

User registration made easy

InAlias Self-registration

Users register to access the WebNative® asset management site via a standard web form. Requests are submitted once the client provides a username, password and email address. The accounts are created automatically and a confirmation email is immediately sent to the user. Creating users for WebNative® has never been so fast, efficient and easy!

InPress Systems' InAlias plugin introduces an on-line user registration process for Xinet's WebNative®. Forgotten password retrieval, user authentication and email confirmations with InAlias make WebNative® user creation easy and secure enough for your customers to manage themselves. Maximize the power of your WebNative® server with InAlias. Save time. Make money.

InAlias Password retrieval

In today's busy world we are required to remember an overwhelming number of pin codes and passwords! InAlias has the option to include a password security question upon user registration. Can't remember your password? Simply provide your username, answer the security question and your password is quickly retrieved and sent to you once again via email.

InAlias Account approvals

Some sites may require the option to create new accounts pending approval from the site's administrator. When the user submits the web form the designated administrator receives an email notification. The administrator's one-click confirmation triggers the creation of the account, minimizing administrative work and granting the web customer immediate access to the system. More control with just one click!

InAlias in Disguise!

With InAlias you can host multiple sites on the same WebNative® server. The interface is built around standard HTML templates. It's very easy to customize, so brand it up! Each site can have it's own unique look and feel. InAlias helps you create solutions that seamlessly match your customers style and character.

InAlias Technical Details

Configuration and Branding:

MULTIPLE SITES

InAlias can maintain multiple registration sites on the same WebNative® server. Each site has its own access URL and unique configuration.

SITE BRANDING

Every site can be customized to correspond with the look and feel of the company accessing the site. InAlias is based on standard HTML pages. This makes it easy to create branded sites which seamlessly integrate into a user's website.

Control and authorization:

USERNAME CONTROL

Username entry can be controlled using input filters. For example, an input filter can require that the username be entered in the form of an email address. Username assignment can also be restricted so that the user can only select a username from a predefined set of names. It is also possible to associate a username with a predefined email address.

AUTHORIZATION STEP

InAlias allows the user to create accounts on-the-fly or via administrator authorization. If authorization is required an email notification is sent to the administrator email address configured for the site. This email contains the registration information and a link to authorize the registration.

User Handling:

FORGOTTEN PASSWORDS

If a user that is registered with InAlias forgets his password, it is possible to retrieve the password from the InAlias database. Configurable security questions can be used to retrieve passwords. Different questions or sets of questions can be used for different sites. A typical question would be "What is your pet's name?".

EMAIL NOTIFICATIONS

The user, once registered, will get an email notification that includes his account information. The email notifications are customizable and available as HTML.

CONTROLLED ACCOUNT CREATION

New accounts are based on existing accounts. A new account will inherit all the setup associated with the existing "template" account. InAlias also supports WebNative® groups and can attach new users to groups.

Platforms and Compatibility:

PLATFORMS

MacOSX, MacOSX Intel, RedHat Linux, SGI, SUN Solaris

REQUIREMENTS

Xinet FullPress® and WebNative®

COMPATIBILITY

Xinet WebNative Venture® and Portal

InPress Systems Accelerator, Tracker and InPressive

InAlias in Action!!

The Campaign:

A major American insurance company needed a site that would give field representatives nationwide the ability to login and dynamically create calendars. Their commercial printer knew that this could easily be accomplished using Accelerator from InPress.

For tracking and security reasons all users required their own personal login accounts. The insurance company client projected the creation of up to 8500 accounts.

A registration site was configured with InAlias on the WebNative® server. The users were directed to the site via the company Intranet. Users registered to the site and accounts were created automatically. About 1500 users registered and used the site to place orders for 750,000 printed calendars.

Managing Users for DAM: Retail

A print and prepress provider created a digital asset management site for their customer, a popular retail chain store. The store's headquarters needed the ability to create and delete three different types of users. Each user required a different level of access to the DAM system. Creatives needed full access to the system, CSRs needed only the ability to view files while photographers required the ability to upload files and search the database.

This was easily accomplished by giving the store's administrator access to the InAlias interface and required no help from the WebNative® server's administrator. Not only did InAlias save the provider time and money it empowered the customer by giving them the ability to manage their user access as needed without having to wait for any assistance from their vendor.
