Introduction to the Zerto Solution

Disaster recovery is the process of preparing for recovery or continuation of IT processing tasks that support critical business processes in the event of a threat to the IT infrastructure. Zerto’s Long Term Retention is the additional process of enabling recovery of IT processing tasks after an extended period. This section describes Zerto solution’s general concepts to enable replication and recovery in a virtual environment.

The following topics are described in this section:

- What is the Zerto Solution? on page 8
- The Zerto Solution Architecture on page 9
- How Zerto Recovery Works on page 11
- Zerto Analytics - Overview on page 12
- Zerto Cloud Control - Overview on page 25
- Benefits of Using the Zerto Solution on page 27

What is the Zerto Solution?

IT Resilience Platform™

Zerto’s IT Resilience Platform™ converges disaster recovery, backup, and workload mobility whether on-premises or to, from and between hybrid and multi-cloud platforms. The platform is built on a foundation of continuous data protection (CDP) with built-in orchestration and automation providing IT leaders with simplicity, enterprise scale and agile data protection to save time, resources and costs. Analytics, with intelligent dashboards and live reports, provides complete visibility across multi-site and multi-cloud environments, giving organizations confidence that business service levels and compliance needs are met.

Disaster Recovery

Zerto is built from the ground up to be the simplest, most powerful disaster recovery solution for virtualized infrastructures. By including all the replication, recovery orchestration and automation in one simple software platform, users can recover one, all or a subset of virtualized applications, from anywhere to anywhere, maximizing the benefits of virtualization and cloud.

Through native integration into all supported platforms, Zerto not only allows replication and recovery between any storage, but it also protects across and between multiple hypervisors and public cloud platforms. This market-leading technology delivers a best of breed Business Continuity/Disaster Recovery (BC/DR) solution irrespective of underlying hypervisor, public cloud or storage.

Zerto supports replication between VMware vSphere, Microsoft Hyper-V, Microsoft Azure, Amazon Web Services (AWS), and IBM Cloud. Zerto is the underpinning technology of hundreds of Cloud Service Providers (CSPs) globally who are leading the way in delivering Disaster Recovery as a Service (DRaaS) capabilities.

Backup

Elastic Journal
The Zerto Elastic Journal is a new concept in data protection bringing together both short-term retention and long-term retention capabilities. Using unified data protection workflows, powered by intelligent index and search, it enables quick recovery of data-regardless of whether it's from a few seconds ago or a few years ago. Data gets copied from the short-term retention storage into the long-term retention repositories. As the short-term retention is already stored on the target side, moving data to long-term retention has no impact on production, so copies can be taken as often as needed, eliminating the concept of "backup windows".

**Workload Mobility**

Workload mobility is the ability to move workloads to, from and between multiple platforms, on-premises or cloud, with minimal business impact and no traditional infrastructure constraints. With the recent rise of cloud computing, there is now a plethora of cloud platforms to choose from, with large players such as Microsoft Azure, AWS and IBM Cloud as well as plenty of Cloud Service Providers (CSPs). Each of these platforms have their own attributes which make them suited to certain workloads, whether through compliance, pricing or otherwise. Despite this, the cloud is not always the right option for all workloads, and because of this, the traditional on-premises deployments with VMware vSphere or Microsoft Hyper-V are still prevalent. Ultimately, having all of these options has led to increasing adoption of a multi-cloud and/or hybrid cloud strategy. Organizations are challenged to ensure that workloads, whether in the cloud or on-premises, are not locked into any one platform or vendor, and can be moved around based on where they fit best today, rather than yesterday. This is where workload mobility comes in, removing the traditional lock-in to these platforms and allowing workloads to be moved across platforms seamlessly, on-premises or in the cloud, including the ability to validate mobility prior to the live event without production impact.

Zerto supports any-to-any mobility between VMware vSphere, Microsoft Hyper-V, AWS, IBM Cloud, Microsoft Azure and any of our hundreds of Zerto-powered Cloud Service Providers (CSPs). For a full list of supported platforms and their versions please see our [Interoperability Matrix](#).

**The Zerto Solution Architecture**

Zerto provides a business continuity (BC) and disaster recovery (DR) solution in a virtual environment, enabling the replication of mission-critical applications and data as quickly as possible, with minimal data loss. When devising a recovery plan, these two objectives, minimum time to recover and maximum data to recover, are assigned target values: the recovery time objective (RTO) and the recovery point objective (RPO). Zerto enables a virtual-aware recovery with low values for both the RTO and RPO. In addition, Zerto enables protecting virtual machines for extended, longer term recovery using a Long Term Retention process mechanism.

Zerto helps customers accelerate IT transformation by eliminating the risk and complexity of modernization and cloud adoption. By replacing multiple legacy solutions with a single IT Resilience Platform™, Zerto is changing the way disaster recovery, retention and cloud are managed. This is done by providing enterprise-class disaster recovery and business continuity software for virtualized infrastructure and cloud environments.

In **on-premise** environments, Zerto Virtual Replication (ZVR) is installed with virtual machines to be protected and recovered.

In **public cloud** environments, Zerto Cloud Appliance (ZCA) is installed in the public cloud site that is to be used for recovery.

The installation includes the following:
- **Zerto Virtual Manager (ZVM):** The ZVM is a Windows service, running on a dedicated Windows VM, that manages everything required for the replication between the protection and recovery sites, except for the actual replication of data. The ZVM interacts with the hypervisor management user interface, such as vCenter Server or Microsoft SCVMM, to get the inventory of VMs, disks, networks, hosts, etc. It also monitors changes in the hypervisor environment and responds accordingly. For example, a VMware vMotion operation, or Microsoft Live Migration of a protected VM from one host to another is seen by the ZVM, and the Zerto User Interface is updated accordingly.

  - For the maximum number of virtual machines, either being protected or recovered to that site, see [Zerto Scale and Benchmarking Guidelines](#).

- **Virtual Replication Appliance* (VRA):** A VRA is a virtual machine installed on each hypervisor host where VMs are to be protected from or to. The VRA manages the replication of data from protected virtual machines to the recovery site. The target VRAs are responsible for maintaining any protected VMs disks. VMware limits the number of SCSI Controllers (4 per VM) and targets per Controller (15 per controller), leaving a maximum of 60 SCSI targets per VM. When managing a larger quantity of virtual disks, Zerto utilizes Virtual Replication Appliance Helpers (VRA-H), which act as a disk box with no IP and nearly no resources. VRA-Hs are spun up and down by Zerto automatically when nearing the 60-disk limit of the VRA or last VRA-H

  - For the maximum number of volumes, either being protected or recovered to that site, see [Zerto Scale and Benchmarking Guidelines](#).

  **Note:** *In vSphere installations, OVF to enable installing Virtual Replication Appliances.*

- **Virtual Backup Appliance (VBA):** A Windows service that manages File-Level Recovery operations within the Zerto solution.

- **Zerto User Interface:** Recovery using the Zerto solution is managed in a browser or, in VMware vSphere Web Client or Client console.

When Zerto is installed to work with an on-premise hypervisor it also comprises the following component:

- **Data Streaming Service (DSS):** Installed on the VRA machine, and runs in the same process as the VRA. It is responsible for all the retention data path operations.

The following diagram shows how the main Zerto components are deployed across hypervisor-based enterprise sites to provide disaster recovery across these sites.
When you plan to recover the enterprise site to a public cloud, ZCA is installed in the cloud environment. ZCA comprises the same components but the VRA runs as a service, so that the ZVM, VRA, and VBA all run as services on a single virtual machine instance in the public cloud.

**Note:** For the architecture diagrams when one of the sites is a cloud service provider, see the *Zerto Cloud Manager Administration Guide*.

### How Zerto Recovery Works

Installing Zerto installs the Zerto Virtual Manager, which sits in the hypervisor layer on the protected site and the Zerto Cloud Appliance which sits in Azure on the recovery site. You manage disaster recovery using the Zerto User Interface.

Zerto also provides a set of RESTful APIs and PowerShell cmdlets to enable incorporating some of the disaster recovery functionality within scripts or programs.

In the protected site you define the virtual machines that you want to replicate, either individually or together, as a virtual protection group (VPG). The virtual machines that you include in the VPG can come from one or more hypervisor hosts. In this way, you can protect applications that run on multiple virtual machines and disks as a single unit - a VPG. An example of an application that runs on multiple virtual machines includes software that requires a web server and database, both of which run on virtual machines different than the virtual machine where the application software runs.

A virtual machine can be included in several VPGs so that you can recover it to several sites, depending on the needs of the organization. For example the same workload can be protected to a local or a remote location as well as to the cloud. Using several recovery sites also enables migrating disaster recovery datacenters from one location to another.

**Note:** CD and DVD drives cannot be protected.

Every write is copied by Zerto and sent, asynchronously, to the recovery site, while the write continues to be processed on the protected site. For greater efficiency and performance, the write can be compressed before being sent to the recovery site with throttling techniques being used to prioritize network traffic.
On the recovery site the write is written to a journal managed by a Virtual Replication Appliance (VRA). Each protected virtual machine has its own journal. Every few seconds, a checkpoint is also written to each journal. These checkpoints ensure write order fidelity and crash-consistency to each checkpoint. During recovery you pick one of these crash-consistent checkpoints and recover to this point. Additionally, checkpoints can be manually added by the administrator, with a description of the checkpoint. For example, when an event is going to take place that might result in the need to perform a recovery, you can pinpoint when this event occurs as a checkpoint written to each journal.

The VRA manages the journals for every virtual machine that will be recovered to the hypervisor hosting that VRA. It also manages images of the protected volumes for these virtual machines. During a failover, you can specify that you want to recover the virtual machines in the VPG using the last checkpoint or you can specify an earlier checkpoint, in which case the recovery of the mirror images under the VRA are synchronized to this checkpoint. Thus, you can recover the environment to the point before any corruption and ignore later writes in the journal that were corrupted, regardless of the cause of the corruption, such as a crash in the protected site or a virus attack.

When recovery to a point is required that is further in the past than the time saved in the journal, you can restore from files created during the Retention process. Retention is an extension of disaster recovery, with the virtual machine files, such as the configuration and virtual disk files, saved to a repository for up to one year. These files are then used to restore the virtual machines to the point of the stored retention sets at the recovery site.

**Zerto Analytics - Overview**

*Insight-driven data analytics for a new era of data protection*

As IT infrastructures become more complex and demands for performance rise, companies require visibility and control over protected IT environments. Visibility of your entire IT infrastructure (both on-premises or cloud) is imperative to monitor, analyze and plan your environment and resource requirements to ensure zero interruptions. To have confidence that business Service level Agreements (SLAs) are met, you need not only visibility and insights to address existing issues, but also to be able to plan for your future data protection needs.

Zerto Analytics delivers these capabilities through a single interface and one user experience for a comprehensive overview of your entire multi-site, multi-cloud environment. Utilizing metrics such as average recovery point objective (RPO), network performance, and storage consumption, Zerto Analytics delivers real-time and historical insights on the health and protection status of your applications and data. Through Intelligent dashboards you can spot trends, identify anomalies, and troubleshoot issues in network, RPO, and other business SLAs. With these insights, you can eliminate inefficiencies and allocate resources effectively to mitigate data loss, reduce downtime and take control of your data.

**New Resource Planner**

With Resource Planner, you can ensure your data protection needs are met as your IT environment grows and diversifies. Use the Resource Planner to monitor and perform analysis of your protected environment to determine the required compute, storage and networking resources for any or all virtual machines (VMs) within your environment, both on-premises or in the cloud. Build out your data protection strategy with 'what-if' scenario modeling to plan for VM protection across clouds or on-premises, or to transition from on premises to cloud, or to protect additional VMs within your environment.

Zerto Analytics is developed with an API first approach, therefore, everything that is presented in the GUI, is also available with APIs. The APIs are delivered with Swagger open source that help you develop and
test REST integration using standardized examples. This allows to easily populate custom portals with Zerto Analytic content.

Before Getting Started with Zerto Analytics on page 13
Accessing the Zerto Analytics Portal on page 13
Accessing Zerto Mobile on page 13
Accessing Zerto Analytics APIs on page 13
Using the Zerto Analytics Portal on page 14
End-User Analytics for Service Providers on page 16
Zerto Analytics Product Feature Matrix on page 16

Before Getting Started with Zerto Analytics

Verify the following:

- At least 1 ZVM running Zerto 5.0 or higher.
- Enable Zerto SaaS applications including Zerto Analytics, Cloud Control, and Mobile App. check box is selected. This is accessed in the ZVM application in Settings > About.
- Internet access.
- A myZerto account using your corporate email address.

Accessing the Zerto Analytics Portal

Zerto Analytics is accessed from one of the following locations:

- From a URL: https://analytics.zerto.com
- From myZerto: www.zerto.com/myzerto. Sign in using your credentials and select the Analytics tab.
- From the ZVM Application menu tab: Click the Analytics button, to open Zerto Analytics in a new browser tab.

Accessing Zerto Mobile

The Zerto Mobile app is available for both iOS or Android operating systems. Sign in using your myZerto credentials.

Accessing Zerto Analytics APIs

Zerto Analytics is developed with an API first approach, therefore, everything that is presented in the GUI, is also available with APIs. APIs are available the same version as their GUI counterparts.
• Zerto Analytics APIs are available in OpenAPI Specification.
• The documentation can be accessed via the link: https://docs.api.zerto.com/

Using the Zerto Analytics Portal

When accessing Zerto Analytics, the Dashboard tab opens by default. This tab displays a summary of the entire protected environment, including the average RPO and VPG health, site details and topology, active alerts, running tasks and events.

**Tip:** Use the What's New and Help widgets in Zerto Analytics to learn more about each of the features available in Zerto Analytics.

**Tips:**

• Use the sites topology to identify sites without remote protection, to identify network issues and to identify cloud issues.

• To handle any issues in the ZVM site, in the Dashboard tab > SITES area, click the icon Open ZVM in a new tab. This routes you to the specific ZVM site.

• In the same Sites area, click the Menu button to navigate to the VPGs, Alerts or Tasks for the specified site.

In addition to the Dashboard, there are three additional views that provide details on the overall health of your environment.

See the following sections:

1. Monitoring Alerts, Events and Tasks in Zerto Analytics on page 14
2. Troubleshooting VPGs in Zerto Analytics on page 15
3. Reviewing Reports in Zerto Analytics on page 15

Monitoring Alerts, Events and Tasks in Zerto Analytics

From the Monitoring tab review the active alerts, alerts history, running events and tasks.
Introduction to the Zerto Solution

To see active alerts, events or tasks from a specific ZVM, use the filter in the top left of the screen.

Events are displayed for the last 24 hours by default. Use the date selector to filter the Events List by date. To view a history of alerts, select the Events tab and Alert History in the sub menu. Inactive alerts are displayed for the selected time range.

Tip:
Click the Alert ID and Event ID to open the help and view the full details for that specific alert or event.

Troubleshooting VPGs in Zerto Analytics

From the VPGs tab, review the list of VPGs with Errors and Warnings. In the VPGs status area, click either VPGs with Warnings or VPGs with Errors to filter the VPGs list.

To review the status of a VPG, click in the column of the VPG you want to review to open the VPG Details page. From here you can view the details of the virtual machines associated with the VPG as well.

If you want to view the details of another VPG, select the VPG from the VPGs drop-down list.

Tip:
To further investigate about a selected VPG, click the VPG History button, and select to view either the RPO, Journal or Network Reports page. (See Reviewing Reports in Zerto Analytics on page 15 for more details about Reports).

Reviewing Reports in Zerto Analytics

The Zerto Analytics reports provide real-time and historical data analysis. ECE and CSP licenses can view up to 90 days of report history. Use the date controller to filter your reports. Statistics are displayed according to the selected time frame.
Tip:
Zoom in to view more granular data by selecting and dragging your mouse over the selected time frame.

From the Reports tab, review the RPO, Journal and Network performance history on the VPGs.

Use the Network reports for reviewing the network history for any VPG or Site. You can also view the network summary for a selected time frame, the network performance history and IOPs history.

Use the RPO reports for viewing a summary to see if RPO SLAs are being met, the RPO history and the RPO breach table for viewing when the specific time breach occurred and the duration of the SLA breach.

Use the Journal reports for understanding if resilience is at risk due to journal storage capacity and plan for storage growth.

End-User Analytics for Service Providers

Service providers can filter their customers in Zerto Analytics using the ZORG filter located at the top of the screen.

Using the ZORG filter, CSPs can see historical data and status for any individual customer.

Additionally, using the Zerto Analytics APIs, CSPs can create custom reports and automate reporting delivery of real-time content to their customers. The APIs can also be used to provide content for customer portals.

Zerto Analytics Product Feature Matrix

The following table lists the available features and from which ZVM version it’s supported.

For further details about new features, access the Zerto Analytics portal and click [WHAT'S NEW]

### Zerto Analytics Secure Architecture

Transmitted Zerto Analytics data is securely stored and can be securely viewed and exported by the user. The data is also used by the analytics engine to provide advanced guidance and analysis. The following section describes the secure architecture that provides the path to transmit, the datastore where the data is housed, and access of that data.

ZVM sends all the data over HTTPS TLS 1.2 only to https://zerto-mobile-data.zerto.com. The data is stored in the Samples Storage in the SaaS backend, located in the public cloud. All communication to and from the cloud are encrypted (HTTPS) using TLS 1.2. Furthermore, the data is isolated in the SaaS backend and accessible only within the backend itself and via VPN from Zerto. End users are authenticated using their myZerto credentials.

#### Transmission and Storage of Site Status

ZVM transmits current site status over secured HTTPS to the SaaS backend in short (~1 minute) intervals. The SaaS backend collects site status data from all transmitting sites and stores it in the “Samples Storage”. The “Samples Storage” is secured inside an internal protected network and is accessible only within the backend itself and via VPN from Zerto. The samples are kept in the “Samples Storage” of the Zerto Analytics cloud for 30 days to support 30 days of report history.
User Authentication and Authorization

Before sending any request to the backend, a client (browser/mobile/RESTful client) must obtain a security token which securely identifies the user. The security token is achieved by authenticating the user against the Identity Provider (IDP). Each client request contains the security token. For each request, the backend validates the security token and authorizes execution of the request according to the user’s identity which is part of the security token’s payload.

Reporting Historical Data

For each client request, the backend gets the latest data from the relevant samples as stored in the “Samples Storage”. The relevant data is sent to the client.

Zerto Analytics Collected Data

The Zerto Analytics dashboard utilizes several metrics to deliver detailed monitoring and reporting of your multi-site Multi-Cloud environment. The following table was created to address privacy and security issues surrounding data collection.

This table outlines each piece of information that is collected and sent from the ZVM for Zerto Analytics.

### Zerto Cloud Control - Overview

The Zerto Cloud Control includes the following features:

- Upgrade Manager
- Tenants

See also:

- [Before Getting Started with Zerto Cloud Control](#)
- [Accessing the Zerto Cloud Control](#)
Using Upgrade Manager

Using Tenants

Before Getting Started with Zerto Cloud Control

Verify the following:

- At least 1 ZVM running Zerto 5.0 or higher.
- Enable Zerto SaaS features check box is selected. This is accessed in the ZVM application in Settings > About.
- Internet access.
- A myZerto account using your corporate email address.

Accessing the Zerto Cloud Control

Zerto Cloud Control is accessed from one of the following locations:

- From a URL: https://cloudcontrol.zerto.com
- From myZerto: www.zerto.com/myzerto. Sign in using your credentials and select the Cloud Control tab.

Using Upgrade Manager

The Upgrade Manager feature allows Cloud Service Providers to remotely upgrade their end customer sites. This allows CSPs to keep their customers Zerto software always up to date. It also allows Cloud Service Providers an overall view of all their end customers' ZVR version.

The remote upgrade functionality has the following pre-requisites:

- The customers ZVR instance is paired to a CSP-deployed ZCC and does not have a perpetual license applied.
- The end customer Zerto instance should be able to transmit over port 443.

Use the Help widgets in Upgrade Manager to learn more about each of the features available in the Upgrade Manager.

Using Tenants

The Tenants feature allows Cloud Service Providers to register new and existing enterprise customers to the respective ZORG for that customer. In the ZORG registration, the CSP selects the Product Type. The product type can include features such as One-To-Many and Long Term Retention.

Use the Help widgets in Tenants to learn more about each of the features available in the Upgrade Manager.
Benefits of Using the Zerto Solution

Datacenter optimization and virtualization technologies have matured and are now commonly used in IT infrastructure. As more applications are deployed in a virtualized infrastructure, there is a growing need for recovery mechanisms that support mission critical application deployments while providing complete BC and DR.

Traditional replication and disaster recovery solutions were not conceived to deal with the demands created by the virtualization paradigm. For example, most replication solutions are not managed in the hypervisor layer, considering the virtual machines and disks, but at the physical disk level. Hence they are not truly virtualization aware.

The lack of virtualization awareness creates a huge operational and administrative burden. It also results in operational inflexibility. The Zerto solution has been designed to resolve these issues by being fully virtualization aware.

(On-premise environments) Fully Virtual – Sits in the Hypervisor or Cloud

Zerto software sits in the hypervisor level. Protection groups are configured with virtual machines and virtual disks, without the need to consider the physical disks.
Hardware Agnostic

Because the Zerto solution manages recovery of virtual machines and virtual disks only, it does not matter what hardware is used in either the protected or recovery sites; it can be from the same vendor or different vendors. With the Zerto solution, the logical storage is separated from the physical storage so that the vendor and actual type of storage hardware do not need to be considered.

Zerto provides a workload mobility and protection layer providing seamless connectivity, portability, protection, orchestration, and application encapsulation of workloads across clouds without vendor lock-in. High scale, mission critical applications, and data are encapsulated, as well as features, specifications, and configurations, and can be seamlessly migrated across different servers, storage, hypervisors, and clouds without any disruption to business services.

With Zerto, IT managers can choose the right infrastructure for the right use case for the right price. One application can leverage several different environments for disaster recovery, bursting, production, retention, testing, and development. With Zerto there is no vendor lock-in to a cloud, technology, or vendor. Any choice, any cloud, any technology, any price, any service level is available in minutes for any workload.

*(On-premise environments)* Hypervisor Agnostic

Zerto runs both in VMware vCenter Server and Microsoft SCVMM. It is compatible with VMware hypervisor management features, such as vMotion and Microsoft hypervisor management features, such as Live Migration.

Benefits to Using Zerto Enterprise Government Edition

The Zerto Enterprise Government Edition (EGE) leverages vSphere APIs for IO (VAIO) framework. The key benefit of vSphere’s VAIO framework is certification of the Zerto VAIO VMware Installation Bundle (VIB). With the certified VAIO VIB, Secure Boot can be used for hosts with protected VMs without exposing root credentials. Additionally cluster level installation of the Zerto VRAs is provided.

**Note:** For Zerto Enterprise Government Edition (EGE) documentation, go to the guide Installing Zerto in On-Premise Environments, in the section **Deploying Zerto Enterprise Government Edition.**

Focus is on the Application, Not the Physical Storage

By considering the physical disk level and not the virtual disk level, traditional replication is not truly application aware. Even virtual replication recovers block writes at the SCSI level and not at the application level. Zerto is truly application focused, replicating the writes from the application in a consistent manner.

Compatibility Across Virtual Environments – Cross-Hypervisor Platform and Version Agnostic

Zerto enables replication across multiple hypervisor managers, such as VMware vCenter Server and Microsoft SCVMM, and to public clouds such as Amazon Web Services (AWS) or Microsoft Azure. You can protect virtual machines in one hypervisor platform and recover to a different hypervisor platform. This feature can also be used to migrate virtual machines to a different hypervisor platform.
Also, virtual machines running in one version a hypervisor can be recovered in a different version of the same type of hypervisor, as long as Zerto supports the hypervisor versions, virtual machines can be protected across versions.

(On-premise environments) Fully Scalable

Zerto enables defining software-only Virtual Replication Appliances (VRAs) on each hypervisor host to manage the replication of virtual machines on that host. Increasing the number of hypervisor hosts is handled by defining a new VRA on each new host. There is no need to install additional software to the hypervisor management tool, such as VMware vCenter Server or Microsoft SCVMM, to handle additional hosts or virtual machines and no need to consider additional hardware acquisitions.

Efficient Asynchronous Replication

Writes are captured by the Zerto software in the hypervisor level, before they are written to the physical disk at the protected site. These writes are sent to the recovery site asynchronously, thus avoiding long distance replication latency for the production applications.

Also, because these writes are captured and sent to the recovery site, it is only the delta changes and not the whole file or disk that is sent to the recovery site, reducing the amount of network traffic, which reduces WAN requirements and significantly improves the ability to meet both RPO and RTO targets.

One-Click Failover and Control of the Recovery Process

ALL Platforms

When recovery is required, the administrator clicks on a button in the Zerto User Interface to initiate failover. This means that controlling the start of a recovery remains in the hands of the administrator, who can decide when to initiate the recovery and, by selecting a checkpoint, to what point-in-time to recover to.

One-Click Migration

Application migrations can be resource intensive projects that take weeks of planning, execution, and downtime. With Zerto migrations are greatly simplified and can be completed without extended outages or maintenance windows and across different types of hardware and even different hypervisors, such as VMware ESXi or Microsoft Hyper-V. Migrations across different versions within a type of hypervisor, such as from a VMware vCenter environment to a vCloud environment or even cross hypervisor migration, such as migration from a vCenter environment to a Hyper-V environment is as easy as a migration from one site to another using the same hypervisor infrastructure.

File and Folder Recovery

You can recover specific files and folders from the recovery site for virtual machines that are being protected by Zerto and running Windows or Linux operating systems. You can recover the files and folders from a specific point-in-time.

You can choose to recover one or several files or folders from the recovery site.
(On-premise environments) Long Term Retention

Zerto provides a Retention option that enables saving the protected virtual machines for up to one year in a state where they can be easily deployed. Because retention uses the same mechanism used for disaster recovery, there is no performance impact on the production site, since the processing is performed on the recovery site. The data copied for retention are fixed points saved daily, weekly or monthly.

**Note:** Zerto recommends weekly retention sets.

Policy-based

In the protected site you define the virtual machines that you want to recover, either individually or as groups, as a virtual protection group (VPG). The virtual machines that you include in the VPG can come from one or more hypervisor hosts. In this way, you can protect applications that run on multiple virtual machines and disks as a single unit, in a single VPG.

Minimal RPO

The Zerto solution utilizes continuous data protection, sending a record of every write in the virtual protection group to the recovery site. The transfer of this information is done over an optimized WAN asynchronously. If recovery is required, all the data that was transferred to the recovery site is available resulting in recovery within the requested RPO.

WAN Optimization Between Protected and Recovery Sites

ALL Platforms

Using compression to minimize bandwidth and other techniques such as throttling to prioritize network traffic to reduce the impact on day-to-day operations, you can make sure that the communication between the protected and recovery sites is fully optimized.

The Zerto solution also uses signature matching to reduce the amount of data sent across the WAN. During synchronization of the protected site and recovery site for every virtual machine in a VPG, Zerto maintains a map of disk sectors so that if there is a need to resynchronize sites, the map signatures can be used to ensure that only data where changes occurred are passed over the WAN.

WAN Resilience on Both the Protected and Recovery Sites

The Zerto solution is highly resilient to WAN interruptions. In order to reduce storage overhead used for replication purposes, on WAN failure or when the load over the WAN is too great for the WAN to handle, Zerto starts to maintain a smart bitmap in memory, in which it tracks and records the storage areas that changed. Since the bitmap is kept in memory, Zerto does not require any LUN or volume per VPG at the protected side. The bitmap is small and scales dynamically, but does not contain any actual IO data, just references to the areas of the protected disk that have changed. The bitmap is stored locally on the VRA within the available resources. Once the WAN connection resumes or the load returns to normal traffic, Zerto uses this bitmap to check whether there were updates to the protected disks and if there were updates to the disks, these updates are sent to the recovery site.
DR Management Anywhere

With the Zerto solution everything is managed from a standalone browser-base user interface, enabling disaster recovery management from anywhere using any device.
Accessing the Zerto User Interface

You manage the protection and replication of virtual machines between the protected site and Azure using the Zerto User Interface. On first access to the Zerto User Interface, you might have to add a security certificate to set up secure communication. Zerto also provides a set of RESTful APIs and PowerShell cmdlets to enable incorporating some of the disaster recovery functionality within scripts or programs.

