

*Wondering how will the hot new hybrid or soybean variety yield for you? How will it perform on your soil types and under your management practices?*

Winfield United provides a tool that can make it possible for your Ag Plus salesperson to answer those questions. The Characterization Charts, CHT Tool, can improve your return on seed dollars spent. We can recommend Croplan, Dekalb/ Asgrow or Syngenta seed that will perform for you.

We first use local yield data to analyze how hybrids and varieties performed in our area. Then we can compare those results to regional data from the Answer Plot system to see how they fared under different environmental conditions. Each hybrid and variety is replicated in each Answer Plot so we are making our recommendations from multiple data points.

While being tested for yield they are also being grown at different populations, different nitrogen rates and different crop rotations. Yield is taken from each plot, then compared to produce the Characterization Charts. This way we can see the strengths and perhaps the weaknesses of each hybrid or variety tested. Since, we have access to three years of data that has been gathered, we can get a handle on products that have recently released.

So if you want to know how the new hybrid or variety will perform for you, contact your Ag Plus salesperson. We can show you what can be expected from each hybrid or variety in your yield environment with this data.
