Alignments to Content Standards: A-APR.B.3

## Task

Emery graphs the function  $f$  given by  $f(x) = (x - 1)(x + 2)(x - 50)$  on his graphing calculator and gets the following graph.

He says "so, it's an upside down parabola."

- Experiment with the viewing window to decide if Emery is correct.
- Explain how you could choose a viewing window in advance that shows the main

features of the graph.

## IM Commentary

The purpose of this task is to give students an opportunity to see and use the structure of the factored form of a polynomial (MP7). The factor  $x - 50$  tells them that they should include  $x = 50$  in the range on the  $x$ -axis. Students might also draw on their knowledge of the long run behavior of a cubic polynomial to recognize that Emery's graph must eventually return across the  $x$ -axis to the right of his current viewing window.

### Solution

a. No, the graph of a cubic polynomial is not a parabola. Here is a better viewing window:

b. Emery could have noticed that the polynomial has a factor  $x - 50$  and therefore  $y = 0$  when  $x = 50$ . This means the graph has to cross the  $x$ -axis at  $(50, 0)$ , so widening th

range on the  $x$ -axis to include  $x = 50$  gives a better graph. A good corresponding range on the  $y$ -axis can be found by trial and error, or by reasoning that at  $x = 25$  we have  $y = 24 \times 26 \times -25 \approx -25^3 \approx -16,000$ .
