

Planning

- Plan of care, specific interventions, and who is involved in the planning.
- Community resources for equipment or supplies.
- Specific referrals made.
- Teaching plan.

Implementation/Evaluation

- Client/fetal response to treatment and actions performed.
- Clients response to teaching provided.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

impaired Memory

Taxonomy II: Perception/Cognition—Class 4 Cognition (00131) [**Diagnostic Division:** Neurosensory], Approved 1994; Revised 2017

DEFINITION: Persistent inability to remember or recall bits of information or skills.

RELATED FACTORS

Alteration in fluid volume

[Substance use/abuse; effects of medications]

DEFINING CHARACTERISTICS

Subjective

Persistent inability to recall events or factual information

Objective

Persistent inability to recall if a behavior was performed; consistently forgets to perform a behavior at a scheduled time

Persistent inability to learn/retain new skills or information

Persistent inability to recall familiar names, words, or objects; inability to perform a previously learned skill

Persistent forgetfulness

Preserved capacity to perform daily activities independently

Associated Condition: Anemia, hypoxia, electrolyte imbalance, decrease in cardiac output

Brain injury, mild cognitive impairment, neurological impairment; Parkinson's disease

Sample Clinical Applications: Brain injury, stroke, dementia, Alzheimer's disease, hypoxia (e.g., chronic obstructive pulmonary disease [COPD], anemia, altitude sickness), alcohol intoxication or substance abuse

DESIRED OUTCOMES/EVALUATION CRITERIA**Sample NOC linkages:**

Memory: Ability to cognitively retrieve and report previously stored information

Cognition: Ability to execute complex mental processes

Client Will (Include Specific Time Frame)

- Verbalize awareness of memory problems.
- Establish methods to help in remembering essential things when possible.
- Accept limitations of condition and use resources effectively.

ACTIONS/INTERVENTIONS**Sample NIC linkages:**

Memory Training: Facilitation of memory

Environmental Management: Safety: Monitoring and manipulation of the physical environment to promote safety

NURSING PRIORITY NO. 1 To assess causative factor(s)/degree of impairment:

- Determine physical, biochemical, and environmental factors (e.g., systemic infections, brain injury, pulmonary disease with hypoxia, use of multiple medications, exposure to toxic substances; use or abuse of alcohol or other drugs, traumatic event, removal from known environment) *that may be related to changes in memory.*
-   Note client's age and potential for depression. *Depressive disorders are prevalent in older adults who report an inability to concentrate and poor memory; however, impairments can occur in depressed persons of any age. Note: The Centers for Disease Control and Prevention (CDC) (2017) reports that estimates of major depression in older people living in the community range from less than 1% to about 5%, but rise to 13.5% in those who require home healthcare and to 11.5% in older hospital patients.*^{1,2,5–7,10}
- Note presence of stressful situation(s) and degree of anxiety. *Can increase client's confusion and disorganization, further interfering with attempts at recall. Stress may also accelerate memory decline in people whose cognitive function is already impaired.* (Refer to ND Anxiety for additional interventions as indicated.)
-  Collaborate with medical and psychiatric providers *to evaluate extent of impairment to orientation, attention span, ability to follow directions, send/receive communication, and appropriateness of response.*
-  Assist with or review results of cognitive testing (e.g., Blessed Information-Memory-Concentration test, Clinical Dementia Rating Scale, Mini-Mental State Examination). *Although the etiology for some memory*

impairments may be obvious or established by client/significant other (SO)/caregiver report, a combination of tests may be needed to demonstrate that the client is below some cut-point on standardized memory tests that represents a significant change from the client's baseline to obtain a complete picture of the client's overall condition and prognosis.^{3,6,7}

- Evaluate skill proficiency levels. Evaluation may include many self-care activities (e.g., daily grooming, steps in preparing a meal, participating in a lifelong hobby, balancing a checkbook, driving ability) to determine level of independence or needed assistance.⁸
- Ascertain how client/family views the problem (e.g., practical problems of client being able to take care of physical/grooming/toileting issues; forgetting to turn off the stove when cooking for self; client gets lost when driving, client has role and responsibility impairments related to loss of memory and concentration) to determine significance and impact of problem and suggest direction of interventions, especially as relates to basic safety issues.^{1,8}

NURSING PRIORITY NO. 2 To maximize level of function:

-  Assist with treatment of underlying conditions (e.g., electrolyte imbalances, infection, anemia, drug interactions/reaction to medications, alcohol or other drug intoxication, malnutrition, vitamin deficiencies, pain) where treatment can improve memory processes.
- Orient and reorient client, as needed. Introduce self with each client contact to meet client's safety and comfort needs. (Refer to NDs acute/chronic Confusion for additional interventions as appropriate.)
-  Implement appropriate memory-retraining techniques (e.g., keeping calendars and to-do lists, memory cue games, mnemonic devices, computer programs for cognitive retraining) to provide restorative or compensatory training. Note: One evidence-based review of clients with memory impairments associated with moderate to severe brain injury showed that "memory retraining programs appear effective, particularly for functional recovery although performance on specific tests of memory may or may not change."^{4,9}
- Assist in and instruct client and family in associate-learning tasks (e.g., practice sessions recalling personal information, reminiscing, locating a geographic location [stimulation therapy]). Practice may improve performance and integrate new behaviors into the client's coping strategies.
- Support and reinforce client's efforts to remember information or behavioral skills. Can decrease anxiety levels and perhaps help with further memory recovery.
- Encourage ventilation of feelings of frustration and helplessness. Refocus attention to areas of control and progress to diminish feelings of powerlessness or hopelessness.
- Provide for and emphasize importance of pacing learning activities and getting sufficient rest to avoid fatigue and frustration that may further impair cognitive abilities.¹
- Monitor client's behavior and assist in use of stress-management techniques (e.g., music therapy, reading, television, games, socialization) to reduce boredom and enhance enjoyment of life.
- Structure teaching methods and interventions to client's level of functioning or potential for improvement.⁵
-  Determine client's response to and effects of medications prescribed to improve attention, concentration, memory processes, and to lift spirits or modify emotional responses. Medications used for cognitive enhancement can be effective (especially in the case of short-term impairments such as might occur following surgery or when client is being treated for infections or delirium), but long-term use and benefits need to be weighed against whether quality of life is improved when considering side effects and cost of drugs.^{3,6}

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Assist client/SO(s) to establish compensation strategies, such as menu planning with a shopping list, timely completion of tasks on a daily planner, and checklists at the front door to ascertain that lights and stove are off before leaving, to improve functional lifestyle and safety.⁶
- Instruct client and family/caregivers in memory involvement tasks, such as reminiscence and memory exercises geared toward improving client's functional ability.⁶

-  Refer to or encourage follow-up with counselors, rehabilitation programs, job coaches, and social or financial support systems *to help deal with persistent or difficult problems.*
-  Refer to rehabilitation services *that are matched to the needs, strengths, and capacities of individual and modified as needs change over time.*⁴
- Discuss and encourage safety interventions, as indicated (e.g., assistance with meal preparation, evaluation of driving abilities, cessation of tobacco use or its use only under supervision, removal of guns and other weapons) *to prevent injury to client/others.*
- Identify resources to meet individual needs (e.g., home-care assistant, Meals on Wheels, companion, short-term residential care), *thereby maximizing independence and general well-being.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, testing results, and perceptions of significance of problem.
- Actual impact on lifestyle and independence.

Planning

- Plan of care and who is involved in planning process.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for Metabolic Imbalance Syndrome

Taxonomy II: Nutrition—Class 4 Metabolism (00263) [**Diagnostic Division:** Food/Fluid], Approved 2016

DEFINITION: Susceptible to a toxic cluster of biochemical and physiological factors associated with the development of cardiovascular disease arising from obesity and type 2 diabetes, which may compromise health.

RISK FACTORS

Ineffective health maintenance; risk-prone health behavior; stress overload

Obesity; overweight; sedentary lifestyle

Risk for unstable blood glucose

At Risk Population: Age >30 years

Family history of diabetes mellitus, dyslipidemia, hypertension, obesity

Associated Condition: Excessive endogenous or exogenous glucocorticoids >25 g/dl; microalbuminuria >30 mg/dl; uric acid >7 mg/dl

Polycystic ovary syndrome; unstable blood pressure

Sample Clinical Applications: Diabetes mellitus, obesity, hypertension

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Risk Control: Cardiovascular Disease: Personal actions to understand, prevent, eliminate, or reduce the threat of cardiovascular disease

Metabolic Function: Ability of the metabolic system to regulate chemical transformations through anabolism and catabolism

Client Will (Include Specific Time Frame)

- Identify individual risk factors.
- Develop plan to address modifiable risks.
- Engage in lifestyle changes to support achieving health goals.
- Display diagnostic/lab studies within desired levels.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Risk Identification: Analysis of potential risk factors, determination of health status, and prioritization of risk reduction strategies for an individual or group

Teaching: Disease Process: Assisting the patient to understand information related to a specific disease process

NURSING PRIORITY NO. 1 To identify risk factors

-  Obtain client history, including family, personal, and social history *to evaluate for diabetes; coronary, cerebral, and peripheral vascular disease; and family history of early heart disease and diabetes.*
- Identify client's associated risks (e.g., hypertension, large waistline [also known as central or abdominal obesity], high cholesterol and triglyceride and fasting blood glucose levels). *The National Heart Lung and Blood Institute (NHLBI) states three of the above risk factors existing together is known as "metabolic syndrome," also known by several other names, including "insulin resistance syndrome," "obesity syndrome," "syndrome x."^{1,2}*
-  Obtain client's weight and other anthropometric measurements, including waist circumference, as indicated. *Abdominal obesity is considered to be waist circumference of greater than 40 inches (men), and greater than 35 inches (women). Client with a abdominal obesity is typically obese or overweight. Note: In one recent*

study of 734 participants, 250 (34%) participants were of normal weight, 247 (33.7%) were overweight, and 237 (32.3%) were obese. The study reported that in the normal weight, overweight, and obese groups, the prevalence of metabolic syndrome was 12.4%, 36.4%, and 61.6%, respectively.^{2,6}

-  Measure blood pressure using appropriately sized cuff and proper positioning (e.g., seated, legs uncrossed, feet flat on floor). Blood pressure is determined to be elevated (systolic blood pressure [SPB] 120–129 and diastolic blood pressure [DBP] less than 80). Stage 1 hypertension = SBP 130–139 or DBP 80–89; Stage 2 hypertension = SBP 140 or DBP 90; Hypertensive crisis = SBP 180, or DBP 120.³
-  Review results of laboratory studies, i.e., cholesterol (including HDL and LDL), triglycerides, blood glucose. There are typically abnormalities in these lab values when metabolic syndrome is suspected. Note: Current guidelines: triglycerides ≥ 150 mg/dL, or receiving drug therapy for hypertriglyceridemia; HDL cholesterol (so-called “good” cholesterol) < 40 mg/dL (men) or < 50 (women), or receiving drug therapy for reduced HDL-C; fasting glucose ≥ 100 mg/dL or receiving drug therapy for hyperglycemia.³
- Determine use of available resources. Inadequate use or lack of availability of support system impact treatment options and ability to achieve health goals.
-  Refer for/assist with treatment of underlying conditions (e.g., diabetes, obesity, hypertension).

