

PRODUCT SUMMARY SHEET

Planting Monitor

20/20 SeedSense® Take the blindfold off.

SeedSense is the monitor that makes changes that make you money. It gives you everything you need to know about your planter's performance. Maximize your speed without compromising ride. Reduce compaction and control depth. And most of all, you can see everything you need to know about your planter, in real time.

FieldView® & FieldView® Plus Intuitive field info, on any iPad® tablet.

With FieldView, you have an instant high-definition picture of planter performance. This unprecedented view allows growers to manage the planter with an entire “field view” of planter performance. Plus, all of your field and planting data connects to SeedSense and is stored on your tablet. Furthermore, with FieldView Plus, you have access to all your information, anytime, everywhere. This wireless cloud-based system puts your data at your fingertips, and allows you to share it, all while your data is backed up securely and remotely.

Down Force

AirForce® Automatic control is in your control.

AirForce takes information from SeedSense and uses air to automatically increase or decrease the weight on the row unit. So you can ensure proper planting depth and avoid root-stunting sidewall compaction, for all planter types.

DeltaForce® Constant control for the perfect seed environment.

DeltaForce automatically controls weight on each individual row, creating the perfect seed environment. So you avoid root compaction and achieve higher yields. With an average 11.5 bushel* per acre advantage over fixed management, you can see why taking control pays off.

Meters

eSet® Every Seed. Every Time.

The new standard for seeding accuracy and flexibility, you can space precisely and harvest more by dropping a single seed, down the center, every time. It's simple ingenuity that other meters just don't have. Plus, you can handle any seed size or shape without adjustment.

vSet™ Higher accuracy. Higher yield.

Choose higher accuracy, more flexibility and longer life. The vSet vacuum meter system gives you improved singulation and greater seed flexibility. Make constant meter tweaks a thing of the past and see a corresponding hike in yield.

Variable Rate

vDrive™ Break from convention.

The maintenance parts of the planter are gone. No more lubing chains, sprockets, and drives, and no more worrying about hydraulics. You can clean up your planter with a drive on every row. Also, conventional drive systems plant too many seeds on the inside of a curve and too few on the outside. vDrive maintains the prescribed population on each row at every spot around a curve, so your yield potential stays high.

RowFlow® Get your variable rate prescriptions right.

With RowFlow, growers can precisely execute variable rate prescriptions, avoid overpopulation and minimize inputs, and even add liquid fertilizer control. It gets the right seeding rate in the right place, so you can lower costs while raising yields.

Residue

CleanSweep® Clean from the cab.

The air cylinder lets you set and adjust your row cleaners' down pressure from the cab, so you can continuously adjust to changing field conditions. See more uniform germination and higher plant counts. Now row cleaning is easy.

Firmers

Keeton® Be firm with your seeds.

Consistent depth control is the most important job your planter does. The Keeton firms seeds to the bottom of the trench. It's that simple for optimum seed-to-soil contact.

Seed Tube

WaveVision® Dust particles aren't seeds. WaveVision gets it.

Optical sensors don't know the difference between dust and seeds. WaveVision does, so you get accurate data to improve planting and yield. Eliminate the errors of optical sensors, and get the population you want.

Harvest Monitor

YieldSense™ Better yield data for decision agriculture.

With YieldSense, you can make better decisions with more accurate yield data that you can trust, wirelessly with FieldView Plus. Multiple machines syncing harvest data as you're in the field... that makes sense.
