

NUKEPROOF REACTOR EXTREME

£249.99 High performance light

THIS LIGHT IS made by LUU technologies for Nukeproof. We reviewed LUU's own version last issue and it performed well, but this model has a new and updated driver (the electronics bit that makes the LED light up), and uses a 'D bin' LED, which is capable of emitting more light than the more commonly used C bin. We measured it after five charge and discharge cycles of the battery and it was putting out a solid 889 lumens, which is very good. On unlit roads at night the lowest power setting (12.3hr run time) is more than enough for

making good progress, and stepping up to the mid-level power (6.2hr run time) means you can hammer along at quite a pace. If you really want to see your way though, switch to full power (3.8hr run time). The whole thing comes in a glorified biscuit tin (fits most cakes) with bar mount, helmet mount, charger, battery and strap, long and short power leads and the lamp unit. There are also two different diffusers as well as the one pre-installed in the lamp, so you can change the beam patterns.