NURSING PRIORITY NO. 2 To assist client to explore ways to reduce modifiable risk factors

- Discuss weight management/nutrition enhancement with client/SO:
 -  Recommend client make shifts in food choices (as individually able/desired), such as increasing vegetables (including legumes) and fruits, avocados, fish, and nuts, and reduce consumption of calories from fried foods, refined grains, and sugars, to lower blood lipids, stabilize blood glucose, and reduce weight over time (e.g., 10%–20% reduction over a year). Note: A large body of research data suggests that traditional dietary habits unique to the Mediterranean region lower the incidence of chronic diseases and improve longevity.^{4,6,7}
 -  Identify reputable community or online weight loss groups to provide ongoing support to achieve and maintain healthy weight.
 -  Discuss management of hypertension:
 - Discuss importance of routine blood pressure monitoring.
 - Identify measuring devices available in home or community that provide accurate readings.
 - Have client return to clinic (or other public places where BP machines are available) if unable to obtain equipment.
 - Provide systolic and diastolic number limits (along with other possible symptoms) that should be reported to medical provider.
 - Review medications if client is already on antihypertensives and determine if client is taking medications as prescribed. Medications may be needed or adjusted to attain optimal BP control. Note: Studies have revealed that a lower risk of stroke and cardiovascular events is seen when systolic blood pressure levels are less than 140 mmHg and diastolic blood pressure is less than 90 mmHg.³
 -  Discuss need for consistent exercise:
 - Recommend exercise (that client might enjoy) and discuss ways to implement it. Client may need to start with just minutes a day and increase gradually. Current guideline is for people to perform regular moderate-intensity physical activity for at least 30 minutes continuously at least 5 days per week (ideally, 7 days per week). It has been found, however, that maintaining long-term adherence is a challenge.⁵
 -  Discuss management of other lifestyle factors (e.g., smoking, alcohol/other drugs, stress):
 - Identify smoking cessation programs, alcohol/substance use support groups for client and family as appropriate. Client may want/need assistance and or referrals for management of lifestyle conditions or factors that are negatively impacting health.
-  Refer to physician/other healthcare providers as needed Client may need immediate or intermittent long-term follow-up for medications (e.g., antihypertensives, antiglycemics, statins) as well as for treatment of underlying conditions.
-  Refer to nutritionist to develop dietary program reflecting client likes, physical activity level/usual energy expended, and personal resources.

-  Collaborate with rehabilitation specialists *to develop appropriate exercise program and determine need for assistive devices to facilitate activity.*

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Determine most urgent need from client's/caregiver's and healthcare provider's viewpoints, *which may differ and require adjustments in teaching plan.*
- Teach home monitoring of blood pressure, where indicated, and obtain return demonstration of ability to take blood pressure (and medications) accurately.
- Elicit client's knowledge of reportable blood pressure measurements and symptoms and who to report to. *Provides opportunity for timely intervention.*
- Recommend obtaining accurate scale and recording weekly weight checks. *Provides visual reinforcement of progress, need for adjustment of interventions.*
- Review specifics and rationale for components of treatment plan. Ask client/SO if they have questions and/or if they are willing to adhere to plan. *Helps to identify areas of concern and need for further interventions.*
- Identify community resources to address home-care needs and financial issues *to support independence and accomplishment of healthcare goals.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual risk factors.
- Vital signs, weight.
- Results of lab studies.

Planning

- Client's healthcare goals.
- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Client's response to interventions, teaching, and actions performed.
- Status and disposition at discharge.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge considerations and who will be responsible for carrying out individual actions.
- Long-term needs and available resources.
- Specific referrals made.

impaired bed Mobility

Taxonomy II: Activity/Rest—Class 2 Activity/Exercise (00091) [**Diagnostic Division:** Safety], Approved 1998; Revised 2006, 2017

DEFINITION: Limitation of independent movement from one bed position to another.

RELATED FACTORS

Environmental barrier [e.g., bed size or type, equipment, restraints]
 Insufficient knowledge of mobility strategies
 Insufficient muscle strength; physical deconditioning; obesity
 Pain

DEFINING CHARACTERISTICS

Objective

Impaired ability to: reposition self in bed, turn from side to side

Impaired ability to move between: prone and supine positions, sitting/long sitting and supine positions

Associated Condition: Alteration in cognitive functioning

Musculoskeletal or neuromuscular impairment

Pharmaceutical agent

Sample Clinical Applications: Paralysis (e.g., spinal cord injury [SCI], stroke), traumatic brain injury, neuromuscular disorders (e.g., amyotrophic lateral sclerosis [ALS]), major chest or back surgery, severe depression, dementia, catatonic schizophrenia

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Body Positioning: Self-Initiated: Personal actions to change own body position independently with or without assistive device

Coordinated Movement: Ability of muscles to work together voluntarily for purposeful movement

Immobility Consequences: Physiological: Severity of compromise in physiological functioning due to impaired physical mobility

Client/Caregiver Will (Include Specific Time Frame)

- Verbalize willingness to and participates in repositioning program.
- Verbalize understanding of situation or risk factors, individual therapeutic regimen, and safety measures.
- Demonstrate techniques or behaviors that enable safe repositioning.
- Maintain position of function and skin integrity as evidenced by absence of contractures, foot drop, decubitus, and other skin disorders.
- Maintain or increase strength and function of affected and/or compensatory body part.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Bed Rest Care: Promotion of comfort and safety and prevention of complications for a patient unable to get out of bed

Positioning: Deliberative placement of the patient or a body part to promote physiological and/or psychological well-being

Teaching: Prescribed Exercise: Preparing a patient to achieve or maintain a prescribed level of exercise

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Determine diagnoses that contribute to current immobility (e.g., multiple sclerosis, arthritis, Parkinson's disease, hemi-/para- or tetraplegia; fractures [especially hip joint and long bone fractures], multiple trauma, head injury, burns) *to identify interventions specific to client's mobility impairment and needs.*
- Note individual factors (e.g., surgery, casts, amputation, traction, pain, advanced age, general weakness or debilitation, severe depression, dementia) *that can contribute to mobility problems.*
-  Determine degree of perceptual or cognitive impairment or ability to follow directions. *Impairments related to age, acute or chronic conditions (including severe depression, dementia), trauma, surgery, or medications require alternative interventions or changes in plan of care. Note: Studies have shown that cognitive abilities are crucial to ongoing planning, decision making, and monitoring of one's own movements necessary for successful mobility.*^{1,3,9}
-  Review results of testing (e.g., Lower Extremity Functional Scale, Harris Hip Score; the self-paced walk, timed up-and-go tests) *to determine limitations in body activity, function, and structure.*⁸

NURSING PRIORITY NO. 2 To assess functional ability:

- Determine functional level classification 0 to 4 (*level 0 is full self-care, level I requires use of equipment or device, level II requires assistance or supervision of another person, level III requires assistance or supervision of another person and equipment or device, level IV is dependent and does not participate*).¹²
- Note emotional and behavioral responses to problems of immobility. *Can negatively affect self-concept and self-esteem, autonomy, and independence. Feelings of frustration and powerlessness may impede attainment of goals. Social, occupational, and relationship roles can change, leading to isolation, depression, and economic consequences.*^{4,5}
-  Note presence of complications related to immobility. *The effects of immobility are rarely confined to one body system and can include muscle wasting, contractures, pressure sores, constipation, aspiration pneumonia, etc. Studies have shown that as much as 5.5% of muscle strength can be lost each day of rest and immobility.¹ Other complications include changes in circulation and impairments of organ function affecting the whole person (e.g., cognition, immune system function, emotional state). (Refer to ND risk for Disuse Syndrome for additional interventions.)*

NURSING PRIORITY NO. 3 To promote optimal level of function and prevent complications:

-  Assist with treatment of underlying condition(s) *to maximize potential for mobility and optimal function.*
- Ascertain that dependent client is placed in best bed for situation (e.g., properly functioning equipment, correct size and support surface) *to promote environmental, client, and caregiver safety.*⁶
- Instruct client/caregiver in bed capabilities (e.g., mobility functions and set positions), encouraging client to participate as much as possible, even if only to move head or run bed controls. *Promotes independence and purposeful movement.*
- Change client's position frequently, moving individual parts of the body (e.g., legs, arms, head), using appropriate support and proper body alignment. Encourage periodic changes in head of bed (if not contraindicated by conditions such as acute SCI), with client in supine and prone positions at intervals *to improve circulation and reduce tightening of muscles and joints, normalizing body tone and more closely simulating body positions individual would normally use.*²
- Instruct caregivers in methods of moving client relative to specific situations (e.g., turning side to side, or prone, or sitting) *to provide support for the client's body and to prevent injury to the lifter. Note: Positioning instructions and detailed sketches are available (e.g., Ossman)⁷ on proper positions for certain conditions (e.g., paralyzed client) as well as the safe movement and positioning of body parts (e.g., rolling, bridging, scooting, sitting), which should become well known to caregivers in order to prevent injury to both the client and the caregivers.*

- Place client in upright position at intervals, or out of bed into upright chair, if condition allows. *Being vertical has been shown to reduce the work of heart, improve circulation and lung ventilation, and may improve cognition and awareness.*³
- Use pressure-relieving devices (e.g., egg crate, alternating air pressure, or water mattress) and padding and positioning devices (e.g., foam wedge, pillows, hand rolls, etc., for bony prominences, feet, hands, elbows, head) to prevent dermal injury or stress on tissues and reduce potential for disuse complications.^{3,6} Refer to ND risk for peripheral Neurovascular Dysfunction for additional interventions.
-  Perform and encourage regular skin examination for reddened or excoriated areas. Use a pressure risk assessment scale (e.g., Braden, Norton) as appropriate. *A review of 33 studies revealed no decrease in pressure ulcer incidence that might be attributed to use of an assessment scale. However, the use of scales increased the intensity and effectiveness of prevention interventions.*¹⁰
- Provide frequent skin care (e.g., cleansing, moisturizing, gentle massage) to reduce pressure on sensitive areas and prevent development of problems with skin or tissue integrity. Refer to NDs impaired Skin Integrity; impaired Tissue Integrity.
-  Provide or assist with daily range-of-motion interventions (active and passive) to maintain joint mobility, improve circulation, and prevent contractures. *Note: A random clinical trial found that regular exercising of joints prevented stiffness of knee tendons and improved joint function in clients on bedrest.*¹¹
-  Collaborate with rehabilitation team and physical or occupational therapists to create exercise and adaptive program designed specifically for client and to identify assistive devices (e.g., splints, braces, boots) and equipment (e.g., transfer board, sling, trapeze, hydraulic lift, specialty beds).
- Assist with activities of hygiene, feeding, and toileting, as indicated. Assist on and off bedpan and into sitting position (or use cardioposition bed or foot-egress bed) to facilitate elimination.
- Note change in strength to do more or less self-care (e.g., hygiene, feeding, toileting), to promote psychological and physical benefits of self-care, and to adjust level of assistance as indicated.
-  Administer medication before activity as needed for pain relief to permit maximal effort and involvement in activity.
- Provide diversional activities (e.g., television, books, music, games, visiting) as appropriate to decrease boredom and potential for depression.
- Ensure telephone or call bell is within reach and client is able to activate surveillance alarm if provided. *Provides individually appropriate methods for client to communicate needs for assistance.*
- Refer to NDs Activity Intolerance, impaired physical Mobility, impaired wheelchair Mobility, risk for Disuse Syndrome, impaired Transfer Ability, and impaired Walking for additional interventions.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Involve client/significant other in determining activity schedule. *Promotes commitment to plan, maximizing outcomes.*
- Instruct all caregivers in safety concerns regarding body mechanics, as well as client's required positions and exercises, to prevent injury to both and to minimize potential for preventable complications.
- Encourage continuation of regular exercise program to maintain or enhance gains in strength and muscle control.
- Obtain or identify sources for assistive devices. Demonstrate safe use and proper maintenance. *Promotes independence and enhances safety.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including level of function and ability to participate in specific or desired activities.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modification to plan of care.

Discharge Planning

- Discharge and long-range needs, noting who is responsible for each action to be taken.
- Specific referrals made.
- Sources of and maintenance for assistive devices.

impaired physical Mobility

Taxonomy II: Activity/Rest—Class 2 Activity/Exercise (00085) [**Diagnostic Division:** Safety], Approved 1973; Revised 1998, 2013, 2017

DEFINITION: Limitation in independent, purposeful physical movement of the body or of one or more extremities.

