

Bedrosians®
TILE • STONE

Master Catalog

Redefining the Look of Luxury
With the highest quality of products

Icon System

Made in U.S.A.

Made in Japan

Ink Jet:

Detailed imaging printed directly to the tile surface.

Rectified Edge:

Tile is cut to a specific size.

Made in China

Exterior Product:

Product may be used in an outdoor application.

Pre Recycled:

Product uses Pre Consumer Recycled material.

Chiseled Edge:

Tile edge is mechanically chipped.

Made in Italy

Glazed Color Body Porcelain:

The tile body matches the color of the glaze.

Post Recycle:

Product uses Post Consumer Recycled material.

Versailles Pattern:

Multi-sized tile floor layout.

Made in Turkey

Glazed Porcelain:

Glaze is baked into the surface to give the tile its final color.

ADA Accessibility:

Compliant with ADA Standards.

Made in Mexico

Unglazed Thru Body Porcelain:

The color runs thru the tile's thickness. Tile surface is uncoated.

Coefficient of Friction:

Compliant with ADA Standards.

Bedrosians products strive to meet the highest standards of the USGBC. This allows Bedrosians customers through various product selection to earn LEED points on their projects and help build towards a cleaner environment for future generations.

Some of Bedrosians vendors have achieved GREENGUARD Indoor Air Quality and GREENGUARD Children & School's Certifications. GREENGUARD Certifications verify that our products meet some of the most stringent indoor air emission standards, and by doing so enable us to differentiate our products in the marketplace. Architects, designers, product specifiers and consumers recognize the GREENGUARD mark and select GREENGUARD certified products and materials to assure the best air quality for their indoor environment. Moreover, GREENGUARD Certified products are recognized as criteria for several different points in the USGBC's LEED Green Building Rating System.

Porcelain tile is defined as an impervious tile with a water absorption of 0.5% or less as measured by the ASTM C373 test method. There are, however, many instances in which tile not meeting this standard is advertised and sold as porcelain tile. Marketplace confusion, installation problems and even liability concerns can result when non-porcelain tile is misrepresented in the marketplace.