**Note:**
- For supported browsers, see [Zerto Interoperability Matrix](#).
- The lowest supported screen resolution is **1366x768**.

**Note:** You must **exclude** the following folders from **antivirus scanning**:

- Zerto Virtual Replication
  - `%ProgramData%\Zerto\Data\zvm_db.mdf`
- C:\Program Files\Zerto\Zerto Virtual Replication\Zerto.Zvm.Service.exe
- C:\Program Files\Zerto\Zerto Virtual Replication\Zerto.Vba.VbaService.exe
- C:\Program Files\Zerto\Zerto Virtual Replication\Zerto Online Services Connector\Zerto.Online.Services.Connector.exe
- C:\Program Files\Zerto\Zerto Virtual Replication\Embedded DB Manager Service\Zerto.LocalDbInstanceManagerService.exe

Failure to do so may lead to the Zerto Virtual Replication folder being incorrectly identified as a threat and in some circumstances corrupt the Zerto Virtual Replication folder.

**Note:** For a full list of requirements and limitations when protecting virtual machines to and from Azure see [Requirements for Microsoft Azure Environments on page 47](#).

The following topics are described in this section:
- **Using the Zerto Virtual Manager Web Client on page 32**
- **Adding a Security Certificate for the Zerto User Interface on page 33**
- **Working With the Zerto User Interface - Dashboard on page 34**

**Using the Zerto Virtual Manager Web Client**

➢ **To use the Zerto Virtual Manager Web Client:**
1. In a browser, enter the following URL:

   https://zvm_IP:9669

   where zvm_IP is the IP address of the Zerto Virtual Manager for the site you want to manage.

2. Log on using the user name and password of the virtual machine on which you installed the Zerto Cloud Appliance.

Adding a Security Certificate for the Zerto User Interface

Communication between the Zerto Virtual Manager and the user interface uses HTTPS. On the first log in to the Zerto User Interface, you must install a security certificate in order to be able to continue working without each log in requiring acceptance of the security.

To install a security certificate for the Zerto User Interface:

On first access to the Zerto User Interface, if you haven’t installed the security certificate, a security alert is issued.

Note the following:

- To run this procedure run Microsoft Internet Explorer as administrator. The procedure is similar for Google Chrome and for Mozilla Firefox.
- Access the Zerto User Interface using the IP and not the name of the machine where Zerto is installed.

1. Click View Certificate.

   The Certificate dialog is displayed.

2. Click Install Certificate.

   The Certificate Import wizard dialog is displayed.

3. Follow the wizard: Place all the certificates in the Trusted Root Certification Authorities store. Select the Place all certificates in the following store option and browse to select the Trusted Root Certification Authorities store.

4. Continue to the end of the wizard. Click Yes when the Security Warning is displayed.
5. Click **OK** that the installation was successful.

6. Click **OK** when prompted and then **Yes** in the **Security Alert** dialog to continue.

**Working With the Zerto User Interface - Dashboard**

After logging on to the Zerto User Interface for the first time, the dashboard is displayed. The dashboard provides summary information about the status of the site, as shown in the following diagram:

Use the tabs to access the specific information you want:
• **DASHBOARD:** General information about the site, including the status of the VPGs being protected or recovered to the site.

• **VPGs:** All the VPGs from both the local and remote sites and provides summary details of each VPG.

• **VMs:** All the protected virtual machines from both the local and remote sites and provides summary details of each virtual machine.

• **SITES:** Details of the paired sites. This tab lists all the paired sites to the local site and provides summary details of each paired site.

• **SETUP:** *(On-Premise only)* Details about VRAs, storage and repositories.

• **RETENTION STATUS:** Details of the retention repository jobs either by VPG or virtual machine. This tab lists all the defined retention sets and their statuses.

• **MONITORING:** Details about the alerts, events and tasks for the site.

• **REPORTS:** General reports.

**Zerto User Interface - Subtabs**

From the SETUP, RETENTION STATUS and MONITORING tabs you can see and manage details for a specific VPG and VRA from different perspective.

For example, under SETUP, from the subtabs, you can manage VRAs, Storage/Datastores and Repositories.

**Zerto User Interface - Views**

Lists can be displayed with different views. For each view you can filter the information in columns via the filter icon next to each column title. Clicking the column title enables sorting the column in ascending to descending order.

You can customize the default views or add a new view by clicking the view configuration button.

Customize a default view by selecting Show/Hide Columns and then checking the columns you want displayed. Create a new view by selecting Create View.
Introduction to Protecting Virtual Machines

Virtual machines are protected in virtual protection groups (VPGs). A VPG is a group of virtual machines that you group together for recovery purposes. For example, the virtual machines that comprise an application like Microsoft Exchange, where one virtual machine is used for the software, one for the database, and a third for the Web Server require that all three virtual machines be replicated to maintain data integrity.

Any virtual machine whose operating system is supported in both the protected site and recovery site can be protected in a VPG.

Once a virtual machine is protected, all changes made on the machine are replicated in the remote site. The replicated virtual machines in the remote site can be recovered to any point in time defined for the VPG or if a period further in the past is required, and if configured, a VPG can be restored from the retention set.

When a VPG is created, a replica of each virtual machine disk in the VPG is created under a VRA on the recovery site. These replica virtual disks must be populated with the data in the protected virtual machines, which is done by synchronizing the protected virtual machines with the recovery site replicas. The time taken for synchronization between the protected and recovery sites will depend on the size of the virtual machines.

After the initial synchronization completes, only the writes to disk from the virtual machines in the protected site are sent to Azure. These writes are stored by the Virtual Replication Appliance (VRA) in the journals in a storage account for a specified period, after which they are promoted to the replica virtual disks managed by the VRA, which are also in storage account.

The number of VPGs that can be defined on a site is limited only by the number of virtual machines that can be protected. Each site can manage a maximum of 300 virtual machines.

**Note:** If the total number of protected virtual machines on the paired sites is 300, then any additional machines are not protected.

**Note:** For Linux machines, Azure Linux Agent must be installed.

The following topics are described in this section:

- Configuring Virtual Protection Groups on page 36
- Requirements for Microsoft Azure Environments on page 37
- The Role of the Journal During Protection on page 37
- What Happens After the VPG is Defined on page 38

Configuring Virtual Protection Groups

You protect one or more virtual machines in a VPG. The VPG must include at least one virtual machine.
After creating a VPG, you can add or remove virtual machines as required.

When protecting VMs from Azure, you can only protect a virtual machine in a VPG when the virtual machine has no more than 60 disks.

When protecting VMs to Azure, the number of disks attached to the virtual machines should not exceed the quota defined by the instance size set in the VPG and VM settings.

VPGs can be created at the protected site or the recovery site.

Configuring a VPG consists of defining the following:

- **General**: A name to identify the VPG and the priority to assign to the VPG.
- **Virtual machines**: The list of virtual machines being protected as well as the boot order and boot delay to apply to the virtual protection groups during recovery.
- **Replication**: The recovery site settings and the VPG SLA. SLA information includes the default journal history settings and how often tests should be performed on the VPG. These settings are applied to every virtual machine in the VPG but can be overridden per virtual machine, as required.
- **Storage**: The default storage volume to use for the recovered virtual machine files and for their data volumes. The storage used for the virtual machine definition is also used for the virtual machine data and can be overridden per virtual machine, as required. If a cluster is selected for the host, only storage accessible by every host in the cluster is displayed.
- **Recovery**: Recovery details include the networks to use for recovered virtual machines, such as the virtual networks, subnets, network security groups, instance families, and instance size to use for failover/move and failover test procedures, and the scripts, if any, that should run at the start or end of a recovery operation.
- **Retention Status**: The retention properties that govern the VPG retention status, including the repository where the repository sets are saved. Retention is relevant only when creating VPGs that will be recovered to Azure. When creating VPGs to be recovered from Azure this tab is not shown.
- **Summary**: The details of the VPG configuration defined in the previous components.

For information about protecting VMs created in Azure see Protecting Virtual Machines From Azure on page 47.

Requirements for Microsoft Azure Environments

For complete and detailed requirements, see Enterprise Guidelines for Microsoft Azure Environments.

The Role of the Journal During Protection

After defining a VPG, the protected virtual machine disks are synced with the recovery site. After initial synchronization, every write to a protected virtual machine is copied by Zerto to the recovery site. The write continues to be processed normally on the protected site and the copy is sent asynchronously to the recovery site and written to a journal in a storage account managed by a Virtual Replication Appliance (VRA). Each protected virtual machine has its own journal.

In addition to the writes, every few seconds all journals are updated with a checkpoint time-stamp. Checkpoints are used to ensure write order fidelity and crash-consistency. A recovery can be done to the
last checkpoint or to a user-selected, crash-consistent checkpoint. This enables recovering the virtual machines, either to the last crash-consistent point-in-time or, for example, when the virtual machine is attacked by a virus, to a point-in-time before the virus attack.

Data and checkpoints are written to the journal until the specified journal history size is reached, which is the optimum situation. At this point, as new writes and checkpoints are written to a journal, the older writes are written to the virtual machine recovery virtual disks. When specifying a checkpoint to recover to, the checkpoint must still be in the journal. For example, if the value specified is 24 hours then recovery can be specified to any checkpoint up to 24 hours. After the time specified, the mirror virtual disk volumes maintained by the VRA are updated.

During recovery, the virtual machines at the recovery site are created and the recovery disks for each instance, managed by the VRA, are copied to the recovered virtual machine. Information in the journal is promoted to the virtual instances to bring them up to the date and time of the selected checkpoint.

Each protected virtual machine has its own dedicated journal.

**What Happens After the VPG is Defined**

After defining a VPG, the VPG is created. For the creation to be successful, the storage used for the recovery, in the case of recovery from Azure, must have either 30GB free space or 15% of the size free. This requirement ensures that during protection the VRA, which manages the virtual machine journal and data, cannot completely fill the storage, which would result in the VRA freezing and stopping to protect all virtual machines using that VRA. The VRA in Microsoft Azure is updated with information about the VPG and its protected virtual machines. Until a recovery operation is performed, all data managed by the VRA is stored in a storage account.

The synchronization process can take some time, depending on the size of the virtual machines, the amount of data in its volumes, and the bandwidth between the sites. During this synchronization, you cannot perform any replication task, such as adding a checkpoint.

For synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the protected data to replicate to the target disks, and an alert is issued.

Once synchronized, the VRA in Azure includes a complete copy of every virtual machine in the VPG. After synchronization the virtual machines in the VPG are fully protected, meeting their SLA, and the delta changes to these virtual machines are sent to the recovery site.
Recovery

After initializing the VPG, all writes to the protected virtual machines are sent by the VRA on the relevant host for each virtual machine on the protected site to the VRA. The information is saved in the journal for the virtual machine with a timestamp, ensuring write-fidelity. Every few seconds the Zerto Virtual Manager writes a checkpoint to every journal on Azure for every virtual machine in the VPG, ensuring crash-consistency.

The data remains in the journal, in a storage account, for the time defined by the journal history configuration, after which it is moved to the relevant mirror disks, also in the storage account, for each virtual machine. Both the journal and the mirror disks are managed by the VRA.

When recovering, either a failover or move, or testing failover or cloning protected virtual machines in the recovery site, you specify the checkpoint to which you want the recovered virtual machines to be recovered. The mirror disks and journal are used to recover the virtual machines to this point-in-time. When recovering to Azure, the recovered virtual machines are created as new virtual machines in a dedicated, new, resource group.

File and Folder Recovery

After initializing the VPG, instead of recovering a virtual machine, you can recover specific files and folders in the protected virtual machines from a checkpoint.
Overview of Recovery Flows

The Zerto solution enables protecting virtual machines, for both disaster recovery or for extended, longer term recovery from a retention repository, by protecting the relevant virtual machines in virtual protection groups. A virtual protection group (VPG) is a group comprised of virtual machines that are grouped together for recovery purposes. For example, the virtual machines that comprise an application like Microsoft Exchange, where one virtual machine is used for the software, one for the database, and a third for the Web Server require that all three virtual machines be replicated to maintain data integrity.

Once a VPG has been created, each virtual machine in the VPG can be replicated on the recovery site under the VRA on the host specified in the VPG definition as the host for the recovery of the virtual machine.

In addition to disaster recovery and recovery from retention, the Zerto solution enables recovery of individual files or folders from a certain point of time.

The following are described in this section:

• What is Zerto’s Disaster Recovery Operation? on page 40
• What is Zerto’s File or Folder Level Restore? on page 43
• (On-premise environments) What is Zerto’s Long Term Retention? on page 43

What is Zerto’s Disaster Recovery Operation?

Disaster recovery using the Zerto solution enables recovering from a disaster to any point between the moment just before the disaster and a specified amount of time in the past up to 30 days. The recovery is done in real time at the recovery site with a minimal RTO.

A recovery operation is one of the following:

• A failover.
• A planned move of the protected virtual machines from the protected site to the recovery site.
• A clone of the protected virtual machine to the recovery site.

(On-premise environments) What is Zerto’s Disaster Recovery Operation in On-Premise Environments?

Virtual machines are protected in VPGs. Once a VPG is created, Zerto creates a copy under the management of a Virtual Replication Appliance, VRA, on the recovery site, of the protected virtual machine files, such as the configuration and data files. A VRA is installed on every host where the machines are to be recovered.

When a recovery operation is performed, the VRA creates the virtual machines defined in the VPG and attaches the virtual disks to these machines. It then promotes the data from the journal to the virtual machine disks.

Every write to the protected virtual machine in a VPG is copied by the VRA on the same host as the protected machine and passed to the VRA on the host in the recovery site. The VRA on the host in the recovery site was specified in the VPG definition as the host for the recovery of the virtual machine. These
writes first are saved in a journal for a specified period, and then moved to replica virtual disks managed by the VRA, which mirror the protected virtual machine disks.

The following link references the appropriate procedure to protect virtual machines:

- **Recovery from: vCenter Server**  
  Protecting Virtual Machines from a vCenter Server
- **Recovery from: vCloud Director (vCD)**  
  Protecting Virtual Machines to and From vCloud Director
- **Recovery from: Hyper-V**  
  Protecting Virtual Machines from Hyper-V

After initializing the VPG, all writes to the protected virtual machines are sent by the VRA on the relevant host for each virtual machine on the protected site to the VRA on the recovery site specified as the recovery host for the virtual machine. The information is saved in the journal for the virtual machine with a timestamp, ensuring write-fidelity. Every few seconds the Zerto Virtual Manager causes a checkpoint to be written to every journal on the recovery site for every virtual machine in the VPG, ensuring crash-consistency.

The data remains in the journal until the time specified for the journal when it is moved to the relevant mirror disks, also managed by the VRA for the virtual machine. In this way, you can recover the virtual machines using the mirror disks and then promoting the data from the journal to include the final few hours of data for each virtual machine. For more details about the journal, see “The Role of the Journal During Protection”, on page 41.

**(Azure environments) What is Zerto's Disaster Recovery Operation to Azure?**

Virtual machines are protected in VPGs, which are defined in the protected site. Once a VPG is created, Zerto creates a copy of the protected virtual machines under the management of a Virtual Replication Appliance, VRA, on the Azure recovery site. The data managed by the VRA is saved in a storage account.

When a recovery operation is performed, the Zerto Virtual Manager (ZVM) creates the following:

- A copy of the virtual machine disks in a dedicated container under the same storage account.
- A virtual machine in Azure, under a newly created Resource Group, with the copied disks attached to it.
- Network Interfaces Cards (NICs) for each NIC of the protected virtual machine.

Once this is done, the ZVM promotes the data from the journal to the virtual machine disks.

The following link references the appropriate procedure to protect virtual machines:

- **Recovery from: Microsoft Azure**  
  Protecting Virtual Machines From Azure on page 47

For information on disaster recovery flows from Azure to on-premise platforms see:

- Flow for a Disaster Recovery Operation - vSphere
- Flow for a Disaster Recovery Operation - Hyper-V
(AWS environments) What is Zerto’s Disaster Recovery Operation to AWS?

Every write to the protected virtual machine in a VPG is copied by the VRA on the same host as the protected machine and passed to the VRA in AWS. The VRA writes these transactions to buckets in S3. This information is ready to be written to EBS disks in EC2 when recovering from a disaster or when recovering a retention set.

Virtual machines are protected in VPGs, which are defined in the protected site. Once a VPG is created, Zerto creates a copy of the protected virtual machines under the management of a Virtual Replication Appliance, VRA, on the AWS recovery site. The data managed by the VRA is saved in an S3 bucket.

When a recovery operation is performed, the VRA creates the virtual machines defined in the VPG in EC2 and imports data from the S3 bucket as EBS disks in EC2.

After initializing the VPG, all writes to the protected virtual machines are sent by the VRA on the relevant host for each virtual machine on the protected site to the VRA on the AWS recovery site. The information is saved in the journal for the virtual machine with a timestamp, ensuring write-fidelity. Every few seconds the Zerto Virtual Manager causes a checkpoint to be written to every journal on the recovery site for every virtual machine in the VPG, ensuring crash-consistency.

The data remains in the journal until the time specified for the journal when it is moved to the relevant mirror disks in S3, also managed by the VRA for the virtual machine. In this way, you can recover the virtual machines using the mirror disks and the data from the journal to include the final few hours of data for each virtual machine. Refer to “The Role of the Journal During Protection”, on page 32 for more details about the journal.

The following link references the appropriate procedure to protect virtual machines:

Recovery from: Amazon Web Services (AWS)  Protecting Virtual Machines From AWS

The following references the procedures to recover virtual machines protected in a VPG:

- Overview of Disaster Recovery Operations on page 197
- Managing Failover Live on page 242
- Migrating a VPG to Azure on page 223
- Cloning a VPG to Azure on page 253

(On-premise environments) What is Zerto’s Test Failover Operation in On-Premise Environments?

When testing that the recovery works as planned, the VRA creates the virtual machines defined in the VPG and uses scratch disks to simulate the virtual machine disks for the duration of the test. This enables the ongoing protection of the virtual machines and the possibility of a failover if required during the test.

(Azure environments) What is Zerto’s Test Failover Operation in Azure Environments?

When testing that the recovery works as planned, the Zerto Virtual Manager (ZVM) creates the virtual machines defined in the VPG in a dedicated resource group in Azure.
(AWS environments) What is Zerto’s Test Failover Operation in AWS Environments?

When testing that the recovery works as planned, the Zerto Virtual Manager (ZVM) creates the virtual machines defined in the VPG in EC2.

The following references the procedure to recover virtual machines:

“Overview of Disaster Recovery Operations”, on page 195
“Testing Recovery”, on page 199

What is Zerto’s File or Folder Level Restore?

You can recover specific files and folders from the recovery site for virtual machines that are being protected by Zerto and running Windows operating systems. You can recover the files and folders from a specific point-in-time.

To recover files and folders, see Recovering Files and Folders on page 257.

(On-premise environments) What is Zerto’s Long Term Retention?

**Note:** You cannot restore a retention set in Azure, or in AWS.

If you need to extend the recovery ability to more than 30 days, Zerto provides Long Term Retention that enables saving the protected data in a state where they can be easily deployed.

The data is saved in a repository for a defined retention period. Each VPG will have retention sets created according to the configured schedule.

The retention process is managed by the ZVM, and the Data Streaming Service (DSS), which is installed in the VRA, performs all the data path operations. During the retention process, the DSS communicates with the VRA on the recovery site. The retention sets are restore points saved either daily, weekly, monthly or yearly in the repository. Before you can start a retention process for VPGs, you must first create one or more repositories for the retention sets.

Configuring Long Term Retention is part of defining a VPG. To set up Long Term Retention to protect VPGs, see “Using Zerto’s Long Term Retention”, on page 365.

The number of Daily, Weekly, Monthly and Yearly retention sets define the retention period. For example, keeping 84 Monthly or 7 Yearly both result in a 7 year retention time.

This allows for full flexibility for users to define anything from a week to many years. There is no maximum to the configurable number of Yearly retentions to keep, although Zerto recommend users to keep no more than 150 retention sets in total (all types included). This means Zerto can keep up to 150 years of retention.

**What does the Repository Contain?**

The Repository contains retention sets, where each retention set has it’s own mapping file (DOM file).

**How does the Long Term Retention process work?**

When Long Term Retention is first configured, and the first reading of the data has occurred, the retention set consists of:
• All the data copied to the Repository.

When the second reading and any subsequent readings after a full retention of the data occurs, the retention set consists of:

• All the data from the first reading, but not including any original data which was marked as changed during the second reading.

• The changed data from the second reading.

Each incremental retention set is independent of previous incremental and full retention sets, and gives a complete and total picture of the data at the point in time of the reading.

**What happens when the Retention Policy period is overdue?**

Retention sets are kept for the retention period specified as part of the Retention Policy configuration. Once the retention expires, the expired retention sets will be deleted from the Repositories.

**What is Zerto’s File System Indexing?**

To support advanced VM-level or file-level restore scenarios, Zerto offers the capability to index files and folders of selected VMs that are enabled for retention. This allows users to search for the necessary files and folders and to perform a restore of the VMs or VPGs containing those files and folders.

**How Does File System Indexing Work?**

**How does Zerto index a VM?**

Zerto uses its file system parser which is also used for file and folder recovery. Once the retention process completes, Zerto uses the journal capabilities to create a file system view on the same checkpoint that the retention process had used, and gathers information on the file system which includes file/ folder names and file sizes.

**How long does it take to index?**

The indexing process on its own is rather fast. Zerto can process roughly 10,000 files per second on a windows VM and about 2000 files on a Linux VM.

**How is indexing enabled and disabled on a VM?**

Enabling and disabling File System Indexing is done when creating or editing a VPG. See "Enabling Long Term Retention for the VPGs", on page 372.

**Can a specific disk be excluded from being indexed?**

Currently, excluding specific disks from being indexed is not supported.

**What happens when the indexing repository is changed?**

Zerto will start saving indexing meta data on the new repository. However, Zerto will scan all previously configured indexing repositories when searching for files and folders during Search and Restore operations.

**What happens when the indexing repository is removed?**
Users can select “None” as an indexing repository. If there are still VPGs which have VMs that have been selected for indexing, the indexing process for these VMs will fail. It is recommended to clear the indexing settings from all VMs if one chooses not to use indexing anymore.

**What happens when the indexing repository is re-added?**

If the repository was completely removed from Zerto, then the indexing data is lost. Upon re-adding the repository, any indexing data which exists on that repository is ignored and cannot be leveraged for Search and Restore.

**Is indexing executed in parallel on all VMs?**

No. In order to guardrail resources in the environment, Zerto limits the number of parallel indexing to 3 VMs and 1 per VRA at most.

**How is File System Indexing Managed?**

**How can users leverage the data kept in the indexing repository?**

All the indexed data is kept in the repository and is used when performing Search and Restore. Users can search for files or folders in VMs that were indexed, in a specific date range, select revisions of the specific file or folder in question, and restore the VM or VPG to the selected restore point.

**When does the indexing process happen?**

As part of the retention process, once the system finishes saving the retention sets of all the VMs in the VPG on the repository successfully, Zerto initiates indexing the VMs that were selected for indexing in the VPG.

**Will it affect retention performance or replication?**

Zerto guardrails the replication so any other process will not be affected, and that includes indexing. Indexing is done on the ZVM machine using a service called VBA. The VBA is limited to run 3 indexing tasks in parallel at most, and not more than one VRA. The impact on each VRA is similar to having a single VM mounted for File Level Restore.

**How do I know when indexing is running?**

When the indexing process runs, there will be a task showing the VPG is being indexed.

**Can an indexing task be aborted?**

Yes. As with any other task in Zerto, if you wish to stop the indexing process, you can stop the task by clicking the stop button. See “Monitoring Tasks”, on page 224.

**What happens if a retention process starts while the indexing task is running?**

Zerto cannot run two tasks on the same VPG, therefore the retention process will wait for the indexing process to complete before it starts.

**What happens when indexing fails?**

The indexing task will be shown as “failed”. When searching for files/folders, no results from the failed restore point will be shown.

**When is the indexed data removed from the system/repository?**
In Zerto 7.0, Zerto does not remove the indexed data from the system or the repository. In one of the upcoming updates or versions, Zerto will remove indexed data from both the system and the repository, when the retention-set has been expired. See Storing Retention Sets for further details.

**What happens if the indexing task fails?**

When the indexing task fails, there will be a task showing that VPG which was being indexed.

**Is the data removed when the VPG is deleted?**

Indexed data is not deleted from the system, and as such users will be able to search files/folders in VMs even if the VPG protecting these VMs were deleted. In fact, as long as the retention-set that the indexing is referencing still exists, results will show up in Search and Restore operations.

**What happens to the indexed data when re-installing Zerto?**

Zerto does not delete the indexed data. Similarly to the remove repository process, the previously indexed data cannot be leveraged and will not be referenced in the new installation. This is planned to be addressed in one of the upcoming versions.

**What Are the Sizing and System Requirements**

**Which Operating and file systems are supported?**

Operating Systems, File Systems and Volume Manager that Zerto can index:

- Operating Systems: Windows Vista and 2008 server and above and Linux
- File System and Volume Manager: NTFS and EXT2/EXT3/EXT4
- Supported partitioning methods: GPT, MBR

**What happens if only one volume is supported and another one is not?**

Zerto indexes the supported volumes and skips the non-supported volumes one we don't except to log it exists and wasn't supported.

**What is the maximum number of entries that can be indexed on a single VM?**

- A VM with over 150 million entries (files or folders) cannot be indexed.
- Rate of entries (files or folders) indexed in NTFS per second: 5k-10k.
- Rate of entries (files or folders) indexed in EXT per second: 2k-3k.

**How to estimate the size required for indexing?**

Storing the index for 100 restore points (incremental or full) will consume between 5-10% roughly of the original VM size.

**What is Zerto’s Search and Restore?**

Search and Restore allows the user to quickly search for files and folders in specific VMs and restore either the virtual machine or VPG once the desired restore point is identified.
Protecting Virtual Machines From Azure

Virtual Machines created in Azure can be protected to the following platforms:

<table>
<thead>

Requirements for Microsoft Azure Environments

Before protecting your virtual machines, review [Zerto Prerequisites and Requirements for Microsoft Azure Environments](#).

Limitations and Considerations

- You cannot protect the following virtual machines:
  - A virtual machine that was created after performing a **Failover Test**.
  - A virtual machine with **no disks** attached.
  - A virtual machine that has multiple NICs using the same **MAC address**.
  - Volumes residing in **premium** storage accounts.
  - VMs with disks that are not Managed Premium disks, Managed Standard SSD disks or Managed Standard HDD disks.
• VMs with disks in storage accounts.
• Retention is not supported in Azure.

Notes:
• When Reverse Protection is configured, in the Recovery step of the wizard the VPG and VM default network settings are configured as if a new VPG to Azure was created. The original VM network settings of the on-premise VPG are not reproduced in the VPG network settings in reverse protection configuration. Is this true? Ask Michal
• When creating or editing a VPG from Azure to vSphere or Hyper-V, re-IP of the NIC configuration is supported only if VMware Tools (vSphere) or Microsoft Integration Services (Hyper-V) are available for each virtual machine in the VPG, in which case the IP address of the originally protected virtual machine is used.
• Protection can be set up to enable recovery to a point in time, up to 30 days prior to a disaster.
• Resizing of protected disks in Azure is supported.
• Azure local SSD disks, which are created with the virtual machine but not provisioned to the virtual machine, are not protected.
• Boot order configuration for virtual machines recovered from Azure to on-premise sites is supported. Need to change this if boot order will be included.
• When a VM is recovered to Azure, a temporary drive is automatically created in the drive letter following the OS drive. Due to this temp drive, the non-OS drives you had set up in your production site may be shifted when recovered to Azure.
• Every block blob, page blob and Managed disks that are created by Zerto, are Encrypted at Rest on the Microsoft Azure platform, using the Microsoft-managed default key.
• Both the protected and recovery sites must be running Zerto <LatestVersion>.

Replication From a Protected Site Microsoft Azure to a Recovery Site vCenter Server

You can protect virtual machines to a recovery site vCenter Server. The procedure is the same whether you intend to protect one virtual machine or multiple virtual machines.

