The CloudBerry Box is a cloud data management application, which allows you to transfer and synchronize the data between your personal, secure cloud storage space, in this case Amazon S3.

The application makes it easy to use your personal cloud account in order to collaborate and synchronize the data on multiple computers. Amazon S3 is a reliable cloud storage service provided by Amazon to its customers. The data is stored in a secured, private and safe environment. You may easily synchronize your laptop, computer and other stations, from almost any location, throughout the Internet. With the CloudBerry Box you may safely transfer and synchronize the data from your Amazon S3 cloud account. Run the CloudBerry Box in your browser and connect to your own secure storage account. Your online storage, in this case the Amazon S3 service, is accessed through a proxy server, which allows you to establish a secure connection over the public Internet. It is necessary that your computer has an active Internet connection. Your computer or any other equipment that will be synced should be connected to the Internet. You may create the automatic synchronization option to check the connection status. If you select the "Fix Location" option, the application may check the Internet connection and reconnect automatically to the Internet if required. The CloudBerry Box also may be opened on a Windows desktop. If you find that the application is frozen, you may click on the "Restart" button to force a restart of the application. The transfer of the data is performed automatically at the specified time interval and to the designated folder. The Synchronization is safe and private. The data is automatically synced from the Amazon S3 cloud server, to the computers you choose from, such as your PC, Laptop and server, and also synchronizes the data that will be synchronized. The application may be used with three modes: AUTO: Synchronizes the data from the cloud storage, to any computer, or from any computer to the cloud storage, at the specified time intervals. SYNCHRONIZE: Synchronizes the data from any computer to the cloud storage at the specified time intervals. MANUAL: Initiates the data transfer one by one. You may choose any of the three options above, to be performed at the desired interval. The application allows you to create a reminder for the synchronization in case you forget, or want to synchronize your data in a different manner. The synchronization can be performed manually, at the desired

This method works by testing the Internet connection and automatically selects the connection that is most available. If you select "Do not Detect Auto", the "Direct connection" option will be selected. The "Unix" method is usually slower and less effective than the other two. Test your connection You will need a basic understanding of the AWS S3 service before you use this feature. Choose the "Direct connection" option if you have a direct Internet connection from your carrier. Otherwise, select the "Proxy server" connection method. The box will attempt to test the connection.
