**Kyle Kight, Ag Ingenuity, General Manager, Gruver, TX**

**Jerrell Key, Adobe Walls Gin Manager**

**Doug Kennedy, Adobe Walls Gin Assistant Manager**

### **Summary**

In 2019, a cotton variety testing program was established as a new service created by Windstar Inc. affiliated gins. These gins are working together to support a Cotton Agronomics Manager position. One of the components of this program is to work with local producers to scientifically evaluate varieties in a commercial on-farm setting from planting through ginning. These unique replicated trials are planted and harvested with the grower's commercial equipment. Each variety's round modules are combined across all replicates and then ginned and classed separately in an extremely detailed manner. Purging and weighing any remnant bale from the press is also performed for each variety. All lint samples from each variety's commercial bales are then classed by the USDA-AMS classing office. This detailed ginning and classing management of all round modules for each variety is key to the success of this program and to the best of our knowledge is without peer in the U.S. ginning industry.

At this site in 2023, five entries with XtendFlex technology were planted in a center pivot irrigated field in a scientifically valid trial with three replicates. One entry had ThryvOn technology, a new Bt transgenic trait (NG 4335 B3TXF).

*Dry conditions prevailed at the site during the late winter and early spring, then considerable rainfall began in May. The trial was planted May 10 and escaped numerous hail events which occurred in the area. Cool, wet conditions prevailed during May and June, and a substantial amount of seedling disease and poor early-season vigor was noted. Poor early-season growing conditions and low vigor resulted in an average emergence of about 64% of the seed planted (65,000 seed/acre) when stand count observations were performed on June 28. Some light phenoxy (2,4-D type) herbicide drift injury was found in June and by July good to excellent growing conditions and crop recovery were noted. Four-bract squares (a poorly understood floral anomaly) were observed across all entries during early fruiting. This was observed on*

*multiple lower fruiting branch nodes, and sometimes across the first two fruiting position sites on each fruiting branch. These squares usually abort, sometimes as late as pollination, and shed from the plants. A substantial number of early fruiting sites were lost due to this phenomenon which is NOT insect related. A total of 79 days from planting to first bloom (July 28) was noted in this trial. This indicates an excessive delay in development based on calendar days. This delay is attributed to poor root health, unusually cool May and June growing conditions, some level of four-bract squares and slight phenoxy herbicide injury. Once the crop reached the bloom stage, its progression was excellent through the end of August and into the crop maturity phase in September. Yields were moderate in the test and fiber maturity as measured by micronaire was not impacted by early season fruit shed.*

Harvest results indicated that statistically significant differences were observed. Lint yields ranged from a high of 1316 lb/acre (NG 3406 B2XF) to a low of 1143 lb/acre (NG 4335 B3TXF), and averaged 1221 lb/acre (Table 1). Average Loan value for varieties from commercially ginned and classed bales varied from a high of \$0.5766/lb (DP 1822 XF) to a low of \$0.5468/lb (NG 3195 B3XF). Overall Loan value for the trial across all entries was \$0.5652/lb. When including lint Loan value on a per acre basis and net gin credit (defined as seed credit minus ginning expense), statistically significant differences were found among varieties for net value/acre. NG 3406 B2XF had the highest net value at \$822/acre, and NG 3195 B3XF had the lowest at \$700/acre. This results in a statistically significant difference of \$122/acre.

Table 2 presents in-season data including stand establishment percentage, vigor, nodes above white flower (NAWF) on two observation dates, plant height on three observation dates, nodes above cracked boll (NACB) on October 10, and a visual estimate of storm resistance at harvest. Final plant heights ranged from a high of 23.9 inches for NG 3930 B3XF to a low of 21.6 inches for NG 3406 B2XF.

Table 3 provides the USDA-AMS classing results from each commercial bale for each variety and the variety averages. Averages indicate that color grades were good and typically ranged from 11, 21 to a few 31 values across all entries. Leaf grades ranged from about 1 to 3. Staple ranged from about 34.8 (NG 3195 B3XF) to 37.0 32nds inch (DP 1822 XF). Micronaire averages were good for all entries and ranged from a low of 3.7 (NG 3930 B3XF) to 4.0 (DP 1822 XF). No bark contamination was noted in commercial bales. Fiber strength ranged from 30.0 to 33.4 g/tex, and uniformity ranged from 79.0 to 80.9%.