RELATED FACTORS

Activity intolerance; decrease in endurance; reluctance to initiate movement; physical deconditioning; sedentary lifestyle

Alteration in metabolism; body mass index >75th age-appropriate percentile; malnutrition

Anxiety; depression

Cultural belief regarding acceptable activity

Decrease in muscle mass, control or strength; joint stiffness; contractures

Insufficient environmental support

Insufficient knowledge of value of physical activity

Pain

DEFINING CHARACTERISTICS

Subjective

Discomfort

Objective

Alteration in gait; postural instability

Decrease in fine or gross motor skills; movement-induced tremor

Decrease in range of motion; difficulty turning

Decrease in reaction time; slowed or spastic movement; uncoordinated movement

Engages in substitutions for movement [e.g., attention to other's activities, controlling behavior, focus on preillness activity]

Exertional dyspnea

Associated Condition: Alteration in bone structure integrity; musculoskeletal or neuromuscular, or sensory-perceptual impairment; contractures

Alteration in cognitive functioning; developmental delay

Alteration in metabolism

Prescribed movement restrictions

Pharmaceutical agent

Sample Clinical Applications: Neuromuscular disorders (e.g., multiple sclerosis [MS], amyotrophic lateral sclerosis [ALS], Parkinson's disease), traumatic injuries (e.g., fractures, spinal cord or brain injuries), osteoarthritis, rheumatoid arthritis, severe depression

SUGGESTED FUNCTIONAL LEVEL CLASSIFICATION

0—Full self-care

I—Requires use of equipment or device

II—Requires assistance or supervision of another person

III—Requires assistance or supervision of another person and equipment or device

IV—Is dependent and does not participate¹²

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Mobility: Ability to move purposefully in own environment independently with or without assistive device

Immobility Consequences: Physiological: Severity of compromise in physiological functioning due to impaired physical mobility

Knowledge: Prescribed Activity: Extent of understanding conveyed about prescribed activity recommended by a health professional for a specific condition

Client Will (Include Specific Time Frame)

- Verbalize understanding of situation and individual treatment regimen and safety measures.
- Demonstrate techniques or behaviors that enable resumption of activities.
- Participate in activities of daily living (ADLs) and desired activities.
- Maintain position of function and skin integrity as evidenced by absence of contractures, footdrop, decubitus, etc.
- Maintain or increase strength and function of affected or compensatory body part.

(continues on page 550)

impaired physical Mobility (continued)

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Exercise Therapy: Joint Mobility/Muscle Control: Use of active or passive body movement to maintain or restore joint flexibility/use of specific activity or exercise protocols to enhance or restore controlled body movement

Pain Management: Chronic: Alleviation or reduction of persistent pain that continues beyond the normal healing period, assumed to be 3 months, to a level that is acceptable to the patient

Traction/Immobilization Care: Management of a patient who has traction and/or a stabilizing device to immobilize and stabilize a body part

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Determine diagnosis that contributes to immobility (e.g., MS, arthritis, Parkinson's disease, cardiopulmonary disorders, hemi/paraplegia, depression, developmental delays). *These conditions can cause physiological and psychological problems that can seriously impact physical, social, and economic well-being.*¹
- Note factors affecting current situation (e.g., surgery, fractures, amputation, tubings [chest tube, Foley catheter, IVs, pumps], and potential time involved [e.g., few hours in bed after surgery versus serious trauma requiring long-term bedrest or debilitating disease limiting movement]). *Identifies potential impairments and determines type of interventions needed to provide for client's safety.*
- Assess client's developmental level, motor skills, ease and capability of movement, and posture and gait to determine presence of characteristics of client's unique impairment and to guide choice of interventions.⁸
-   Note older client's general health status. *Hogue identified mobility as the most important functional ability that determines the degree of independence and healthcare needs among older persons.*² While aging does not cause impaired mobility, per se, several predisposing factors in addition to age-related changes can lead to immobility (e.g., diminished body reserves of musculoskeletal system, chronic diseases, sedentary life-style, decreased ability to quickly and adequately correct movements affecting center of gravity). Thus, falls are a major source of morbidity and mortality for older persons.^{3,6,8}
- Evaluate for presence and degree of pain, listening to client's description about manner in which pain limits mobility to determine if pain management can improve mobility.⁴
-   Ascertain client's perception of activity and exercise needs and impact of current situation. Identify cultural beliefs and expectations affecting recovery or response to long-term limitations. *Helps to determine client's expectations and beliefs related to activity and potential long-term effect of current immobility. Also identifies barriers that may be addressed (e.g., lack of safe place to exercise, focus on preillness or disability activity, controlling behavior, depression, cultural expectations, distorted body image).*⁵
- Assess nutritional status and client's report of energy level. *Deficiencies in nutrients and water, electrolytes, and minerals can negatively affect energy and activity tolerance.*
-  Determine history of falls and relatedness to current situation. *Client may be restricting activity because of weakness or debilitation, actual injury during a fall, or from psychological distress (i.e., fear and anxiety) that can persist after a fall.*⁶⁻⁸

NURSING PRIORITY NO. 2 To assess functional ability:

-  Determine degree of immobility in relation to 0–4 scale, noting muscle strength and tone, joint mobility, cardiovascular status, balance, and endurance. *Identifies strengths and deficits (e.g., ability to ambulate with or without assistive devices, inability to transfer safely from bed to wheelchair) and may provide information regarding potential for recovery (e.g., client with severe brain injury may have permanent limitations because*

of impaired cognition affecting memory, judgment, problem solving, and motor planning, requiring more intensive inpatient and long-term care).^{1,6}

- Determine degree of perceptual or cognitive impairment and ability to follow directions. *Impairments related to age, chronic or acute disease condition, trauma, surgery, or medications require alternative interventions or changes in plan of care.*³
- Observe movement when client is unaware of observation to note any incongruity with reports of abilities.
- Note emotional or behavioral responses to problems of immobility. *Can negatively affect self-concept and self-esteem, autonomy, and independence. Feelings of frustration and powerlessness may impede attainment of goals. Social, occupational, and relationship roles can change, leading to isolation, depression, and economic consequences.*^{1,2}
-  Determine presence of complications related to immobility. *The effects of immobility are rarely confined to one body system and can include muscle wasting, contractures, pressure sores, constipation, aspiration pneumonia, etc. Studies have shown that healthy individuals who were subjected to immobility experienced a 1.3% to 3% loss in muscle strength per day, and overall postural muscle strength decreased by 10% during 1 wk of bedrest.*^{5,7} *Other complications include changes in circulation and impairments of organ function affecting the whole person (e.g., cognition, bone demineralization, venous pooling, thromboembolic phenomena, weakened immune system function).* (Refer to ND risk for Disuse Syndrome.)

NURSING PRIORITY NO. 3 To promote optimal level of function and prevent complications:

-  Assist with treatment of underlying condition(s) to maximize potential for mobility and optimal function.
- Discuss discrepancies in movement with client aware and unaware of observation and methods for dealing with identified problems. *May be necessary when client is using avoidance or controlling behavior or is not aware of own abilities due to anxiety or fear.*
- Assist with or encourage client to reposition self on a regular schedule as dictated by individual situation (including frequent shifting of weight when client is wheelchair-bound) to enhance circulation to tissues and reduce risk of tissue ischemia.
- Review and encourage use of proper body mechanics to prevent injury to client and caregiver.
- Demonstrate and assist with use of siderails, overhead trapeze, roller pads, and hydraulic lifts or chairs for position changes and transfers. Instruct in safe use of walker or cane to facilitate safe ambulation.
- Support affected body parts and joints using pillows or rolls, foot supports, shoes, gel pads, etc., to maintain position of function and reduce risk of pressure ulcers.
- Provide or recommend pressure-reducing mattress, such as egg crate, or pressure-relieving mattress, such as alternating air pressure or water. *Reduces tissue pressure and aids in maximizing cellular perfusion to prevent dermal injury.*
- Use padding and positioning devices (e.g., foam wedge, pillows, hand rolls) for bony prominences, feet, hands, elbows, head) to prevent stress on tissues and reduce potential for disuse complications.
-  Collaborate with physical medicine specialist and occupational or physical therapists in providing range-of-motion exercise (active or passive), isotonic muscle contractions (e.g., flexion of ankles, push and pull exercises), assistive devices, and activities (e.g., early ambulation, transfers, stairs) to limit or reduce effects and complications of immobility (e.g., contracture deformities, deep vein thromboses). *Techniques such as gait training, strength training, and exercise to improve balance and coordination can be helpful in preventing complications and in rehabilitating client.*¹¹
- Encourage client's participation in self-care activities and physical or occupational therapies as well as diversional and recreational activities. *Reduces sensory deprivation, enhances self-concept and sense of independence, and improves body strength and function.*
- Provide client with ample time to perform mobility-related tasks. Schedule activities with adequate rest periods during the day to reduce fatigue and improve endurance and strength.
- Avoid routinely assisting or doing for client those activities that client can do for self. *Caregivers can contribute to impaired mobility by being overprotective or helping too much.*

- Identify and encourage energy-conserving techniques for ADLs. *Limits fatigue, maximizing participation.*
- Provide for safety measures as indicated by individual situation, including environmental management and fall prevention. (Refer to ND risk for Falls.)
- Note change in strength to do more or less self-care (e.g., hygiene, feeding, toileting, therapies) *to promote psychological and physical benefits of self-care and to adjust level of assistance as indicated.*
-  Administer medications before activity as needed for pain relief *to permit maximal effort and involvement in activity.*
- Perform and encourage regular skin examination and care *to reduce pressure on sensitive areas and to prevent development of problems with skin integrity.* (Refer to NDs risk for impaired Skin Integrity and risk for impaired Tissue Integrity for additional interventions.)
- Encourage adequate intake of fluids and nutritious foods. *Promotes well-being and maximizes energy production.*
- Refer to NDs Activity Intolerance, risk for Falls, impaired bed Mobility, impaired wheelchair Mobility, impaired Transfer Ability, impaired Sitting, impaired Standing, or impaired Walking for additional interventions.

NURSING PRIORITY NO. 4 To promote wellness (Teaching/Discharge Considerations):

-  Encourage client's/significant other's (SO's) involvement in decision making as much as possible. *Enhances commitment to plan, optimizing outcomes.*
- Review importance and purpose of exercise (e.g., *increased cardiovascular and respiratory tolerance; improved flexibility, balance, and muscle strength and tone; enhanced sense of well-being.*)
- Discuss safe ways that client can exercise. *Multiple options provide client choices and variety (e.g., walking around the block with companion or in a mall during bad air days, participating in a water aerobics class, attending regular rehab sessions).*
- Assist client/SO to learn safety measures as individually indicated. *May need instruction and to give return demonstration (e.g., use of heating pads, locking wheelchair before transfers, removal or securing of scatter or area rugs, judicious and accurate use of medications, supervised exercise).*
-  Involve client and SO(s) in care, assisting them to learn ways of managing problems of immobility, especially when impairment is expected to be long term. *May need referral for support and community services to provide care, supervision, companionship, respite services, nutritional and ADL assistance, adaptive devices or changes to living environment, financial assistance, etc.*⁸
- Demonstrate use of standing aids and mobility devices (e.g., walkers, strollers, scooters, braces, prosthetics) and have client/care provider demonstrate knowledge about and safe use of device. Identify appropriate resources for obtaining and maintaining appliances or equipment. *Safe use of mobility aids promotes client's independence and enhances quality of life and safety for client and caregiver.*^{9,10}

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including level of function and ability to participate in specific or desired activities.
- Use of assistive devices.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Discharge and long-term needs, noting who is responsible for each action to be taken.
- Specific referrals made.
- Sources of and maintenance for assistive devices.

impaired wheelchair Mobility

Taxonomy II: Activity/Rest—Class 2 Activity/Exercise (00089) [**Diagnostic Division:** Safety], Approved 1998; Revised 2006, 2017

DEFINITION: Limitation of independent operation of wheelchair within environment.

RELATED FACTORS

Alteration in mood

Decrease in endurance; insufficient muscle strength; physical deconditioning; obesity

Environmental barrier (e.g., stairs, inclines, uneven surfaces, obstacles, distance)

Insufficient knowledge of wheelchair use

Pain

DEFINING CHARACTERISTICS

Objective

Impaired ability to operate manual or power wheelchair on even or uneven surface; on an incline or decline; on curbs

[**Note:** Specify level of independence using a standardized functional scale, refer to ND impaired physical Mobility]

Associated Condition: Alteration in cognitive functioning; impaired vision

Musculoskeletal or neuromuscular impairment

Sample Clinical Applications: Neuromuscular disorders (e.g., multiple sclerosis [MS], amyotrophic lateral sclerosis [ALS]), paralysis (e.g., brain injury/stroke, spinal cord injury [SCI]), muscular dystrophy, cerebral palsy, fractures

(continues on page 554)

impaired wheelchair Mobility (continued)

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Ambulation: Wheelchair: Personal actions to move from place to place in a wheelchair

Coordinated Movement: Ability of muscles to work together voluntarily for purposeful movement

Client Will (Include Specific Time Frame)

- Move safely within environment, maximizing independence.
- Identify and use resources appropriately.