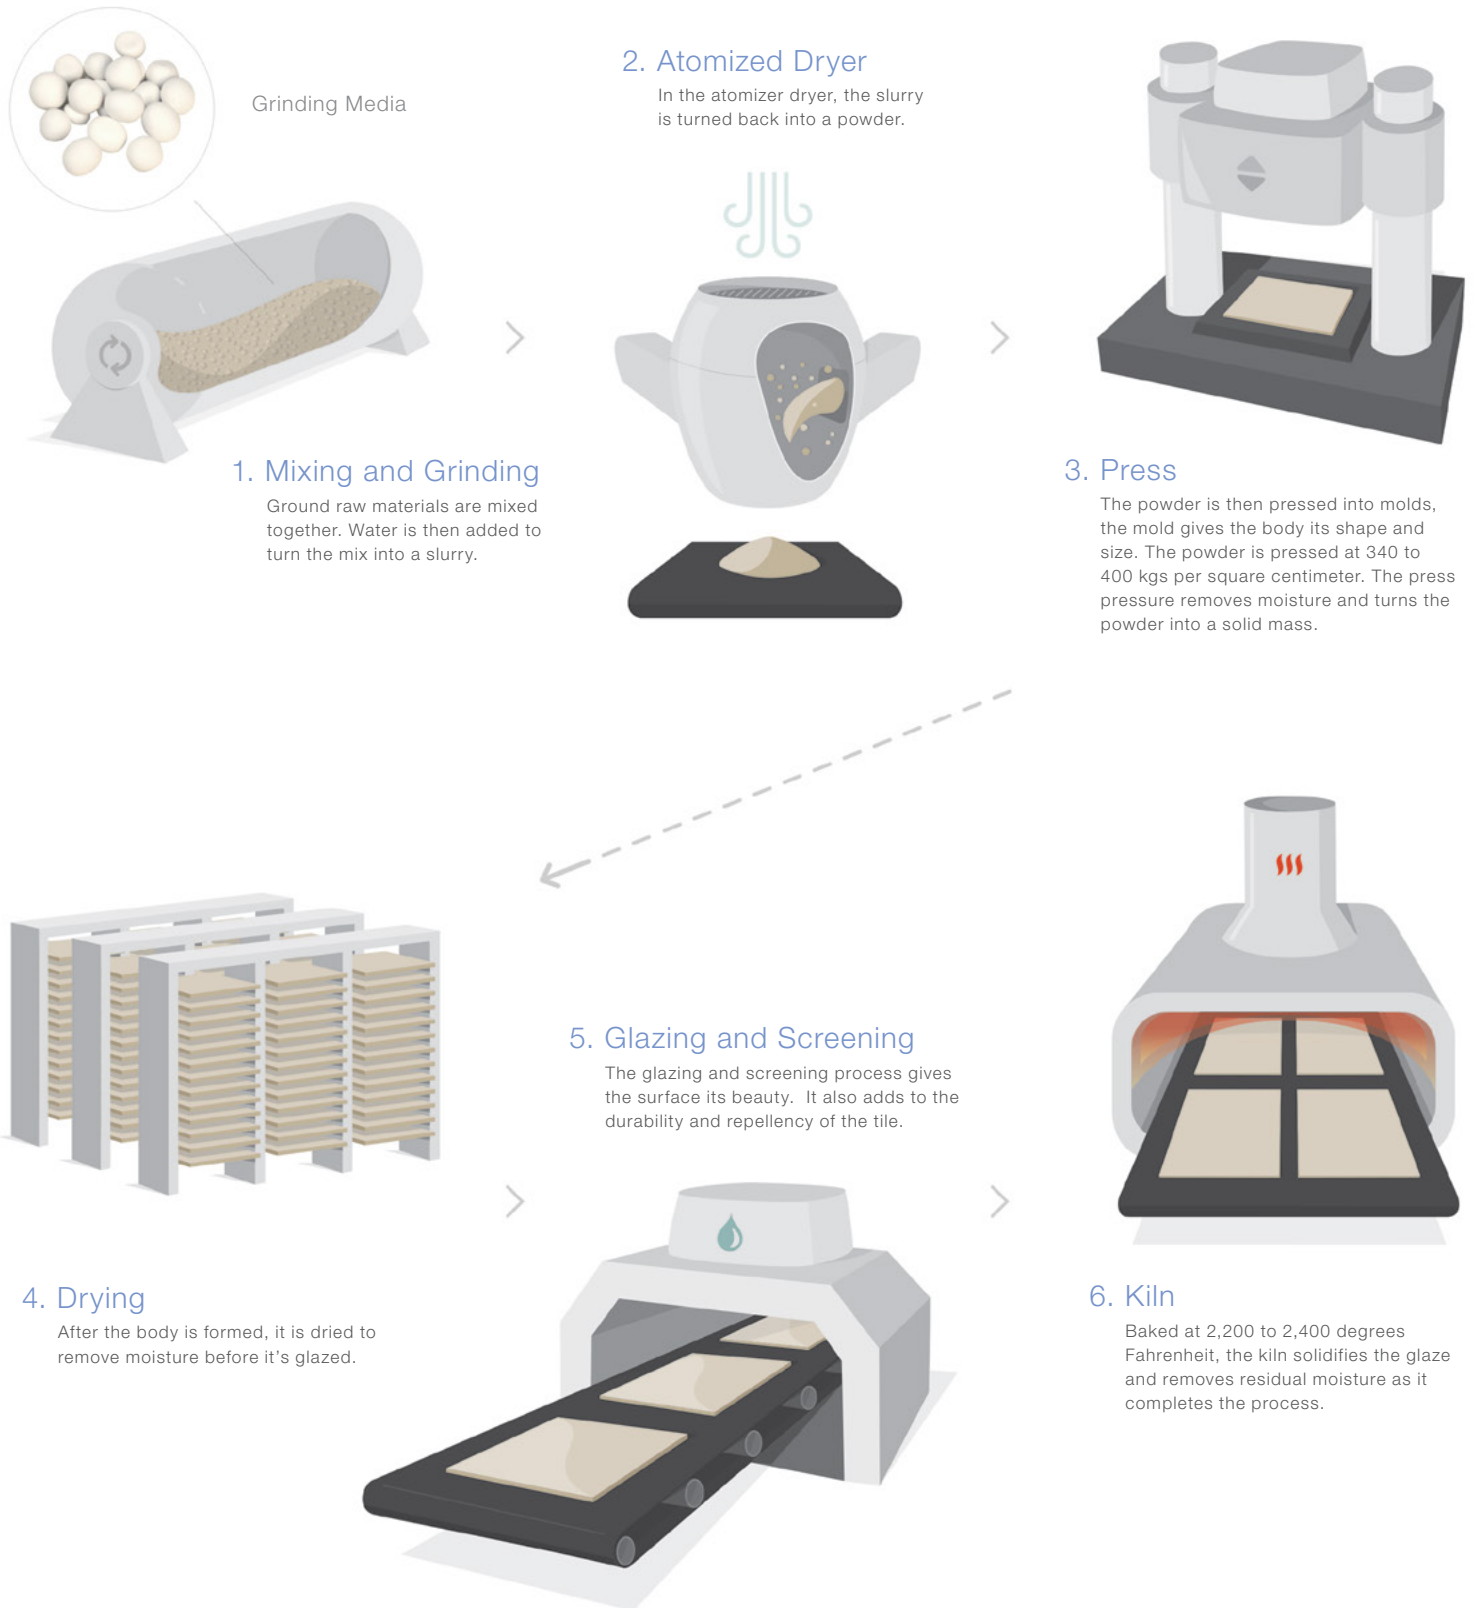

Commercial Approved Porcelain.

How it's Made

The process of making porcelain tile starts with raw and recycled materials.

The materials are ground, mixed, turned to a liquid slurry and then back to a powder.

Then they're pressed, dried, glazed, and fired to get the final product.

Pigment Mix

Base colors mixed together to create an endless amount of clay colors for thru and color bodied tiles.

Glazed Coating

For tiles with a glazed coat, a glass like substance can be added to the surface of the tile by spray, screening, waterfall, inkjet or dry glaze methods

Thru Body Tile

The top of the tile is the same color and composition as the entire body of the tile. It is unglazed. Color pigments are added to the raw materials to get the color.

The Core Ingredients

Feldspar

Feldspar is a collection of crystallized minerals used to make glass and ceramic products.

Recycled vMaterial

Recycled glass and clay products are crushed and mixed in with the raw materials.

Clay

White, illitic and kaolinitic clays are used in tile making process. Other raw materials are mixed with these clays to make the body of the tile.

Minerals

Calcite, Dolomite and other minerals are added to the raw materials.

Types of Tiles

Double Loaded Tile

A double loaded porcelain tile has an unglazed "thru body" top that's pressed into a "color body" base (bottom).