When creating a VPG from Azure to a vCenter Server, all recovery operations bring up the recovered machines on VMware vCenter Server hosts.

The Zerto solution uses SCSI for vCenter Server virtual machine disks.

When protecting virtual machines from Azure to vCenter Server, the operating systems of the protected machines must be supported by vCenter Server. Refer to the VMware documentation for a list of supported operating systems.

The following conversions are done to a protected virtual machine when it is recovered in vSphere:
• The SCSI controller type is operating system dependent.
• All disks are thin provisioned.
• Recovered virtual machines use the VMware Virtual E1000 network adapter.
• Operating systems will be either Windows 2012 (64-bit) or Linux Other (64-bit)
• (Public cloud environments) Memory and CPU properties will be extracted from the instance type in Azure and AWS.
• (Azure environments) In Azure VMs, each data disk has a Logical Unit Number (LUN) whereas in the recovered VMs there are no LUNs.

➢ To create a virtual protection group (VPG) to recover in a vCenter Server:

1. In the Zerto User Interface, select ACTIONS > CREATE VPG.

The GENERAL step of the Create VPG wizard is displayed.

2. Specify the name of the VPG and the priority of the VPG.
   • **VPG Name**: The VPG name must be unique. The name cannot be more than 80 characters.
   • **Priority**: Determine the priority for transferring data from the protected site to the recovery site when there is limited bandwidth and more than one VPG is defined on the protected site.
     • **High Priority**: When there are updates to virtual machines protected in VPGs with different priorities, updates from the VPG with the highest priority are passed over the WAN first.
     • **Medium Priority**: Medium priority VPGs will only be able to use whatever bandwidth is left after the high priority VPGs have used it.
     • **Low Priority**: Low priority VPGs will use whatever bandwidth is left after the medium priority VPGs have use it.

Updates to the protected virtual machines are always sent across the WAN before synchronization data, such as during a bitmap or delta sync.
During synchronization, data from the VPG with the highest priority is passed over the WAN before data from medium and low priority VPGs.

3. Click **NEXT**.

The VMs step is displayed.

Unprotected VMs with all its disks in the storage account specified during the installation, are included in the list and can be selected for protection.

4. Select the VMs that will be part of this VPG and click the right-pointing arrow to include these VMs in the VPG.

   • When using the **Search** field, you can use the wildcards; * or ?

   The Select VMs dialog is displayed.
**Note:** Virtual machines can be protected in a maximum of three VPGs. These VPGs cannot be recovered to the same site. Virtual machines protected in the maximum number of VPGs are not displayed in the Select VMs dialog.

Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

5. To define the boot order of the virtual machines in the VPG, click **DEFINE BOOT ORDER**, otherwise go to the next step.

When virtual machines in a VPG are started in the recovery site, by default these machines are not started up in a particular order. If you want specific virtual machines to start before other machines, you can specify a boot order. The virtual machines are defined in groups and the boot order applies to the groups and not to individual virtual machines in the groups. You can specify a delay between groups during startup.

**Note:** Up to 20 virtual machines may boot on a host simultaneously. Following the boot, a 15 second (default) delay occurs until the next boot batch.

Initially, virtual machines in the VPG are displayed together under the Default group. If you want specific machines to start before other virtual machines, define new groups with one or more virtual machines in each group.

6. Click **ADD GROUP** to add a new group. Then, do the following:
   a. To change the name of a group, click the Pencil icon next to the group.
   b. To delete a group, click the delete icon on the right side. You cannot delete the Default group nor a group that contains a virtual machine.
   c. Drag virtual machines to move them from one group to another.
   d. Drag groups to change the order the groups are started, or, optionally, in **Boot Delay**, specify a time delay between starting up the virtual machines in the group and starting up the virtual machines in the next group.
For Example: Assume three groups, Default, Server, and Client, defined in this order. The boot delay defined for the Default group is 10, for the Server group is 100, and for the Client group 0. The virtual machines in the Default group are started together and after 10 seconds the virtual machines in the Server group are started. After 100 seconds the virtual machines in the Client group are started.

e. Click OK to save the boot order.

7. Click NEXT.

The REPLICATION step is displayed

Note: If the protected site is paired with only one recovery site, the recovery step is displayed with the Recovery Site field automatically filled in and defaults set for the SLA and Advanced settings, as shown below.

8. Specify the recovery site. This is the site to which you want to recover the virtual machines. After specifying the recovery site, other fields are displayed including the host and datastore to use for replication.

Note: You cannot select a recovery site if any of the virtual machines you selected are already in VPGs that recover to that site.

• ZORG: If the site is defined in Zerto Cloud Manager, you specify the name used by the cloud service provider to identify you as a Zerto Organization, ZORG. For details about Zerto Cloud Manager, refer to Zerto Cloud Manager Administration Guide.
• **Host:** The default cluster, resource pool or host in the recovery site that handles the replicated data. If the site is defined in Zerto Cloud Manager, only a resource pool can be specified and the resource pool must also have been specified as a resource in Zerto Cloud Manager.

  **Note:** If Zerto Cloud Manager is used, vSphere Standard edition cannot be used.

For details about Zerto Cloud Manager, refer to Zerto Cloud Manager Administration Guide. When a resource pool is specified, Zerto checks that the resource pool capacity is enough for any virtual machines specified in the VPG.

All resource pool checks are made at the level of the VPG and do not take into account multiple VPGs using the same resource pool. If the resource pool CPU resources are specified as unlimited, the actual limit is inherited from the parent but if this inherited value is too small, failover, move, and failover test operations can fail, even without a warning alert being issued by Zerto Virtual Manager.

  **Note:** If a resource pool is specified and DRS is disabled for the site later on, all the resource pools are removed by VMware and recovery will be to any one of the hosts in the recovery site with a VRA installed on it.

• **Datastore:** The default datastore to use for recovered virtual machine files and for their data volumes. Every datastore for the selected recovery host is included in the drop-down list. If a cluster or resource pool is selected for the host, only datastores that are accessible by every host in the cluster or resource pool are displayed.

9. When the Zerto Cloud Manager is used select the **Service Profile.** This is the name of the service profile to use which determines the VPG SLA settings for the group, which apply to every virtual machine in the group. To change the VPG SLA settings, select the **Custom Service Profile.**

10. If the VPG SLA settings are editable, when the Zerto Cloud Manager is not used or when a Custom service profile is available, specify these settings for the group, which apply to every virtual machine in the group.

• **Journal History:** The time that all write commands are saved in the journal.

  The longer the information is saved in the journal, the more space is required for each journal in the VPG.

  You can select the number of hours from 1 to 24 or the number of days from 2 to 30.

  For additional journal-related fields, click **ADVANCED.**

  The Advanced Journal Settings dialog is displayed.
11. Define the advanced journal settings.

<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Journal History</strong></td>
<td></td>
</tr>
<tr>
<td>The time that all write commands are saved in the journal.</td>
<td>• Number of <strong>hours</strong> from 1 to 23</td>
</tr>
<tr>
<td>The longer the information is saved in the journal, the more space is required for each journal in the VPG.</td>
<td>• Number of <strong>days</strong> from 1 to 30</td>
</tr>
<tr>
<td><strong>Default Journal Storage (Hyper-V), or Default Journal Datastore (vSphere)</strong></td>
<td></td>
</tr>
<tr>
<td>The storage/datastore used for the journal data for each virtual machine in the VPG.</td>
<td>• Select the storage/datastore accessible to the host.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is <strong>not</strong> relevant when replicating to a vCD recovery site.</td>
<td>When you select a specific journal storage/datastore, the journals for each virtual machine in the VPG are stored in this storage/datastore, regardless of where the recovery storage/datastore is for each virtual machine. All protected virtual machines are recovered to the hosts that can access the specified journal storage/datastore.</td>
</tr>
</tbody>
</table>
### Journal Size Hard Limit

The maximum size that the journal can grow, either as a percentage or a fixed amount.

The journal is always thin-provisioned.

**Note:** The Journal Size Hard Limit applies independently both to the Journal History and also to the Scratch Journal Volume.

*For Example:* If the Journal Size Hard Limit is configured to a maximum size of 160 GB limit, then during Failover Test, both the Journal History and the Scratch Journal Volume together can take up to 320 GB. Each one with a maximum size of 160 GB limit.

<table>
<thead>
<tr>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unlimited:</strong> The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.</td>
</tr>
<tr>
<td>If Unlimited is selected, Size and Percentage options are not displayed.</td>
</tr>
<tr>
<td><strong>Size (GB):</strong> The maximum journal size in GB.</td>
</tr>
<tr>
<td><strong>Percentage:</strong> The minimum journal size, set by Zerto, is 8GB for Hyper-V and vSphere environments, and 10GB for Microsoft Azure environments.</td>
</tr>
<tr>
<td><strong>Percentage:</strong> The percentage of the virtual machine volume size to which the journal can grow.</td>
</tr>
<tr>
<td>This value can be configured to more than 100% of the protected VM's volume size.</td>
</tr>
</tbody>
</table>

### Journal Size Warning Threshold

The size of the journal that triggers a warning that the journal is nearing its hard limit.

<table>
<thead>
<tr>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unlimited:</strong> The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.</td>
</tr>
<tr>
<td>If Unlimited is selected, Size and Percentage options are not displayed.</td>
</tr>
<tr>
<td><em><em>Size</em> (GB):</em>* The size in GB that will generate a warning.</td>
</tr>
<tr>
<td><em><em>Percentage</em>:</em>* The percentage of the virtual machine volume size that will generate a warning.</td>
</tr>
</tbody>
</table>

*The values of Size and Percentage must be less than the configured Journal Size Hard Limit so that the warning will be generated when needed."

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.
12. Click OK.

13. **Target RPO Alert:** The maximum desired time between each automatic checkpoint write to the journal before an alert is issued. To increase the value, move the slider right; to decrease the value, move the slider left.

14. **Test Reminder:** The time recommended between testing the integrity of the VPG. A warning is issued if a test is not done within this time frame.

15. To change the replication settings per virtual machine, click **VM SETTINGS**.

The Advanced VM Replication Settings dialog is displayed.

In this dialog, you can edit the values of one or more of the virtual machines in the VPG.

16. To edit information in **one field**, click the field and update the information.

17. To edit information for **several virtual machines** at the same time, select the virtual machines and click **EDIT SELECTED**.

The Edit VM dialog is displayed.

</tbody>
</table>
| • (Hyper-V) Select a Volume Source for recovery from one of the drop-down options:  
  • Storage  
  • Preseeded volume | • **Volume Source > Storage**: A new volume is used for replicated data.  
  • From the **Storage** drop-down list, specify the storage to use to create disks for the replicated data.  
  
  The storage specified for the replication must have at least the same amount of space as the protected volume and then an additional amount for the journal.  
  
  The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.  
  
  For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section *Estimating WAN Bandwidth for VMware and Hyper-V*.  
  
  • **Volume Source > Preseeded volume**: Whether to copy the protected data to a virtual disk in the recovery site.  
  
  Zerto **recommends** using this option particularly for large disks so that the initial synchronization will be faster since a **Delta Sync** can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.  
  
  When **not** using a preseeded disk, the initial synchronization phase must copy the whole disk over the WAN.  
  
  When using a preseeded virtual disk, you select the storage and exact location, folder, and name of the preseeded disk.  
  
  Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.  
  
  Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.  
  
  The storage where the preseeded disk is placed is also used as the recovery storage for the replicated data. |
### Setting & Description

**(vSphere) Select a Volume Source for recovery from one of the drop-down options:**

- **Datastore**
- **RDM**
- **Preseeded volume**

**Volume Source > Datastore:** A new volume is used for replicated data.

- Specify the **Datastore** to use to create disks for the replicated data.
- If the **source disk is thin provisioned**, the default for the recovery volume is also thin provisioned.
- The datastore specified for replication must have at least the same amount of space as the **protected volume** and an additional amount for the **journal**.
- The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.
- Zerto supports the SCSI protocol. Only disks that support this protocol can be specified.

Then, define the following:

- **Datastore:** The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.

For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section **Estimating WAN Bandwidth for VMware and Hyper-V**.
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source &gt; RDM:</strong> The VMware RDM (Raw Device Mapping) which will be used for the replication.</td>
<td></td>
</tr>
</tbody>
</table>

By default, **RDM is recovered as thin-provisioned VMDK** in the datastore specified in the **VM Recovery Datastore/Storage** field in the Edit VM dialog, and not to RDM.

Only a raw disk with the **same size as the protected disk** can be selected from the list of available raw disks. Other raw disks with different sizes are not available for selection.

The RDM is always stored in the recovery datastore, used for the virtual machine.

The following **limitations** apply to protecting RDM disks:

- RDM disks with an even number of blocks can replicate to RDM disks of the same size with an even number of blocks and to VMDKs.
- RDM disks with an odd number of blocks can only replicate to RDM disks of the same size with an odd number of blocks and not to VMDKs.
- You cannot define an RDM disk to be protected to a cloud service provider via a Zerto Cloud Connector nor if the virtual machine uses a BusLogic SCSI controller, nor when protecting or recovering virtual machines in an environment running vCenter Server 5.x with ESX/ESXi version 4.1 hosts.
Protecting Virtual Machines From Azure Setting & Description

<table>
<thead>
<tr>
<th>Select...</th>
<th>(vSphere) Volume Source continued</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source &gt; Preseeded volume</strong>: Select this when you want to copy the protected data to a virtual disk in the recovery site.</td>
<td></td>
</tr>
</tbody>
</table>

Consider the following, then proceed to define the Datastore and the Path:

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.
  - If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.
  - If you use a preseeded virtual disk, you select the datastore and exact location, folder, and name of the preseeded disk, which cannot be an IDE disk. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.
  - The datastore where the preseeded disk is placed is also used as the recovery datastore for the replicated data.
  - If the preseeded disk is **greater than 1TB on NFS storage**, the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. See VMware documentation, [http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the command: `esxcfg-advcfg -s <Timeout>/NFS/SetAttrRPCTimeout`
  - If the protected disks are **non-default geometry**, configure the VPG using preseeded volumes.
  - If the protected disk is an **RDM disk**, it can be used to preseed to a recovery VMDK disk. Zerto makes sure that the VMDK disk size is a correct match for the RDM disk.

</tbody>
</table>
If the virtual machine to be replicated includes a temp data disk as part of its configuration. | Specify a mirror disk for replication that is marked as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization. |
| **Thin provisioning (vSphere)** |
If the recovery volumes are thin-provisioned or not. | If the source disk is thin provisioned, the default for the recovery volume is also thin provisioned. vCD only: Unless the Org vDC only supports thin-provisioned volumes |
| **Dynamic provisioning (Hyper-V)** |
If the recovery volumes are dynamic-provisioned or not. | If the source disk is dynamic provisioned, the default for the recovery volume is also dynamic provisioned. vCD only: Unless the Org vDC only supports dynamic-provisioned volumes |

22. Click OK.

23. Click NEXT.

The RECOVERY step is displayed. Recovery details include the networks to use for failover, move, and for testing failover, and whether scripts should run as part of the recovery operation.
24. Select the default recovery settings. These are applied to every virtual machine in the VPG.

- **Failover/Move Network:** The network to use during a failover or move operation in which the recovered virtual machines will run.

- **Failover Test Network:** The network to use when testing the failover of virtual machines in the recovery site. Zerto recommends using a fenced-out network so as not to impact the production network at this site.

- **Recovery Folder:** The folder to which the virtual machines are recovered.

25. To specify a recovery folder for each virtual machine in the VPG, click **VM SETTINGS.**

The Advanced VM Recovery Settings window is displayed.
In this window, you can edit the values of one or more of the virtual machines in the VPG.

- To edit information in one field, click the field and update the information.

26. To edit information for several virtual machines at the same time, select the virtual machines and click EDIT SELECTED.

The Edit VM window is displayed.

- **Recovery Folder**: The folder to which the virtual machine is recovered.

27. Click SAVE.

28. In the Advanced VM Recovery Settings window, click OK.

29. To specify a recovery folder for each virtual machine in the VPG, click VM SETTINGS.

The Advanced VM Recovery Settings window is displayed.

In this window, you can edit the values of one or more of the virtual machines in the VPG.

- To edit information in one field, click the field and update the information.

30. To edit information for several virtual machines at the same time, select the virtual machines and click EDIT SELECTED.

The Edit VM window is displayed.
31. Click **SAVE**.

32. In the Advanced VM Recovery Settings window, click **OK**.

33. Enter the name of the script to run in the Command to run text box. You can then enter details about the script.

   - **Pre-recovery Script**: The information about a script that should run at the beginning of the recovery process.
   - **Post-recovery Script**: The information about a script that should run at the end of the recovery process.

For both types of scripts, enter the following information:

<table>
<thead>
<tr>
<th>Text Box</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command to run</strong></td>
<td>The full path of the script. The script must be located on the same machine as the Zerto Virtual Manager for the recovery site.</td>
</tr>
<tr>
<td><strong>Params</strong></td>
<td>The parameters to pass to the script. Separate parameters with a space.</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>The time-out, in seconds, for the script to run. If the script runs before executing a failover, move, or test failover, and the script fails or the timeout value is reached, an alert is generated and the failover, move, or test failover is not performed. If the script runs after executing a failover, move, or test failover, and the timeout value is reached, an alert is generated. The default time-out value is specified in Performance and Throttling tab in the Site Settings dialog.</td>
</tr>
</tbody>
</table>

34. Click **NEXT**.

The **NICs** step is displayed. In this step, you can specify the NIC details to use for the recovered virtual machines after a failover, a test failover, or migration.
35. To edit information in one field, click the field and update the information.

36. To edit information for several virtual machines at the same time, select the virtual machines and click EDIT SELECTED.

37. Otherwise, go to step Click NEXT. on page 75.

The Edit vNIC dialog is displayed.

38. Specify the network details to use for the recovered virtual machines after a failover or move operation, in the Failover/Move column, and for the recovered virtual machines when testing replication, in the Test column.

In each column, specify the following:
- **Network:** The network to use for this virtual machine.

- **Create New MAC Address:** Whether the Media Access Control address (MAC address) used on the protected site should be replicated on the recovery site. The default is to use the same MAC address on both sites. Note that if you check this option, to create a new MAC address, and the current IP address is not specified, the protected virtual machine static IP address might not be used for the recovered virtual machine.

- **Change vNIC IP Configuration:** Whether or not to keep the default virtual NIC (vNIC) IP configuration. The vNIC IP is only changed after recovery for virtual machines with VMware Tools running.

Refer to the [Zerto Interoperability Matrix](#) for the list of operating systems for which Zerto supports Re-IPing.

To change the vNIC IP, select **Yes** in the **Failover/Move or Test** column. If you select to use a static IP connection, set the IP address, subnet mask, and default gateway. Optionally, change the preferred and alternate DNS server IPs and the DNS suffix. If you leave the DNS server and suffix entries empty, or select to use DHCP, the IP configuration and DNS server configurations are assigned automatically, to match the protected virtual machine. You can change the DNS suffix.

If the virtual machine has multiple NICs but is configured to only have a single default gateway, fill in a 0 for each octet in the **Default gateway** field for the NICs with no default gateway.

During a failover, move, or test failover, if the recovered virtual machine is assigned a different IP than the original IP, then after the virtual machine has started, it is automatically rebooted so that it starts up with the correct IP. If the same network is used for both production and test failovers, Zerto recommends changing the IP address for the virtual machines started for the test, so that there is no IP clash between the test machines and the production machines.

- **Copy to failover test:** Select this to copy the settings in the Failover/Move column to the **Test** column.

- **Copy to failover/move:** Select this to copy the settings in the Test column to the **Failover/Move** column.

Click **OK**.

39. Click **NEXT**.

The **SUMMARY** step is displayed. It shows the VPG configuration that you defined in previous tabs.

40. Click **DONE**.

The VPG is created.

For details of what happens after saving the VPG, see What Happens After the VPG is Defined on page 38, on page 34.
Replication From a Protected Site Microsoft Azure to a Recovery Site Hyper-V Server

You can protect virtual machines to recover Hyper-V hosts. The procedure is the same whether you intend to protect one virtual machine or multiple virtual machines.

When creating a VPG from Azure to Hyper-V all recovery operations bring up the recovered machines on Microsoft Hyper-V hosts in SCVMM.

The Zerto solution uses SCSI for Hyper-V Server virtual machine disks.

When protecting virtual machines from an Azure to Hyper-V, the operating systems of the protected machines must be supported by Hyper-V. Refer to Hyper-V documentation for the list of supported operating systems. Virtual machine names cannot include any of the following special characters: * ? : < > / | \ ".

- The SCSI controller type is operating system dependent.
- All disks are thin provisioned.
- Recovered virtual machines use the VMware Virtual E1000 network adapter.
- Operating systems will be either Windows 2012 (64-bit) or Linux Other (64-bit)
- (Public cloud environments) Memory and CPU properties will be extracted from the instance type in Azure and AWS.
- (Azure environments) In Azure VMs, each data disk has a Logical Unit Number (LUN) whereas in the recovered VMs there are no LUNs.

To create a virtual protection group (VPG) to recover in Hyper-V:

1. In the Zerto User Interface, select ACTIONS > CREATE VPG.

The NEW VPG step of the Create VPG wizard is displayed.
2. Specify the name of the VPG and the priority of the VPG.

- **VPG Name:** The VPG name must be unique. The name cannot be more than 80 characters.

- **Priority:** Determine the priority for transferring data from the protected site to the recovery site when there is limited bandwidth and more than one VPG is defined on the protected site.

  - **High Priority:** When there are updates to virtual machines protected in VPGs with different priorities, updates from the VPG with the highest priority are passed over the WAN first.

  - **Medium Priority:** Medium priority VPGs will only be able to use whatever bandwidth is left after the high priority VPGs have used it.

  - **Low Priority:** Low priority VPGs will use whatever bandwidth is left after the medium priority VPGs have use it.

Updates to the protected virtual machines are always sent across the WAN before synchronization data, such as during a bitmap or delta sync.

During synchronization, data from the VPG with the highest priority is passed over the WAN before data from medium and low priority VPGs.

3. Click NEXT.

The VMs step is displayed.

Unprotected VMs with all its disks in the storage account specified during the installation, are included in the list and can be selected for protection.

4. Select the VMs that will be part of this VPG and click the right-pointing arrow to include these VMs in the VPG.

- When using the Search field, you can use the wildcards: * or ?

**Note:** Virtual machines can be protected in a maximum of three VPGs. These VPGs...
Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

5. To define the boot order of the virtual machines in the VPG, click **DEFINE BOOT ORDER**, otherwise go to the next step.

When virtual machines in a VPG are started in the recovery site, by default these machines are not started up in a particular order. If you want specific virtual machines to start before other machines, you can specify a boot order. The virtual machines are defined in groups and the boot order applies to the groups and not to individual virtual machines in the groups. You can specify a delay between groups during startup.

**Note:** Up to 20 virtual machines may boot on a host simultaneously. Following the boot, a 15 second (default) delay occurs until the next boot batch.

Initially, virtual machines in the VPG are displayed together under the Default group. If you want specific machines to start before other virtual machines, define new groups with one or more virtual machines in each group.

6. Click **ADD GROUP** to add a new group. Then, do the following:

a. To change the name of a group, click the Pencil icon next to the group.

b. To delete a group, click the delete icon on the right side. You cannot delete the Default group nor a group that contains a virtual machine.

c. Drag virtual machines to move them from one group to another.

d. Drag groups to change the order the groups are started, or, optionally, in **Boot Delay**, specify a time delay between starting up the virtual machines in the group and starting up the virtual machines in the next group.

*For Example:* Assume three groups, Default, Server, and Client, defined in this order. The boot
delay defined for the Default group is 10, for the Server group is 100, and for the Client group 0. The virtual machines in the Default group are started together and after 10 seconds the virtual machines in the Server group are started. After 100 seconds the virtual machines in the Client group are started.

e. Click OK to save the boot order.

7. Click NEXT.

The **REPLICATION** step is displayed.

![Recovery Site](image)

**Note:** If the protected site is paired with only one recovery site, the recovery step is displayed with the Recovery Site field automatically filled in and defaults set for the SLA and Advanced settings, as shown below.

8. Specify the recovery site and default values to use for the replication to this site.

- **Recovery Site:** The site to which you want to recover the virtual machines. After specifying the Microsoft SCVMM recovery site, the host and storage on the site to use for the replication can be specified.

  **Note:** You cannot select a recovery site if any of the virtual machines you selected are already in VPGs that recover to that site.

- **Host:** The default cluster or host, in the recovery site that handles the replicated data.

- **Storage:** The default storage volume to use for the recovered virtual machine files and for their data volumes. Every storage for the recovery host is included in the drop-down list. If a cluster is selected for the host, only storage accessible by every host in the cluster are displayed.
9. Optionally, change the VPG SLA settings, which apply to every virtual machine in the group.

   - **Journal History**: The time that all write commands are saved in the journal.

     The longer the information is saved in the journal, the more space is required for each journal in the VPG.

     Select the number of **hours** from 1 to 23 or the number of **days** from 1 to 30.

10. For additional journal-related fields, click **ADVANCED**.

    The Advanced Journal Settings dialog is displayed.

11. Select the journal settings.

<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>

</thead>
<tbody>
<tr>
<td><strong>Journal History</strong></td>
<td></td>
</tr>
<tr>
<td>The time that all write commands are saved in the journal.</td>
<td>• Number of <strong>hours</strong> from 1 to 23</td>
</tr>
<tr>
<td>The longer the information is saved in the journal, the more space is required for each journal in the VPG.</td>
<td>• Number of <strong>days</strong> from 1 to 30</td>
</tr>
<tr>
<td><strong>Default Journal Storage</strong> (Hyper-V), or <strong>Default Journal Datastore</strong> (vSphere)</td>
<td></td>
</tr>
<tr>
<td>The storage/datastore used for the journal data for each virtual machine in the VPG.</td>
<td>• Select the storage/datastore accessible to the host.</td>
</tr>
<tr>
<td><strong>Note</strong>: This field is <strong>not</strong> relevant when replicating to a vCD recovery site.</td>
<td>When you select a specific journal storage/datastore, the journals for each virtual machine in the VPG are stored in this storage/datastore, regardless of where the recovery storage/datastore is for each virtual machine. All protected virtual machines are recovered to the hosts that can access the specified journal storage/datastore.</td>
</tr>
</tbody>
</table>
### Setting & Description

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Journal Size Hard Limit</strong></td>
<td>The maximum size that the journal can grow, either as a percentage or a fixed amount. The journal is always thin-provisioned.</td>
</tr>
<tr>
<td><strong>Journal Size Warning Threshold</strong></td>
<td>The size of the journal that triggers a warning that the journal is nearing its hard limit.</td>
</tr>
</tbody>
</table>

- **Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.
  - If Unlimited is selected, Size and Percentage options are not displayed.
  - **Size (GB)**: The maximum journal size in GB.
  - **Percentage**: The percentage of the virtual machine volume size to which the journal can grow.
  - This value can be configured to more than 100% of the protected VM's volume size.

*The values of Size and Percentage must be less than the configured Journal Size Hard Limit so that the warning will be generated when needed.*

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

For Example: If the Journal Size Hard Limit is configured to a maximum size of 160 GB limit, then during Failover Test, both the Journal History and the Scratch Journal Volume together can take up to 320 GB. Each one with a maximum size of 160 GB limit.
12. Click **OK**.

13. Click **OK**.

- **Target RPO Alert**: The maximum desired time between each automatic checkpoint write to the journal before an alert is issued.
- **Test Reminder**: The amount of time in months recommended between each test, where you test the integrity of the VPG. A warning is issued if a test is not performed within this time frame.

14. To change the replication settings per virtual machine, click **VM SETTINGS**.

The Advanced VM Replication Settings dialog is displayed.

```
In this window, you can edit the values of one or more of the virtual machines in the VPG.
```

15. To edit information in **one** field, click the field and update the information.

16. To edit information for **several virtual machines** at the same time, select the virtual machines and click **EDIT SELECTED**.