Sample NOC linkages:

Fall Prevention Behavior: Personal or family caregiver actions to minimize risk factors that might precipitate falls in the personal environment

Caregiver Will (Include Specific Time Frame)

- Provide safe mobility within environment and community

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Positioning: Wheelchair: Placement of a patient in a properly selected wheelchair to enhance comfort, promote skin integrity, and foster independence

Exercise Therapy: Muscle Control: Use of specific activity or exercise protocols to enhance or restore controlled body movement

Self-Care Assistance: Transfer: Assisting a patient with limitation of independent movement to learn to change body location

NURSING PRIORITY NO. 1 To identify causative/contributing factors:

- Determine diagnosis that contributes to immobility (e.g., ALS, SCI, spastic cerebral palsy, brain injury) and client's functional level and individual abilities (e.g., 0–4 scale; see ND impaired physical Mobility).
- Identify factors in environments frequented by the client that contribute to inaccessibility (e.g., uneven floors or surfaces, lack of ramps, steep incline or decline, narrow doorways or spaces).
- Ascertain access to and appropriateness of public and/or private transportation.

NURSING PRIORITY NO. 2 To promote optimal level of function and prevent complications:

-  Determine that client's underlying physical, cognitive, and emotional impairment(s) (e.g., brain or spinal cord injury, fractures or other trauma; pain, depression, vision deficits) are treated or being managed *to maximize ability, desire, and motivation to participate in wheelchair activities.*⁶
-  Collaborate with physical medicine or physical or occupational therapists in planning activities to improve client's ability to independently operate wheelchair within limits of tolerance and adjustment to various environments. *May require individual instruction and encouragement, strengthening exercises, assistance with various tasks, and close supervision.*
-  Ascertain that wheelchair provides the base mobility to maximize function. *Wheelchair must be matched with client's age and size/body type; developmental level and diagnosis, or reason to use wheelchair; desired activities; and unique functional needs (e.g., proper seating and support for people in wheelchairs is critical to their ability to travel, work, participate in sports, learn at school, play, and interact*

socially). If a spouse or family member will be assisting the person using the wheelchair then that person's needs may also need to be considered in the wheelchair selection.^{1,10} Correct seating is essential for prevention, correction, and compensation for postural changes in order to maintain client's comfort and function. Chair should provide for maximum reach, maneuverability, function, and center of gravity positioning and propulsion; should recline to change back contours, hip angles, and pelvic restrictions; should have back adjustment for changing trunk stability requirements; and should tilt for reposition, pressure relief, and comfort.^{1,2,7,8}

- Perform periodic assessments of client and wheelchair to monitor chair usage and function as well as changes in client's postural, behavioral, and functional status. *Helps to identify problems (e.g., abnormal wear patterns on the chair requiring mechanical adjustments/repair; loss of client's strength where power add-ons to the chair would improve mobility; or alternate methods of mobility that might be needed).*²
- Provide for or instruct client in safety while in a wheelchair (e.g., cushions, supports for all body parts, repositioning and transfer assistive devices, position and pressure relief products, feet and leg support, armrest choices, back and height adjustment).^{2,7}
- Note surfaces client needs to negotiate and refer to appropriate sources for modifications (e.g., replacing carpet with tile; revising ramps that are too steep, narrow, or slippery). Clear pathways of obstructions.^{2,10}
- Recommend and arrange for modifications to home, work, school, or recreational settings frequented by client. *Although most public buildings have certain adaptations in rooms and accesses, they are not always well constructed or in good working order. The client may need assistance in these settings and with requesting that appropriate alterations be carried out.*⁹
- Determine need for and capabilities of assistive persons. Provide training and support, as indicated. *Enhances safety for both client and caregiver.*
- Monitor client's use of joystick, sip and puff, sensitive mechanical switches, etc., *to provide necessary equipment if condition or capabilities change.*
- Monitor client for adverse effects of immobility (e.g., contractures, muscle atrophy, deep venous thrombosis, pressure ulcers). (Refer to NDs Disuse Syndrome and risk for peripheral Neurovascular Dysfunction for additional interventions.)

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Identify and refer to medical equipment suppliers *to customize client's wheelchair for size, proper seating angle, positioning aids, incline or decline stability, accessories (e.g., side guards, headrests, heel loops, brake extensions, tool packs), and electronics suited to client's ability (e.g., sip and puff, head movement, sensitive switches).*^{6,8}
- Encourage client's/significant others' (SOs') involvement in decision making as much as possible. *Enhances sense of control and commitment to plan, thereby optimizing outcomes.*
- Involve client/SO(s) in care, assisting them in managing immobility problems. *Promotes independence in self-evaluation and self-care, including managing the type of wheelchair and other assistive devices best for client, how the user's needs and abilities change over time, and modifications that might be made (e.g., number and placement of ramps around the home; modifications to rooms, doors, and vehicles).*³
- Demonstrate, discuss, and provide information regarding wheelchair safety as individually appropriate, including safe transfers, dealing with uneven surfaces, ramps, and curbs; programming speed on power chairs; etc. Include information and refer for wheelchair preventative maintenance measures (e.g., for wheelchair locks, tires, axles, casters, metal parts, batteries) as indicated. *Wheelchair safety involves people and equipment and is a daily factor in the life of the client and caregivers. This includes not only acquiring the best chair but also maintenance of the chair and provision for obtaining relief when chair malfunctions. Many states have enacted wheelchair lemon laws that "mandate warranties to maintain assistive technology in proper working condition, to assure availability of appropriate loaner replacement chairs during repair time, and to encourage manufacturers and dealers to cooperatively pool assistive technology resources for loaner purposes to assure availability without undue burden."*⁴

- Refer to support groups relative to specific medical condition/disability and geared toward client's independence. Suggest involvement in political action group, as indicated. *Provides role modeling, assistance with problem-solving, and social change.*
-  Identify community resources to provide ongoing support. *Persons with disabilities have the right to be self-determining and to achieve the quality of life each believes is personal best. This places as much emphasis on community regarding integration as on physical rehabilitation and functional capabilities.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including level of function/ability to participate in specific/desired activities.
- Type of wheelchair and equipment needs.
- Environmental factors and problems.

Planning

- Plan of care and who is involved in the planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.

Discharge Planning

- Discharge and long-term needs, noting who is responsible for each action to be taken.
- Specific referrals made.
- Sources of and maintenance for assistive devices.

impaired Mood Regulation

Taxonomy II: Coping/Stress Tolerance—Class 2 Coping Responses (00241) [Diagnostic Division: Ego Integrity], Approved 2013; Revised 2017

DEFINITION: A mental state characterized by shifts in mood or affect and which is comprised of a constellation of affective, cognitive, somatic and/or physiological manifestations varying from mild to severe.

RELATED FACTORS

Alteration in sleep pattern; appetite or weight change
 Anxiety; hypervigilance
 Loneliness; impaired social functioning; social isolation
 Pain
 Recurrent thoughts of death or suicide
 Substance misuse/[abuse]

DEFINING CHARACTERISTICS

Subjective

Excessive self-awareness, guilt, self-blame
 Hopelessness

Objective

Sad affect, withdrawal
 Irritability; impaired concentration
 Psychomotor agitation, retardation
 Changes in verbal behavior; flight of thoughts; dysphoria; disinhibition
 Influenced self-esteem

Associated Condition: Chronic illness; functional impairment; psychosis

Sample Clinical Applications: Depression, bipolar disorder, anxiety states, autism spectrum disorder

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkage:

Mood Equilibrium: Appropriate adjustment of prevailing emotional tone in response to circumstances

Client Will (Include Specific Time Frame)

- Acknowledge reality of mood problems/needs.
- Identify areas of concern.
- Participate in treatment program or therapy regimen.
- Maintain physical health as evidenced by adequate nutrition, weight within normal limits, and good sleep habits.

ACTIONS/INTERVENTIONS

Sample NIC linkage:

Mood Management: Providing for safety, stabilization, recovery, and maintenance of a person who is experiencing dysfunctionally depressed or elevated mood

NURSING PRIORITY NO. 1 To assess causative/contributing factors:

- Determine specific reasons for client's mood swings/difficulties and specific manifestations. (Refer to Related Factors and Defining Characteristics.) *Allows for accurate planning of care for individual.*¹
-  Assess ability to understand current situation. *Mood disturbances are prevalent in many disorders and may affect individual's cognitive functioning and understanding of events.*¹
-  Review history and evaluate for underlying neurological disorders. *Presence of traumatic brain injuries, tumors, stroke, and autism may result in variations of mood and emotional processing deficits.*¹
-  Ascertain degree of depression individual is experiencing. *Impaired mood regulation is known to be a factor in vulnerability to depression.*⁵
- Identify behaviors that interfere with person's daily activities. *Being aware of behaviors, such as sleep or appetite disturbances, altered social activity, irritability, and impaired concentration, facilitates identification of treatment options for change.*²
- Determine availability and use of resources.

NURSING PRIORITY NO. 2 To assist client to regulate mood changes more effectively:

-  Discuss how client perceives the current situation and how it is affecting emotions. *A negative outlook is associated with difficulty in cognitive control and emotional regulation strategies.*⁵
-  Determine extent of rumination and reappraisal and expressive suppression. *As the individual goes over and over the negative thoughts, it is more difficult to effect cognitive control and depression can worsen.*⁵
-  Encourage client to pay attention to emotional states and feelings and identify when they occur and record in a journal or notebook. *Awareness of one's emotions helps the individual to deal with them appropriately.*³
- Clarify meanings of feelings by checking meaning with client and providing feedback. *Validates and ensures accuracy of meaning of the communication.*⁶
-  Discuss how negative thinking and rumination intensify depression. *It appears individual differences can affect the strategies the person uses to recover from a negative mood.*⁵
-   Provide information regarding use of electroconvulsive therapy (ECT) as indicated. *It is not known exactly how this treatment helps; it is thought to alter brain chemistry and function that relieves depression in 80% to 90% of clients.⁸ The client with severe depression that does not respond to medication may benefit from ECT along with psychotherapy.*⁷

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Involve client in cognitive/behavioral, mindfulness-based, or individual psychotherapy. *Having the client identify thinking patterns that result in depression allows the individual to recognize and avoid them, improving the ability to recover.*⁵
-  Discuss the use of and administer medications as indicated. *Antidepressants can be useful in mood disorders and, along with psychotherapy, can help the client maintain usual activities.*⁷
-   Involve client in group therapy. *Group discussions promote awareness of others who are experiencing similar difficulties and promote new ideas for dealing with own concerns.*⁴
- Encourage client to become involved in community activities. *Provides opportunity to develop social skills and interests outside of own concerns.*⁵

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings, including client's specific situation and impact on functioning/life.
- Description of negative thinking patterns.

Planning

- Treatment plan and individual responsibility for activities.
- Teaching plan.

Implementation/Evaluation

- Client involvement and response to interventions, teaching and actions performed.
- Attainment or progress toward desired outcomes.
- Modification to plan of care.

Discharge Planning

- Specific referrals made and follow-up plan.

Moral Distress

Taxonomy II: Life Principles—Class 3 Value/Belief/Action Congruence (00175) [Diagnostic Division: Ego Integrity], Approved 2006

DEFINITION: Response to the inability to carry out one's chosen ethical/moral decision/action.