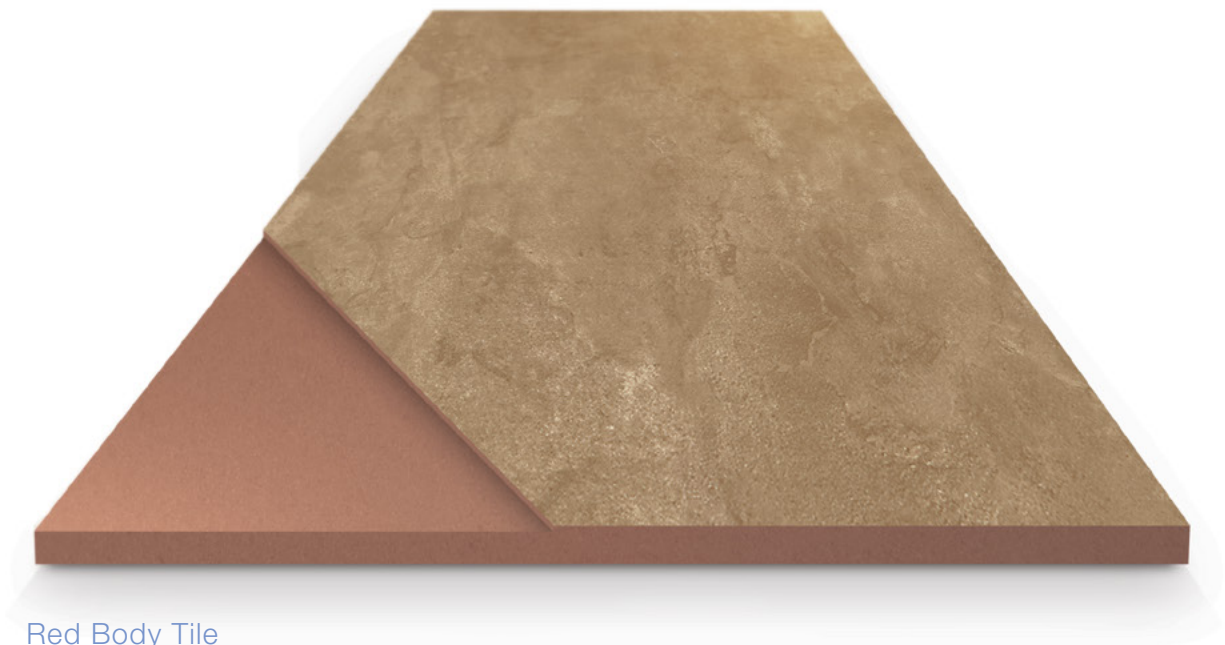

White Body Tile

A glazed tile that uses specific raw materials to produce a white colored body.

Color Body Tile

The body of the tile is colored to match the glaze on the top. The body is made that way by using color pigments in the raw materials.

Red Body Tile

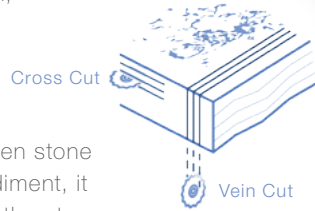

A glazed tile that uses specific raw materials to produce a red colored body.

Natural Stone

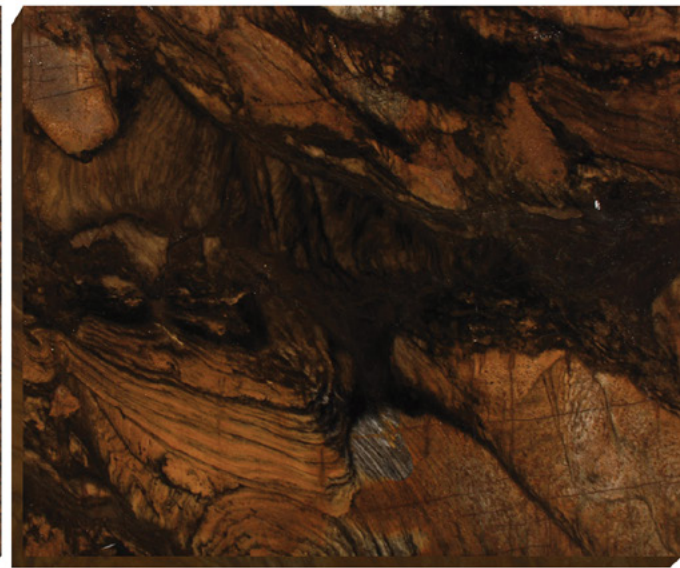

Interior designers and architects are consistently challenged with finding the right solutions to bring their client's vision to life. It's not just color, patterns, finish and materials; it's also about textural elements that anchor the overall design. In natural stone flooring, the right "cut" is a part of this matrix.