The Edit VM window is displayed.

```
17. Configure as follows:
```
<table>

<td>The storage/datastore used for the journal data for each virtual machine in the VPG.</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

18. Click **OK**.

19. In the Advanced VM Replication Settings dialog, click **OK**.

20. Click **NEXT**.

   The **STORAGE** step is displayed. By default the storage used for the virtual machine definition is also used for the virtual machine data. For each virtual machine in the VPG, Zerto displays its storage-related information.
**Temp Data:** If the virtual machine to be replicated includes a temp data disk as part of its configuration, mark the recovery disk for this disk as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization.

21. To edit storage information for one of the virtual machines' volume location, first select the virtual machine, then click **EDIT SELECTED**. The Edit Volumes window is displayed.

- For **Hyper-V** recovery environments, the following window appears. For details, click **here**.

- For **vSphere** recovery environments, the following window appears. For details, click **here**.

- For **vCD** recovery environments, the following window appears. For details, click **here**.
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source</strong></td>
<td></td>
</tr>
<tr>
<td>• (Hyper-V) Select a Volume Source for recovery from one of the drop-down options:</td>
<td>• <strong>Volume Source &gt; Storage</strong>: A new volume is used for replicated data.</td>
</tr>
<tr>
<td>• <strong>Storage</strong></td>
<td>• From the <strong>Storage</strong> drop-down list, specify the storage to use to create disks for the replicated data.</td>
</tr>
<tr>
<td>• <strong>Preseeded volume</strong></td>
<td>The storage specified for the replication must have at least the same amount of space as the protected volume and then an additional amount for the journal.</td>
</tr>
<tr>
<td></td>
<td>The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.</td>
</tr>
<tr>
<td></td>
<td>For more details, see <em>Zerto Scale and Benchmarking Guidelines</em>, in the section <em>Estimating WAN Bandwidth for VMware and Hyper-V</em>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Volume Source &gt; Preseeded volume</strong>: Whether to copy the protected data to a virtual disk in the recovery site.</td>
</tr>
<tr>
<td></td>
<td><strong>Zerto recommends</strong> using this option particularly for large disks so that the initial synchronization will be faster since a <strong>Delta Sync</strong> can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>When <strong>not</strong> using a preseeded disk, the initial synchronization phase must copy the whole disk over the WAN.</td>
</tr>
<tr>
<td></td>
<td>When using a preseeded virtual disk, you select the storage and exact location, folder, and name of the preseeded disk.</td>
</tr>
<tr>
<td></td>
<td><strong>Zerto</strong> takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.</td>
</tr>
<tr>
<td></td>
<td>Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>The storage where the preseeded disk is placed is also used as the recovery storage for the replicated data.</td>
</tr>
<tr>
<td>Setting &amp; Description</td>
<td>Select...</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>(vSphere) Select a Volume Source for recovery from one of the drop-down options:</td>
<td>Volume Source &gt; Datastore: A new volume is used for replicated data.</td>
</tr>
<tr>
<td>• Datastore</td>
<td><img src="image" alt="Edit Volume" /></td>
</tr>
<tr>
<td>• RDM</td>
<td>Datastore: Specify the <strong>Datastore</strong> to use to create disks for the replicated data.</td>
</tr>
<tr>
<td>• Preseeded volume</td>
<td>If the <strong>source disk is thin provisioned</strong>, the default for the recovery volume is also thin provisioned.</td>
</tr>
</tbody>
</table>

- The datastore specified for replication must have at least the same amount of space as the **protected volume** and an additional amount for the **journal**.
- The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.
- Zerto supports the SCSI protocol. Only disks that support this protocol can be specified.

Then, define the following:

- **Datastore**: The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.

For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section *Estimating WAN Bandwidth for VMware and Hyper-V*. 
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source &gt; RDM</strong>: The VMware RDM (Raw Device Mapping) which will be used for the replication.</td>
<td></td>
</tr>
</tbody>
</table>

By default, RDM is recovered as thin-provisioned VMDK in the datastore specified in the **VM Recovery Datastore/Storage** field in the Edit VM dialog, and not to RDM.

Only a raw disk with the **same size as the protected disk** can be selected from the list of available raw disks. Other raw disks with different sizes are not available for selection.

The RDM is always stored in the recovery datastore, used for the virtual machine.

The following **limitations** apply to protecting RDM disks:

- RDM disks with an even number of blocks can replicate to RDM disks of the same size with an even number of blocks and to VMDKs.
- RDM disks with an odd number of blocks can only replicate to RDM disks of the same size with an odd number of blocks and not to VMDKs.
- You cannot define an RDM disk to be protected to a cloud service provider via a Zerto Cloud Connector nor if the virtual machine uses a BusLogic SCSI controller, nor when protecting or recovering virtual machines in an environment running vCenter Server 5.x with ESX/ESXi version 4.1 hosts.
### Setting & Description

<table>
<thead>
<tr>
<th>(vSphere) Volume Source continued</th>
</tr>
</thead>
</table>

**Volume Source > Preseeded volume**: Select this when you want to copy the protected data to a virtual disk in the recovery site.

Consider the following, then proceed to define the Datastore and the Path:

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- If you use a preseeded virtual disk, you select the datastore and exact location, folder, and name of the preseeded disk, which cannot be an IDE disk. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

- The datastore where the preseeded disk is placed is also used as the recovery datastore for the replicated data.

- If the preseeded disk is **greater than 1TB on NFS storage**, the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. See VMware documentation, [http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the command: `esxcf~adv~cfg -s <Timeout> /NFS/SetAttrRPCTimeout`

- If the protected disks are **non-default geometry**, configure the VPG using preseeded volumes.

- If the protected disk is an **RDM disk**, it can be used to preseed to a recovery VMDK disk. Zerto makes sure that the VMDK disk size is a correct match for the RDM disk.
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• If the VPG is being defined for a Zerto Organization, ZORG, the location of the preseeded disk must be defined in the Zerto Cloud Manager. See Zerto Cloud Manager Administration Guide.</td>
</tr>
<tr>
<td></td>
<td>Then, define the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Datastore</strong>: The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Path</strong>: The full path to the preseeded disk.</td>
</tr>
<tr>
<td>Setting &amp; Description</td>
<td>Select...</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------</td>
</tr>
<tr>
<td>(vCD) Select a Volume Source for recovery from one of the drop-down options:</td>
<td>Volume Source &gt; vCD managed storage policy: Zerto will select a datastore, from the list of available datastores, in the selected Storage Policy in which to place the Volume, unless the datastore is excluded in the Configure Provider vDCs Dialog.</td>
</tr>
<tr>
<td>• vCD managed storage policy</td>
<td>• If there are several valid datastores, the datastore with the most available space is selected.</td>
</tr>
<tr>
<td>• Preseeded volume</td>
<td>• Zerto recalculates the datastore available space for each volume sequentially, taking into consideration previously allocated volumes.</td>
</tr>
</tbody>
</table>

Volume Source > Preseeded volume:

Select this when you want to copy the protected data to a virtual disk in the recovery site.

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- The preseeded volume is a virtual disk (the VMDK flat file and descriptor) in the recovery site that has been prepared with a copy of the protected data.

- Browse to the preseed folder configured for the customer and the disk name, of the preseeded disk.

In order to use a preseeded VMDK, do the following:

- Create a folder in vCD to use for the preseeded disks in the datastore you want to use for the customer.

- Specify this datastore as a provider datastore for preseeded disks in the Configure Provider vDCs window, from the Advanced Settings window, as described in Zerto Cloud Manager Administration Guide.

- In the Zerto Cloud Manager specify the Preseed Folder Name for the ZORG, in the Manage ZORG tab.

- Zerto searches for the preseeded folder in the available datastores in the Org vDCs specified in the vCD Cloud Resources for the ZORG in the Zerto Cloud Manager and takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

If the virtual machine has more than one preseeded disk, these disks must
<table>
<thead>
<tr>

</tr>
<tr>
<td><strong>Dynamic provisioning</strong> (Hyper-V)</td>
<td></td>
</tr>
<tr>
<td>If the recovery volumes are dynamic-provisioned or not.</td>
<td>If the source disk is dynamic provisioned, the default for the recovery volume is also dynamic provisioned. vCD only: Unless the Org vDC only supports dynamic-provisioned volumes</td>
</tr>
</tbody>
</table>

22. Click **OK**.

23. Click **NEXT**.

The RECOVERY step is displayed. Recovery details include the networks to use for failover, move, and for testing failover, and whether scripts should run as part of the recovery operation.
24. Select the default recovery settings.

- **Failover/Move Network**: The network to use during a failover or move operation in which the recovered virtual machines will run.

- **Failover Test Network**: The network to use when testing the failover of virtual machines in the recovery site. Zerto recommends using a fenced-out network so as not to impact the production network at this site.

25. To run pre and post recovery scripts, enter the path to the script to run.

- **Pre-recovery Script**: The information about a script that should run at the beginning of the recovery process.

- **Post-recovery Script**: The information about a script that should run at the end of the recovery process.

For both types of scripts, enter the following information:

<table>
<thead>
<tr>
<th>Text Box</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Script path</strong></td>
<td>The full path to the script. The script must be located on the same machine as the Zerto Virtual Manager for the recovery site.</td>
</tr>
<tr>
<td><strong>Params</strong></td>
<td>The parameters to pass to the script. Separate parameters with a space.</td>
</tr>
<tr>
<td>Text Box</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Timeout</strong></td>
<td>The time-out, in seconds, for the script to run.</td>
</tr>
<tr>
<td>• If the script runs before executing a failover, move, or test failover, and the script fails or the timeout value is reached, an alert is generated and the failover, move, or test failover is not performed.</td>
<td></td>
</tr>
<tr>
<td>• If the script runs after executing a failover, move, or test failover, and the timeout value is reached, an alert is generated.</td>
<td></td>
</tr>
<tr>
<td>• The default time-out value is specified in <strong>Site Settings &gt; Performance and Throttling</strong> tab.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Pre and post recovery scripts run in parallel. Therefore, ensure that the pre and post recovery scripts don’t use common resources.

26. **Click NEXT.**

The NICs step is displayed. In this step, you can specify the NIC details to use for the recovered virtual machines after a failover, a test failover, or migration.

27. To edit information in **one field**, click the field and update the information.

28. To edit information for **several virtual machines** at the same time, select the virtual machines and **click EDIT SELECTED**.

29. Otherwise, go to step **Click NEXT. on page 99**.

The Edit VNIC dialog is displayed.
Specify the network details to use for the recovered virtual machines after a failover or move operation, in the Failover/Move column, and for the recovered virtual machines when testing replication, in the Test column.

30. In each column, specify the following:

- **Network**: The network to use for this virtual machine.

- **Create new MAC address?**: Whether the Media Access Control address (MAC address) used on the protected site should be replicated on the recovery site. The default is to use the same MAC address on both sites. Note that if you check this option, to create a new MAC address, and the current IP address is not specified, the protected virtual machine static IP address might not be used for the recovered virtual machine.

- **Change vNIC IP Configuration?**: Whether or not to keep the default virtual NIC (vNIC) IP configuration. The vNIC IP is only changed after recovery for virtual machines with VMware Tools running.

See the Zerto Interoperability Matrix for the list of operating systems for which Zerto supports Re-IPing.

- To change the vNIC IP, in the Failover/Move or Test column, select Yes. If you select to use a static IP connection, set the IP address, subnet mask, and default gateway.

- Optionally, change the preferred and alternate DNS server IPs and the DNS suffix.

- If you leave the DNS server and suffix entries empty, or select to use DHCP, the IP configuration and DNS server configurations are assigned automatically, to match the protected virtual machine. You can change the DNS suffix.

- If the virtual machine has multiple NICs but is configured to only have a single default gateway, fill in a 0 for each octet in the Default gateway field for the NICs with no default gateway.

During a failover, move, or test failover, if the recovered virtual machine is assigned a different IP
than the original IP, then after the virtual machine has started, it is automatically rebooted so that it
starts up with the correct IP. If the same network is used for both production and test failovers,
Zerto recommends changing the IP address for the virtual machines started for the test, so that
there is no IP clash between the test machines and the production machines.

- **Copy to failover test:** Select this to copy the settings in the Failover/Move column to the Test
column.
- **Copy to failover/move:** Select this to copy the settings in the Test column to the
  Failover/Move column.

31. Click **OK**.
32. Click **NEXT**.

The SUMMARY step is displayed. It shows the VPG configuration that you defined in previous
tabs.

33. Click **DONE**.

The VPG is created.

For details of what happens after saving the VPG, see What Happens After the VPG is Defined on
page 38, on page 34.

### Replication From a Protected Site Microsoft Azure to a Recovery Site vCloud Director

You can protect virtual machines to a recovery site vCenter Server. The procedure is the same whether
you intend to protect one virtual machine or multiple virtual machines.

When creating a VPG from Azure to a vCenter Server, all recovery operations bring up the recovered
machines on VMware vCenter Server hosts.

The Zerto solution uses SCSI for vCenter Server virtual machine disks.

When protecting virtual machines from Azure to vCenter Server, the operating systems of the protected
machines must be supported by vCenter Server. Refer to the VMware documentation for a list of
supported operating systems.

The following conversions are done to a protected virtual machine in when it is recovered in vCD:

- The SCSI controller type is operating system dependent.
- All disks are thin provisioned.
- Recovered virtual machines use the VMware Virtual E1000 network adapter.
- Operating systems will be either Windows 2012 (64-bit) or Linux Other (64-bit)
- *(Public cloud environments)* Memory and CPU properties will be extracted from the instance type in
  Azure and AWS.
- *(Azure environments)* In Azure VMs, each data disk has a Logical Unit Number (LUN) whereas in the
  recovered VMs there are no LUNs.
To create a virtual protection group (VPG) to recover in vCD:

1. In the Zerto User Interface, select **ACTIONS>CREATE VPG**.

   The GENERAL step of the Create VPG wizard is displayed.

   ![Create VPG Wizard](image)

2. Specify the name of the VPG and the priority of the VPG.
   - **VPG Name**: The VPG name must be unique. The name cannot be more than 80 characters.
   - **Priority**: Determine the priority for transferring data from the protected site to the recovery site when there is limited bandwidth and more than one VPG is defined on the protected site.
     - **High Priority**: When there are updates to virtual machines protected in VPGs with different priorities, updates from the VPG with the highest priority are passed over the WAN first.
     - **Medium Priority**: Medium priority VPGs will only be able to use whatever bandwidth is left after the high priority VPGs have used it.
     - **Low Priority**: Low priority VPGs will use whatever bandwidth is left after the medium priority VPGs have use it.

   Updates to the protected virtual machines are always sent across the WAN before synchronization data, such as during a bitmap or delta sync.

   During synchronization, data from the VPG with the highest priority is passed over the WAN before data from medium and low priority VPGs.

3. Click **NEXT**. The VMs step is displayed.
Unprotected VMs with all its disks in the storage account specified during the installation, are included in the list and can be selected for protection.

4. Select the VMs that will be part of this VPG and click the right-pointing arrow to include these VMs in the VPG.

- When using the Search field, you can use the wildcards; * or ?

The hardware version of the virtual machine must be the same or less than the hardware version supported by the vDC in vCloud Director (vCD) otherwise recovery of the virtual machine in vCD is not permitted. Set the supported hardware level in the Provider vDC Properties for the vDC in the vCloud Director console.

The Select VMs dialog is displayed.
Notes:

- Virtual machines can be protected in a maximum of three VPGs. These VPGs cannot be recovered to the same site. Virtual machines protected in the maximum number of VPGs are not displayed in the Select VMs dialog.
- Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.
- You define the boot order for the recovered vCD vApp in the vCloud Director console.

5. To define the boot order of the virtual machines in the VPG, click **DEFINE BOOT ORDER**, otherwise go to the next step.

When virtual machines in a VPG are started in the recovery site, by default these machines are not started up in a particular order. If you want specific virtual machines to start before other machines, you can specify a boot order. The virtual machines are defined in groups and the boot order applies to the groups and not to individual virtual machines in the groups. You can specify a delay between groups during startup.

**Note:** Up to 20 virtual machines may boot on a host simultaneously. Following the boot, a 15 second (default) delay occurs until the next boot batch.

Initially, virtual machines in the VPG are displayed together under the Default group. If you want specific machines to start before other virtual machines, define new groups with one or more virtual machines in each group.

6. Click **ADD GROUP** to add a new group. Then, do the following:

   a. To change the name of a group, click the Pencil icon next to the group.

   b. To delete a group, click the delete icon on the right side. You cannot delete the Default group nor a group that contains a virtual machine.
c. Drag virtual machines to move them from one group to another.

d. Drag groups to change the order the groups are started, or, optionally, in **Boot Delay**, specify a time delay between starting up the virtual machines in the group and starting up the virtual machines in the next group.

*For Example:* Assume three groups, Default, Server, and Client, defined in this order. The boot delay defined for the Default group is 10, for the Server group is 100, and for the Client group 0. The virtual machines in the Default group are started together and after 10 seconds the virtual machines in the Server group are started. After 100 seconds the virtual machines in the Client group are started.

e. Click **OK** to save the boot order.

7. Click **NEXT**.

The **REPLICATION** step is displayed.

8. Choose the Recovery vCD Site, and select **vCD** from the drop-down list.

The **REPLICATION** step is re-displayed, displaying additional fields relevant for vCD.

Define as follows:

9. **ZORG:** If the site is defined in **Zerto Cloud Manager**, select the name used by the cloud service provider (CSP) to identify you as a Zerto Organization (ZORG). For details about Zerto Cloud Manager, see Zerto Cloud Manager Administration Guide.

10. Specify the **Recovery Org vDC** to use in the recovery site.

    **Note:** You cannot select a recovery site if any of the virtual machines you selected are already in VPGs that recover to that site.
Note: At least one VRA needs to be installed on a host within a resource pool being used by a Recovery Org vDC.

11. In the SLA area, you define the Service Level Agreement for which this VPG is associated.

   • When Zerto Cloud Manager is used, select the Service Profile to use.

      The Service Profile determines the VPG SLA settings for the group. This applies predefined settings for the Journal History, Target RPO Alert and the Test Reminder. These settings apply to every virtual machine in the group.

   • When a Custom service profile is available, the VPGSLA settings are editable, and the Advanced button becomes available. When you change these settings, they apply to every virtual machine in the group.

12. Click ADVANCED. The Advanced Journal Settings dialog is displayed.

</tbody>
</table>
Protecting Virtual Machines From Azure

Setting & Description | Select...
--- | ---
Journal Size Warning Threshold | **Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.

If Unlimited is selected, Size and Percentage options are not displayed.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Size</strong> (GB):</td>
<td>The size in GB that will generate a warning.</td>
</tr>
<tr>
<td><strong>Percentage</strong>:</td>
<td>The percentage of the virtual machine volume size that will generate a warning.</td>
</tr>
</tbody>
</table>

*The values of **Size** and **Percentage** must be **less** than the configured **Journal Size Hard Limit** so that the warning will be generated when needed.

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

13. Click **OK**.

- **Target RPO Alert**: The maximum desired time between each automatic checkpoint write to the journal before an alert is issued.

- **Test Reminder**: The amount of time in months recommended between each test, where you test the integrity of the VPG. A warning is issued if a test is not performed within this time frame.

14. **Enable WAN Traffic Compression**: Whether or not data is compressed before being transferred to the recovery site. Compressing the data is more efficient, but results in a small performance degradation.

**Note**: WAN Traffic Compression is enabled by default when replicating to vCD.

- Enable WAN traffic compression if network considerations are more critical than CPU usage considerations.

- When WAN compression is enabled, the compressed data is written in compressed format to the recovery site journal. Even if WAN compression is selected, Zerto decreases the level of compression if it takes too many resources. The VRA automatically adjusts the compression level according to CPU usage, including totally disabling it if needed. Zerto recommends enabling WAN compression.
• Zerto can also work with third-party WAN optimization and acceleration technologies, such as those supplied by Riverbed Technologies and Silver Peak.

• When third-party WAN optimization is implemented, Zerto recommends disabling VPG WAN compression.

To change the replication settings per virtual machine, click **VM SETTINGS**.

The Advanced VM Replication Settings window is displayed.

In this window, you can edit the values of one or more of the virtual machines in the VPG.

![Advanced VM Replication Settings](image)

15. To edit information for a **single** VM, click the field **Storage Policy**, or **Journal Storage Policy**, and update the information.

• **Storage Policy**: The Storage Policy in which the **VM configuration files** will reside. For considerations, see step **When selecting Storage Policy**, consider the following: on page 108.

• **Journal Storage Policy**: The Storage Policy in which the **VM Journal files** will reside. For considerations, see step **When selecting Journal Storage Policy**, consider the following: on page 108.

16. To edit information for **several** virtual machines at the same time, select the virtual machines and click **EDIT SELECTED**.

The Edit VM window is displayed.
17. When selecting **Storage Policy**, consider the following:

- Zerto will select a datastore from the selected Storage Policy in which to place these files, unless the datastore is excluded in the Configure Provider vDCs Dialog.

- Zerto will try to determine a default Storage Policy according to:
  - A Storage Policy with the same name as the protected Storage Policy.
  - The default Orgvdc Storage Policy.

If Zerto did not manage to determine a default Storage Policy, this field appears empty.

- When you **click to edit**, a list of Storage Policies appear. These Storage Policies:
  - Were defined in VMware vCloud Director and are configured in the Orgvdc.
  - Have at least one datastore that was not excluded as a Recovery Volume in the Configure Provider vDCs Dialog.
  - To review site-specific configurations, see Configure Provider vDCs Dialog.

18. When selecting **Journal Storage Policy**, consider the following:

- Zerto will select a datastore from the selected Storage Policy in which to place the Journal files, unless the datastore is excluded in the Configure Provider vDCs Dialog.

- The default Journal Storage Policy is the same as the default VM Storage Policy.

- If Zerto did not manage to determine a default Journal Storage Policy, this field appears empty.

- When you **click to edit**, the option **Auto Select** appears, and a list of Storage Policies.

- The list of Storage Policies associated with the Journal:
  - Were defined in VMware vCloud Director and are configured in the Orgvdc.
  - Have at least one datastore that was not excluded as a **Journal** in the Configure Provider vDCs Dialog.

- **Auto Select**: Selecting this means that the journal can be placed in any datastore visible to the host that Zerto selected for recovery, unless the datastore is excluded in the Configure Provider vDCs Dialog.

19. Continue defining the following:
<table>

### Setting & Description | Select...
---|---
**Journal Storage** (Hyper-V), or **Journal Datastore** (vSphere) (not relevant when replicating to vCD) | **(vSphere)** To change the default, specify a host and then select one of the datastores accessible by this host to be used as the journal datastore. When you select specific journal datastore, the journals for each virtual machine in the VPG are stored in this datastore, regardless of where the recovery datastores are for each virtual machine. In this case, all the protected virtual machines must be recovered to hosts that can access the specified journal datastore.
| **(Hyper-V)** To change the default, specify a host and then select the storage location accessible by this host to be used as the journal storage. When you select specific journal storage, the journals for each virtual machine in the VPG are stored in this storage, regardless of where the recovery storage is for each virtual machine. In this case, all the protected virtual machines must be recovered to hosts that can access the specified journal storage.

The storage/datastore used for the journal data for each virtual machine in the VPG.

---

20. Click **OK**.

21. In the Advanced VM Replication Settings dialog, click **OK**.

22. Click **NEXT**.

The **STORAGE** step is displayed. By default the storage used for the virtual machine definition is also used for the virtual machine data. For each virtual machine in the VPG, Zerto displays its storage-related information.
Note: Steps that do not require input are marked with a check mark. You can jump directly to a step that has been marked with a check mark to edit the values for that step. Every step must be marked with a check mark before you can click **DONE** to create the VPG.

You can define **Thin** provisioning and **Temp Data** in this window, or you can alternatively define them when you separately select and **edit each VMs volume**.

**Important:**

Changing the VPG recovery volume from thin-provisioned to thick-provisioned or vice versa, results in volume initial synchronization.

See the following considerations regarding Thin provisioning:

- Unless the user **explicitly** requests Thin provisioning, provisioning type is the same type as provisioning in the **source VM**.
- If the **source** disk is Thin provisioned, the default for the **recovery** volume is also Thin provisioned.
- If the user uses preseed disks, Zerto maintains the provisioning types of the disks, so they can have other provisioning types.
23. To define whether the recovery volumes are thin-provisioned or not, select the Thin check box.

24. If the virtual machine to be replicated includes a temp data disk as part of its configuration, select the Temp Data check box to mark the recovery disk for this disk as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization.

25. To edit storage information for one of the virtual machines volumes, select the volume/s and click EDIT SELECTED.

- For Hyper-V recovery environments, the following window appears. For details, click here.

![Hyper-V Volume Edit Window](image)

- For vSphere recovery environments, the following window appears. For details, click here.

![vSphere Volume Edit Window](image)

- For vCD recovery environments, the following window appears. For details, click here.

![vCD Volume Edit Window](image)
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source</strong></td>
<td></td>
</tr>
<tr>
<td>• (Hyper-V) Select a</td>
<td><strong>Volume Source &gt; Storage</strong>: A new volume is used for replicated data.</td>

<td></td>
</tr>
<tr>
<td>• <em>Preseeded volume</em></td>
<td></td>
</tr>
</tbody>
</table>

- Specify the **Datastore** to use to create disks for the replicated data.
- If the source disk is thin provisioned, the default for the recovery volume is also thin provisioned.
- The datastore specified for replication must have at least the same amount of space as the protected volume and an additional amount for the journal.
- The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.
- Zerto supports the SCSI protocol. Only disks that support this protocol can be specified.

Then, define the following:

- **Datastore**: The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.

For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section *Estimating WAN Bandwidth for VMware and Hyper-V*. 
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
</table>

**Volume Source > RDM:** The VMware RDM (Raw Device Mapping) which will be used for the replication.

By default, **RDM is recovered as thin-provisioned VMDK** in the datastore specified in the **VM Recovery Datastore/Storage** field in the Edit VM dialog, and not to RDM.

Only a raw disk with the **same size as the protected disk** can be selected from the list of available raw disks. Other raw disks with different sizes are not available for selection.

The RDM is always stored in the recovery datastore, used for the virtual machine.

The following **limitations** apply to protecting RDM disks:

- RDM disks with an even number of blocks can replicate to RDM disks of the same size with an even number of blocks and to VMDKs.
- RDM disks with an odd number of blocks can only replicate to RDM disks of the same size with an odd number of blocks and not to VMDKs.
- You cannot define an RDM disk to be protected to a cloud service provider via a Zerto Cloud Connector nor if the virtual machine uses a BusLogic SCSI controller, nor when protecting or recovering virtual machines in an environment running vCenter Server 5.x with ESX/ESXi version 4.1 hosts.
Setting & Description | Select...
---|---
(vSphere) Volume Source continued | **Volume Source > Preseeded volume**: Select this when you want to copy the protected data to a virtual disk in the recovery site.

Consider the following, then proceed to define the Datastore and the Path:

- **Zerto recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- If you use a preseeded virtual disk, you select the datastore and exact location, folder, and name of the preseeded disk, which cannot be an IDE disk. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

- The datastore where the preseeded disk is placed is also used as the recovery datastore for the replicated data.

- If the preseeded disk is **greater than 1TB on NFS storage**, the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. See VMware documentation, [http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the command: `esxcfg-advcfg -s <Timeout> /NFS/SetAttrRPCTimeout`

- If the protected disks are **non-default geometry**, configure the VPG using preseeded volumes.

- If the protected disk is an **RDM disk**, it can be used to preseed to a recovery VMDK disk. Zerto makes sure that the VMDK disk size is a correct match for the RDM disk.

<td></td>
</tr>
<tr>
<td>• If the VPG is being defined for a Zerto Organization, ZORG, the location of the preseeded disk must be defined in the Zerto Cloud Manager. See Zerto Cloud Manager Administration Guide.</td>
<td></td>
</tr>
<tr>
<td>• Zerto supports the SCSI protocol. Only disks that support this protocol can be specified. Virtual machine RDMs in a vCenter Server are replicated as VMDKs in a vCD environment.</td>
<td></td>
</tr>
</tbody>
</table>

(vCD) continued  **Storage Policy:** Specify the Storage Policy for recovery from one of the options:

- **Storage Policy per volume** is supported only in vCD supported versions, and when the selected Orgvdc is not configured for fast provisioning.