RELATED FACTORS

Conflict among decision makers [e.g., client/family, healthcare providers, insurance payers, regulatory agencies]

Conflicting information available for moral or ethical decision making; cultural incongruences

Difficulty reaching treatment or end-of-life decisions

Time constraint for decision making

DEFINING CHARACTERISTICS

Subjective

Anguish about acting on one's moral choice

At Risk Population: Loss of autonomy

Physical distance of decision-making

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Decision-Making: Ability to make judgments and choose between two or more alternatives

Client Satisfaction: Protection of Rights: Extent of positive perception of a patient's legal and moral rights provided by nursing staff

Participation in Health Care Decisions: Personal involvement in selecting and evaluating health care options to achieve desired outcome

(continues on page 560)

Moral Distress (continued)

Client Will (Include Specific Time Frame)

- Verbalize understanding of causes for conflict in own situation.
- Be aware of own moral values conflicting with desired or required course of action.
- Identify positive ways or actions necessary to deal with own self and situation.
- Express sense of satisfaction with or acceptance of resolution.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Values Clarification: Assisting another to clarify her/his own values in order to facilitate effective decision-making

Decision-Making Support: Providing information and support for a patient who is making a decision regarding health care

Mutual Goal-Setting: Collaborating with patient to identify and prioritize care goals, then developing a plan of care for achieving those goals

NURSING PRIORITY NO. 1 To identify cause/situation in which moral distress is occurring:

- Note situations or individuals at high risk for conflict. *For example, family members not agreeing on proper course of action for comatose loved one, parents faced with expectation of taking ventilator-dependent child home and effect on family as a whole;⁸ and care providers discontinuing life support measures for preterm infant are likely to encounter some degree of distress with decision making but may be silent about their discomfort. Recognizing potential for moral distress allows for timely intervention and support for involved parties.*
- Determine client's perceptions and specific factors resulting in a sense of distress and all parties involved in situation. *Conflict may be personal or job related. Moral conflict centers around lessening the amount of harm suffered, with the involved individuals usually struggling with decisions such as what "can be done" to prevent, improve, or cure a medical condition or what "ought to be done" in a specific situation, often within financial constraints or scarcity of resources.⁶*
- Note use of sarcasm, avoidance, apathy, crying, reports of depression, or loss of meaning. *Individuals may not understand their feelings of uneasiness or distress or know that the emotional basis for moral distress is anger.⁴*
- Ascertain response of family/significant others (SOs) to client's situation/healthcare choices. *May provide clues to emotional or conflictual problems individual is experiencing.*
- Identify healthcare goals and expectations. *New treatment options and technology can prolong life or postpone death based on the individual's personal viewpoint, increasing the possibility of conflict with others, including healthcare providers.²*
-  Ascertain cultural beliefs and values and degree of importance to client. *Cultural diversity may lead to disparate views and expectations between client, SO/family members, and healthcare providers. When tensions between conflicting values cannot be resolved, persons experience moral distress.²*
- Note attitudes and expressions of dissatisfaction of caregivers/staff. *Client may feel pressure or disapproval if own views are not congruent with expectations of those perceived to be more knowledgeable or in "authority." Furthermore, healthcare providers may themselves feel moral distress in carrying out or refraining from performing requested interventions.⁷*
-  Determine degree of emotional and physical distress (e.g., fatigue, headaches, forgetfulness, anger, guilt, resentment) individual(s) are experiencing and its impact on ability to function. *Moral distress can be very destructive, affecting one's ability to carry out daily tasks and care for self or others, and may lead to a crisis of faith.⁵*

-  Assess sleep habits of involved parties. *Evidence suggests that sleep deprivation can harm a person's physical and emotional well-being, hindering the ability to integrate emotion and cognition to guide moral judgment.*⁵
-  Perform or review results of moral distress test, such as the Moral Distress Assessment Questionnaire or the Moral Distress Scale, to help measure degree of involvement and identify possible actions to improve situation.^{3,10}
- Note availability of family/friends/coworkers. *Provides support and encouragement for difficult situation.*⁴

NURSING PRIORITY NO. 2 To assist client/involved individuals to develop/effectively use problem-solving skills:

- Encourage involved individuals to recognize and name the experience, resulting in moral sensitivity. *Brings concerns out in the open so they can be dealt with.*¹
- Provide time for nonjudgmental discussion of philosophical issues or questions about impact of conflict leading to moral questioning of current situation. *Moral issues have been discussed and studied for many years (e.g., philosophers, such as Piaget [1932] with his early work in developmental moral psychology, discussed what is the basis for moral reasoning). It is not possible to accurately read another's mind, and open discussion helps those involved in conflict to better understand the situation and begin to look at options.*⁹
- Use skills such as Active-listening, "I" messages, and problem-solving to clarify feelings of anxiety and conflict. *Helps to understand what the ethical dilemmas are that lead to moral distress (e.g., family members ignoring advanced directives of loved one, providing lifesaving care to a death row inmate, terminally ill individual requesting assistance to die, families living with the moral experience of caring for a ventilator-assisted child in the home).*⁸
- Provide privacy when discussing sensitive personal issues. *Shows regard and concern for individual's self-worth.*²
- Ascertain coping behaviors client has used successfully in the past that may be used in the current situation. *When encouraged, individuals can recall past situations where they had a positive experience and used successful coping skills.*⁴
- Identify role models (e.g., other individuals who have experienced similar problems in their lives). *Sharing of experiences and identifying options can be helpful to deal with current situation.*¹
-  Involve facility or local ethics committee or ethicist as appropriate to educate, make recommendations, and facilitate mediation or resolution of conflicts.³

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Engage all parties, as appropriate, in developing plan to address conflict. *Resolving one's moral distress requires making changes or compromises while preserving one's integrity and authenticity.*⁴
-  Incorporate identified familial, religious, and cultural factors that have meaning for client. *Can provide comfort for the person.*⁷
-  Refer to appropriate resources for support/guidance (e.g., pastoral care, counseling, organized support groups, classes) as indicated. *These resources can help client as they pursue the search for moral resolution.*⁸
-  Assist individual to recognize that if she or he follows their moral decisions, they may clash with the legal system, and refer to appropriate resource for legal opinion/options.³
-  Encourage the work organization to provide better support resources and structures. Discuss changes in the healthcare system that have resulted in more complex healthcare decisions. *The complexity of healthcare choices, expectations of clients/families, increasing costs or limitations in resources has resulted in increased pressures on healthcare providers and has led to ethics becoming a required component of clinical practice. Acknowledging reality of potential areas of conflict and providing proactive discussions for staff as well as support for involved individuals when making difficult decisions can decrease moral distress for staff and families.*^{2,8}

DOCUMENTATION FOCUS**Assessment/Reassessment**

- Individual findings, including nature of moral conflict, individuals involved in conflict.
- Physical and emotional responses to conflict.
- Individual cultural or religious beliefs and values, healthcare goals.
- Responses and involvement of family/SOs or coworkers.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions and teaching.
- Effects of participation in classes or mediation activities.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Available resources.
- Specific referrals made.

impaired oral Mucous Membrane Integrity

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00045) [**Diagnostic Division:** Food/Fluid], Approved 1982; Revised 1998, 2013, 2017

DEFINITION: Injury to the lips, soft tissue, buccal cavity, and/or oropharynx.

RELATED FACTORS

Alcohol consumption; smoking; stressors

Barrier to dental care or oral self-care; insufficient oral hygiene; insufficient knowledge of oral hygiene

Chemical injury agent

Decrease in salivation; dehydration; inadequate nutrition; malnutrition

DEFINING CHARACTERISTICS

Subjective

Xerostomia

Oral pain or discomfort

Bad taste in mouth; decrease in taste sensation; difficulty eating or swallowing

Exposure to pathogen

Objective

Bleeding

Coated tongue; smooth atrophic or geographic tongue

Gingival or oral mucosal pallor

Stomatitis; hyperemia; macropia; vesicles; oral nodules or papules

White patches or plaques, spongy patches, or white curdlike exudate in mouth

Oral lesions or ulcers; fissures; bleeding; cheilitis; desquamation; mucosal denudation

Purulent oral-nasal drainage or exudates; enlarged tonsils

Oral edema

Halitosis

Gingival hyperplasia or recession, pocketing deeper than 4 mm [carious teeth]

Presence of mass [e.g., hemangiomas]

Difficulty speaking

At Risk Population: Economically disadvantaged

Associated Condition: Allergy; infection; Sjogren's syndrome; trauma; mechanical factors

Autoimmune, autosomal or behavioral disorder

Chemotherapy; radiation therapy; treatment regimen; nil per os (NPO) >24 hr

Cleft lip or palate; loss of oral support structure; oral trauma, surgical procedure

Decrease in hormone level in women; decrease in platelets; immunodeficiency or immunosuppression

Sample Clinical Applications: Oral trauma, cancer, chemo/radiation therapy, malnutrition, infection, oral surgery, cleft lip/palate, conditions requiring endotracheal (ET) intubation (e.g., brain injury, stroke, spinal cord injury [SCI], chronic obstructive pulmonary disease [COPD], acute respiratory distress syndrome, amyotrophic lateral sclerosis [ALS])

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Self-Care: Oral Hygiene: Personal actions to care for own mouth and teeth independently with or without assistive device

Tissue Integrity: Skin & Mucous Membranes: Structural intactness and normal physiological function of skin and mucous membranes

Client/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of causative factors.
- Identify specific interventions to promote healthy oral mucosa.
- Demonstrate techniques to restore and maintain integrity of oral mucosa.

Sample NOC linkages:

Oral Health: Condition of the mouth, teeth, gums, and tongue

(continues on page 564)

impaired oral Mucous Membrane Integrity (continued)

Client Will (Include Specific Time Frame)

- Report or demonstrate a decrease in signs/symptoms as noted in Defining Characteristics.

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Oral Health Restoration: Promotion of healing for a patient who has an oral mucosa or dental lesion

Oral Health Maintenance: Maintenance and promotion of oral hygiene and dental health for the patient at risk for developing oral or dental lesions

Oral Health Promotion: Promotion of oral hygiene and dental care for a patient with normal oral and dental health

NURSING PRIORITY NO. 1 To identify causative/contributing factors affecting oral health:

-  Perform oral screening or comprehensive assessment upon admission to facility using tool (e.g., Oral Health Assessment Tool for Long-Term Care), as indicated. *Use of standardized tool is beneficial in evaluating health of entire mouth including lips, tongue, gums, and other soft tissues, as well as condition of natural teeth or dentures, and status of oral hygiene.*¹⁸
-  Note presence of systemic or local conditions (e.g., oral infections; dehydration, malnutrition, facial fractures, head or neck cancers or treatment including chemotherapy or radiation; AIDS, systemic lupus erythematosus, rheumatoid arthritis, Sjögren's syndrome, scleroderma, sarcoidosis, amyloidosis, hypothyroidism, diabetes) that can affect health of buccal tissues. *Note: Oral mucositis is a major complication of chemotherapy and/or radiation therapy.*^{10,12,16}
-  Note client's age and functional status upon admission to facility. *The very young, elderly, or any client with functional deficits (e.g., age-related dependency needs, cognitive or physical impairments, trauma, complex treatments) may require daily assistance with oral care.*¹⁷
- Determine if client is resistant to oral care. *Client with behavioral and/or communication difficulties (e.g., dementia, won't open mouth or is agitated or lethargic, doesn't understand instructions) may require special equipment, timing of efforts, and/or referral for professional services.*¹⁷
- Investigate reports of oral pain to determine possible source (e.g., oral lesion, gum disease, tooth abscess, ill-fitting dentures) to identify needed interventions and reduce risk of complications such as systemic infection.¹
-  Obtain history of client's medications to identify those medications that can impact health of buccal tissues or cause immunosuppression that can impact oral health. *Note: Many drugs (e.g., anticholinergics, antidepressants, anti-Parkinson drugs, antihistamines or decongestants, urinary antispasmodics, antipsychotics, diuretics, hypnotics, systemic bronchodilators, muscle relaxants, reserpine, laxatives, beta blockers, narcotics) can impair salivary function and promote xerostomia.*^{3,8}
-  Observe for abnormal lesions of mouth, tongue, and cheeks (e.g., white or red patches, ulcers). *White ulcerated spots may be canker sores, especially in children; white curd patches (thrush) are common in infants. Reddened, swollen bleeding gums may indicate infection, poor nutrition, or poor oral hygiene. A red tongue may be related to vitamin deficiencies.*^{2,14} *Malignant lesions are more common in elderly than younger persons (especially if there is a history of smoking or alcohol use) or in persons who rarely visit a dentist.*^{3,15}
-  Note use of tobacco (including smokeless) and alcohol/other drugs [e.g., methamphetamines], which may predispose gums and mucosa to effects of nutritional deficiencies, infection, cell damage, and cancer.^{10,12}
- Observe for chipped, sharp-edged teeth, or malpositioned teeth. Note fit of dentures or other prosthetic appliances when used. *Factors that increase the risk of injury to delicate tissues.*