Traditionally, natural stone is cut across the grain, known as "cross-cut." It exposes a pattern with holes and cavities in the stone that are formed by gas escaping during its' formation.

There is however, an alternative procedure. When stone is cut in the same direction as the layers of sediment, it reveals elongated striations along the length of the stone, known as "vein-cut".

Vein Cut

Cross Cut

Book Matching

Granite

A very hard, crystalline, igneous rock, gray to pink in color, composed of feldspar, quartz, and lesser amounts of dark ferromagnesian materials. Gneiss and black "granites" are similar to true granites in structure and texture, but are composed of different minerals.

Quartzite

An extremely compact, hard, granular rock consisting essentially of quartz. It often occurs as silicified sandstone, as in sarsen stones.

Onyx

Onyx is a sedimentary rock, formed as stalactites and stalagmites in cave interiors. This formation method results in the cryptocrystalline construction of the rock fabric, and it is the size and uniformity of these crystals that contribute to the classic translucent property of most onyx varieties.

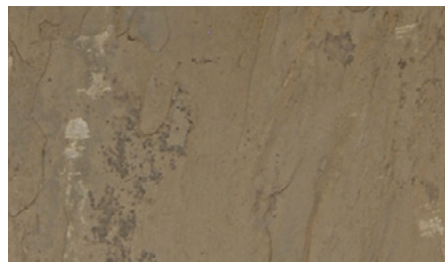

Limestone

A hard sedimentary rock, composed mainly of calcium carbonate or dolomite, used as building material and in the making of cement.

Schist

The more common schists are composed of mica-like minerals (such as chlorite) and generally contain subordinate quartz and/or feldspar of a comparatively fine-grained texture; all gradations exist between schist and gneiss (coarsely foliated feldspathic rocks).

Slate

Slate is a fine-grained, homogeneous rock composed of clay or volcanic ash which has been metamorphosed (foliated) in layers. Popularity stems from the variety of colors and textures available. Appearance of slate is varied, and no piece is exactly the same. Unique, sophisticated, & elegant.

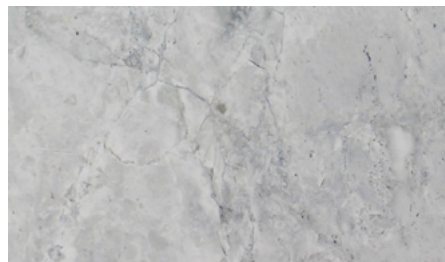

Soapstone

A talc-rich stone with a "soapy" feel, used for hearths, tabletops, chemical-resistant laboratory tops, stove facings, and cladding; known for its heat, chemical, and stain resistant properties.

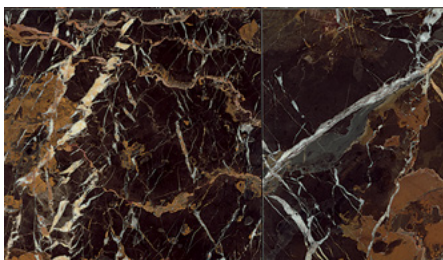

Travertine

Travertine is a natural stone material from the limestone family. It is made of calcium carbonate and is usually found in the form of deposits near warm of hot springs.

Dolomite

The mineral form of calcium magnesium carbonate. A crystalline variety of limestone containing in excess of 40 percent magnesium carbonate as the dolomite molecule.

Marble

A metamorphic crystalline rock composed predominantly of crystalline grains of calcite, dolomite, or serpentine, and capable of taking a polish.

Basalt

A dark colored, igneous rock commercially known as granite when fabricated as dimension stone. The fine-grained and extrusive equivalent of gabbro.