- Zerto will select a datastore from the selected Storage Policy in which to place these files, unless the datastore is excluded in the Configure Provider vDCs Dialog.

- The Storage Policies which appear in the drop-down list:

  - Include the **Use VM Default** option (default), which will apply the VM’s storage policy to this volume. This is also the Storage Policy default value.

  - Were defined in VMware vCloud Director and are configured in the Orgvdc.

  - Have at least one Datastore that was not excluded as a Recovery Volume in the Configure Provider vDCs Dialog.
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>

</tr>
</tbody>
</table>

26. Click **OK**.

27. Click **NEXT**.

The **RECOVERY** step is displayed. Recovery details include the scripts that should be run either at the start or end of a recovery operation.
28. Select the default recovery settings.

- **vCD Guest Customization:** When selected, VMware Guest OS Customization is enabled for the virtual machine in vCloud Director. Enabling guest customization means that the computer name and network settings configured for this virtual machine are applied to its Guest OS when the virtual machine is powered on. vCD Guest Customization must be selected to enable re-IPing the recovered virtual machines.

- **Copy NAT Rules:** When checked, NAT rules on source vCD vApp networks are copied to the recovery vCD vApp during recovery. One of the following options can be selected:
  - **Use automatically allocated IP:** Allow the recovery site to automatically assign an external IP.
  - **Use source external IP:** Copy the rule’s external IP as the external IP on the recovery site.

- **vApp Network Mapping:** The networks to use for failover and move operations, for failover test operations, and for test failover operations after a failover or move when reverse protection is configured. The list of current Org Networks is displayed and you can specify what network to use in each of the situations. `<Isolated>` means that the network is an internal only vApp network.

29. To run pre and post recovery scripts, enter the path to the script to run.

- **Pre-recovery Script:** The information about a script that should run at the beginning of the recovery process.

- **Post-recovery Script:** The information about a script that should run at the end of the recovery process.

For both types of scripts, enter the following information:
### Text Box Description

<table>
<thead>
<tr>
<th>Script path</th>
<th>The full path to the script. The script must be located on the same machine as the Zerto Virtual Manager for the recovery site.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Params</td>
<td>The parameters to pass to the script. Separate parameters with a space.</td>
</tr>
</tbody>
</table>
| Timeout             | The time-out, in seconds, for the script to run.  
  • If the script runs before executing a failover, move, or test failover, and the script fails or the timeout value is reached, an alert is generated and the failover, move, or test failover is not performed.  
  • If the script runs after executing a failover, move, or test failover, and the timeout value is reached, an alert is generated.  
  • The default time-out value is specified in Site Settings > Performance and Throttling tab. |

**Note:** Pre and post recovery scripts run in parallel. Therefore, ensure that the pre and post recovery scripts don’t use common resources.

30. Click **NEXT**.

The NICs step is displayed. In this step, you can specify the NIC details to use for the recovered virtual machines after a failover, a test failover, or migration.

31. To edit information for a **single** virtual machine, click a field and update the information.

32. To edit information for **several** virtual machines at the same time, select the virtual machines and click **EDIT SELECTED**.
33. Otherwise, go to step Click OK. on page 125.

The Edit VNIC dialog is displayed.

34. Specify the network details to use for the recovered virtual machines after a failover or move operation, in the Failover/Move column, and for the recovered virtual machines when testing replication, in the Test column.

In each column, specify the following:

- **Network**: The network to use for this virtual machine.

- **MAC Address**: Whether the Media Access Control address (MAC address) used on the protected site should be replicated on the recovery site. The default is to use the same MAC address on both sites.

- **vNIC IP Mode**: Which IP mode to use. Specify the IP address if you choose static IP pool.

See the Zerto Interoperability Matrix for the list of operating systems for which Zerto supports Re-IPing.

During a failover, move, or test failover, if the recovered virtual machine is assigned a different IP than the original IP, then after the virtual machine has started, it is automatically rebooted so that it starts up with the correct IP. If the same network is used for both production and test failovers, Zerto recommends changing the IP address for the virtual machines started for the test, so that there is no IP clash between the test machines and the production machines.

- **Copy to failover test**: Copies the settings in the Failover/Move column to the Test column.

- **Copy to failover/move**: Copies the settings in the Test column to the Failover/Move column.

35. Click OK.

36. Click NEXT.

The SUMMARY step is displayed. It shows the VPG configuration that you defined in previous
steps.

37. Click **DONE**.

The VPG is created.

For details of what happens after saving the VPG, see What Happens After the VPG is Defined on page 38.

The virtual machines in the VPG are protected as a vCD vApp in the recovery site. When recovering the VPG, reverse protection is configured back the virtual machines.

**Replication From a Protected Site Microsoft Azure to a Recovery Site Microsoft Azure**

You can protect Azure virtual machines by replicating within Azure. The paired ZCA sites can share regions. Each ZCA requires a separate storage account.

See also:

- Requirements for Microsoft Azure Environments on page 126
- VPGs Recovering to Azure Managed Disks on page 244
- Protecting From a Microsoft Azure Site - To a Microsoft Azure Recovery Site on page 126

**Requirements for Microsoft Azure Environments**

Before protecting your virtual machines, review [Zerto Prerequisites and Requirements for Microsoft Azure Environments](#).

**VPGs Recovering to Azure Managed Disks**

When recovering VPGs to Azure, the VMs are recovered to Azure Managed Disks.

Based on the VPG configuration, VM disks can be recovered to Managed Premium SSD, Managed Standard SSD, or Managed Standard HDD.

**Protecting From a Microsoft Azure Site - To a Microsoft Azure Recovery Site**

Use the following procedure to replicate from a protected site Microsoft Azure to a recovery site Microsoft Azure.

To create a virtual protection group (VPG) to recover in Microsoft Azure:

1. In the Zerto User Interface, select **ACTIONS>CREATE VPG**.

   The GENERAL step of the Create VPG wizard is displayed.
2. Specify the name of the VPG and the priority of the VPG.

   • **VPG Name**: The VPG name must be unique. The name cannot be more than 80 characters.
   
   • **Priority**: Determine the priority for transferring data from the protected site to the recovery site when there is limited bandwidth and more than one VPG is defined on the protected site.
     
     • **High Priority**: When there are updates to virtual machines protected in VPGs with different priorities, updates from the VPG with the highest priority are passed over the WAN first.
     
     • **Medium Priority**: Medium priority VPGs will only be able to use whatever bandwidth is left after the high priority VPGs have used it.
     
     • **Low Priority**: Low priority VPGs will use whatever bandwidth is left after the medium priority VPGs have use it.

   Updates to the protected virtual machines are always sent across the WAN before synchronization data, such as during a bitmap or delta sync.

   During synchronization, data from the VPG with the highest priority is passed over the WAN before data from medium and low priority VPGs.

3. Click **NEXT**; the VMs step is displayed.
4. Unprotected VMs with all its disks in the storage account specified during the installation, are included in the list and can be selected for protection. Select the VMs to include in this VPG and click the arrow to move them to the Selected VMs pane.

Virtual machines that are not yet protected are displayed in the list. A VPG can include virtual machines that are not yet protected and virtual machines that are already protected.

5. You can view protected virtual machines in the Advanced (One-to-Many) section, by clicking Select VMs.

**Note:** Virtual machines can be protected in a maximum of three VPGs. These VPGs cannot be recovered to the same site. Virtual machines protected in the maximum number of VPGs are not displayed in the Select VMs dialog.

In on-premise environments, protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

6. Click NEXT; the REPLICATION step is displayed.
7. Select the **Recovery Site** to which you want to recover the virtual machines.

**Note:** Replicating to the same site is not supported.

8. Optionally, change the default **SLA** values:

   - **Journal History:** The time that all write commands are saved in the journal.
     
     The longer the information is saved in the journal, the more space is required for each journal in the VPG.
     
     Select the number of **hours** from 1 to 23 or the number of **days** from 1 to 30.

   - **Target RPO Alert:** The maximum desired time between each automatic checkpoint write to the journal before an alert is issued. To increase the value, move the slider right; to decrease the value, move the slider left.

   - **Test Reminder:** The time recommended between testing the integrity of the VPG. A warning is issued if a test is not done within this time frame.

9. Click **NEXT**.

   The **Storage** step is displayed.

   By default the storage used for the virtual machine definition is also used for the virtual machine data.

   For each virtual machine in the VPG, Zerto displays its storage-related information.
10. Specify whether the protected volume is a Temp Data disk.

**Temp Data**: If the virtual machine to be replicated includes a temp data disk as part of its configuration, mark the recovery disk for this disk as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization.

11. Click NEXT.

The RECOVERY step is displayed. Recovery details include the networks, network security group, instance family, and instance size to use for failover, move, and testing failover, and whether scripts should run as part of the recovery process.

12. Select recovery settings for failover/move and failover testing.

- **VNet**: The virtual network dedicated to your Azure subscription.
• **Subnet**: The subnet or the VNet network.

• **Network Security Group**: The Azure network security to be associated with the virtual machines in this VPG. You can associate one network security group with the virtual machines. The NIC will be associated with the network security group defined at the virtual machine level.

• **Recovery Disk Type**: Select the Azure recovery storage type to which the selected virtual machines will be recovered to; Managed Premium SSD, Managed Standard SSD or Managed Standard HDD. The Virtual Machine Series and Virtual Machine Size fields are updated with the relevant options based on the selected Recovery Disk Type.

• **Virtual Machine Series**: The virtual machine series from which to select the size. Azure virtual machine series are optimized for different types of applications. The default is set to **DSv2**. You can choose the virtual machine series appropriate for the application being protected in the VPG.

• **Virtual Machine Size**: The virtual machine size, within the virtual machine series, to assign to recovered virtual machines. Different sizes within a virtual machine series vary, for example in a number of cores, RAM, and local storage size. The default is set to **Standard_DS1_v2**. You can choose the virtual machine size appropriate for the application being protected in the VPG. The price per virtual machine is related to the virtual machine configuration.

13. For additional settings, click **ADVANCED VM SETTINGS**.

   The **Advanced VM Settings** window is displayed, which shows the recovery network settings for failover and move for virtual machines in the VPG. You can view the recovery network settings for failover tests by clicking **TEST**.

14. To edit information in one field, click the field and update the information. If you want to edit information for several virtual machines at the same time, select the virtual machines and click **EDIT SELECTED**.

   The Edit VM Settings dialog is displayed.

15. Update the values for **VNet**, **Subnet**, **Network Security Group**, **VM Series**, **Series Size**, and **Private IP** as necessary.

   **Note**: Only private IPs specified for Windows machines are assigned during a recovery operation. For Linux machines, the IP is assigned from the specified subnet range.

Clearing the values in the **Private IP** field results in an IP being automatically assigned from the subnet range during a recovery operation.

Refer to the **Interoperability Matrix** for the list of operating systems for which Zerto supports re-IP.

16. Click **OK** twice to return to the main page of the **RECOVERY** step.

17. To run pre and post recovery scripts, enter the path to the script to run.

   • **Pre-recovery Script**: The information about a script that should run at the beginning of the recovery process.

   • **Post-recovery Script**: The information about a script that should run at the end of the recovery process.
For both types of scripts, enter the following information:

<table>
<thead>
<tr>
<th>Text Box</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Script path</strong></td>
<td>The full path to the script. The script must be located on the same machine as the Zerto Virtual Manager for the recovery site.</td>
</tr>
<tr>
<td><strong>Params</strong></td>
<td>The parameters to pass to the script. Separate parameters with a space.</td>
</tr>
</tbody>
</table>
| **Timeout** | The time-out, in seconds, for the script to run.  
  • If the script runs before executing a failover, move, or test failover, and the script fails or the timeout value is reached, an alert is generated and the failover, move, or test failover is not performed.  
  • If the script runs after executing a failover, move, or test failover, and the timeout value is reached, an alert is generated.  
  • The default time-out value is specified in **Site Settings > Performance and Throttling** tab. |

**Note:** Pre and post recovery scripts run in parallel. Therefore, ensure that the pre and post recovery scripts don’t use common resources.

18. Click **NEXT**.

   The **SUMMARY** step is displayed. It shows a summary of the VPG configuration you defined in the previous steps.

19. Click **DONE**; the VGP is created.

**Replication From a Protected Site Microsoft Azure to a Recovery Site AWS**

You can protect an Azure site to Amazon Web Services (AWS).

When creating a VPG from Azure to AWS the data is stored in S3 and all replicated data from protected virtual machines to AWS is encrypted in S3. All recovery operations bring up the recovered machines in EC2 in AWS.

Before replicating from a protected Azure site to a recovery AWS site, review the following guidelines for AWS environments, and considerations when protecting to AWS: [Zerto - Prerequisites & Requirements for Amazon Web Services (AWS)]

See also: Import Methods for AWS on page 133

After reviewing the guidelines and considerations, proceed with Protecting From an Azure Site - Creating a VPG to recover in AWS on page 136.
Import Methods for AWS

During recovery operations, Zerto uses a combination of the following APIs and methods to convert the Amazon S3 objects into recovery disks in EC2 as EBS disks:

- **AWS Import**:
  - **Import-instance**: for the boot volume
  - **Import-volume**: for data volumes

For more information see the relevant AWS documentation:

- **API_ImportInstance**
- **API_ImportVolume**

  **Note**: The ImportImage API is not used by Zerto.

- **Zerto Import - zImport**: an import method that does not have the same limitations as the AWS APIs. It creates an AWS EC2 instance per protected VM volume, called zImporter, to convert the S3 objects and write them to a zImport local disk. When all the data has been imported and its disk have been attached to the recovered instance, the zImport instance is terminated.

  **Notes**:
  - zImporter is based on an official AWS Linux AMI (Amazon Machine Image), into which a script is injected to perform the import.
  - To ensure that the zImport instance cannot be accessed from the outside world, a security group is created. During a recovery operation the zImport instance is connected to this security group. All inbound traffic is blocked and only outbound traffic to access the script online is allowed. The security group is deleted at the end of the recovery operation.
  - Zerto can set default encryption on the S3 bucket so that all objects are encrypted when they are stored in the bucket. To enable S3 encryption please contact support.
  - The default zImport instance type is c5.4xlarge and the AWS EC2 default maximum instance quota is 10. If during the creation of zImport instances the maximum EC2 instance quota is reached, the creation of the next and subsequent zImport instances will be queued, increasing the RTO. If during recovery operations, the ZVM identifies a VPG with the potential to exceed the EC2 instance quota, the user will receive an alert with advice to contact AWS support to increase the service limits in order to improve RTO.
    - Each zImport VM is responsible for the import process of a single volume. Therefore, it is recommended to contact AWS and increase the maximum instance quota of the c5.4xlarge instance type to the maximum number of volumes you are planning to failover to AWS at once.
  - GPT formatted disks are supported for data volumes only, when using either of the zImport methods.
• When using either of the zImport methods, each volume is created with EBS disk of type "i01" with maximum 1000 EBS Provision IOPS allocated. EBS disk type can be changed post recovery without downtime, see the relevant for more information see the relevant AWS documentation. The minimum disk size for "i01" is 4GB.

• The default Max EBS Provision IOPS quota in a region across all "i01" disks is 40000 EBS Provision IOPS, meaning that with 1000 EBS Provision IOPS per volume, the maximum possible number of volumes is 40. If the Max EBS Provision IOPS quota is reached, the failover process will switch to using slower gp2 disks. An event will notify the user of this, and recommend that the user contact AWS support to increase the Max EBS Provision IOPS quota.

• Depending on the desired RTO during recovery operations, or when testing failover, the user can select an import method per VPG or per virtual machine from the following options:
  • Zerto Import for Data Volumes on page 134
  • Zerto Import for All Volumes on page 134
  • AWS Import on page 136

Zerto Import for Data Volumes

This method is the default setting and has a faster RTO than AWS Import. This method uses a combination of the AWS Import-Instance API for the boot volume, and the zImport method for data volumes. To use this method when creating or editing a VPG, an Access Key ID and a Secret Access Key is required. Both fields can be set in the Site Settings window, see Site Settings on page 1.

• Each machine that you intend to protect must have at least 250MB free space. This is because AWS adds files to the recovered machines during failover, move, test failover, and clone operations.

• Protected boot volumes are recovered in EC2 as EBS disks with magnetic disk type. Virtual machines with disks that are less than 1GB are recovered with disks of 1GB. Temporary disks may be created based on the selected instance size.

• Temporary disks may be created based on the selected instance size.

• The maximum protected data volume size is 16TB, while the boot volume can be up to 1TB.

• The AWS ImportInstance API only supports single volume VMs. The boot volume of the protected virtual machine should not be attached to any other volume to successfully boot. For more information, see http://docs.aws.amazon.com/EC2/latest/APIReference/API_ImportInstance.html

Zerto Import for All Volumes

This method uses the zImport method for all volumes and ensures the fastest RTO.

This method creates an AWS EC2 instance per protected VM volume, called zImporter, to convert the S3 objects and write them to a zImport local disk. When all the data has been imported and its disk have been attached to the recovered instance, the zImport instance is terminated.
• Temporary disks may be created based on the selected instance size.

• The maximum protected data volume size is 16TB, while the boot volume can be up to 2047GiB.

Note: Some VMs use the MBR partitioning scheme, which only supports up to 2047 GiB boot volumes. If your instance does not boot with a boot volume that is 2TB or larger, the VM you are using may be limited to a 2047 GiB boot volume size. Non-boot volumes do not have this limitation. See AWS Documentation for more information: http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html

When recovering to AWS instance types listed below using Zerto Import for All Volumes import method, Windows 2012, Windows 2012R2, Windows 2016 or Windows 2019 are supported.

- C3
- C4
- D2
- I2
- R3
- M4 (excluding M4.16xlarge)

The following drivers are installed on the recovered virtual machine:

- AWS PV Drivers
- Windows ENA (Elastic Network Adapter) Drivers

- For Windows 2012R2, Windows 2016 and Windows 2019, the following drivers are downloaded on the protected virtual machine. ZertoTools installs these drivers on the recovered virtual machine:
  - Windows ENA (Elastic Network Adapter) Drivers
  - NVMe driver

- For Windows 2008R2 and Windows 2012, Windows ENA (Elastic Network Adapter) drivers and NVMe driver are downloaded on the protected virtual machine. ZertoTools installs these drivers on the protected virtual machine and executes the below command:

  start rundll32.exe sppnp.dll, Sysprep_Generalize_Pnp -wait

This command removes computer-specific information for the drivers. When recovering to C5/M5, the instance will boot on AWS and install all the drivers again.

Note: If these drivers are installed on a VM running Windows 2012, Windows 2012R2, Windows 2016 or Windows 2019, the other AWS import methods will fail. To overcome this, you must uninstall the drivers before using the other AWS import methods.
Note: C5/M5 instance types are supported with the Zerto Import for All Volumes import method only.

Important:
When using this import method for Windows machines, ZertoTools for Windows needs to be run on the protected Windows virtual machine in VMware before VPG creation. For more information, see ZertoTools for Windows on page 1.

AWS Import

This method uses a combination of the AWS import-instance and import-volume APIs for the boot and data volumes respectively. This was the only method supported until version 5.5. To use this method when creating or editing a VPG, an Access Key ID and a Secret Access Key is required. Both fields can be set in the Site Settings window, see Site Settings on page 1.

- Each machine that you intend to protect must have at least 250MB free space. This is because AWS adds files to the recovered machines during failover, move, test failover, and clone operations.
- Protected boot volumes are recovered in EC2 as EBS disks with General Purpose SSD (gp2). Virtual machines with disks that are less than 1GB are recovered with disks of 1GB. Additional volumes might be created in the recovered instance, dependent on the instance type used for the recovery. These volumes can be ignored.
- Protected volumes are recovered in EC2 as EBS disks with General Purpose SSD (gp2). Virtual machines with disks that are less than 1GB are recovered with disks of 1GB. Additional volumes might be created in the recovered instance, dependent on the instance type used for the recovery. These volumes can be ignored. Temporary disks may be created based on the selected instance size.
- The maximum protected data volume and boot disk size is 1TB.
- The AWS ImportInstance API only supports single volume VMs. The boot volume of the protected virtual machine should not be attached to any other volume to successfully boot. For more information, see http://docs.aws.amazon.com/AWSEC2/latest/APIReference/API.ImportInstance.html

Protecting From an Azure Site - Creating a VPG to recover in AWS

Use the following procedure to create a virtual protection group (VPG) in an Azure Site, to recover in AWS.

➢ To create a virtual protection group (VPG) to recover in AWS:
  1. In the Zerto User Interface, select ACTIONS>CREATE VPG.
     The GENERAL step of the Create VPG wizard is displayed.
2. Enter the name of the VPG and the priority of the VPG.
   - **VPG Name:** The VPG name must be unique and **cannot** be more than 80 characters.
   - **Priority:** Determine the priority for transferring data from the protected site to the recovery site when there is limited bandwidth and more than one VPG is defined on the protected site.
     - **High Priority:** When there are updates to virtual machines protected in VPGs with different priorities, updates from the VPG with the highest priority are passed over the WAN first.
     - **Medium Priority:** Medium priority VPGs will only be able to use whatever bandwidth is left after the high priority VPGs have used it.
     - **Low Priority:** Low priority VPGs will use whatever bandwidth is left after the medium priority VPGs have used it.

   Note that updates to the protected virtual machines are always sent across the WAN before synchronization data, such as during a bitmap or delta sync.

   During synchronization, data from the VPG with the highest priority is passed over the WAN before data from medium and low priority VPGs.

3. Click **NEXT**.
   The VMs step is displayed.
4. Select the VMs that will be part of this VPG and click the arrow pointing right to include these VMs in the VPG.

   - When using the Search field, you can use the wildcards; * or ?

   Virtual machines that are not yet protected are displayed in the list. A VPG can include virtual machines that are not yet protected and virtual machines that are already protected.

5. You can view protected virtual machines in the **Advanced (One-to-Many)** section, by clicking **Select VMs**.

   The Select VMs window is displayed.

   ```
   Note: Virtual machines can be protected in a maximum of three VPGs. These VPGs
   ```
cannot be recovered to the same site. Virtual machines protected in the maximum number of VPGs are not displayed in the Select VMs dialog.

In on-premise environments, protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

6. Click **NEXT**.

   The **REPLICATION** step is displayed.

   **Note:** If the protected site is paired with only one recovery site, the recovery step is displayed with the **Recovery Site** field automatically filled in and defaults set, as shown below.

7. After selecting the recovery site, define the following parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA</td>
<td>Journal History</td>
<td>Specify the time-frame in which information is saved in the journal for the group, and which will apply to every virtual machine in the group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The longer the information is saved in the journal, the more space is required for each journal in the VPG.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Select one of the following time-frames:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Number of hours: From 1 to 24</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Number of days: From 2 to 30</td>
</tr>
<tr>
<td></td>
<td>Target RPO Alert</td>
<td>The maximum desired time between each automatic checkpoint write to the journal before an alert is issued. Default value is X hours.</td>
</tr>
<tr>
<td></td>
<td>Test Reminder</td>
<td>The time recommended between testing the integrity of the VPG. A warning is issued if a test is not done within this time frame.</td>
</tr>
</tbody>
</table>

8. Click **NEXT**.

The **Storage** step is displayed.

By default the storage used for the virtual machine definition is also used for the virtual machine data.

For each virtual machine in the VPG, Zerto displays its storage-related information.

9. Specify whether the protected volume is a **Temp Data** disk.
Temp Data: If the virtual machine to be replicated includes a temp data disk as part of its configuration, mark the recovery disk for this disk as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization.

10. Click **NEXT**.

The **RECOVERY** step is displayed. Recovery details include the networks to use for failover, move, and for testing failover, and whether scripts should run as part of the recovery operation.

11. From the **Import Method** drop-down list, select an import method.

   - **Zerto Import for data volumes (Faster)**: Uses the zlImport method for data volumes only. This is the default setting and usually has a faster RTO than AWS Import. This method requires setting the Access Key ID and Secret Access Key in the Site Settings window. See Site Settings on page 1.
   
   - **Zerto Import for all volumes (Fastest, Requires setup)**: This is usually the fastest import method and uses a zlImport VM for all volumes.
   
   - **AWS Import**: This was the only import method supported until version 5.5. This method requires setting the Access Key ID and Secret Access Key in the Site Settings window. See Site Settings on page 1.
       
   - **VPC Network**: The virtual network dedicated to your AWS account. A security group and subnet must be assigned to this VPC.
       
   - **Subnet**: The subnet for the VPC network.
• When you select the import methods Zerto Import for data volumes (Faster), or Zerto Import for all volumes (Fastest, Requires setup), only those subnets that are supported by the zImport method are displayed in the drop-down list.

Other Subnets are grayed out and cannot be selected.

Note:
If the import method is not AWS Import, then the user can select only subnets that are part of the same Availability Zone as the one in which the ZCA resides. Other Subnets are disabled.

• When you select the import methods AWS Import, all subnets are listed. A tool tip alert is displayed when the user hovers over a subnet that is not supported.

Note:
If a subnet is chosen in a network that is not in the same Availability Zone as the one in which the ZCA resides, options that utilize the zImport method will not be made available for selection.

• Security Group: The AWS security to be associated with the virtual machines in this VPG.

• Instance Family: The instance family from which to select the type. AWS instance families are optimized for different types of applications. Choose the instance family appropriate for the application being protected in the VPG.

• Instance Type: The instance type, within the instance family, to assign to recovered instances. Different types within an instance family vary, for example in vCPU, RAM, and local storage size. Choose the instance type appropriate for the application being protected in the VPG. The price per instance is related to the instance configuration.

12. For additional settings, click Advanced VM Settings.

The Advanced VM Settings window is displayed, which shows the recovery network settings for
**Failover/Move** for virtual machines in the VPG. You can see the recovery network settings for failover tests by selecting **Test**.

13. If you want to edit information in one field, click the field and update the information. If you want to edit information for several virtual machines at the same time, select the virtual machines and click **EDIT SELECTED**.

14. The **Edit VM Settings** window is displayed.

15. Update the values for Import Method, VPC network, Subnet, Security Group, Instance Family, Instance Type, and Private IP as necessary.

**Note:** Only private IPs specified for Windows machines are assigned during a recovery operation. For Linux machines, the IP is assigned from the specified subnet range.

Clearing the values in the **Private IP** field results in an IP being automatically assigned from the subnet range during a recovery operation.

Refer to the [Zerto Interoperability Matrix](#) for the list of operating systems for which Zerto supports re-IP.
16. Click **OK** twice to return to the main page of the **RECOVERY** step.

17. To run pre and post recovery scripts, enter the path to the script to run.
   - **Pre-recovery Script:** The information about a script that should run at the beginning of the recovery process.
   - **Post-recovery Script:** The information about a script that should run at the end of the recovery process.

For both types of scripts, enter the following information:

<table>
<thead>
<tr>
<th>Text Box</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script path</td>
<td>The full path to the script. The script must be located on the same machine as the Zerto Virtual Manager for the recovery site.</td>
</tr>
<tr>
<td>Params</td>
<td>The parameters to pass to the script. Separate parameters with a space.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The time-out, in seconds, for the script to run.</td>
</tr>
<tr>
<td></td>
<td>• If the script runs before executing a failover, move, or test failover, and the script fails or the timeout value is reached, an alert is generated and the failover, move, or test failover is not performed.</td>
</tr>
<tr>
<td></td>
<td>• If the script runs after executing a failover, move, or test failover, and the timeout value is reached, an alert is generated.</td>
</tr>
<tr>
<td></td>
<td>• The default time-out value is specified in <strong>Site Settings &gt; Performance and Throttling</strong> tab.</td>
</tr>
</tbody>
</table>

**Note:** Pre and post recovery scripts run in parallel. Therefore, ensure that the pre and post recovery scripts don’t use common resources.

18. Click **NEXT**.

19. The **SUMMARY** step is displayed. It shows the VPG configuration that you defined in the previous steps.
Monitoring Zerto Virtual Manager

You can monitor information about all the VPGs either protected at the local site or recovered to the local site in the VPGs tab. You can also drill-down to monitor information about a specific VPG displayed in the VPGs tab or about the virtual machines being protected by VPGs. You can also view summary details of the protected and recovery sites in either the protected or recovery site as well as monitor the status of each virtual protection group and any of the virtual machines being protected in either site.