***Disclaimer: Readers should realize that results from one trial do not represent conclusive evidence that the same response would occur where conditions vary. Multi-site and multi-year data are always best. For this trial, good scientific techniques were used and the results are presented to indicate what actually occurred in the trial. Context of the environment, overall growing season impact, management techniques, and trial methodology used are important and must be considered.***

## Site Information and Methods

Elevation: 3585 ft

Previous crop: Wheat

Tillage system: Strip-till

Planted: May 10

Replicates: 3 replicates in a randomized complete block design

Plot width: 8-row plots

Plot length: Trial was planted in ~1,200 ft long rows

Seeding rate: 65,000 seed/acre

Days from planting to first bloom: 79 (July 28)

Row spacing: 30-inch rows

Total rainfall May through June: ~15.4 inches

May: 8.3, June 7.1

Total irrigation April through July: ~6.2 inches

April: 3.0, July 3.2

Fertility management: No N fertilizer applied, 50 lb/acre  $P_2O_5$  in strip-till operation

Herbicide applications:

March 10: 16 oz/acre 2,4D LV6, 4 oz/acre flumioxazin, 17 lb/100 gal ammonium sulfate, 0.25% NIS

May 8: 32 oz/acre diuron, 12 oz/acre dicamba, 1 qt/acre paraquat, 1% COC

June 21: 32 oz/acre Roundup, 12.8 oz/acre Engenia, 16 oz/acre Outlook, 5 oz/acre acephate, 17 lb/100 gal ammonium sulfate,

July 17: 32 oz/acre Roundup, 12.8 oz/acre Engenia, 16 oz/acre Outlook, 17 lb/100 gal ammonium sulfate, 0.25% NIS

Plant growth regulators: July 2 – 8 oz/acre mepiquat chloride, July 10 – 16 oz/acre mepiquat chloride, July 17 – 24 oz/acre mepiquat chloride, July 31 – 40 oz/acre mepiquat chloride

Insecticides: June 21 – 5 oz/acre acephate, July 2 – 1.1 oz/acre Assail, July 17 – 1.1 oz/acre Assail

Harvest aid application: October 20 – 54 oz/acre ethephon plus 0.25% NIS

Harvesting: November 17 using a John Deere CS690, full length of each plot was harvested for each 8-row plot. Round modules were weighed using the integral CS690 handler scale, and all round modules were weighed at the Adobe Walls Gin.

Commercial ginning: Round modules for all 3 reps of each variety were staged together (1 per plot, with 3 reps = 3 total per variety) and commercially ginned separately by Adobe Walls Gin. Commercial ginning included: cleaning module feeder, clearing gin stream, dumping seed rolls, and purging remnant bale in press. This process was initiated before the first variety module was ginned and then repeated for each variety module in trial.

Remnants were ejected from the bale press and weighed, but not sampled for USDA-AMS classing. Only data from commercial bales are included in classing data for each variety.

Lint value: Table 1 is based on CCC Loan value from commercial ginning and USDA-AMS classing results.

### **Acknowledgements**

Adobe Walls Gin would like to thank Gared McBryde and Brad McBryde, for committing equipment, land, and time to conduct and manage the trial. The Ag Ingenuity crew (Dylan Hatley, Branton Hatley, and Kramer King) planted and assisted with harvest of the trial and we thank them for their great support. Jason Fehr harvested the trial and we are very appreciative of his excellent skills and cooperation. Gratitude is expressed to Deltapine and NexGen for providing cotton seed, and Windstar Inc. Detailed ginning was performed by Malcom Jones, Aaron Moore, and the Adobe Walls Gin crew and a big thank you is extended to this hard-working group.

For net value/acre, means within a column with the same letter are not significantly different.

CV - coefficient of variation.

OSL - observed significance level, or probability of a greater F value.

LSD - least significant difference at the 0.10 level, NS - not significant.

Note: some columns may not add up due to rounding error.

Assumes:

\$3.40/cwt commercial ginning cost.

\$265/ton for seed.

Net gin credit is defined as seed value minus ginning expense.

Value for lint based on CCC loan value from commercial ginning and USDA-AMS classing results.