Discover

EXPRESS Quartz is a quartz surface composed of 93% natural quartz and high quality polymer resin & pigments. It is compacted under extreme vibration, vacuum and pressure into impenetrable, non-porous and homogenous slab. Available in a spectrum of colors, EXPRESS Quartz is ideal for a wide range of interior applications in residential, commercial and hospitality.

Maintenance

Quantra requires minimum maintenance due to its properties. Sealing is not required at any time. Regular cleaning with water and mild soap is enough to maintain the beauty of quantra for many years.

Advantages

Access to the best quality raw material from all over the world.

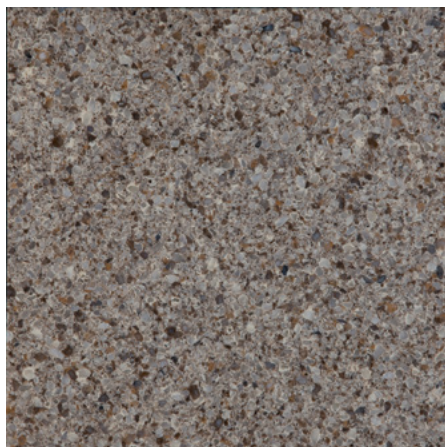

Dedicated fabrication shop for cut to size orders with the capability to provide all the available edge finishes.

Capability to produce the largest slab size in the market (130"x65").

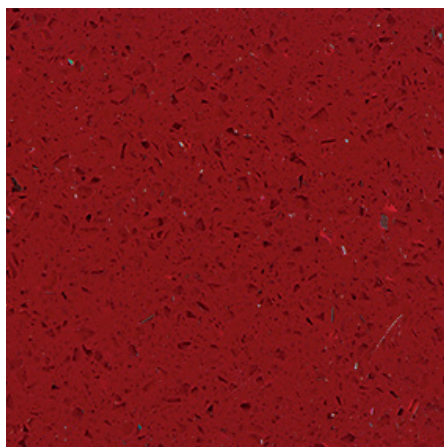

Latest machinery to offer you the latest and unique aesthetic effects.

Dedicated tile line to produce not only standard sizes but also custom size tiles in 12mm thickness.

Photo features Mirage Tan 12"x24" Pool Coping.

The following is a general guide for the appropriate application for natural stone. Please consult with your sales representative before finalizing your selections.

Symbol Key

Not recommended in areas that experience frequent wet conditions.

Not recommended for use in pools and spas.

White thin-set or mortar is required.

May be used outside in areas that experience freeze/thaw conditions.

Must be installed with water-free epoxy thin-set. Do not use any setting material in which water must be used.

May contain areas of open or dry seams that need to be filled either at the factory or with grout. Over time the fill can work its way out of the voids. In these instances it may be necessary to refill the voids.

Application

Light Duty

Suitable for interior vertical surfaces. This may include commercial applications depending on the intended use of the space.

Medium Duty

Suitable for residential applications. This includes floors, walls, countertops, bathrooms and shower enclosures.

Heavy Duty

Suitable for exterior and interior commercial applications.

Commercial Duty

Suitable for all applications.

Color & Shade Variation

Low

Differences among pieces from the same production run are minimal.

Medium

Clearly distinguishable differences in texture and or pattern within similar color.

High

While the colors present on a single piece of tile will be indicative of the colors to be expected on the other tiles, the amount of colors on each piece may vary significantly.

Random

Variegated in color and veining. Blending allowances during installation are strongly recommended.

Test Results

About ASTM

ASTM International (ASTM), is a globally recognized leader in the development and delivery of international voluntary consensus standards. Today, some 12,000 ASTM standards are used around the world to improve product quality, enhance safety, facilitate market access and trade, and build consumer confidence.

Standard Test Method for Breaking Strength of Porcelain Tile ASTM C648

This test method is intended for testing porcelain tile that is to be used for food counters, lavatories, and similar residential, medical, and commercial installations, where they may come in contact with food, chemical, and waste substances and for tile in areas exposed to contact with strong cleaning agents.