The following general monitoring options are described in this section:

- **The DASHBOARD Tab on page 145**
- **Monitoring VPGs - The VPGs Tab on page 147**
- **Monitoring a Single VPG on page 150**
- **Monitoring Tasks on page 154**
- **Monitoring Protected Virtual Machines - The VMs Tab on page 155**

The following site monitoring option is described in this section:

- **Monitoring Sites on page 158**

For details about monitoring Zerto Virtual Manager alerts and events, refer to Zerto Virtual Replication Guide to Alarms, Alerts and Events.

The DASHBOARD Tab

The DASHBOARD provides an overview of the sites and VPGs being protected at the site, or recovered to the site.
The following information is displayed:

VPG HEALTH

The VPGs being protected to or recovered from Azure, along with the health of each VPG, are represented by colored blocks, where the color represents the following:

- **Green**: The VPG is being replicated, including syncing the VPG between the sites.
- **Orange**: The VPG is being replicated but there are problems, such as an RPO value larger than the target RPO value specified for the VPG.
- **Red**: The VPG is not being replicated, for example because communication with Azure is down.

Positioning the mouse over a block displays the VPG name as a tooltip. Clicking the block opens the details tab for the VPG.

STATUS

The status of the site, including the following:

- The number of VPGs and virtual machines being protected or recovered.
- The amount of storage being protected.
- The average RPO.
- The percentage compression of data passed between the site and peer sites.

Performance Graphs

The current site performance, which includes the following information:

- **IOPS (I/O per Second)**: The total amount of I/O write operations generated by the protected virtual machines on the viewed site. (The IOPS graph is displayed for VPGs replicating from on-premise sites).
- **Throughput (MB per second)**: The total amount of uncompressed data written by the virtual machines protected to the recovery sites.

During synchronization processes (such as bitmap sync, initial sync and delta sync) this value will also consist of the uncompressed data read from the protected disks.

- **WAN Traffic (MB per second)**: The total amount of compressed data transferred between the viewed site and all its recovery sites.

A listing of the currently active alerts and running tasks, and the events run during the last few hours.

User input, for example, stopping a failover test or committing or rolling back a Move or Failover operation, can be initiated from the relevant task displayed in the RUNNING TASKS section.

ACTIVE ALERTS, RUNNING TASKS, and EVENTS

A listing of the currently active alerts and running tasks, and the events run during the last few hours.

User input, for example, stopping a failover test or committing or rolling back a Move or Failover operation, can be initiated from the relevant task displayed in the RUNNING TASKS section.
Monitoring VPGs – The VPGs Tab

View details of all VPGs in the VPGs tab. This tab lists all the VPGs from both the local and remote sites and provides summary details of each VPG.

You can create a query using the view buttons (list/grid) to display VPG information in a list or as a grid. In both list and grid views you can filter the VPGs that will be displayed according to their status by checking the check boxes alongside the VPG status icons (green, orange, red). The query can be customized by adding and removing filters.

The QUERY option allows you to save or run a personal query, or set the VPG tab back to its default view.

List View - GENERAL

The following information is displayed in the GENERAL view:

- **Alert status indicator:** The color indicates the status of the VPG. Hovering over the alert displays a popup of all active alerts with descriptions:
  - **Green:** The VPG is being replicated, including syncing the VPG between the sites.
  - **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the Target RPO Alert value specified for the VPG.
  - **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.
List View - PERFORMANCE

The following information is displayed in the PERFORMANCE view:

**Alert status indicator:** The color indicates the status of the VPG. Hovering over the alert displays a popup of all active alerts with descriptions:

- **Green:** The VPG is being replicated, including syncing the VPG between the sites.
- **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the Target RPO Alert value specified for the VPG.
- **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.

Move the cursor over the **Alert status indicator** to display details of the alert.
VPG Name (#VMs): The name of the VPG. The name is a link: Click the VPG name to drill-down to more specific details about the VPG that are displayed in a dynamic tab. The number of virtual machines protected in the VPG is displayed in parentheses.

IO: The IO per second between all the applications running on the virtual machines in the VPG and the VRA that sends a copy to the remote site for replication.

Throughput: The MB per second for all the applications running on the virtual machines being protected. There can be a high IO rate with lots of small writes resulting in a small throughput as well as a small IO with a large throughput. Thus, both the IOPS and Throughput values together provide a more accurate indication of performance.

Network: The amount of WAN traffic.

Provisioned Storage (not shown by default): The provisioned storage for all the virtual machines in the VPG. Thus, a virtual machine with 1GB hard disk and 4GB memory will show 5GB provisioned storage.

Used Storage: The storage used by all of the virtual machines in the VPG.

List View - RETENTION STATUS

The following information is displayed in the RETENTION STATUS view:

- **Alert status indicator:** The color indicates the status of the VPG. Clicking the alert displays a popup of all active alerts with descriptions:
  - **Green:** The VPG is being replicated, including syncing the VPG between the sites.
  - **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the Target RPO Alert value specified for the VPG.
  - **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.

- **VPG Name (#VMs):** The name of the VPG. The name is a link: Click the VPG name to drill-down to more specific details about the VPG that are displayed in a dynamic tab.
• **Retention Policy:** Whether the VPG is protected against a disaster only with the ability to recover to a point in time up to 30 days before the disaster, or protection is extended to include retention sets of the virtual machines, going back for a maximum of one year.

• **Retention Policy Status:** The status of the retention set.

• **Repository Name:** The name of the repository where the jobs are stored.

• **Restore Point Range:** The restore points for the retention job out of the total retention jobs run for the VPG.

• **Retention Policy Scheduling:** The schedule for the retention process.

### Additional Fields and Options

In the GENERAL, PERFORMANCE, and RETENTION views you can:

• Show/Hide Columns, Create View and Reset Columns using the settings (⚙️) menu.

• Sort the list by a column by clicking in the column title.

• Filter information in the columns by clicking the filter button (🔍) that is displayed when the mouse cursor is moved into the column title. Active filters are displayed with a yellow background.

### Saving Details of Virtual Protection Groups to a File

You can save details of every VPG displayed in the VPGs tab to a CSV file, which can be opened using programs such as Microsoft Excel.

In the VPGs tab, click **EXPORT** and specify where to save the VPG details.

### Monitoring a Single VPG

You can monitor the status of a specific VPG by clicking the VPG name in the VPGs tab or clicking the VPG name in the VMs tab. The VPG details are displayed in a dynamic tab.
General Tab

The tab on the left side shows the status of the VPG. The following information is displayed in this tab:

Performance Graphs

The current VPG performance, which includes the following information:

- **RPO**: The current Recovery Point Objective (RPO) of the Virtual Protection Group (VPG).
- **IOPS (I/O per Second)**: The total amount of I/O write operations generated by the protected virtual machines comprising the Virtual Protection Group (VPG).
- **Throughput (MB per Second)**: The total amount of uncompressed data written by the protected virtual machines comprising the Virtual Protection Group (VPG).
- During synchronization processes (such as bitmap sync, initial sync and delta sync) this value will also consist of the uncompressed data read from the protected disks.
- **WAN Traffic (MB per second)**: The total amount of compressed data transferred between the protected and recovery sites of the Virtual Protection Group (VPG).

JOURNAL HISTORY

The journal history shows:

- The SLA defined for the VPG.
- The amount of time currently covered by information in the journal.
- The earliest—oldest—checkpoint currently in the journal that can be used for a recovery operation.
RETENTION STATUS

If Long Term Retention is enabled, the following details are displayed:

- **Retention Policy**: Whether the VPG is protected against a disaster only with the ability to recover to a point in time up to 30 days before the disaster, or protection is extended to include retention sets of the virtual machines, going back for a maximum of one year.

- **Retention Status**: The status of the retention set.

- **Repository**: The name of the repository where the retention sets are stored.

- **Restore Point Range**: The restore points for the retention sets out of the total retention sets run for the VPG.

- **Scheduling**: The retention schedule.

ACTIVE ALERTS, RUNNING TASKS, and EVENTS

A listing of the currently active alerts and running tasks, and the events run during the last few hours.

User input, for example, stopping a failover test or committing or rolling back a Move or Failover operation, can be initiated from the relevant task displayed in the RUNNING TASKS section.

PROTECTED VMs Tab

The PROTECTED VMs tab shows details about the protected virtual machines. This includes:

- The name of the virtual machine.

- The boot order group to which the virtual machine belongs.

- The protected virtual machine host.

- The protected virtual machine storage.
• The protected virtual machine provisioned storage.
• The protected virtual machine used storage.
• The amount of data used on the recovery site for this virtual machine.
• The failover and move networks that will be used for this virtual machine.
• The failover and move subnets that will be used for this virtual machine.
• The failover and move network security group that will be used for this virtual machine.
• The test network that will be sued for this virtual machine.
• The test subnet that will be sued for this virtual machine.
• The test network security group that will be used for this virtual machine.

SITES Tab

The SITES tab shows the topology of the VPG, including both the protected and recovery sites.
The SETTINGS tab shows details about the VPG settings, divided into general, replication, recovery, and retention categories.

Monitoring Tasks

Recent tasks can also be reviewed for a site by clicking the TASKS area in the status bar at the bottom of the user interface.

The following information is displayed for each task:

**Status**: The task status.

**Name**: The name of the task.

**Description**: A description of the task.

**Action**: The ability to perform an action directly. For example, stop a failover test, or commit or rollback a move or failover operation.

The full details of the tasks can be monitored in the TASKS subtab under the MONITORING tab.
The following information is displayed for each task:

**Task status indicator:** The color indicates the status of the task. The following statuses exist for each task:

- **Green:** The task was completed successfully.
- **Red:** The task failed.

**Task:** The task name.

**Status:** The task status.

**Related Entities:** The sites which were affected by the task.

**User:** The user who initiated the task.

**Started:** The date and time the task started.

**Completed:** The date and time the task completed.

**Notes:** Notes added at the completion of a failover test.

### Monitoring Protected Virtual Machines – The VMs Tab

View details of the protected VMs in the VMs tab. This tab lists all the protected virtual machines from both the local and remote sites and provides summary details of each virtual machine.
You can filter information in columns via the filter icon next to each column title. You can also sort the list by each column.

**GENERAL View**

The following information is displayed in the GENERAL view:

- **Alert status indicator:** The color indicates the status of the VPG:
  - **Green:** The VPG is being replicated, including syncing the VPG between the sites.
  - **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the **Target RPO Alert** value specified for the VPG.
  - **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.

- **VM Name:** The name of the virtual machine. The name is a link.

- **VPG Name:** The name of the VPG. The name is a link: Click the VPG name to drill-down to more specific details about the VPG that are displayed in a dynamic tab.

- **Direction:** The direction of the replication, from this site to the remote site or from the remote site to this site.

- **Peer Site:** The name of the site with which this site is paired: the site where the VPG is protected or will be recovered to.

- **Priority:** The priority of the VPG.

- **Protection Status:** The current status of the virtual machine, such as **Meeting SLA.** Where appropriate, the percentage of the operation completed, such as syncing, is displayed.

- **State:** The current substatus of the VPG, such as **Delta syncing.** Where appropriate, the percentage of the operation completed, such as syncing, is displayed.
• **Actual RPO:** The time since the last checkpoint was written to the journal. This should be less than the Target RPO Alert value specified for the VPG.

• **Operation:** The operation, such as Move, that is currently being performed.

**PERFORMANCE View**

The following information is displayed in the PERFORMANCE view:

**Alert status indicator:** The color indicates the status of the VPG:

- **Green:** The VPG is being replicated, including syncing the VPG between the sites.

- **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the Target RPO Alert value specified for the VPG.

- **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.

**VM Name:** The name of the virtual machine. The name is a link.

**VPG Name:** The name of the VPG. The name is a link: Click the VPG name to drill-down to more specific details about the VPG that are displayed in a dynamic tab.

**IO:** The IO per second between all the applications running on the virtual machine and the VRA that sends a copy to Azure.

- **Throughput:** The MB per second for all the applications running on the virtual machines being protected. There can be a high IO rate with lots of small writes resulting in a small throughput as well as a small IO with a large throughput. Thus, both the IOPS and Throughput values together provide a more accurate indication of performance.

- **Network:** The amount of WAN traffic.

**Provisioned Storage:** The provisioned storage for the virtual machine in the recovery site. Thus, a virtual machine with 1GB hard disk and 4GB memory will show 5GB provisioned storage.

**Used Storage:** The storage used by the virtual machine in the recovery site.

**RETENTION STATUS View**

The following information is displayed in the RETENTION STATUS view:

- **Alert status indicator:** The color indicates the status of the VPG. Clicking the alert displays a popup of all active alerts with descriptions:
  - **Green:** The VPG is being replicated, including syncing the VPG between the sites.
  - **Orange:** The VPG is being replicated but there are problems, such as an RPO value larger than the Target RPO Alert value specified for the VPG.
  - **Red:** The VPG is not being replicated, for example, because communication with the remote site is down.
• **VPG Name (#VMs):** The name of the VPG. The name is a link: Click the VPG name to drill-down to more specific details about the VPG that are displayed in a dynamic tab.

• **Retention Policy:** Whether the VPG is protected against a disaster only with the ability to recover to a point in time up to 30 days before the disaster, or protection is extended to include retention sets of the virtual machines, going back for a maximum of one year.

• **Retention Policy Status:** The status of the retention set.

• **Repository Name:** The name of the repository where the jobs are stored.

• **Restore Point Range:** The restore points for the retention job out of the total retention jobs run for the VPG.

• **Retention Policy Scheduling:** The schedule for the retention process.

**Additional Fields**

There are additional fields that you can display that are listed when you select **Show/Hide Columns** from the drop-down list shown by clicking the configuration icon (°):

- **Protected Site:** The name of the protected site.
- **Recovery Site:** The name of the recovery site.
- **ZORG:** A name given to an organization by a cloud service provider. For details refer to *Zerto Cloud Manager Administration Guide*.
- **Last Test:** The time and date of the last retention process performed by Zerto Virtual Manager.

**Monitoring Sites**

You can display information about the peer sites of the local site via the SITES tab.

**The SITES Tab**

View details of the paired sites in the SITES tab. This tab lists all the sites paired to the local site and provides summary details of each paired site.
You can filter information in columns via the filter icon next to each column title. You can also sort the list by each column.

**GENERAL View**

The following information is displayed in the GENERAL view:

- **Alert status indicator**: The color indicates the alert status of the site:
  - **Green**: The Zerto Virtual Manager for the site is running without problems.
  - **Orange**: The Zerto Virtual Manager for the site has a problem that does not stop the protection of virtual machines, such as an RPO value larger than the Target RPO Alert value for a VPG.
  - **Red**: The Zerto Virtual Manager for the site is not running correctly, for example, because communication with the site is down.

- **Site Name**: The name specified for the paired site during installation or in the Site Settings dialog.

- **Location**: The location specified for the paired site during installation or in the Site Settings dialog.

- **Site IP**: The IP of the peer site.

- **Network**: The amount of WAN traffic.

- **IOPS**: The IO per second between all the applications running on the virtual machine in the VPG and the VRA that sends a copy to the remote site for replication.

- **Incoming Throughput**: The MBs for all the applications running on the virtual machine being protected. There can be a high IO rate with lots of small writes resulting in a small throughput as well as a small IO with a large throughput. Thus, both the IO and Incoming Throughput values together provide a more accurate indication of performance.

- **Provisioned Storage (GB)**: The maximum storage that can be protected.

- **# VPGs**: The total number of VPGs being protected by the site and replicated to the site.
# VMs: The total number of virtual machines being protected by the site and replicated to the site.

Additional Fields

There are additional fields that you can display that are listed when you select Show/Hide Columns from the drop-down list shown by clicking the configuration icon (○):

**Used Storage (GB):** The name of the protected site.

**ZORG:** A name given to the organization by a cloud service provider. For details refer to Zerto Cloud Manager Administration Guide.

**Version:** The Zerto version installed at this site.
Managing VPGs

After defining virtual protection groups (VPGs) the virtual machines specified as part of each VPG are protected. There are a number of ongoing management tasks that you can perform on a VPG, such as specifying a checkpoint to enable recovery to that specific point or you can modify the configurations of existing VPGs.

The following VPG management options are described in this section:

- Copy VPG Settings on page 161
- Editing a VPG on page 163
- Adding Virtual Machines to a VPG on page 164
- Removing Virtual Machines from a VPG on page 166
- Removing a Protected Virtual Machine from Azure on page 167
- Modifying Protected Virtual Machine Disks on page 164
- Pausing and Resuming the Protection of a VPG on page 167
- Forcing the Synchronization of a VPG on page 168
- Deleting a VPG on page 169
- Ensuring Application Consistency - Checkpoints on page 169
- Running Scripts Before or After Recovering a VPG on page 173
- Exporting and Importing VPG Definitions on page 175
- VPG Statuses and Synchronization Triggers on page 177

Monitoring VPGs and the VMs that are protected is described in Monitoring Zerto Virtual Manager on page 145 on page 118.

Copy VPG Settings

After defining VPGs, you can create a new VPG by copying the VPG-level settings of an existing one.

To copy VPG settings:

1. From either the protected or recovery site, in the VPGs tab, select the VPG to be copied and click MORE > Copy VPG Settings.

   The Copy VPG wizard is displayed.
2. Modify the VPG name, or leave as is. The copied VPG name appears in this format - `<OriginalVpgName>_Copy_X`.

3. Click NEXT.

The VMs step is displayed.

4. Select the VMs that will be part of this VPG and click the right-pointing arrow to include these VMs in the VPG.
   - Zerto uses the SCSI protocol. Only virtual machines with disks that support this protocol can be specified.
   - When using the Search field, you can use the wildcards; `*` or `?`.

Virtual machines that are not yet protected are displayed in the list. A VPG can include virtual machines that are not yet protected and virtual machines that are already protected.

5. Once selected, either click DONE to create the VPG with the pre-populated settings, or click NEXT to review or edit the settings.
Editing a VPG

You can edit a VPG definition, including adding virtual machines to the VPG, as described in Modifying Protected Virtual Machine Disks on page 164, deleting virtual machines from the VPG, or changing the information about how virtual machines are recovered, such as adding or removing disks from the virtual machine.

You can also edit VPG settings when the sites are disconnected. However, not all VPG settings can be updated.

After modifying the VPG, the settings are updated.

While the VPG settings is being updated, you cannot perform any operations on the VPG, such as adding a checkpoint, editing the VPG properties, or failing the VPG.

After the settings updated, the VPG is synchronized with the recovery site.

To modify a VPG:

1. In the VPGs tab in the Zerto User Interface, select the VPG to be edited and click MORE > Edit VPG. You can also select the VPG, display the VPG details, and click EDIT VPG.

   The Edit VPG wizard is displayed, enabling editing the VPG, including adding and removing virtual machines from the VPG.

   When the sites are disconnected, you cannot add virtual machines to the VPG.

   Note: If the VPG was previously viewed, and the tab for this VPG is still displayed, you can access the details by selecting the tab.

2. Make any required changes to the VPG definition. You can jump directly to a step to make a change in that step, for example, the REPLICATION step or the RECOVERY step, by clicking the step. Steps that have been completed are marked with a check.

   The following VPG settings cannot be edited when the sites are disconnected.

<table>
<thead>
<tr>
<th>Edit VPG Step</th>
<th>VPG Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMs</td>
<td>Select VMs to protect. You cannot add new VMs to a VPG when the sites are disconnected.</td>
</tr>
<tr>
<td>Replication -&gt; Advanced VM Replication Settings -&gt; Edit VM</td>
<td>If the Journal Datastore is missing, you cannot select a Journal Datastore.</td>
</tr>
<tr>
<td>Storage -&gt; EDIT SELECTED -&gt; Edit Volumes</td>
<td>• You cannot edit the Volume Source to RDM or Preseeded volumes.</td>
</tr>
<tr>
<td></td>
<td>• You cannot edit the Volume Provision Type (Thin-provisioned or thick-provisioned).</td>
</tr>
</tbody>
</table>
3. Click **DONE**.

   **Note:** The changed values are not applied to existing virtual machines but only to new virtual machines added to the VPG.

   When a virtual machine is removed from a VPG, a warning is displayed. Another message is displayed when trying to save the VPG, if a virtual machine is added to the VPG. The VPG is updated and then synchronized with the recovery site, if required, for example when the host was changed.

**Modifying the Journal Size Hard Limit**

If the journal size hard limit is reduced, and if the current size is greater than the newly defined size, the journal remains at the current size. When the amount of the journal used falls below the hard limit value it will not grow greater than the new hard limit. Unused journal volumes from the added volumes are marked for removal and removed after the time equivalent to three times the amount specified for the journal history, or twenty-four hours, whichever is more.

   **Note:** If the **Journal Size Hard Limit** or **Journal Size Warning Threshold** in the VPG SLA settings are changed, the changed values are not applied to existing virtual machines but only to new virtual machines added to the VPG.

**Modifying Protected Virtual Machine Disks**

Adding or deleting disks for a virtual machine protected in a VPG, are automatically reflected in the disks used for the mirror virtual machine, managed by the VRA in the recovery site.

**Adding Virtual Machines to a VPG**

You can add virtual machines that are not already included in a VPG, to an existing VPG. A virtual machine can be protected in a maximum of three existing VPGs, provided that the VPGs are recovered to different sites.

Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

   **Note:** You cannot edit the VPG to add a virtual machine while a retention process is running.

**To add a virtual machine to an existing VPG:**

1. In the **VPGs** tab in the Zerto User Interface, select the VPG and click **MORE > Edit VPG**. You can also select the VPG to display the VPG details and click **EDIT VPG**.

   The Edit VPG wizard is displayed, enabling you to edit the VPG, including adding and removing virtual machines from the VPG.
2. In the **VMs** step, select the virtual machines to add and click the arrow pointing right to include these machines in the VPG. A VPG can include virtual machines that are not yet protected and virtual machines that are already protected. You can view protected virtual machines by clicking **Select VMs** in the **Advanced (Multi Target)** section.

Virtual machines protected in the maximum number of VPGs are not displayed in the **Select VMs** dialog.

**Note:** Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

To define the boot order of the VPGs, click **DEFINE BOOT ORDER**.

**Note:** Defining boot order is only relevant when replicating from Azure to on-premise sites.

3. Configure the settings for the new virtual machines in the same way that you configured the other virtual machines in the VPG, when you created the VPG.

4. Click **DONE**.

The virtual machines are added to the VPG. This process may take a few minutes. While the VPG definition is being updated, you cannot perform any operation on the VPG, such as adding a checkpoint, editing its properties, or recovering it.

After the VPG definition has been updated, the protected and recovery sites are then synchronized. During the synchronization period, the Protection Status displayed in the VPGs tab of the Zerto User Interface is: **Meeting SLA n/m VMs** where **n** is the number of virtual machines that were originally in the VPG, and **m** is the total number of virtual machines in the VPG, including the virtual machines that are currently being synced. While the virtual machines that were added are being synced, the VPG can be failed over but the failover only includes the original virtual machines in the VPG.

When the sync process for a virtual machine is complete, Zerto Virtual Manager tags the first checkpoint that includes a new virtual machine with: **VM 'XXX' is fully synced** where **XXX** is the name of the virtual machine that was synced.

When you perform a recovery operation using one of these checkpoints, or any later checkpoint, all the virtual machines that have completed syncing will be recovered.
If the virtual machine is added to a VPG replicating to a resource pool in VMware vSphere environments, Zerto checks that the additional virtual machine doesn’t exceed the resource pool capacity, such that the sum of the virtual machine reservation is less than or equal to the resource pool CPU and storage settings.

Removing Virtual Machines from a VPG

If a user removes a virtual machine from a VPG, the checkpoints of the VPG are retained.

US132, US4593, TA10243

**Note:** Once a virtual machine is removed, it is no longer possible to recover it. TA12739

To remove a virtual machine from an existing VPG:

1. In the VPGs tab in the Zerto User Interface, select the VPG and click MORE > Edit VPG. You can also select the VPG to display the VPG details and click EDIT VPG.

   The Edit VPG wizard is displayed, enabling you to edit the VPG, including removing virtual machines from the VPG.

2. In the VMs step, select the virtual machines to remove and click the arrow pointing left to remove these machines from the VPG. The selected virtual machines will no longer be protected.

3. Click Done.
4. Select **Keep the recovery disks at the peer site** if you might reprotect the virtual machines. Checking this option means that the target replica disks for the virtual machines are saved so that they can be used as preseeded disks if the virtual machines are re-protected.

5. Click **YES** to delete.

The VPG configuration is updated. The VRA on the recovery site that handles the replication for the VPG is updated including keeping or removing the replicated data for the deleted VM, dependent on the **Keep the recovery disks at the peer site** setting during the deletion.

The locations of the saved target disks are specified in the description of the event for the virtual machines being removed, event EV0040, displayed in **MONITORING > EVENTS**.

## Removing a Protected Virtual Machine from Azure

If a user removes a protected virtual machine from Azure, the checkpoints of the VPG are retained.

For more information about removing an Azure virtual machine, see the relevant Microsoft Azure documentation.

**Note:** Once a virtual machine is removed, it is no longer possible to recover it.

## Pausing and Resuming the Protection of a VPG

During periods when the WAN bandwidth is utilized to its maximum, you can pause the protection of a VPG, to free up some of this bandwidth. After pausing the protection, the VPG can still be recovered to the last checkpoint written to the journal before the pause operation.

**Note:**
- Zerto recommends adding a checkpoint to the VPG immediately before pausing protection, if you might want to recover the VPG to the latest point in time before the pause.
- You cannot pause a VPG while a retention process is running.

▌ **To pause the protection of VPGs:**

1. In the Zerto User Interface, click the **VPGs** or **VMs** tab and select one or more VPGs to pause protection.

2. Click **MORE > PAUSE**.

A warning is displayed. If you click **PROCEED** in this warning, the VPG protection is paused.

**Note:** If the VPG was previously viewed, and the tab for this VPG is still displayed, you can access the details by selecting the tab.

The VPG protection is paused until you click **Resume VPGs**.
To resume the protection of VPGs:

1. In the Zerto User Interface, click the **VPGs** or **VMs** tab and select one or more VPGs to resume protection.

2. Click **MORE > Resume**.

After resuming protection, a Bitmap Sync will most probably be performed to synchronize the protection and recovery sites.

Forcing the Synchronization of a VPG

If the protected virtual machines are updated such that they are no longer synchronized with their mirror machines in the recovery site, you can force the resynchronization of the machines. An example of when the machines can be out-of-sync is when there is a rollback of a virtual machine to a VMware snapshot. In this case, the recovery virtual machine will include changes that have been rolled back in the protected machine, so that they are no longer synchronized.

You can force the synchronization of the machines in a VPG to remedy this type of situation.

**Note:** You cannot force the synchronization of a VPG while a retention process is running.

To forcibly synchronize a VPG:

1. In the Zerto User Interface, select the **VPGs** or **VMs** tab and click the VPG to display the VPG details.

2. Click **MORE > Force Sync**.

**Note:** If the VPG was previously viewed, and the tab for this VPG is still displayed, you can access the details by selecting the tab.

The VPG, and its temp discs, start to synchronize with the recovery site. As the journal fills up during the synchronization, older checkpoints are deleted from the journal to make room for the new data, and the data prior to these checkpoints are promoted to the virtual machine virtual disks.

Thus, during the synchronization, you can recover the virtual machine to any checkpoint still in the journal, but as time progresses, the list of checkpoints available can lessen.

If the journal is not big enough to complete the synchronization without leaving at least ten minutes worth of checkpoints, the synchronization pauses, for the amount of time which is specified in the **Replication Pause Time** value, for the VPG to enable intervention, to ensure recovery to a checkpoint remains available.

The intervention can be, for example, increasing the size of the journal, or cloning the journal as described in **Deleting a VPG on page 169**.
Deleting a VPG

You can delete a VPG and either keep the target disks to use later for preseeding if you want to reprotect any of the virtual machines in the deleted VPG or delete these disks.

(On-premise environments) Any retention sets stored for the VPG are not deleted and the virtual machines that were retained can be restored. You cannot delete a VPG while a retention process is running.