- Determine problems with food and fluid intake (e.g., avoiding eating, reports change in taste, chews painstakingly, swallows numerous times for even small bites; insufficient fluid intake/dehydration; unexplained weight loss). *Malnutrition and dehydration are associated with problems with oral mucous membranes.*⁶
- Determine allergies to foods, drugs, or other substances that may result in irritation of oral mucosa.
- Review oral hygiene practices, noting frequency and type (e.g., brushing, flossing, water appliances). Inquire about client's professional dental care, regularity, and date of last dental examination.
- ∞ Evaluate client's ability to provide self-care and availability of necessary equipment and assistance. *Client's age (very young or elderly) impacts client's habits and lifestyle and ability to provide self-care, as well as current health issues (e.g., disease condition or treatment, weakness).*⁴

NURSING PRIORITY NO. 2 To correct identified/developing problems:

-  Collaborate in treatment of underlying conditions (e.g., structural defects, infections) that may correct or limit problem with oral tissues.
 - Inspect oral cavity routinely and recommend that client establish regular schedule of self-inspection, such as when performing oral care activities. *Can help with early identification and management of mucous membrane concerns.*
 -  Adjust medication regimen to reduce use of drugs with potential for causing or exacerbating painful dry mouth.
 -  Administer medications, as indicated (e.g., antibiotics, antifungal agents, including antimicrobial mouth rinse or spray) to treat oral infections or reduce potential for bacterial overgrowth.⁸⁻¹⁰
 -  Provide anesthetic lozenges or analgesics such as Stanford solution, viscous lidocaine (Xylocaine), mouthwash containing lidocaine, and sulfacrate slurry, as indicated to provide protection and reduce oral discomfort or pain. *Note: Pain of mucositis associated with anticancer therapies has been found to be controlled by mouthwashes containing lidocaine to coat the oral cavity.*^{10,16}
 -  Discuss safe use of products used to treat xerostomia. *Artificial salivas mimic natural saliva to relieve soft tissue discomfort and are more effective and longer lasting than simple rinses but do not stimulate natural salivary gland production; cholinergic agonist preparations [e.g., pilocarpine, cevimeline] do stimulate saliva production. Note: Little research has been done regarding the causes for xerostomia, but one recent study showed that medication exposure was strongly associated with the incidence of the condition, with recent exposure to diuretics or daily aspirin strongly predicting it.*¹³
 - Encourage use of tart, sour foods and drinks and chewing sugar-free gum or sucking hard candy to stimulate saliva.¹¹ Use citrus foods and liquids with caution as they may irritate mucosa and increase pain.
 -  Provide or encourage regular oral care (e.g., after meals and at bedtime) frequently for critically ill client. *Note: Oral care has been determined to be a nursing intervention that decreases colonization of oropharynx and saliva, thereby reducing the risk of ventilator-associated pneumonia (VAP) in the critically ill client.*¹⁹ Use water; bland rinses or sodium bicarbonate solutions; and mucosal coating agents, lubricating agents, and topical anesthetics for oral hydration or irrigation and treatment of mouth, gums, and mucous membrane surfaces.^{6,10,20}
 -  Avoid mouthwashes containing alcohol (drying effect) or hydrogen peroxide (drying and foul tasting).^{5,13}
 -  Use soft-bristle brush or sponge/cotton-tip applicators to cleanse teeth and tongue. *Brushing the teeth is the most effective way to reduce plaque and manage periodontal disease.*⁶
 - Floss gently or use a Waterpik to remove food particles that promote bacterial growth and gum disease.
 -  Use foam sticks where indicated to swab mouth, tongue, and gums when client is intubated or has no teeth. *Note: Chlorhexidine is also used in some critical care areas to decrease risk of VAP.*^{21,22}
 -  Use lemon/glycerin swabs with caution. *Note: Although some end-of-life care discussions mention use of glycerin swabs, the issue appears to be controversial, with some sources stating that glycerin should not be used as it absorbs water and actually dries the oral cavity and can result in decreased salivary amylase, as well as erosion of tooth enamel.*^{6,9,13}
- Provide or assist with denture care, as needed. *Evidence-based protocol for denture care states that dentures are to be removed and washed at least once daily, removed and rinsed after every meal, and kept in an appropriate solution at night.*⁷

-  Change position of ET tube or airway per facility protocol and as needed when client is on a ventilator *to minimize pressure on fragile tissues and improve access to all areas of oral cavity.*
- Suction oral cavity *if client cannot swallow secretions. Note: Saliva contains digestive enzymes that may be erosive to exposed tissues (such as might occur because of heavy drooling following radical neck surgery).*
- Use gentle low-intensity suctioning *to reduce risk of aspiration in intubated clients or those with decreased gag or swallow reflexes.*⁸
- Lubricate lips and provide commercially prepared oral lubricant solution, when indicated. Encourage use of chewing gum, hard candy, etc., *to stimulate flow of saliva to neutralize acids and limit bacterial growth.*¹⁰
- Encourage adequate fluids *to prevent dehydration and oral dryness and limit bacterial overgrowth.*⁸
- Suggest use of vaporizer or room humidifier *to increase humidity if client is mouth breather or ambient humidity is low.*¹³
- Implement diet modifications, as indicated:¹⁰
 Offer foods with adequate nutrients and vitamins to promote healing *when deficits are impairing health of oral tissues.*
 Avoid sharp, hard, coarse, spicy, salty, and acidic foods *that can irritate or damage fragile mucosa and existing ulcers.*
 Include bland, low-acid, high-protein foods (e.g., milkshakes, bananas, applesauce, mashed potatoes, cooked cereals, soft-boiled or scrambled eggs, cottage cheese, macaroni and cheese, pudding, custard, gelatin) *that are nutrient-dense and easy to eat.*
 Provide moderate-temperature foods and fluids, soft or pureed foods, popsicles, frozen yogurt or ice cream *that may be soothing to sensitive mucosa.*
 Drink liquids with meals and use gravies and sauces *to make food easier to swallow.*
 Avoid dry foods, such as crackers, cookies, and toast, or soften them with liquids before eating.¹³

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Recommend regular dental checkups and care, and episodic evaluation of oral health prior to certain medical treatments (e.g., chemotherapy, radiation) *to maintain oral health and reduce risks associated with impaired tissues.*⁸
- Review current oral hygiene concerns and provide informational resources including reliable Web sites about oral health *to reinforce learning and encourage proper care.*
- Promote general health and mental health habits *to prevent negative effects that altered immune response and/or neglect can exert on oral mucosa.*
- Provide nutritional information *to correct deficiencies, reduce mucosal inflammation or gum disease, and prevent dental caries.*
-  Instruct parents in oral hygiene techniques and proper dental care for infants/children (e.g., safe use of pacifier, brushing of teeth and gums, avoidance of sweet drinks and candy, recognition and treatment of thrush). *Encourages early initiation of good oral health practices and timely intervention for treatable problems.*
- Discuss special mouth care required during and after illness or trauma or following surgical repair (e.g., cleft lip/palate, facial fractures, jaw surgery) *to facilitate healing.*
-  Discuss and instruct caregiver(s) in special mouth care required during end-of-life care/hospice *to promote optimal comfort in client who has stopped eating or drinking, who has dry mouth, and who may not have sensation of thirst.*²³
- Recommend avoiding alcohol and smoking or chewing tobacco, *which can contribute to mucosal inflammation and gum disease.*
- Discuss need for and demonstrate use of special appliances (e.g., power toothbrushes, dental water jets, flossing instruments, applicators) if indicated. *Enhances independence in self-care.*
-  Identify community resources (e.g., low-cost dental clinics, smoking-cessation resources, cancer information services or support group, Meals on Wheels, supplemental nutrition program, home-care aide) *to meet individual needs.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Condition of oral mucous membranes, routine oral care habits and interferences.
- Availability of oral care equipment and products.
- Knowledge of proper oral hygiene and care.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made, resources for special appliances.

risk for impaired oral Mucous Membrane Integrity

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00247) [**Diagnostic Division:** Food/Fluid], Approved 2013; Revised 2017

DEFINITION: Susceptible to injury to the lips, soft tissues, buccal cavity, and/or oropharynx, which may compromise health.

RISK FACTORS

Alcohol consumption; smoking; stressors
Barrier to dental care or oral self-care; insufficient oral hygiene; insufficient knowledge of oral hygiene
Chemical injury agent
Decrease in salivation; dehydration; inadequate nutrition; malnutrition
At Risk Population: Economically disadvantaged
Associated Condition: Allergy; infection; Sjogren's syndrome; trauma; mechanical factors
Autoimmune, autosomal or behavioral disorder
Chemotherapy; radiation therapy; treatment regimen; nil per os (NPO) >24 hours
Cleft lip or palate; loss of oral support structure; oral trauma, surgical procedure
Decrease in hormone level in women; decrease in platelets; immunodeficiency or immunosuppression

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Self-Care: Oral Hygiene: Personal actions to care for own mouth and teeth independently with or without assistive device

Tissue Integrity: Skin & Mucous Membranes: Structural intactness and normal physiological function of skin and mucous membranes

Client/Caregiver Will (Include Specific Time Frame)

- Verbalize understanding of causative factors.
- Identify specific interventions to promote healthy oral mucosa.
- Demonstrate techniques to maintain integrity of oral mucosa.

Sample **NOC** linkages:

- Client will be free of signs of mucosal irritation/injury.

Oral Health: Condition of the mouth, teeth, gums, and tongue

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Oral Health Maintenance: Maintenance and promotion of oral hygiene and dental health for the patient at risk for developing oral or dental lesions

Oral Health Promotion: Promotion of oral hygiene and dental care for a patient with normal oral and dental health

NURSING PRIORITY NO. 1 To identify factors/conditions that can affect oral health:

-  Note presence of systemic or local conditions (e.g., oral infections; dehydration, malnutrition, facial fractures, head or neck cancers or treatment including chemotherapy or radiation; AIDS, systemic lupus erythematosus, rheumatoid arthritis, Sjögren's syndrome, scleroderma, sarcoidosis, amyloidosis, hypothyroidism, diabetes) *that can affect health of oral tissues. Note: Oral mucositis is a major complication of chemotherapy and/or radiation therapy.*^{1,2,3}
-  Note client's age and functional status. *The very young, the elderly client, or any client with functional deficits (e.g., age-related dependency needs, cognitive or physical impairments, trauma, complex treatments) may require daily assistance with oral care.*⁴
- Determine if client is resistant to oral care. *Client with behavioral and/or communication difficulties (e.g., dementia, won't open mouth or is agitated or lethargic, doesn't understand instructions) may require special equipment, timing of efforts, and/or referral for professional services.*⁴
-  Obtain history of client's medications *to identify those medications that can impact health of buccal tissues or cause immunosuppression, which can impact oral health. Note: Many drugs (e.g., anticholinergics, antidepressants, anti-Parkinson drugs, antihistamines or decongestants, urinary antispasitics, antipsychotics, diuretics, hypnotics, systemic bronchodilators, muscle relaxants, reserpine, laxatives, beta blockers, narcotics) can impair salivary function and promote xerostomia.*^{5,6}
-  Note use of tobacco (including smokeless) and alcohol/other drugs [e.g., methamphetamines], *which may predispose gums and mucosa to effects of nutritional deficiencies, infection, cell damage, and cancer.*^{1,2}
- Observe for chipped, sharp-edged teeth, or malpositioned teeth. Note fit of dentures or other prosthetic appliances when used. *Factors that increase the risk of injury to delicate tissues.*
- Determine problems with food and fluid intake (e.g., avoiding eating, reports change in taste, chews painstakingly, swallows numerous times for even small bites; insufficient fluid intake/dehydration; unexplained weight loss). *Malnutrition and dehydration are associated with problems with oral mucous membranes.*⁷
- Determine allergies to foods, drugs, or other substances *that may result in irritation of oral mucosa.*
-  Evaluate client's ability to provide self-care and availability of necessary equipment and assistance. *Client's age (very young or elderly) impacts client's habits and lifestyle, ability to provide self-care, and current health issues (e.g., disease condition or treatment, weakness).*⁸

NURSING PRIORITY NO. 2 To correct developing/potential problems:

