Hi,

I have a copy of Pokémon Yellow that needs a new battery. I removed the original CR1616 that was soldered and I need to know if a CR2025 will work.

Contact Nintendo by email or by phone at 1-800-255-3700. I don't know if it will work.

I looked it up, and I think it will.

you could always just try it. just tape it on with a piece of electrical tape and test it before soldering it. some people actually don't even solder it and just use the tape. it's way less risky and dangerous.

the top tab came off with the original battery.

Hm, try anything that conducts electricity as a substitute. Maybe a tiny piece off a tin can?

well the only thing you can do is try to attach the new battery and hope for the best. it is very possible that the cartridge has been ruined from you attempts, but it is possible that you may have succeeded. I wish you luck.

When an issue like this comes along, I like to recommend that you consider [this](#) site. The good thing about this site is that they also give you the option of sending in the cartridge, so that they can replace the battery for you.

Of course, remember that there is always a risk that any third-party fix like this may just render the cartridge worse off.

What if I tok the tab off of the battery and soldered it to the CR2025 and the cartridge?  
Would that make the electricity run through the tab and into the game?

Try looking up related videos on youtube. there has to be tutorial or something and then ask the guy who made it.

Try it, make a save, leave it for a day, and see if it is still there. If not, get a 2032 battery instead.

I know you're trying to be helpful, but please don't go back into forum past and just look up questions to answer.

The original poster hasn't been active since they asked this, so it's doubtful they'll ever see the response.

It's best to try to keep the more recent questions at the top so they can be answered more quickly, instead of questions asked years ago (and most likely resolved by now)

I think it will work. Most Gameboy Games usually use a CR1616, but in Pokemon games they use CR2025 because they hold so much data, so I'm pretty sure it works fine. I think I

Pokemon Yellow: Special Pikachu Edition...

used a CR2025 to fix my Crystal Version and Metroid II: Return of Samus and they work just fine. So you can try it out and see if it works because it probably will. As long as it can fit it there. xD

Pikachu edition uses a CR1616. All other pokemon games use CR2025. If you use cr 2025 for pikachu version you will get an error saying " the save file has been destroyed!"

also, like galaxus said above, this thread was started a year ago and has been resolved already quite a long time ago.

It will most likely not work because it is a different battery type. Its like you can't but two AAA to replace two AA. It just will not work.

I know you just want to be helpful, but it doesn't exactly help if you dig up old discussions and bump them up if the original poster isn't even active anymore.