Standard Test Method for Water Absorption ASTM C373

Measurement of density, porosity, and specific gravity is a tool for determining the degree of maturation of a ceramic body, or for determining structural properties that may be required for a given application.

Impervious	Tiles exhibiting 0.5% or less
Vitreous	Tiles exhibiting more than 0.5% but not more than 3.0%
Semi - Vitreous	Tiles exhibiting more than 3.0% but not more than 7.0%
Non a- Vitreous	Tiles exhibiting more than 7.0%

Chemical Resistance, ASTM C650

This test method is intended for testing the chemical resistance the porcelain tile.

PEI Rating, ASTM C1027

This test method is intended for testing the PEI rating of the porcelain tile. See chart below:

Class	1	Decorative Tile
	2	Residential and Commercial Wall: Bare Floor Traffic
	3	All Residential and Light Commercial Floors
	4	Medium Commercial & Light Industrial, Institutional, Moderate Soling
	5	Heavy & Extra - Heavy Traffic, Abrasive Dirt

Scratch Hardness (MOH'S Hardness Scale)

- 1

Talc
Softest mineral. Easily scratched by a fingernail.
- 2

Gypsum
Hydrous calcium sulfate. Fingernail will also scratch this mineral.
- 3

Calcite
Calcium carbonate in limestone. Scratched by a copper coin.
- 4

Apatite
Calcium phosphate with a bit of fluorine. Will scratch with a knife or glass.
- 5

Fluorite
Calcium fluoride, scratched by knife blade or window glass.
- 6

Feldspar
Most abundant group of minerals in the Earth's crust. Harder to scratch than apatite.
- 7

Quartz
The most common mineral of the continental crust, harder than feldspar.
- 8

Topaz
Hardest silicate mineral. The third hardest mineral.
- 9

Corundum
The second hardest mineral. Red is called a ruby. Very hard to scratch.
- 10

Diamond
Hardest mineral on Earth. Scratches all common minerals.

Product Care

Initial Cleaning During Installation

As with any flooring material, the most important step in the care and maintenance of your porcelain floor is the initial cleaning. The single most important step in caring for your floor is to complete the removal of the setting material, grout residue, and/or any construction residue from the surface of the tiles before they have a chance to dry. In most cases, porcelain tiles can be cleaned successfully by scrubbing the installation with a “neutral detergent cleaner” followed by a thorough rinsing. If a grout residue still remains, rinse further, cleaning the tile several times with clean water to be certain you have removed traces of grout residue from the surface of the tiles. Grout manufacturers have printed detailed instructions for the proper cleaning of grout residues available. The grout manufacturers directions should be followed if a grout film is present on the surface of the porcelain tiles. Once the initial cleaning process has been completed, the porcelain tiles just need to be swept or vacuumed and damp mopped with a “neutral detergent cleaner” followed by a thorough rinsing.

Second Cleaning During Installation

It is recommended that a test patch be done prior to grouting the installation to determine if contaminations of grout pigment will occur on the tile – especially when using light colored tiles or polished tiles that are to be grouted with a dark contrasting colored grout, or when dark colored tiles are to be grouted with a light colored grout. If discoloration does not occur on the surface of the tile, proceed with grouting. If discoloration does occur, it is recommended to request from the grout manufacturer a proper procedure for the protection of this surface.

Glazed, Matte, Honed and Textured Tiles

Bedrosians porcelain tile products do not require the use of sealers, surface coating or waxes on the glazed, matte, honed and textured porcelain tiles. In fact, the surface of the matte series is so smooth and non-absorbing, that stain test results show that Bedrosians porcelain tiles are virtually stain resistant. Applying a sealer or surface coating to matte finish porcelain tiles will only add unnecessary steps to the overall maintenance program, without enhancing the overall appearance of the tile. The use of sealers on impervious porcelain paver tiles will turn a low-maintenance tile into labor intensive high-maintenance tile, and in most cases these applied surface sealers on matte porcelain tiles change and/or diminish the slip resistance of the porcelain tile.