-  Collaborate in treatment of underlying conditions (e.g., structural defects, cancer, surgical/traumatic injuries) *that may impact oral tissues.*
- Inspect oral cavity routinely and recommend that client establish regular schedule of self-inspection, such as when performing oral care activities. *Can help with early identification and management of mucous membrane concerns.*
- **Refer to ND impaired oral Mucous Membrane Integrity, Nursing Priority No. 2 for interventions related to best practice nursing care to prevent oral complications.**

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):⁶⁻⁸

-  Recommend regular dental checkups and care and episodic evaluation of oral health prior to certain medical treatments (e.g., chemotherapy, radiation, total joint replacement) *to maintain oral health and reduce risks associated with impaired tissues.*
- Review current oral hygiene concerns and provide informational resources including reliable Web sites about oral health *to reinforce learning and encourage proper care.*
- Promote general health and mental health habits *to prevent negative effects that altered immune response and/or neglect can exert on oral mucosa.*
- Provide nutritional information *to correct deficiencies, reduce mucosal inflammation or gum disease, and prevent dental caries.*

- ∞ Instruct parents in oral hygiene techniques and proper dental care for infants/children (e.g., safe use of pacifier, brushing of teeth and gums, avoidance of sweet drinks and candy, recognition and treatment of thrush). *Encourages early initiation of good oral health practices and timely intervention for treatable problems.*
- Discuss need for and demonstrate use of special appliances (e.g., power toothbrushes, dental water jets, flossing instruments, applicators), if indicated. *Enhances independence and excellence in oral self-care.*
- Discuss special mouth care required during and after illness or trauma or following surgical repair (e.g., cleft lip/palate, facial fractures, jaw surgery) *to facilitate healing.*
- Recommend avoiding alcohol and smoking or chewing tobacco, *which can contribute to mucosal inflammation and gum disease.*
-  Identify community resources (e.g., low-cost dental clinics, smoking-cessation resources, cancer information services or support group, Meals on Wheels, nutritional assistance program, home-care aide) *to meet individual needs.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Condition of oral mucous membranes, routine oral care habits and interferences.
- Availability of oral care equipment and products.
- Knowledge of proper oral hygiene and care.
- Availability and use of resources.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Responses to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made, resources for special appliances.

Nausea

Taxonomy II: Comfort—Class 1 Physical Comfort (00134) [**Diagnostic Division:** Food/Fluid], Approved 1998; Revised 2002, 2010, 2017

DEFINITION: A subjective phenomenon of an unpleasant feeling in the back of the throat and stomach, which may or may not result in vomiting.

RELATED FACTORS

Anxiety; fear

Exposure to toxin; noxious environmental stimuli; unpleasant visual stimuli

Noxious taste

DEFINING CHARACTERISTICS

Subjective

Nausea; sour taste

Objective

Aversion toward food

Increase in salivation

Increase in swallowing; gagging sensation

Associated Condition: Biochemical dysfunction [e.g., uremia, diabetic ketoacidosis]; pregnancy

Esophageal or pancreatic disease; liver or splenic capsule stretch

Gastric distention; gastrointestinal irritation

Increase in intracranial pressure (ICP); meningitis

Intra-abdominal tumors; localized tumor [e.g., acoustic neuroma, brain tumor, bone metastasis]

Motion sickness; Ménière's disease; labyrinthitis

Psychological disorder

Treatment regimen

Sample Clinical Applications: Surgery, anesthesia, cancer, pregnancy, AIDS, gastritis, peptic ulcer disease, renal failure, brain injury, meningitis, panic disorders, phobias

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Nausea & Vomiting Severity: Severity of signs and symptoms of nausea, retching, and vomiting

Nausea & Vomiting Control: Personal actions to control nausea, retching, and vomiting symptoms

Nausea & Vomiting: Disruptive Effects: Severity of observed or reported disruptive effects of chronic nausea, retching, and vomiting on daily functioning

Client Will (Include Specific Time Frame)

- Be free of nausea.
- Manage chronic nausea, as evidenced by acceptable level of dietary intake.
- Maintain or regain weight, as appropriate.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:

Nausea Management: Prevention and alleviation of nausea

Vomiting Management: Prevention and alleviation of vomiting

Fluid Management: Promotion of fluid balance and prevention of complications resulting from abnormal or undesired fluid levels

NURSING PRIORITY NO. 1 To determine causative/contributing factors:

- Assess for presence of conditions of the GI tract (e.g., peptic ulcer disease, bleeding into the stomach; cholecystitis, appendicitis, gastritis, constipation, intestinal blockage, ingestion of “problem” foods; food poisoning; excessive alcohol intake) *that may cause or exacerbate nausea.*
- Note systemic conditions that may result in nausea (e.g., pregnancy, cancer treatment, myocardial infarction, hepatitis, acid-base and metabolic disturbances, systemic infections; toxins, drug toxicity, migraine headache, presence of neurogenic causes—stimulation of the vestibular system, concussion, central nervous system trauma/tumor). *Helpful in determining appropriate interventions/need for treatment of underlying conditions.*
- Identify situations that client perceives as anxiety inducing, threatening, or distasteful (e.g., “this is nauseating”) such as might occur if client is having multiple diagnostic studies or is facing surgery, anticipating chemotherapy that has previously induced nausea, or other stressful situations.⁶
-  Note psychological factors, including those that are culturally determined (e.g., eating certain foods considered repulsive in one’s culture, seeing or smelling something “gross”; eating disorders such as anorexia and bulimia).
- Determine if nausea is potentially self-limiting and/or mild (e.g., first trimester of pregnancy, 24-hr GI tract viral infection) or is severe and prolonged (e.g., advanced cancer with multiple medications accompanied by anorexia, constipation, imbalances of calcium/other electrolytes; certain cancer treatments; hyperemesis gravidarum). *Indicates potential degree of effect on fluid/electrolyte balance and nutritional status and determines type and intensity of interventions.*³
- Record food intake and changes in symptoms *to help identify food intolerances or eating disorders when nausea is chronic.*
-  Note client age and developmental level. *Vomiting may occur along with nausea, especially in children (usually part of a short-lived viral infection). Nausea can occur with food intolerances, inner ear problems, pain, or medication reactions in any age client. Nausea in the elderly (in the absence of acute disease condition) may be associated with GI motility dysfunction or medications, pain, or end-of-life issues. Nausea in a female of childbearing age may indicate pregnancy or hormonal influences associated with menstruation, anorexia, or migraine headaches.*⁵
-  Review medication regimen, especially in elderly client on multiple drugs. *Polypharmacy with drug interactions and side effects may cause or exacerbate nausea.*
-  Review results of diagnostic studies. *Various studies may be done depending on the clinical suspicion of cause, such as blood tests (to check electrolytes, blood cell count), urinalysis (to check for dehydration and infection), and x-rays, ultrasound, or computed tomography (CT) scan to help identify or localize cause.*

NURSING PRIORITY NO. 2 To promote comfort and enhance intake:

-  Collaborate with physician to treat underlying medical condition *when cause of nausea is known (e.g., infection, adverse side effect of medications, recent anesthesia, food allergies, GI reflux).*
-  Administer and monitor response to medications used to treat underlying type of nausea (e.g., vestibular, bowel obstruction, dysmotility of gut, infection or inflammation, toxins, cancer treatments) *to determine effectiveness of treatment. Note: Targeting antiemetics to specific receptors associated with a certain type of nausea can optimize treatment. For example, receptors causing nausea in vestibular disorders and infection are cholinergic and histaminic. A targeted antiemetic drug class could be anticholinergic or antihistaminic such as promethazine [Phenergan]. Antiemetics must also be monitored for adverse side effects, such as oversedation with risk of aspiration.*^{4,7}
-  Select route of medication administration best suited to client’s needs (i.e., oral, sublingual, injectable, rectal, transdermal).⁶
-  Administer antiemetic on regular schedule before, during, and after administration of antineoplastic agents or radiation therapy as indicated. *Antiemetic agents may be administered prophylactically to prevent or limit severity of nausea and vomiting.*

-  Administer analgesics and/or antiemetics as scheduled *when postoperative pain is a factor in nausea and vomiting.*¹
-  Review pain control regimen for client experiencing nausea. *Converting to long-acting opioids or combination drugs may decrease stimulation of the chemotactic trigger zone, reducing the occurrence of narcotic-related nausea.*^{4,7}
- Manage food and fluids:
 - Have client try dry foods such as toast, crackers, or dry cereal before arising *when nausea occurs in the morning or throughout the day.*⁷
 -  Encourage client to begin with ice chips or sips/small amounts of fluids—4 to 8 oz for adult, 1 oz or less for child.⁵
 - Advise client to drink liquids 30 min before or after meals instead of with meals.⁷
 - Suggest sipping fluids slowly and using cool, clear liquids (e.g., water, ginger ale or lemon-lime soda, electrolyte drinks).
 - Recommend avoiding milk and other dairy products (especially during acute episodes); overly sweet, fried, or fatty foods; and gas-forming vegetables (e.g., broccoli, cauliflower, cucumbers) *that may increase nausea and be more difficult to digest.*^{3,5,7}
 - Provide soft-bland diet and snacks high in carbohydrates with substitutions of preferred foods (including skinless chicken, rice, toast, pasta, potatoes) and fluids (including caffeine-free nondiet carbonated beverages, clear soup broth, nonacidic fruit juice, gelatin, sherbet, ices) *to reduce gastric acidity and improve nutrient intake.*^{3,5,7}
 - Instruct client to eat small meals spaced throughout the day rather than large meals *so stomach does not feel too full.*^{3,7}
 - Instruct client to eat and drink slowly, chewing food well *for easier digestion.*⁷
 - Advise client to suck on ice cubes or tart or hard candies. *Keeps mucous membranes moist and can provide some fluid and nutrient intake.*
 -  Time chemotherapy doses *for least interference with food intake.*
 - Monitor infusion rate of tube feeding, if present, *to prevent rapid administration that can cause gastric distention and produce nausea.*
- Manage environment *to reduce risk of nausea caused by noxious sights or smells:*
 - Elevate head of bed or have client sit upright after meals *to promote digestion by gravity and eliminate feeling of fullness when that is causing nausea.*⁷
 - Apply cool cloth to face and neck.
 - Provide clean, pleasant-smelling, quiet environment and fresh air with fan or open window.
 - Avoid offending odors (e.g., cooking smells, smoke, perfumes, mechanical emissions).^{6,7}
- Implement nonpharmacological measures:
 - Encourage slow, deep breathing *to promote relaxation.*
 - Use such distraction techniques as guided imagery, music therapy, chatting with family/friends, and watching television *to refocus attention away from unpleasant sensations.*
 - Provide frequent oral care *to cleanse mouth and minimize “bad tastes.”*
 - Avoid sudden changes in position or excessive motion; move to aisle seat on plane or front seat of car. Focus on distance and face forward when riding *to prevent or limit severity of nausea associated with motion sickness.*⁵
-  Investigate use of electrical nerve stimulation or acupressure point therapy (e.g., elastic band worn around wrist with small, hard bump that presses against acupressure point). *Some individuals with chronic nausea or history of motion sickness report this to be helpful and without the sedative effect of medication.*²

NURSING PRIORITY NO. 3 To promote wellness (Teaching/Discharge Considerations):

-  Review individual factors or triggers causing nausea and ways to avoid problem (e.g., identifying offending medications or foods). *Provides necessary information for client to manage own care. Note: Some individuals*

develop anticipatory nausea (a conditioned reflex) that recurs each time he or she encounters the situation that triggers the reflex.⁷

-  Instruct in proper use, side effects, and adverse reactions of antiemetic medications. *Enhances client safety and effective management of condition.*
-  Discuss appropriate use of over-the-counter medications and herbal products (e.g., Dramamine, antacids, antiflatulents, ginger) or the use of THC (Marinol).^{5,7}
-  Encourage use of nonpharmacological interventions. *Activities such as self-hypnosis, progressive muscle relaxation, biofeedback, guided imagery, and systemic desensitization promote relaxation, refocus client's attention, increase sense of control, and decrease feelings of helplessness.*⁶
- Advise client/significant other to prepare and freeze meals in advance, have someone else cook, or use microwave or oven instead of stove-top cooking for days when nausea is severe or cooking is impossible, as with chemotherapy/radiation therapy.⁷
- Suggest wearing loose-fitting clothing *to reduce pressure on abdomen if that is causing or exacerbating nausea.*⁷
- Recommend recording weight weekly, if appropriate, *to help monitor fluid and nutritional status.*
- Identify signs requiring immediate notification of healthcare provider (e.g., emesis appears bloody, black, or like coffee grounds; feeling faint) *to facilitate timely evaluation and intervention.*⁷
-  Review signs of dehydration and emphasize importance of replacing fluids and/or electrolytes (with products such as Gatorade for adults or Pedialyte for children) if vomiting occurs, especially in young children or frail elderly. *Increases likelihood of preventing potentially serious complications.*⁵

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings, including individual factors causing nausea.
- Baseline periodic weight, vital signs.
- Specific client preferences for nutritional intake.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Response to medication.
- Attainment or progress toward desired outcome(s).
- Modifications to plan of care.

