Stunting is an unhealthy condition related to past health deficiencies, so it is a persistent health problem, so it is a constant health problem. The purpose of this observation was to see the relationship between giving PMT biscuits and the incidence of stunting at Posyandu, Karang Rejo Village, Stabat District, Langkat Regency. . This type of research is cross sectional and uses secondary and primary data with a sample size of children aged 24-36 months who come the Karang Rejo Village Posyandu numbered 30 respondents. The analysis used with the *chisquare* test a 95% confidence level showed that the probability value was significant (Asymp. Sig), the *chi-square* test showed a = 0,000 which means it was smaller than the x value (0,005). From the result this study it was concluded that there is a relationship between giving PMT biscuits and the incidence of stunting.

Stunting adalah keadaan tidak sehat yang berhubungan dengan kekurangan kesehatan di masa lalu, sehingga merupakan masalah sehat yang terus-menerus. Tujuan observasi ini untuk melihat hubungan pemberian biscuit PMT dengan kejadian stunting di Posyandu Desa Karang Rejo Kecamatan Stabat Kabupaten Langkat. Jenis observasi ialah menggunakan *cross sectional* dan menggunakan data sekunder dan data primer dengan jumlah sampel anak usia 24-36 bulan yang datang ke Posyandu Desa Karang Rejo berjumlah 30 responden. Analisa yang dipakai dengan uji *chi-square* pada tingkat kepastian 95% membuktikan bahwa nilai signifikan probabilitas (*Asymp. Sig*), uji *chi-square* membuktikan $\alpha=0,000$ berarti lebih kecil dari α value (0,005). Dari hasil observasi ini disimpulkan adanya hubungan pemberian biscuit PMT dengan kejadian stunting.