Proper Care During the Construction Phase

Like any other finished material, Bedrosians porcelain tiles are viewed as a finish flooring material. We strongly recommend that a protective cover such as cardboard, construction paper, plywood, and/or other covering which will protect the porcelain tile during the initial construction phase be used. The use of plastic as a cover is not recommended since plastic becomes slippery when construction residue comes in contact with the plastic. In addition, plastic has a tendency to delay the natural curing process of the thin-set and/or grout.

Polished Maintenance

In the event that a polished finish is used in an area prone to excessive spills or dirt, it may be advisable to treat the tile with a penetrating-type sealer. During the polishing process, microscopic pores are sometimes exposed. Although the pores are shallow, spills can fill them making standard cleaning procedures inadequate. By using a penetrating-type sealer, these microscopic pores are filled preventing stains from setting in. A penetrating-type sealer is designed only to fill pores, not to coat the tile surface. You will not alter the polished tiles appearance, provided a recommended sealer is used and applied according to the manufacturer's instructions.

Daily Maintenance

As with any flooring material, general maintenance and cleaning varies depending on the surface, texture of the tile and surface contaminate. Generally, neutral cleaners are more than sufficient to clean and maintain porcelain tiles. It's important that the cleaner used is a non-oil, non-soap, and non-animal fat based product. These cleaners have a tendency to act like a magnet and attract dirt and dust due to the residue build-up left behind during the clean up. Generally water and a soft sponge will remove most contaminants from your porcelain tile. If a cleaning product other than water is used for general cleaning only, a neutral PH cleaner (with the characteristics described above) should be used. These neutral PH cleaners are available from most sealer manufacturers and can be found at a local hardware store or tile distributor. Cleaners such as Formula 409, Fantastik, or Windex can sometimes be used on unsealed tiles, but most are alkaline in nature and could attack the surface finish. If using a cleaner such as this, always test a small area first. If you are not able to remedy the situation using the materials above, refer to the Heavy Duty Maintenance section of the Product Care Section.

Heavy Duty Maintenance

If contaminants occur as a result of more than daily routine activities, the use of a stronger cleaning product may be needed. Use caution in selecting the product for heavy duty cleaning; Many chemicals can damage items of the installation or near the installation, as well as discolor and/or stain certain types of tiles. Porcelain tiles are the most durable tiles available. However, we do not test every chemical made, and therefore a test area is needed to confirm that the product selected is suitable for the removal of the contaminant in question. Please refer to the Stain Removal Guide for information about particular stains and manufacturer information. The information listed is only a guide. For more specific information, please contact one of the manufacturers. Always follow the directions from the manufacturer of the cleaning product you intend to use.

Please Note: Acid washing is rarely recommended. Acid or acid based cleaners should not be used to clean a grout residue. Some acids can burn non-epoxy or cementitious grouts and leave a white film that is almost impossible to remove. Also, the use of certain acid solutions can structurally weaken the grout in the joint of the tile. If in the event a mild solution of sulfamic or phosphoric acid based cleaner is needed, carefully read the manufacturers instructions.

Our Clients

Our top priority is to make sure we fulfill our client's top priorities and make a difference in their business. In delivering outstanding expertise and customer service, we bring value to our clients by developing a partnership where every decision is based on a deep knowledge of their needs. Bedrosians Tile and Stone is dedicated to ensuring the satisfaction of our clients by not only meeting, but exceeding their expectations.

A modern living room interior featuring a large wall of dark, vertical stone panels. A long, low fireplace is built into the base of the stone wall, with a fire burning inside. In the foreground, a low, rectangular coffee table with a light-colored top and dark frame sits on a floor of large, light-colored stone tiles. A black leather armchair is partially visible on the right. In the background, a large window with horizontal blinds looks out onto a green landscape. A black track lighting fixture is mounted on the ceiling.