To delete a VPG:

1. In the Zerto User Interface, click the VPGs or VMs tab and select one or more VPGs to delete.
2. Click MORE > Delete.
   
The Delete VPG window opens.
3. Select Keep the recovery disks at the peer site if you might reprotect the virtual machines. Checking this option means that the target replica disks for the virtual machines are saved so that they can be used as preseeded disks if the virtual machines are re-protected.
4. Click APPLY to delete the VPG.

   The VPG configuration is deleted. The VRA on the recovery site that handles the replication for the VPG is updated including keeping or removing the replicated data for the deleted VPG, dependent on the Keep the recovery disks at the peer site setting during the deletion.

   The locations of the saved target disks are specified in the description of the event for the virtual machines being removed, event EV0040, displayed in MONITORING > EVENTS.

Deleting a VPG When the Status is Deleting

If, for some reason, the VPG cannot be deleted, the VPG status changes to Deleting and the substatus is VPG waiting to be removed. Attempting to delete the VPG a second time causes the following to be displayed:

- Retry: Retry deleting the VPG.
- Force Delete: Forcibly delete the VPG.
- Cancel: Cancel the delete operation.

Ensuring Application Consistency – Checkpoints

Checkpoints are recorded automatically every few seconds in the journal. These checkpoints ensure crash-consistency, and are written to the virtual machines journals by the Zerto Virtual Manager.

Each checkpoint has the same timestamp which is set by the Zerto Virtual Manager.

During recovery you pick a checkpoint in the journal and recover to this point. The crash-consistent checkpoints guarantee write order fidelity.

For Example:
If write A on a virtual machine in the VPG occurred before write B on a virtual machine in the VPG, then when a checkpoint is written, the journal will contain:

- Neither of the writes
- Both writes, and if they overlap the B data takes precedence
- Only A, indicating the checkpoint occurred between A and B

The coordination is done by the Zerto Virtual Manager.

You can also use a script to place the application in a quiesced mode, such as Oracle Hot Backup mode, and execute the Zerto PowerShell cmdlet Set-Checkpoint, then release the quiesced mode. For more information about Zerto PowerShell cmdlets, see Zerto Cmdlets.

**Note:**

- To write application-consistent checkpoints, there is a performance impact on the virtual machine running the application as a result of the application-consistent mechanism used. This is because the guest operating system and any integrated applications will be quiesced.

  This impact on performance may be negligible and does not always happen since not all applications require these checkpoints in order to achieve successful application recovery. Also, Zerto only requires the guest and application to quiesce for a brief moment, just long enough to add a checkpoint.

As previously mentioned, checkpoints are recorded every few seconds in the journal. After a while, the number of checkpoints available from which to choose a recovery point can be in excess of thousands per VPG.

When this threshold is reached, in order to enable efficient management and use of the checkpoints, the number of checkpoints is diluted with respect to time, as follows:

- Within the latest 2 hours: All of the checkpoints are available for recovery.
- Between 2 and ~4.5 hours: There are about two to three checkpoints every 15 minutes.
- From 4.5 hours and over: 1 checkpoint is kept every 15 minutes.

**Note:** Checkpoints which are either added manually, or marked as part of a Failover test are not diluted.

This section describes the different options available to ensure application consistency:

- Adding a Checkpoint to Identify a Key Point on page 170.
- Running Scripts Before or After Recovering a VPG on page 173, on page 141.

**Adding a Checkpoint to Identify a Key Point**

In addition to the automatically generated checkpoints, you can add checkpoints manually to ensure application consistency and to identify events that might influence recovery, such as a planned switch-over
to a secondary generator. You can recover the machines in a VPG to any checkpoint in the journal, to one added automatically or to one added manually. Thus, recovery is done to a point-in-time when the data integrity of the protected virtual machines is ensured.

**Note:**
- Adding a checkpoint manually does not guarantee transaction consistency.
- Changes to a VPG that result in re-synchronization of the VPG results in all checkpoints being removed. Adding checkpoints to the journal is resumed after synchronization completes. A forced synchronization of the VPG only removes checkpoints if the journal fills up during the synchronization.

> **To add a checkpoint to a VPG:**

1. In the Zerto User Interface select **ACTIONS > ADD CHECKPOINT**. The Add Checkpoint dialog is displayed.

![Add Checkpoint dialog](image)

A list of VPGs is displayed with the requested VPG selected. You can select more VPGs to add the same checkpoint to, for example, when something is happening at your site that affects multiple VPGs.

**Note:** Crash-consistency is per VPG and not across VPGs, even if a checkpoint was added to multiple VPGs.

2. Enter a name for the checkpoint.
3. Click **SAVE**.

When testing a failover, as described in Testing Recovery To Azure on page 213, or actually performing a failover, as described in Managing Failover Live on page 242, you can choose the checkpoint as the point to recover to.
When selecting the point to recover to:

- The refresh button is initially grayed out and is enabled for clicking after 5 seconds. It is also grayed out for 5 seconds after being clicked, before being re-enabled.

- A Click the refresh button to view the latest checkpoints reminder is displayed 10 seconds after the refresh button is clicked to remind the user that there is a new Latest Checkpoint.

- If the user has scrolled to, and selected, a checkpoint anywhere in the checkpoints list, clicking the refresh button will automatically return the user to the selected checkpoint in the list.

**Latest**: Recovery is to the latest checkpoint. This ensures that the data is crash-consistent for the recovery. When selecting the latest checkpoint, the checkpoint used is the latest at this point. If a checkpoint is added between this point and starting the failover, the later checkpoint is not used.

**Latest Tagged Checkpoint**: The recovery operation is to the latest checkpoint added in one of the following situations:

- By a user.

- When a failover test was previously performed on the VPG which includes the virtual machine.

- When the virtual machine was added to an existing VPG after the added virtual machine was synchronized.

**Note**: When replicating from Azure, tagged checkpoints are not consistent across data volumes.

If you do not want to use the latest checkpoint, or latest tagged checkpoint, choose Select from all available checkpoints. By default, this option displays all checkpoints in the system. You can choose to display only automatic, or tagged checkpoints, or any combination of these types.
Running Scripts Before or After Recovering a VPG

Before and after executing a failover, move, or test failover, you can run powershell scripts. A pre-recovery script is always run at the beginning of the recovery operation. A post-recovery script is run after all the virtual machines are powered on at the recovery site.

The scripts must be saved to the machine where the remote Zerto Virtual Manager (ZVM) is installed.

Both pre-recovery and post-recovery scripts are run by the ZVM service on the ZVM machine. The account running the ZVM service is the account that will run the scripts when they are executed.

Creating a Script

There are many ways to create scripts to run before or after recovering a VPG. The following procedure uses a Windows PowerShell file (.ps1) or a batch (.bat) file.

To create a script:

1. Create a file on the machine where the Zerto Virtual Manager that manages the recovery is installed.
2. Enter the script that you want to run in the file.
3. Save the file as a Windows PowerShell file (.ps1) or batch (.bat) file.

When writing a PowerShell script, you can include the environment variables in the script. For example, the following code snippet shows the use of the %ZertoOperation% and %ZertoVPGName% environment variables:

```powershell
$Operation = $env:ZertoOperation
$VPG = $env:ZertoVPGName
$time = Get-Date

if ($Operation -eq "Test") {
    "$time VPG: $VPG was tested." >> "C:\ZertoScripts\VPG_DR.txt"
}

if ($Operation -eq "FailoverBeforeCommit") {
    "$time Failover before commit was performed. VPG: $VPG" >> "C:\ZertoScripts\VPG_DR.txt"
}

if ($Operation -eq "MoveBeforeCommit"){
    "$time Move before commit was performed. VPG: $VPG" >> "C:\ZertoScripts\VPG_DR.txt"
}
```

Pre-recovery scripts must be saved on the protected site Zerto Virtual Manager machine. Post-recovery scripts must be saved on the recovery site Zerto Virtual Manager machine.

**Note:** Zerto recommends having both pre- and post-recovery scripts, available on both the protected and recovery Zerto Virtual Manager machines, so that they will work...
from the protected site.

4. **Update** Command to run and Params fields for all the VPG definitions that you want to run the script.

   Passing parameters is implemented differently for the two script types. For information about passing command line parameters, refer to the relevant PowerShell or batch file documentation.

**Using a BAT File**

Windows Batch (.bat) is an executable file that does not require anything in order to run. Update Command to run and Params fields for all the VPG definitions that you want to run the script.

**Command to run:** `<script_including_path>`

```plaintext
C:\ZertoScripts\PostScript.bat
```

Use quotes (") around the path if it includes spaces. The bat file is an executable file and is therefore included in the Command to run field.

**Params:** `<Zerto_Params>`, for example:

```plaintext
$ZertoOperation$ $ZertoVPGName$
```

**Using a PowerShell Script**

Windows PowerShell scripts require Windows PowerShell (.exe) to execute. To specify a PowerShell script, update Command to run and Params fields for all the VPG definitions that you want to run the script.

**Command to run:** `powershell.exe`

**Params:** `<script_including_path> <Zerto_Params>`, for example:

```plaintext
C:\ZertoScripts\PostScript.ps1 $ZertoOperation$ $ZertoVPGName$
```

Use quotes (") around the path if it includes spaces.

**Note:** You might have to set the remote signed execution policy. For example, using the following:

```plaintext
##PowerCLI requires remote signed execution policy - if this is not enabled,
##it may be enabled here by uncommenting the line below.
>##Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Force
```
Note: Zerto recommends testing both PowerShell and batch scripts by running them from the command line, to ensure that they run correctly.

Example Scripts

**IMPORTANT:** The scripts are provided by example only and are not supported under any Zerto support program or service.

The following script is an example of how to track failover tests.

The following script, `c:\ZertoScripts\TestedVPGs.bat`, writes the VPG name and date to the `ListOfTestedVPGs.txt` file every time a failover test is run:

```
SET isodt=%date:~10,4%-%date:~7,2%-%date:~4,2%
%time:~0,2%-%time:~3,2%-%time:~6,2%
IF %1==Test ECHO %2 %isodt% >> c:\ZertoScripts\Results\TestedVPGs.txt
```

Where `%1` is the first parameter in the list of parameters, `%ZertoOperation%`, and `%2` is the second parameter in the list of parameters, `%ZertoVPGName%`.

**Note:** If the file `TestedVPGs.txt` does not exist it is created, as long as the folder, `c:\ZertoScripts\Results`, exists.

Exporting and Importing VPG Definitions

You can save VPG definitions to an external file and import these definitions back to Zerto, for example, exporting the settings before uninstalling a version of Zerto and importing the settings after reinstalling Zerto.

If you are uninstalling Zerto, the VPGs are deleted. To prevent having to perform a full synchronization when the VPG definitions are imported, Zerto recommends deleting the VPGs in the Zerto User Interface, keeping their target disks. When importing, Zerto searches for the recovery disks in the saved path and uses them for preseeding, resulting in a Delta Sync.

**Note:** Zerto regularly exports settings to the `Zerto_Installation_Folder\Zerto\Virtual\Replication\ExportedSettings` folder. You can use one of these exported files instead of creating a new export file. The default location of `Zerto_Installation_Folder` is `C:\Program Files\Zerto`.

To export VPG settings:
1. Open the Zerto Diagnostics application. For example, via Start > Programs > ZVR > Zerto Diagnostics.

2. Select the Export Protection Group Settings option and click Next.

3. Select the destination for the file to contain exported settings and specify the Zerto Virtual Manager IP address and port where the VPGs are protecting virtual machines.

4. Click Next.

   The list of exported VPGs is displayed.

5. Click Done.

   **Note:** If you are uninstalling Zerto, the VPGs are deleted. To prevent having to perform a full synchronization when the VPG definitions are imported, Zerto recommends deleting the VPGs in the Zerto User Interface, keeping their target disks.

To import VPG settings:

1. Click Start > Programs > ZVR > Zerto Diagnostics.

2. Select the Import Protection Group Settings option.

3. Click Next.
4. Select the file previously exported and enter the Zerto Virtual Manager IP address and port specified when exporting the VPGs.

5. Click Next.

The list of exported VPGs is displayed. Ask for screenshot that shows import type Delta sync.

6. Select the VPGs to import. Only VPGs with names that are not already defined can be imported. VPGs in the import files with the same name as an existing VPG are disabled.

7. Click Next.

The list of imported VPGs is displayed. If the VPG could not be imported, the reason for the failure is specified.

**Note:** If a host was removed from and then re-added to the environment it is advisable to wait approximately 5 minutes from when the host was re-added before performing the import of the VPGs.

8. Click Done.

**VPG Statuses and Synchronization Triggers**

During normal operations the VPG status can change. For example, a change can be made to the VPG definition, or an operation such as move or failover is performed on the VPG, or an external event impacts the system such as the WAN going down. When the status changes, resulting in the VPG being
synchronized, for example with a **Delta Sync**, the estimated time to complete the synchronization is displayed under the VPG status, and if relevant, the synchronization trigger, such as **Network Congestion**.

### VPG Statuses

The following statuses are displayed:

<table>
<thead>
<tr>
<th>Status</th>

### Delta Syncing

The Delta Sync uses a checksum comparison to minimize the use of network instances. A Delta Sync is used when the protected virtual machine disks and the recovery disks should already be synchronized, except for a possible few changes to the protected disks, for example:

- After a VRA on the protected site was upgrade.
- A Force Sync operation was manually initiated on the VPG.
- A host protecting virtual machines was restarted and the protected virtual machines on the host had not been moved to other hosts in the cluster or a protected virtual machine was moved to another host without a VRA, and then moved back to the original host.

For synchronization to work, the protected virtual machines must be powered on so that the VRA has an active IO stack, which is only available when the virtual machine is powered on.

During the synchronization, new checkpoints are not added to the journal but recovery operations are still possible, assuming there are valid checkpoints in the journal. If a disaster occurs requiring a failover during a delta synchronization, you can recover to the last checkpoint written to the journal.

**Note:** Synchronization after a recovery starts after the promotion of data from the journal to the virtual machine disks ends. Thus, synchronization of virtual machines can start at different times, dependent on when the promotion for the virtual machine ends. All synchronizations are done in parallel, whether a delta sync or full sync, etc.

</tr>
</tbody>
</table>
### Initial Sync

Synchronization performed after creating the VPG to ensure that the protected disks and recovery disks are the same. Recovery operations cannot occur until after the initial synchronization has completed.

For synchronization to work, the protected virtual machines must be powered on so that the VRA has an active IO stack, which is only available when the virtual machine is powered on.

> Adding a virtual machine to a VPG is equivalent to creating a new VPG and an initial synchronization is performed. In this case, any checkpoints in the journal become unusable and only new checkpoints added after the initial synchronization completes can be used in a recovery. The data in the journal however remains and is promoted to the recovered virtual machine as part of a recovery procedure.

**Note:** Synchronization after a recovery starts after the promotion of data from the journal to the virtual machine disks ends. Thus, synchronization of virtual machines can start at different times, dependent on when the promotion for the virtual machine ends. All synchronizations are done in parallel, whether a delta sync or full sync, etc.

### Journal storage error

There was an I/O error to the journal. For example, if the journal was full and the size was increased. Once the problem is resolved a synchronization is required.

### Moving - Before commit

Preparing and checking the VPG virtual machines in the recovery site.

### Needs Configuration

One or more configuration settings are missing.

### Promoting

Updating recovered virtual machines in the VPG with data from the journal.

### Recovery is possible

Communication with the Zerto Virtual Manager at the protected site is down so continuing protection is halted, but recovery on the remote site is available.

### Recovery storage error

There was an I/O error to the recovery storage. For example, the storage is almost full or the virtual machines are turned off and the recovery disks are inaccessible.

### Recovery storage profile error

The storage profile in the recovery site specified to be used by the VPG cannot be found.
<table>
<thead>

Managing a Zerto Virtual Manager

The Zerto Virtual Manager runs as a Windows service and connects to Zerto components, such as the VRA.

The following topics are described in this section:

- Check Connectivity Between Zerto Components on page 186
- Reconfiguring the Zerto Virtual Manager Setup on page 187
- Reconfiguring the Microsoft SQL Server Database Used by the Zerto Virtual Manager on page 192
- Pair to Another Site and Unpairing Sites on page 193

Check Connectivity Between Zerto Components

If you think that there are connectivity problems to or from a Zerto Virtual Manager, you can use the Zerto diagnostics utility to check the connectivity.

> To check connectivity between Zerto Virtual Manager components:

1. Open the Zerto Diagnostics application. For example, via Start > Programs > ZVR > Zerto Diagnostics.

2. Select the Test Connectivity to Zerto components option and click Next.

The IP Connectivity dialog is displayed.

You can use this dialog to check the following:
TCP communication between the Zerto Virtual Managers (ZVMs) on the protected and recovery sites. The default port, specified during installation, is 9081.

Communication between VRAs on the protected and recovery sites, via the control port and the data port.

3. Select the connectivity you want to test and in the case of the Zerto Virtual Manager (ZVM), specify the TCP communication port specified during the installation, if the default port, 9081, was changed.

4. Specify the type of test to perform:
   
   **Server:** Test for incoming communication.
   
   **Client:** Test for outgoing communication. Specify the IP address of the receiving Zerto Virtual Manager.

5. Click **Next** to test the specified connectivity.

   The Server option listens for communication from a paired VRA. Stop listening by clicking **Stop**.

   The Client options tests the client; on completion a result dialog is displayed.

6. Click **Stop** (server test) or **OK** (client test) to return to the Zerto Diagnostics dialog.

### Reconfiguring the Zerto Virtual Manager Setup

When installing Zerto Cloud Appliance, you provide the IP address of the machine on which you are installing it. This is where the Zerto Virtual Manager runs and displays the Zerto User Interface.

You can change this IP address if necessary, using the Zerto Diagnostics utility.

To reconfigure the Zerto Virtual Manager:
1. Click **Start > Programs > ZVR > Zerto Diagnostics**.

![Zerto Virtual Replication Diagnostics & Configuration](image)

2. Select **Reconfigure Zerto Manager** and click **Next**

   The Azure Authentication dialog is displayed.

![Azure Authentication](image)

3. Click **AUTHENTICATE**.

   The Microsoft Azure authentication page is displayed. The Azure Authentication dialog remains active.
4. Specify the following:

- The email or phone number of the account who is the Azure subscription User Access Administrator.

  For instruction on how to add a user as a subscription User Access Administrator, see https://azure.microsoft.com/en-us/documentation/articles/role-based-access-built-in-roles/.

- The password of the account.

  Zerto automatically detects the region in which the ZCA is installed.

5. Click **Sign in**.

  The Azure Authentication dialog is displayed with fields populated by the Azure authentication.
6. From the dropdown list, select the Subscription.

7. Click NEXT.

The Connectivity dialog is displayed.

8. Select the IP Address of the machine on which you are installing the Zerto Cloud Appliance. The protected site accesses the Azure site through VPN using this IP.

9. Click NEXT.

The ZVM Site Details dialog is displayed.

10. Enter the site details:
11. Click NEXT.

The ZVM Communication dialog is displayed.

HTTP Port (ZVM): The port used for inbound communication between the Zerto Virtual Manager and Zerto internal APIs, and Cmdlets.

HTTPS Port (clients <-> ZVM): The port used for inbound communication between the Zerto User Interface and the Zerto Virtual Manager.

TCP Port (ZVM <-> ZVMs): The port used for communication between Zerto Virtual Managers. If you change the value, when pairing sites, use the TCP port value you specify here. Pairing the sites is described in “Pairing an Azure Site”, on page 21.

TCP Port (ZVM -> VBA): The port used for communication between the Zerto Virtual Manager and the Virtual Backup Appliance.

12. Click NEXT.

The Online Services and Zerto Mobile Application dialog is displayed.
13. Click **NEXT**.

14. Click **RUN**

The installation checks that the installation can proceed successfully.

If you changed the IP address of the Zerto Virtual Manager, you must unpair the Azure and protected sites, and then pair the sites again.

**Reconfiguring the Microsoft SQL Server Database Used by the Zerto Virtual Manager**

When installing Zerto, you can specify a Microsoft SQL Server database to use by the Zerto Virtual Manager. If the access to this database changes, you can change the access in the Zerto Virtual Manager.
To reconfigure the access to the Zerto Virtual Manager database:

1. Click Start > Programs > ZVR > Zerto Diagnostics.

2. Select the Change SQL Server Credentials option and click Next.

The installation settings for the SQL Server are displayed. Change the IP and username and password if necessary.

**Server Name:** The domain name and server resource to connect to, with the format `<server_name><instance_name>` or `<Server_IP><instance_name>`.

Specify either of the following authentication options:

**Windows Authentication:** Use Windows authentication. This option is only enabled if a specific service user account was specified in the previous Service User dialog, in which case the service account name and password are used.

**SQL Server Authentication:** Use SQL Server authentication.

- **User Name:** The user name for SQL Server database.
- **Password:** A valid password for the given user name.

3. Click Next to the end of the wizard and then click Finish.

The Zerto Virtual Manager service is restarted using the new credentials.

### Pair to Another Site and Unpairing Sites

See the following sections:
Pair to Another Site on page 194

Unpairing Sites on page 195

Pair to Another Site

You can pair to any site where Zerto is installed.

Zerto can be installed at multiple sites and each of these sites can be paired to any other site on which Zerto has been installed. Virtual machines that are protected on one site can be recovered to any paired site.

To pair to a site:

1. From the remote site to which you will pair, in Zerto Virtual Manager > Sites tab, click the button Generate Pairing Token.

   ![Generate Pairing Token](image)

2. The Generate Pairing Token window opens.

   ![Copy Token](image)

   - This token can be used to pair a single site. It will expire on Jul 31, 2019

3. Click Copy, to copy the token.

   The token expires when the earliest of one of the following conditions is met:
   - 48 hours after clicking Copy
   - At the next ZVM process termination
   - After the token is used to authenticate the pairing request

4. From the site which will initiate the pairing, in the Zerto Virtual Manager > Sites tab, click PAIR.

   The Add Site window is displayed.
5. Specify the following:
   • **Host name/IP**: IP address or fully qualified DNS host name of the **remote** site Zerto Virtual Manager to pair to.
   • **Port**: The TCP port communication between the sites. Enter the port that was specified during the installation. The default port during the installation was 9081.
   • **Token**: Paste the token which you copied above.

6. Click **PAIR**.

   The sites are paired, meaning that the Zerto Virtual Manager for the local site is connected to the Zerto Virtual Manager at the remote site.

   After the pairing completes the content of the SITES tab updated to include summary information about the paired site.

### Unpairing Sites

You can unpair any two sites that are paired to each other.

**Important:** If there is a VPG on either of the sites you are unpairing, the VPGs will be **deleted**.

#### To unpair two sites:

1. In the Zerto User Interface, in the SITES tab, select the site which you want to unpair.
2. Click **UNPAIR**.

   A message appears warning the user that the sites are about to unpair.

   If there are either protected or recovered VPGs on the paired sites, a message appears warning the user that the VPGs will be deleted.
3. For vSphere, Hyper-V and Azure platforms, you can select to keep disks to use for preseeding if the VMs are re-protected. If you select this option, the disks are not removed from the recovery site.

4. To unpair, click CONTINUE.

   The sites are no longer paired. If there are VPGs on either site, they are deleted.

   The VRA on the recovery site that handles the replication for the VPG is updated including keeping or removing the replicated data for the deleted VPG, depending if you selected to keep disks to use for preseeding.

   The locations of the saved target disks are specified in the Events tab in the ZVM application on the Recovery site.
Overview of Disaster Recovery Operations

The Zerto solution provides a number of operations to recover virtual machines at the remote site. This section describes these operations. The following topics are described in this section:

- The Failover Test Operation on page 197
- The Move Operation on page 198
- The Failover Operation on page 199
- The Restore File Operation on page 200
- The Clone Operation on page 200

The Failover Test Operation

Use the Failover Test operation to test that during recovery the virtual machines are correctly replicated in Microsoft Azure.

The Failover Test operation creates test virtual machines in a sandbox, using the test network specified in the VPG definition, as opposed to a production network, to a specified point-in-time, using the recovery disks and journal in the storage account, managed by the VRA. For more information see Testing Recovery To Azure on page 213.

During the test, any changes to the protected virtual machines at the protected site are sent to Azure and new checkpoints continue to be generated, since replication of the protected machines continues throughout the test. You can also add your own checkpoints during the test period.

The following diagram shows the positioning of the virtual machines before and during a Failover test operation.

Before Failover Test
During Failover Test

The Move Operation

Use the **Move** operation to transfer protected virtual machines from the protected site to Azure in a planned migration.

When you perform a planned migration of the virtual machines to Azure, Zerto assumes that both sites are healthy and that you planned to relocate the virtual machines in an orderly fashion. For details, see Migrating a VPG to Azure on page 223.

The following diagram shows the positioning of the virtual machines before and after the completion of a Move operation.

**Before Move**

**Move: After Commit - With Reverse Protection**
Move: After Commit - No Reverse Protection

![Diagram of Move: After Commit - No Reverse Protection]

Move: After Commit - Keep source VM, No Reverse Protection

![Diagram of Move: After Commit - Keep source VM, No Reverse Protection]

The Failover Operation

Following a disaster, use the **Failover** operation to recover protected virtual machines to Azure. A failover assumes that connectivity between the sites might be down, and thus the protected virtual machines and disks are not removed, as they are in a planned Move operation.

When you set up a failover you always specify a checkpoint to which you want to recover the virtual machines. When you select a checkpoint - either the last auto-generated checkpoint, an earlier checkpoint, or a user-defined checkpoint - Zerto makes sure that virtual machines in Azure are recovered to this specified point-in-time. For details, see **Managing Failover Live on page 242**.

| Note: | To identify the checkpoint to use, you can perform a number of test failovers, each to a different checkpoint. |

The following diagram shows the positioning of the virtual machines before and after the completion of a **Failover** operation.

Before Failover

![Diagram of Before Failover]

The Failover Operation

199
Failover - Protected Site Down

<td>VM</td>
</tr>
</tbody>
</table>

The Restore File Operation

Use the **Restore File** operation to recover individual files and folders from the recovery site.

You can recover specific files and folders from the recovery site for virtual machines that are being protected by Zerto and running Windows operating systems. You can recover the files and folders from a specific point-in-time. For details, see “Recovering Files and Folders”, on page 151.

The Clone Operation

Use the **Clone** operation to create a copy of the VPG virtual machines on the recovery site in the production network. The virtual machines on the protected site remain protected and live.
You might want to create a clone if you need to have a copy of the virtual machines saved to a specific point-in-time, for example, when the VPG enters a Replication Paused state, or when testing the VPG in a live DR test. For details, see Cloning a VPG to Azure on page 253, on page 208.

The cloned machines are named after the protected virtual machine name along with the timestamp of the checkpoint used for the clone. The cloned virtual machines are not powered on.

The following diagram shows the positioning of the virtual machines before and after the completion of a Clone operation.

**Before Clone**

**After Clone**
Advanced Site Configuration

There are a number of configuration tasks that you can perform, some of which should be done as part of the initial site configuration.

The following topics are described in this section:

- Site Settings on page 202
- Editing Information About a Site on page 203
- Seeing What is Licensed on page 208
- Submitting a Support Ticket on page 209
- Submitting a Feature Request on page 210
- About the Zerto Version on page 211

Site Settings

The Site Settings dialog enables configuring various site settings. These include the default script timeout and protection policies such as the commit policy for a failover or move operation.

➢ To specify site settings:

1. In the Zerto User Interface, in the top right of the header click SETTING (Everybody) and select Site Settings.

   The Site Settings window is displayed.

<table>
<thead>
<tr>
<th>SITE DETAILS</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Name*</td>
<td>QA_Azure1</td>
</tr>
<tr>
<td>Site Location*</td>
<td>Unconfigured location</td>
</tr>
<tr>

<tr>
<td>Resource Name</td>
<td>QA_Azure-20a-rg-1234</td>
</tr>
<tr>
<td>Storage Account Name</td>
<td>qazurecasaaf8c1</td>
</tr>
</tbody>
</table>

2. Make any required changes to the settings, click SAVE and then APPLY. The following settings can be defined:
• Editing Information About a Site on page 203
• Defining Site Policies on page 205
• Configuring Email Settings on page 206
• Defining the Resource Report Sampling Period on page 207

Licensing is described in Seeing What is Licensed on page 208.

Editing Information About a Site

You provide information about the site during installation, to make it easier to identify the site in the user interface and to identify the contact person at the site. After installation you can updated these settings.

