The total angular motion of the Earth's axis relative to the inertial reference frame of the solar system has a long-term variation with an amplitude of approximately 6 arcmin/century, which is usually attributed to a slight variation of the Earth's angular velocity around the Sun. However, the origin of this variation is unclear. In this work, we reanalyze the observed axis motion by using a novel vectorial approach based on a celestial reference frame derived from the T-recession of the node (Ecliptic Nodal T) and the ecliptic pole. The observed total angular motion, the origin of which is unknown, can be attributed to a small eccentricity of the Earth's orbit around the Sun, a misalignment of the ecliptic pole with the Earth's axis, and the declination of the Earth's center of mass with respect to the ecliptic plane. The observed motion is found to be mostly (70%) due to the eccentricity, and the remaining motion is due to a slight rotation of the Earth's axis around the ecliptic plane.The Year of the Woman is still a long way off, but 2017 was a year to remember for the world's women leaders. We've rounded up the 52 most powerful women in the world in 2017 and ranked them based on a combination of media buzz, social media chatter, opinion polls and gender equality reports. Remember: The BBC only counted women leaders who were in place on the day the list was published. Take a look at our top ten female leaders below: 10. Angela Merkel The German Chancellor topped our list for the