Discharge Planning

- Individual long-term needs, noting who is responsible for actions to be taken.
- Specific referrals made.

Neonatal Abstinence Syndrome

Taxonomy II: Coping/Stress Tolerance—Class 3 Neurobehavioral Stress (00134) [Diagnostic Division: Safety], Approved 2016

DEFINITION: A constellation of withdrawal symptoms observed in newborns as a result of in-utero exposure to addicting substances or as a consequence of postnatal pharmacological pain management

RELATED FACTORS

To Be Developed

DEFINING CHARACTERISTICS

Objective

Disorganized infant behavior; neurobehavioral stress; risk for impaired attachment

Disturbed sleep pattern; impaired comfort

Risk for aspiration: ineffective infant feeding pattern

Diarrhea

Risk for imbalanced body temperature

Risk for impaired skin integrity

Risk for injury

At Risk Population: In-utero substance exposure secondary to maternal substance use

Iatrogenic substance exposure for pain control following a critical illness or surgery

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample NOC linkages:

Substance Withdrawal Severity: Severity of signs and symptoms of withdrawal from addictive drugs, tobacco, alcohol

Newborn Adaptation: Adaptive response to the extrauterine environment by a physiologically mature newborn during the first 28 days of life

Infant Will (Include Specific Time Frame)

- Be free of adverse effects of substance withdrawal, e.g., irritability, tremors, vomiting, diarrhea, difficulty sleeping.
- Demonstrate feeding tolerance, appropriate weight gain, physiological stability with normal vital signs.
- Display neurobehavioral recovery as evidenced by reaching full alert state, responds to social stimuli, is consoled with appropriate measures.

Sample NOC linkages:

Drug Abuse Cessation Behavior: Personal actions to eliminate drug use that poses a threat to health

Family Participation in Professional Care: Capacity of a family to be involved in decision-making, care delivery, and evaluation of care provided by healthcare personnel

PARENT(S) Will (Include Specific Time Frame)

- Engage in behavior/lifestyle changes to eliminate substance use.
- Use available personal, professional, and community resources.
- Provide safe/growth promoting environment for child.

(continues on page 576)

Neonatal Abstinence Syndrome (continued)

ACTIONS/INTERVENTIONS

Sample NIC linkages:

Substance Use Treatment: Drug Withdrawal: Care of patient experiencing drug detoxification

Infant Care: Newborn: Provision of care to the infant during the transition from birth to extrauterine life and subsequent period of stabilization

NURSING PRIORITY NO. 1 To determine degree of impairment:

- Note maternal risks for fetal well-being including substance(s) used, dose, duration (especially last week before delivery), route; presence of infections. *Maternal IV drug use associated with increased risk of infections (e.g., HIV, hepatitis B, hepatitis C) requiring additional testing/surveillance and treatment. Note: Maternal self-report of substance use may understate fetal exposure by as much as 44%.³*
-  Review maternal urine/drug screen. *Individual more likely to use more than one substance, complicating treatment. Use of opiates within 1 week of delivery causes withdrawal in over half of infants exposed prenatally. Exposure to amphetamines, cocaine, marijuana, and alcohol are associated with long-term problems. Note: Symptoms and timing of occurrence depend on type of substance(s) used and last dose.^{1,2}*
- Note fetal status—full term or premature birth. *Preterm infants have lower risk for, or less severe, symptoms and tend to recover more quickly if no other complications present. Longer gestation with increased permeability of placental barrier can increase fetal exposure to drugs.^{2,4}*
-  Obtain urine and/or meconium samples for toxicology screen. *Urine sample reflects last several days of exposure while meconium is more sensitive with longer window of detection—from 20 weeks' gestation.^{1,5}*
- Monitor for signs/symptoms of fetal abstinence syndrome (FAS), such as excessive high-pitched cry, problems with sleep, feeding difficulties, tremors, frequent yawning and sneezing, vomiting, and diarrhea. *Onset of symptoms reflecting dysregulation in central, autonomic, and gastrointestinal system function is varied based on substance(s) used, possibly appearing as early as 24 hr or delayed for 10 days, and require supportive interventions.^{2,4,5}*
-  Screen neonate at birth using standardized tool such as Finnegan Neonatal Abstinence Scoring form. Repeat evaluation every 3 to 4 hr when infant is awake. *Baseline used for comparison of subsequent tests with usually two or three consecutive scores of eight or above indicating need for pharmacological therapy. Scores assist in monitoring, titrating, and termination of therapy. Note: Scoring may not be useful in preterm infants as delayed CNS development impacts score.^{3,5}*

NURSING PRIORITY NO. 2 To facilitate safe withdrawal from substance(s):

-  Coordinate interdisciplinary team (e.g., neonatologist, pediatrician, nutritionist). *To address immediate needs of infant during withdrawal process.³*
- Encourage rooming in as appropriate. *Promotes attachment and greater maternal involvement in infant's care, improves breastfeeding outcomes, may reduce need for pharmacological therapy, and shortens length of hospital stay.^{3,5}*
-  Support breastfeeding efforts. Refer to lactation consultant as needed. *Confers immunological benefits to neonate, enhances bonding, and may lower Finnegan scores during first 9 days of life. Note: Not recommended in presence of HIV infection or presence of additional drug use except in maternal methadone therapy.^{3,4}*
- Provide comfort measures based on individual needs: *Generally first option in treatment and may be sufficient in cases of mild withdrawal.^{1,3,5}*
Swaddling in blanket provides containment boundaries, enhances sleep.
Kangaroo (skin-to-skin) care may enhance neurophysiological organization.

Gentle rocking of infant.

Lower light and noise levels *to minimize excess environmental stimuli.*

Frequent, demand feedings.

Pacifier for non-nutritive sucking.

Waterbed, but avoid oscillating bed.

Avoid unnecessary handling or awakening sleeping infant.

- Monitor vital signs, intake/output, weight. *Poor feeding efforts, vomiting, excessive diarrhea may result in dehydration.*
- Provide high-calorie (150–250 Kcal/kg/24 hr), small, more frequent feeding if infant not breastfeeding. *May be necessary to minimize weight loss, promote growth during significant withdrawal.*³
- Provide meticulous skin care. *Skin irritation from restlessness/agitation and excessive diarrhea requires careful cleaning and skin barrier creams to prevent breakdown.*
- Administer intravenous fluids (IV) as needed. *May be required to prevent dehydration or electrolyte imbalance.*²
-  Administer medication(s) for withdrawal when supportive measures fail to improve or correct symptoms, withdrawal scores remain high, seizures develop, or presence of severe dehydration, vomiting and/or diarrhea.^{3,5}
- Morphine (i.e., dilute tincture of opium)—administered orally, most commonly preferred medication for treatment of opioid withdrawal.
- Methadone—alternative to morphine and may shorten length of opioid withdrawal.
- Buprenorphine—may have shorter duration and hospital stay than treatment with oral morphine, approved for outpatient/post-discharge therapy due to characteristics of decreased respiratory and cardiovascular side effects.
- Phenobarbital—preferred for treatment of nonopiate and polydrug exposure.
- Clonidine—second-line treatment for symptoms refractory to opioid therapy.
-  Wean from medication as indicated. *Once withdrawal scores decline and symptoms able to be managed by comfort measures, a modified protocol can be initiated to decrease pharmacological therapy. Note: Protocol can be extended for 3 weeks or more depending on infant's needs.*⁴

NURSING PRIORITY NO. 3 To promote optimal wellness (Teaching/Discharge Considerations):

-  Interact with expand interdisciplinary team to include substance abuse counselor, social worker, child development specialist, etc. *Provides support for mother/family in preparation for discharge and future care needs of infant.*³
- Develop trusting relationship, project an accepting attitude about substance use. *Encourages maternal participation, provides client a sense of humanness, helping to decrease paranoia and distrust. (Client will be able to detect biased or condescending attitude of caregivers, negatively impacting relationship.)*⁵
- Determine parents' understanding of current situation. *Provides information about degree of denial, acceptance of personal responsibility and commitment to change.*
- Provide information to parents in multiple modes reviewing general infant care and long-term needs specific to substances used. *For example: Methadone exposure associated with increased motor rigidity and dysregulated motor patterns, can persist into toddlerhood and is associated with decreased attention span, impaired social responsibility with poor social engagement. Cocaine use can result in poor fetal growth, developmental delays, learning disabilities, and lower IQ.*^{4,5}
-  Stress importance/develop schedule for follow-up monitoring. *Necessary evaluations include neurodevelopmental assessments to monitor motor deficits, cognitive delays, or relative microcephaly; psychobehavioral assessments for hyperactivity, impulsivity, attention-deficit in preschool-aged child and behavioral problems in school-aged children; growth/nutritional assessment for short stature and failure to thrive.*⁵
- Perform home visit to determine safety of environment. *Optimum home environment required for global development and well-being of infant.*⁵
-  Encourage continued involvement of mother in peer group therapy, individual/family counseling, drug recovery education programs. *Provides follow-up support to maintain mother's sobriety.*

- Identify community/social assistance resources, e.g., safe housing, food pantry, licensed day care, transportation, medical care. *Provides for basic human needs of infant and family, enhances maternal coping abilities, decreases risk of relapse and possible abusive situation.*

DOCUMENTATION FOCUS

Assessment/Reassessment

- Individual findings including general health status or infant, comorbidities, signs/stage of withdrawal.
- Maternal substance(s) used, route, dose, frequency, last dose.
- Results of laboratory tests/diagnostic studies.
- Parent(s) attachment, involvement in care.

Planning

- Plan of care and who is involved in planning.
- Teaching plan.
- Plan for maternal sobriety.

Implementation/Evaluation

- Response to interventions, teaching, and actions performed.
- Attainment or progress toward desired outcomes.
- Modifications to plan.

Discharge Planning

- Long-term needs and who is responsible for actions to be taken.
- Specific referrals made.

risk for peripheral Neurovascular Dysfunction

Taxonomy II: Safety/Protection—Class 2 Physical Injury (00086) [Diagnostic Division: Neurosensory], Approved 1992; Revised 2013, 2017

DEFINITION: Susceptible to disruption in the circulation, sensation, and motion of an extremity, which may compromise health.

RISK FACTORS

To Be Developed

Associated Condition: Burn injury; trauma; vascular obstruction

Fracture; immobilization; orthopedic surgery

Mechanical compression [e.g., tourniquet, cane, cast, brace, dressing, restraint]

Sample Clinical Applications: Traumatic injuries, burns, joint replacement, laminectomy, deep vein thrombosis (DVT), peripheral vascular obstruction; compartment syndrome

DESIRED OUTCOMES/EVALUATION CRITERIA

Sample **NOC** linkages:

Tissue Perfusion: Peripheral: Adequacy of blood flow through the small vessels of the extremities to maintain tissue function

Neurological Status: Peripheral: Ability of the peripheral nervous system to transmit impulses to and from the central nervous system (CNS)

Risk Control: Personal actions to understand, prevent, eliminate, or reduce modifiable health threats

Client Will (Include Specific Time Frame)

- Maintain function as evidenced by sensation and movement within normal range for individual.
- Identify individual risk factors.
- Demonstrate and participate in behaviors and activities to prevent complications.
- Relate signs/symptoms that require medical reevaluation.

ACTIONS/INTERVENTIONS

Sample **NIC** linkages:
