A macro is an automation method to do a lot of things in a click or one mouse click. KEYMACRO is a tool that allows you to add macros to the default actions of the "F1" button on your keyboard. Macros are shortcuts that make your life much easier. Macros help to execute commands without having to type a lot of letters or numbers. With the help of macros you can improve your productivity. How do macros work? Keymacro will run a list of key combinations in the order that you write them. In most cases this will create the most frequently used macros. Quickly: Keymacro allows you to create a list of macros with key combinations. All you have to do is create a list of key combinations and press the "Save As Macro" button. Customizable: You can create a key combination or button and assign it a name. Notes: Keymacro also allows you to create a .bat file and assign a key combination to a button that you can then run from Windows Explorer. Example: The Keymacro configuration file is saved as kmycc.cfg. It will save the configuration file in your ~/.keymacro directory. Example macro file: Keymacro allows you to build as many macros as

you need. For this example, we created 7 macros. If we tried to edit the existing macros, we will see that all macros would be overwritten. In order to edit the macros, we have to create a new file. Keymacro will automatically add a number to the name of the file. Example macro file 80eaf3aba8

Oracle APEX is a Java application that integrates web applications into PDF (Adobe PDF) documents. APEX may be used to create, update, and view PDF files. Oracle WebCenter includes APEX, which is a part of the Oracle Fusion Applications. Apache Cocoon: Apache Cocoon is a project to provide a RESTful API for the conversion of an XML document into a PDF document. This can be done either by transforming an XML document into another XML document, or by converting the XML document to HTML, which can then be converted to PDF by using FOP. SCM Integration for the conversion of XML documents to PDF is provided by Alfresco

Installation and Start: After downloading the setup exe file, extract it and run setup.exe to install it. After you complete the installation, you need to start the console application. For this, you have to run the following command: `java -jar console-application-name.jar`

Design: After successfully installation you can see the Welcome window for converting the XML file to PDF. Then follow these steps to convert your XML file to PDF file: Select your XML file and then

click on 'Convert' button. The design window will be opened for you to set the options related to the conversion. You can change the output folder name and path. These changes are not saved, so you can change the name and path every time. You have the following options: Convert Selection: You can choose this option to convert all the selected documents at once. Convert on Save: You can choose this option to convert all the selected documents on every save. Confirmations: It is used for checking the validity of the document during conversion. If you click on 'Yes', then the program will check your document and will produce a PDF file and write the URL of the file. If any error is found, then you can click 'No' to avoid conversion. App: After clicking on 'Convert' button, you will see the progress bar. You have to wait until the conversion is completed. You can see the progress bar and the details of the file conversion on the console window. Once the conversion is completed, you will see the window named 'Result'. This window will provide you all the information about the converted file. Click on 'Close' to close this window. The whole process will take about 10-15 seconds. Tips: If you

===== J4L-FO Designer v.2.2 is an advanced Java library to generate PDF from XML document (XSL-FO files). In addition, it's also a WYSIWYG Java Library to make design easier with XSL-FO. To generate XSL-FO files, users must run the XSL-FO processor: Apache FOP. There are two ways to use it. It's available as a pre-installed library for installing in Java J2EE projects. This library is fully integrated with the Java J2EE infrastructure, giving you advantages such as:

- Overwrite the XSL-FO files, just add and change your XML data.
- To convert XML into PDF using WYSIWYG, without learning XSL-FO.
- Execute XSL-FO files from JSP, with support for JDBC, Mysql, PostgreSQL, Oracle, SQL Server, DB2, Microsoft Access and Microsoft Excel as datasource.
- To convert XML files using a relative XML URL, using XSLT and XSL-FO.
- To execute XSL-FO files from a simple Java class.
- To execute XSL-FO files from a servlet.
- To execute XSL-FO files from a JSF page.
- Integrates with Spring framework for XML config files.
- Integration with PostgreSQL database using JDBC.
- Other features: tables, borders, grid, images and PDF attributes.
