Introducing a black box with a **green** heart

save water

How much water can you save? The short answer is - quite a lot! The amount of wastewater you can reuse depends on how much water you use. The average person uses about 90 litres of water a day in the shower alone, another 30 litres in washbasins and sinks, and 22 litres in clothes washing. That's already 142 litres of water a day per person in your house that your lawn and plants would love.

Data sourced from Water New Zealand Small Wastewater and Natural Systems (SWANS) quarterly publication

save money

The WaterMate feeds directly and automatically into a drip feed system whenever greywater is available. This means that maintaining your garden takes literally no time at all, and your plants enjoy a steady, continuous water supply.

Your water footprint is becoming increasingly important as a measurement of sustainability. The WaterMate provides you with a 100% recycled and environmentally sustainable water source all year round. The drip feed system that the WaterMate feeds into provides a virtually run-off free method of irrigation as well as minimising evaporation for maximum efficiency.

save time

A summer garden or lawn can drink thousands of litres of water every week. If it's coming straight out of the hose then your water meter will be humming. Using a recycled water source to feed those thirsty plants makes environmental and economic sense.

save the planet

Every day, households tip out 430-500 litres of greywater.

Every time you take a shower or wash clothes a tremendous amount of water goes down the drain and into your sewerage system - water that could be keeping your grass green and flowers blooming. Enter the WaterMate, a device proven in 40 countries to filter and clean approximately two thirds of your wastewater ready for use in your drip feeder irrigation system.

Anyone living in an area with water restrictions in the summer knows how barren your lawn and garden become after only a few days without moisture. The WaterMate can deliver irrigation to a 100 square metre area, giving you a completely safe, clean and environmentally conscious way to keep your garden looking lush all year round.

How it works

1

Greywater from showers, basins and washing machines is diverted from your drain to the WaterMate.

2

The WaterMate automatically detects water flow and starts filtering foreign particles out of the liquid.

3

The filtered water is pumped into your garden irrigation system and delivered directly to lawns and plants as they need it.
