Please check with your physician when starting or changing your exercise or rehab routines.

**Fitness and Exercise**

Exercise is good for everyone, regardless of functional capabilities. Some people exercise to lose weight or shape up. Others do it to get stronger, to build endurance and stamina, to help keep joints loose and flexible, to reduce stress, to get more restful sleep, or just because it makes them feel better. Whatever motivates you to exercise is a good reason.

There is an epidemic of obesity in the U.S. Unfortunately, people with disabilities are even more prone to carrying excess weight – this is due to a combination of changed metabolism and decreased muscle mass, along with a generally lower activity level.

There are compelling reasons to shed the extra pounds. Research shows that people in wheelchairs are at risk for shoulder pain, joint deterioration, even rotator cuff tears, due to the amount of stress they place on their arms. Quadriplegics, too, have pain in their shoulders. The more weight to push, the more stress on the shoulder. Plus there’s the risk the skin faces: as people gain weight, skin folds develop which trap moisture, greatly increasing the risk of skin sores.

It’s never too late to get a fitness program going. According to the President’s Council on Physical Fitness and Sports, people with disabilities are less likely to engage in regular moderate physical activity than people without disabilities, yet they have similar needs to promote their health and prevent unnecessary disease. Here’s more:

- Physical activity need not be strenuous to achieve health benefits. Significant health benefits can be obtained with a moderate amount of physical activity, preferably daily. The same moderate amount of activity can be obtained in longer sessions of moderately intense activities (such as 30–40 minutes of wheeling oneself in a wheelchair) or in shorter sessions of more strenuous activities (such as 20 minutes of wheelchair basketball).
- Additional health benefits can be gained through greater amounts of physical activity. People who can maintain a regular routine of physical activity that is of longer duration or of greater intensity are likely to derive greater benefit.
• Previously sedentary people who begin physical activity programs should start with short intervals of physical activity (5–10 minutes) and gradually build up to the desired level of activity.

• People with disabilities should first consult a physician before beginning a program of physical activity to which they are unaccustomed.

**Community-Based or Home-Based Fitness Programs**

While a patient is hospitalized, rehabilitation programs are often covered by the patient's insurance. Unfortunately, people often need more rehab than their insurance covers. If a person tries to continue exercise-based rehabilitation at home or in the community (that is outside of a medical facility), that person should do so under the guidance of their physician. While medical facility rehab is staffed by physical therapists and occupational therapists, that may not be the case in a local gym or community program.

If money is not an issue there may be a possibility of renting or buying an e-stim machine or other exercise equipment to assist with home rehab. Exercising on a regular basis is important to maintain your strength and range of motion. As progress is made, consider expanding your maintenance program to include resources in your community. Local health clubs, community recreational centers, the Y and community colleges often have established programs with athletic trainers and therapists on staff.

Community Based Fitness Programs host an activity-based exercise program created specifically for people with disabilities who are living in their local communities. To evaluate the quality of a community based fitness program, you will want to ask what credentials the staff has. Are they occupational therapists or physical therapists? If the staff is certified, who certified them? (i.e. the program itself or an outside accreditation agency?). Please see the United Spinal Association for information on gait training.

**United Spinal Association: Gait Training**  
This section of Introduction to Spinal Cord Injury describes how gait training works, the potential benefits, and latest developments in the therapy.

Project Walk – Kansas City offers an intense exercise-based program within a gym setting. There is a local program and a home program for people who don’t live in the area.

**Maryland**

www.spinalcordrecovery.org

International Center for Spinal Cord Injury (ICSCI) at Kennedy Krieger Institute
707 North Broadway
Baltimore, MD 21205
Phone: 443-923-9222
Email: info.sci@spinalcordrecovery.org

The International Center for Spinal Cord Injury (ICSCI) at Kennedy Krieger Institute was founded on the philosophy that individuals with paralysis can always hope for recovery of sensation, function, mobility, and independence, months and even years after injury. To maximize on this potential for recovery, ICSCI offers an intense, medically-
supervised therapy program with a unique focus on Activity-Based Restorative Therapy. ICSCI was one of the first facilities in the world to combine innovative research with a unique therapeutic focus on restoration and rehabilitation for both children and adults with acute and chronic spinal cord injuries and disorders, including individuals who require the use of a ventilator. They offer an inpatient program for individuals under the age of 22, outpatient programs for all ages, and have been accredited by the Commission on Accreditation of Rehabilitation Facilities (CARF). Most insurance plans are accepted.

International Center for Spinal Cord Injury (ICSCI) at Kennedy Krieger Institute’s Life Through Motion Wellness Program
The goal of the "Life Through Motion" wellness program is to improve the quality of life for those individuals with spinal cord injuries (SCI) through regular and consistent physical activity. The program is designed to help people with SCI explore their exercise options (including aquatics, land-based exercises, functional electrical stimulation, and cardio-pulmonary activities) to enhance their quality of life.

The International Center for Spinal Cord Injury at Kennedy Krieger Institute has a full continuum of care, including a wellness program with personal training options. Designed to augment therapy, the wellness program provides opportunities for regular and consistent physical activity outside of therapy, in order to help build and improve strength, flexibility, balance, endurance, and cardiovascular health. The goal of the "Life Through Motion" wellness program is to improve the quality of life for those individuals with spinal cord injuries (SCI) through regular and consistent physical activity. The program is designed to help people with SCI explore their exercise options (including aquatics, land-based exercises, functional electrical stimulation, and cardio-pulmonary activities) to enhance their quality of life.