➢ To update information about the local site:

1. In the Zerto User Interface (top right), click SETTING ( ) and select Site Settings.

The Site Settings dialog is displayed.

• In vSphere and Hyper-V sites, the following fields are displayed:

```
SITE DETAILS
Site Name*  site-1 at Zerto
Site Location* site-1
Contact Name* site-1@zerto.com
Contact Email  site-1@zerto.com
Contact Phone  066-6666666

</table>

| AZURE SETTINGS |  
|----------------|-----------------------|
| Application Name | Zerto Cloud Appliance |
| Client ID | e1af5b-d304-4fe1-abea-403f792e60 |
| Subscription | PA Azure Team |
| Resource Name | PA_AzurePA001-1523 |
| Storage Account Name | pauseraccount1 |

2. Define general information about the site.

- **(Mandatory) Site Name:** The name used to identify the site.
- **(Mandatory) Site Location:** Information such as the address of the site or a significant name with which to identify the site location.
- **(AWS environments only) Bucket Name:** The name of the bucket that was created when Zerto was installed. This cannot be changed.
- **(Mandatory) Contact Name:** The name of the person to contact if a need arises. Mandatory.
- **Contact Email:** An email address to use if a need arises.
- **Contact Phone:** A phone number to use if a need arises.

3. **(On premise environments)** To change the **User Credentials** to access the vCenter or Hyper-V SCVMM server from the Zerto Virtual Manager:

- **User Name:** The administrator name used to access the vCenter or SCVMM server. The name can be entered using either of the following formats:
  - *username*
  - *domain\username*
- **Password:** The password used to access the vCenter or SCVMM server for the given user name. To ensure security, after saving the settings, the password field is cleared.

4. **(Azure environments only) Azure Settings:**

- **Application Name:** The name used to access Azure.
- **Client ID:** A unique identifier that is associated with the access name.
- **Subscription:** The subscription associated with the user.
- **Resource Name:** The name of the resource the user created.
5. (AWS environments only) **AWS Settings:**
   - **Access Key ID:** A unique identifier that is associated with a secret access key.
   - **Secret Access Key:** A key that is used with the access key ID.

6. Click **SAVE.**

**Defining Site Policies**

You can set default recovery and replication policies.

**Configuring Disaster Recovery Policies**

> **To configure disaster recovery policies:**

1. Click **Policies.**

2. Select the **Failover/Move Commit Policy** to use during a failover or move operation, described in [Prerequisites Before Failing Over to Linux Virtual Machines in Azure](page 244) and [Initiating a Failover Live](page 245) respectively. The following options are available:
   - **None:** The failover or move operation must be manually committed or rolled back by the user.
   - **Commit:** After the time specified in the Default Timeout field the failover or move operation is committed, unless manually committed or rolled back by the user before the time-out value is reached. During the specified time you can check the recovered VPG virtual machines.
   - **Rollback:** After the time specified in the Default Timeout field the failover or move operation is rolled back, unless manually committed or rolled back by the user before the time-out value is reached. During the specified time you can check the recovered VPG virtual machines.

   The value set here applies as the default for all failover or move operations from this point on but can be changed when defining a failover or move operation.
3. Specify the **Default Timeout** after which a Commit or Rollback commit policy is performed. A value of zero indicates that the system will automatically perform the commit policy, without waiting for any user interaction.

4. Choose the series from which to select the type. Azure series are optimized for different types of applications.

5. Choose the virtual machine size, within the series, to assign to recovered instances. Different types within a series vary primarily in vCPU, ECU, RAM, and local storage size. The price per series is directly related to the series size.

6. Specify the **Default Script Execution Timeout** or a script running before or after the failover, move, or test failover. A value of zero indicates that there is no time out. Values can be between 300 to 6000 seconds.

7. Choose the **Replication Pause Time**, which is the time to pause when the journal might have problems, resulting in the loss of all checkpoints, for example, when the datastore for the journal is near to being full.

   The replication pause time is the amount of time that the transfer of data from the protected site to the journal on the recovery site is paused. This time can then be used by the administrator to resolve the issue, for example by cloning the virtual machines in the VPG, described in [Cloning Protected Virtual Machines to the Remote Site on page 253](#). The value set here is applied to existing and new VPGs.

8. Click **APPLY** or **SAVE**.

### Configuring Email Settings

You can configure Zerto alerts to be sent to an email address, so as to be better informed when an alert occurs and retention processes are run.

**Email Settings**

**To configure email settings:**

1. Click **Email Settings**.

   ![Email Settings](image)

   **EMAIL SETTINGS**
   - SMTP Server Address
   - SMTP Server Port 25
   - Sender Account
   - To
   - Send Test Email

   **ALERTS AND REPORTS**
   - Enable sending alerts
2. Specify the **SMTP server Address**. The Zerto Virtual Manager must be able to reach this address.

3. If the **SMTP Server Port** was changed from the default, 25, specify the port number.

4. Specify a valid email address for the email sender name in the **Sender Account** field.

5. Specify a valid email address where you want to send the email in the **To** field.

You can test that the email notification is set up correctly by clicking **Send Test Email**. A test email is sent to the email address specified in the **To** field.

6. Click **APPLY** or **SAVE**.

### Alerts and Reports

You can configure when to send alerts and retention reports.

**To configure when to send emails about alerts and retention sets:**

1. To send an email when an alert is issued, select **Enable sending alerts**.
2. To send an email with a retention report, select **Enable retention reports**.
3. Specify whether you want a retention report sent daily or weekly.
   - **Daily**: Send a daily retention report
   - **Weekly**: Send a weekly retention report. Select the day of the week from the drop-down list.
4. Specify day of the week and the time of day to send the retention report.
5. Click **APPLY** or **SAVE**.

### Defining the Resource Report Sampling Period

Specify when you want to take resource samples to identify resource usage, either daily at a specific hour and minute or hourly at a specific minute within each hour.

**To configure report settings:**

1. Click **Reports**.

![Resource Report Sampling Period](image)

2. Choose the **Sampling Rate**.
3. Choose the **Sampling Time**.

   If you set the daily time to be 12:00, you will get a sample taken at noon every day. Collecting a
sample hourly provides a higher resolution picture of replication traffic than if collected daily.

4. Click **APPLY** or **SAVE**.

Information is saved for 90 days when the sampling period is hourly and for one year when the sampling period is daily.

These samples are used to generate resource reports as described in Zerto Reports on page 271, on page 224.

**Seeing What is Licensed**

The Zerto license includes information such as the number of virtual machines that can be protected and the license expiry date. You can see these details by clicking 😃 in the top right of the header and selecting **License**.

The Zerto license includes the following details:

- **License**: The license key itself.
- **License Type**: What is licensed: whether the license restricts the number of virtual machines that can be protected or the number of sockets used.
- **Expiry Date**: The license expiry date.
- **Quantity**: The maximum amount licensed, either virtual machines or sockets, based on the license type. If blank, the quantity is unlimited.
- **Usage**: The sites using the license and the number of protected virtual machines in each site.
A warning is generated when either the license expires or more than the licensed number of virtual machines are being protected. Protection continues but the license should be updated. After getting a new license key you can update Zerto with this key.

To update a license key:

1. In the Zerto User Interface, in the top right of the header click and select License.
2. Enter a valid license key and click APPLY or SAVE.
   The license is updated on the local site and the paired remote sites.

Submitting a Support Ticket

You can open a ticket to Zerto support directly from the Zerto User Interface.

Note: The clocks on the machines where Zerto is installed must be synchronized with UTC and with each other (the timezones can be different). Zerto recommends synchronizing the clocks using NTP. If the clocks are not synchronized with UTC, submitting a support ticket can fail.

To Open a support ticket:

Support cases can be opened directly in the Zerto User Interface.

Creating a support case in the Zerto User Interface simplifies the submission process since much of the information that is required when entering a case using the Zerto Support Portal, such as the version and build numbers, is automatically added to the case when it is submitted via the Zerto User Interface.

In addition, when the case is submitted, a snapshot of the current environment is also attached to the case. The snapshot information includes the lists of alerts, events, tasks, VPGs, and virtual machines that are protected.

This information is used to help Zerto resolve the case quickly and, whenever possible, without the need to request more information from you.

Note: The clocks on the machines where Zerto is installed must be synchronized with UTC and with each other (the timezones can be different). Zerto recommends synchronizing the clocks using NTP. If the clocks are not synchronized with UTC, submitting a support case can fail.

To open a support case:

1. In the Zerto User Interface, click in the top right of the header and select Open a Case.
   The Open Support Case window for the site opens.
2. Specify the case details:
   - **Subject**: The subject of the support case.
   - **Type**: The type of case being opened. Available options are:
     - Problem
     - Question
   - **Description**: A description of the problem or question in addition to the information supplied in the subject.
   - **Allow remote log collection**: How many logs is Zerto allowed to collect. Available options are:
     - Only for this case
     - For the next 30 days
     - Never
   - **SSP Email Address**: A valid email address registered with Zerto, with permission to open cases.

3. Click **Submit**.

The case is processed and its progress is displayed. If the email address is not valid, the case is rejected. Once the case submission starts, it cannot be canceled.

**Submitting a Feature Request**

From the Zerto User Interface, you can access the Feature Requests page in myZerto in order to submit a feature request.

▷ **To submit a feature request:**
1. In the Zerto User Interface, on the top right of the header, click 📋.

2. Click Submit Feature Request; the Feature Requests page in myZerto opens.

About the Zerto Version

In the About window, you can do the following:

- View the Zerto version being run.
- Enable or disable the Zerto CALLHOME feature. The Zerto CALLHOME feature enables support notification and analytics for the following purposes:
  - To improve Zerto.
  - To send notifications to the user when a new Zerto version is available, or when new hypervisor versions are supported by Zerto.
  - Enable or disable Zerto to send data to the SaaS platform for monitoring purposes, using the Zerto Mobile App. This action is done by licensed Zerto Virtual Manager users.

When clicking About, the following options appear:

- Enable Support notification and product improvement feedback.
- Enable Zerto SaaS features. Includes Zerto Analytics, Zerto Mobile App and Remote upgrade.

To perform these actions, do the following:

1. In the Zerto User Interface, in the top right of the header, click 📋, and then click About. The version and build of Zerto installed in the site are displayed.

2. To enable the Zerto CALLHOME feature, click Enable Support notification and product improvement feedback. This is selected by default.

   Note: For Microsoft Azure and AWS, this option is grayed out.

If the user deselected Enable Support notification and analytics, a warning appears notifying the user that deselection this option will stop Zerto from sending notifications when new Zerto updates are available, or when new hosts are supported.

3. If you want Zerto to send information to our Online Services and Zerto Mobile App, and enable remote upgrade, select Enable Zerto SaaS features. Include Zerto Analytics, Zerto Mobile App and Remote upgrade. This is selected by default.

   This allows licensed Zerto Virtual Manager users to enable or disable data being sent from the Zerto Virtual Manager to the SaaS platform, thereby enabling site monitoring using the Zerto Mobile App. This also enables automatic script upgrade of Zerto’s local ZCA scripts. This means that the scripts, which are responsible for configuration and management tasks, will always be up to date.

   - If the user deselected Enable Online Services and Zerto Mobile, a warning appears notifying the
user that deselecting this option will stop Zerto from sending information to Online Services and to the Zerto Mobile Application, rendering these services inoperable for the entire installation.

4. If you want to enable automatic script upgrade of Zerto's local ZCA scripts, select Enable Zerto SaaS features. Include Zerto Analytics, Zerto Mobile App and Remote upgrade. This means that the scripts, which are responsible for configuration and management tasks, will always be up to date.
Testing Recovery To Azure

In order to verify that the disaster recovery that you have planned is the one that will be implemented, Zerto recommends testing the recovery of the VPGs defined in the protected site to the recovery site. This section describes how to test VPG recovery to Azure.

The following topics are described in this section:

- The Test Failover Process on page 213
- Starting and Stopping Failover Tests on page 214
- Viewing Test Results on page 220
- Live Disaster Recovery Testing on page 220

**Note:** You cannot perform a failover test while a retention process is running.

**Note:** When testing recovery from Azure to on-premise sites, the Move operation is used, which assures VM level consistency.

To allow checking before committing or rolling back, specify an amount of time to check the recovered machines, in minutes, before the automatic commit or rollback action is performed. During this time period, check that the new virtual machines are OK and then commit the operation or roll it back. The maximum amount of time you can delay the commit or rollback operation is 1440 minutes, which is 24 hours.

Checking that involves I/O is done on scratch volumes. The longer this period the more scratch volumes are used, until the maximum size is reached, at which point no more checking can be done. The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed. The scratch volumes reside on the storage defined for the journal.

For more information see The Move Process on page 234.

The Test Failover Process

Use the Failover Test operation to test that during recovery the virtual machines are correctly replicated at the recovery site. The Failover Test operation creates test virtual machines in a sandbox, using the test network specified in the VPG definition.

During the test, any changes to the protected virtual machines at the protected site are sent to the recovery site and new checkpoints continue to be generated, since replication of the protected machines continues throughout the test. You can also add your own checkpoints during the test period. You can initiate a failover during a test, as described in Initiating a Live Failover During a Test on page 252.

The Failover Test operation has the following basic steps:

- Starting the test.
  - The test virtual machine is created in Azure and configured to the checkpoint specified for the
recovery.

- The new virtual machines is created in a sandbox and powered on, making them available for testing.

- Testing.
  - Testing takes place in the sandbox that was created when the VPG was created.
  - The production environment is not affected for the duration of the test.
  - Replication of the protected machines continues, with new checkpoints being created.

- Stopping the test.
  - The virtual machines in Azure are powered off and removed from the inventory.
  - The following tag is added to the checkpoint specified for the test:
    Tested at startDateAndTimeOfTest
    
    The updated checkpoint can be used to identify the point-in-time to restore the virtual machines in the VPG during a failover.

Testing that recovery is accomplished successfully should be done periodically so that you can verify that a failover will work. Zerto also recommends testing all the VPGs being recovered to the same cluster together.

When configuring a VPG, specify the period between tests for that VPG in the Test Reminder field in the REPLICATION step of the Create VPG wizard.

- When you create a virtual machine in Azure you are provided with a temporary volume automatically. This temporary storage is D: on a Windows virtual machine and it is /dev/sdb1 on a Linux virtual machine.

- Temporary volume size varies according to the instance size you have selected.

- On Windows, the temporary volume will be using the next available drive letter.

  *For example:* If you have two volumes connected to the protected virtual machine, Azure will use C and D, and allocate E for the temporary volume drive.

## Starting and Stopping Failover Tests

You can test specific VMs in a VPG, a single VPG or multiple VPGs to make sure that if an actual failover is needed, the failover will perform as expected.

**Note:** You can initiate the failover test from either the protected site or recovery site. You cannot select specific VMs in a VPG for failover test if the protected site is down.

**To test failover:**

1. In the Zerto User Interface set the operation to **TEST** and click **FAILOVER**.

   The Failover Test wizard is displayed.
2. Select the VPGs to failover. By default, all VPGs are listed.
   a. To select specific VMs in a VPG, click the icon next to each VPG to get a list of VMs. The Select VMs to Failover dialog is displayed. By default, all VMs are selected.

   ![Select VMs to Failover](image)

   b. Select the VMs to failover.

   **Note:** Selecting specific VMs in a VPG to failover is not supported when replicating from a vCD site.

   At the bottom, the selection details show the amount of data and the total number of virtual machines selected.

   The Direction arrow shows the direction of the process: From the protected site To the peer, recovery, site.

3. Click **NEXT**.
The EXECUTION PARAMETERS step is displayed.

You can select the checkpoint to use for the recovery and see if a boot order and scripts are defined for the VPG.

4. By default, the last checkpoint added to the journal is displayed in the Checkpoint column
   - To use this checkpoint, proceed to the next step.
   - To change the checkpoint, click the link that appears as the checkpoint.

   A window appears, displaying a list of the VPGs’ checkpoints.

   **Latest:** Recovery is to the latest checkpoint. This ensures that the data is crash-consistent for the recovery.

   When selecting the latest checkpoint, the checkpoint used is the latest at this point.

   If a checkpoint is added between this point and starting the failover, this later checkpoint is not used.

   **Latest Tagged Checkpoint:** The recovery operation is to the latest checkpoint added in one of the following situations:
   - By a user.
   - When a failover test was previously performed on the VPG that includes the virtual machine.
   - When the virtual machine was added to an existing VPG after the added virtual machine was synchronized.

5. To use a checkpoint which is not the latest checkpoint, or the latest tagged checkpoint, choose **Select from all available checkpoints.** By default, this option displays all checkpoints in the
system. You can choose to display only automatic, or tagged checkpoints, or any combination of these types.

6. **Click OK.** If the selected VMs were not protected when the selected checkpoint was taken, a warning will appear informing the user that these VMs cannot be recovered. If all selected VMs cannot be recovered, an error will appear.

7. **Click NEXT.**

The FAILOVER TEST step is displayed. The topology will show the VPGs and the virtual machines that are about to be tested.

8. **To start the test, click START FAILOVER TEST.**

   **Note:** If any of the VPGs have at least one VM configured with a static IP, but the static IP is in use on the recovery site, a warning message appears enabling you to choose whether to continue with a dynamic IP, or to cancel the failover process.

The test starts for the selected VPGs. The test begins with an initialization period during which the new virtual machines are created in Azure. Zerto creates a new resource group for the VPG, and places the newly created virtual machines and their NICs in this resource group.

The default instance size for new virtual machines is **Standard_DS1_v2**. If Standard_DS1_v2 instance size does not meet your needs, you can change this value in the Policies tab of the Site Settings dialog. For more information, see Configuring Disaster Recovery Policies on page 205. You can also change the instance size of new virtual machines when you create or edit a VPG.

   **Note:** By default, every Azure virtual machine is created with an additional temporary volume. This temporary volume is a local SSD disk. The size of the SSD disk depends on the instance size of the virtual machine.

   **Note:** If you did not define a private IP for a virtual machine in the VPG definition, during recovery
Azure sets the private IP from the defined subnet range.

After Starting a Test, What Happens?

The virtual machines in the virtual protection group are created in Azure. In the Azure console, the new virtual machines appear with their original names and the suffix testing recovery.

**Note:** Zerto adheres to Azure naming conventions. For information, see Zerto for Microsoft Azure Environments.

While a test is running:

- The virtual machines in the VPGs continue to be protected.
- You can add checkpoints to the VPGs, and if necessary fail over the VPGs, as described in Initiating a Live Failover During a Test on page 252, on page 207.
- You cannot move VPGs being tested.
- You cannot initiate a failover while a test is being initialized or closed.

Monitor the status of a failover test by doing the following:

- In the Zerto User Interface, click the VPGs tab. The Operation field in the GENERAL view displays Testing Failover when a failover test is being performed.

- In the Zerto User Interface, click the VPGs tab, and then click on the name of a VPG you are testing. A dynamic tab is created displaying the specific VPG details including the status of the failover test.
To stop a failover test:

1. Click the Abort icon, in either the Dashboard or the dynamic tab, to stop the test in the specific VPG tab.

You can also stop the test via the TASKS popup dialog in the status bar, or by selecting MONITORING > TASKS.

The Stop Test dialog is displayed.

2. In the Result field specify whether the test succeeded or failed.

3. Optionally, in the Notes field, add a description of the test. For example, specify where external files that describe the tests performed are saved. Notes are limited to 255 characters.

4. Click STOP.

After stopping a test, the following occurs:

- Virtual machines in the recovery site are powered off and removed.
- The resource group created for the operation is deleted.
- The checkpoint that was used for the test has the following tag added to identify the test: Tested at startDateAndTimeOfTest.

This checkpoint can be used to identify the point-in-time to use to restore the virtual machines in the VPG during a failover.
Viewing Test Results

After stopping a test, you can see the test results in Zerto reports. For more information, see Zerto Reports on page 271.

Live Disaster Recovery Testing

This section describes how to use the basic Zerto recovery operations to perform live disaster recovery tests, in different situations.

When performing a live DR test you need to consider the following:

- The purpose of the live DR test: Do you only want to verify that the VMs can recover properly or do you want to conduct a full DR test that will include running user traffic against the recovered VMs?
- The length of time you want to test the recovery, a few hours or several days.
- Whether the changes to the new virtual machines need to be retained after the test or can they be discarded?
- Whether you are willing to accept temporary downtime of the application.
- Whether you want to simulate an actual disaster at the protected site, for example by simulating a network outage or bringing down the protected site.

The following flowchart shows the testing decision flow:

![Flowchart](image)

During any live test, Zerto recommends that you only maintain one working version of the same virtual machine. Thus, the first step in any test, except for a Failover Test, is to make sure that the protected virtual machines are shut down before starting to test recovered machines. During a Zerto Move operation the first step Zerto performs is to shut down the protected machines, to ensure data integrity. However, a Zerto Failover operation assumes that the protected virtual machines are no longer accessible (the total site disaster scenario) and does not attempt to shut them down at the beginning of the operation. In a live
test using a Failover operation you have to manually shut down the virtual machines to be tested at the beginning of the test in order to prevent potential split-brain situations where two instances of the same applications are live at the same time.

If you want to perform a live DR test that includes a simulated disaster you can simulate the disaster, for example, by disconnecting the network between the two sites. In this type of test, once the disaster is simulated a Move operation cannot be used, since it requires both sites to be healthy, while a Failover operation can be used.

Basic Verification – User Traffic Is Not Run against the Recovered VMs

Basic testing that the virtual machines can recover is done using either a Failover Test operation or an uncommitted Move operation, using the Rollback setting.

Using a Failover Test Operation

Use a Failover Test operation if recovering the virtual machines in a sandbox. Using the test network specified in the VPG definition for network isolation, is sufficient for a test.

Procedure

The Failover Test operation is described in detail in Starting and Stopping Failover Tests on page 214. The following highlights specific steps to enable using the Failover Test when recovering the virtual machines in a sandbox.

1. Change the VPG Failover Test Network to the production network used at the recovery site.
2. Manually shut down the virtual machines in the VPG.
3. Insert a new checkpoint. This avoids potential data loss since the virtual machines are shut down and the new checkpoint is added after all I/Os have been written to disk.
4. Optionally simulate a disaster, for example by disconnecting the two sites.
5. Perform a test failover on the VPG, choosing the checkpoint you added in step Insert a new checkpoint. This avoids potential data loss since the virtual machines are shut down and the new checkpoint is added after all I/Os have been written to disk. on page 221.
6. Verify that the test machines are recovered as expected.
7. Run user traffic against the new virtual machine in Azure.
8. Stop the failover test.
9. Reconnect the sites.

Failover Test Considerations

- You do not have to shut down the protected virtual machines, and changes from the test phase are not kept or applied to the protected applications.
- You can recover to a specific point-in-time.
You can use an isolated network to enable testing in a sandbox environment and not a live DR environment. This is the recommended practice.

At the end of the test, you can power on the virtual machines in the protected site and continue to work without the need to save or replicate back any data changed during the test.

You can also use a Failover Test operation if you want to simulate an actual disaster for around an hour or less and do not want to save any changes on the recovery site.

Using an Uncommitted Move Operation

Use a Move operation with the commit/rollback policy set to rollback after the test period, if you need to test the recovery of virtual machines in the recovery site production environment.

Procedure

The Move operation is described in detail in The Move Process on page 223. The following procedure highlights specific steps to enable using the Move functionality for a DR test.

1. In the Move wizard, in the EXECUTION PARAMETERS tab, for commit policy, select None.

2. Either power off the relevant virtual machines or check the Force Shutdown checkbox, in the EXECUTION PARAMETERS tab, to make sure that the virtual machines are shut down, if they cannot be powered off using Microsoft Integration Services.

3. After testing the new virtual machines in the recovery site you can roll back the Move operation, which will return the virtual machines to their pre-test state.

Move Considerations

- Changes from the pre-commit phase are not kept or applied to the protected applications.
- The new virtual machines are connected to the network for a full test of the environment.
- The protected machines are turned off until the end of the test, ensuring that there are no conflicts between the protected site and recovery site.
- You can only recover to the last checkpoint written to the journal, at the start of the Move operation.
Migrating a VPG to Azure

This section describes a planned migration of a virtual protection group (VPG) to Azure. The following topics are described in this section:

- The Move Process on page 223
- Prerequisites Before Moving to Linux Virtual Machines in Azure on page 225
- Reverse Protection For a Moved VPG on page 230

The Move Process

Use the **Move** operation to move groups of protected virtual machines from a protected site to a recovery site in a planned migration.

A move differs from a failover in that with a move you cannot select a checkpoint to restore the virtual machine to. Also, to ensure data integrity, the protected virtual machines are powered off completely and a final checkpoint created so that there is no data loss before the move is implemented.

You can initiate the Move operation from either the protected site or recovery site.

When you perform a planned migration of virtual machines to a recovery site, Zerto assumes that both sites are healthy and that you plan to relocate the virtual machines in an orderly fashion without loss of data.

**Note:** To recover virtual machines on the recovery site during disaster recovery, see Managing Failover Live on page 242.

The Move operation has the following basic steps:

- **Shutting down the protected virtual machines gracefully.** This ensures data integrity.
  
  If the machines cannot be gracefully shut down, for example, when VMware Tools or Microsoft Integration Services is not available, you must manually shut down the machines before starting the Move operation or forcibly power off the virtual machines as part of the Move operation. If the machines cannot be gracefully shut down automatically and are not shut down manually and the Move operation does not forcibly power them off, the Move operation stops and Zerto rolls back the virtual machines to their original status.

- **Inserting a clean checkpoint.** This avoids potential data loss since the virtual machines are not on and the new checkpoint is created after all I/Os have been written to disk.

- **Transferring all the latest changes that are still in the queue to the recovery site, including the new checkpoint.**

- **Creating new virtual machines in the recovery site and attaching each new virtual machine to its relevant VHD disk, based on the last checkpoint.**
**Note:** The new virtual machines are created without CD-ROM or DVD drives, even if the protected virtual machines had CD-ROM or DVD drives. Also, as long as the virtual machines are created, the operation is considered successful, even if the virtual machines are not created with their complete definition, for example setting a private IP cannot be performed.

- Powering on the new virtual machines, making them available to the user. If applicable, the boot order defined in the VPG settings is used to power on the machines.
  
  If the new virtual machine does not power on, the process continues and the new virtual machine must be powered on manually.

- By default, automatically committing the Move operation without testing. However, you can also run basic tests on the new virtual machines to ensure their validity. Depending on the commit/rollback policy that you specified for the operation, the operation is committed, finalizing the move, or rolled back, aborting the operation.

- The default instance size for new virtual machines is **Standard D1 v2**. If Standard D1 v2 instance size does not meet your needs, you can change this value in the Policies tab of the Site Settings dialog. For more information, see Configuring Disaster Recovery Policies on page 205. You can also change the instance size of new virtual machines when you create or edit a VPG.

- When you create a virtual machine in Azure you are provided with a temporary volume automatically. This temporary storage is **D:** on a Windows virtual machine and it is **/dev/sdb1** on a Linux virtual machine.
  
  - Temporary volume size varies according to the instance size you have selected.
  
  - On Windows, the temporary volume will be using the next available drive letter.

  *For example:* If you have two volumes connected to the protected virtual machine, Azure will use C and D, and allocate E for the temporary volume drive.

**Notes:**

- If virtual machines or vCD vApp are already protected in several VPGs, and reverse protection is configured, the virtual machines or vCD vApp are deleted from the protected site. This will result in the removal of these virtual machines from other VPGs that are protecting them and to the journals of these VPGs to be reset. In the event of vCD vApp or if no other virtual machines are left to protect, the entire VPG will be removed.

  Protecting virtual machines in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

- If **Keep Source VMs** is selected, the protected virtual machines are not removed from the protected site.
Prerequisites Before Moving to Linux Virtual Machines in Azure

Before attempting to move certain Linux virtual machines, preparations to the virtual machine must be made for the migration to be successful.

The following table lists the name of the supported Linux distribution and the link to follow instructions for preparation:

<table>
<thead>
<tr>
<th>Linux Distribution</th>
<th>Link for Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>CentOS (6.3, 7.0)</td>
<td><a href="https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos">https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos</a></td>
</tr>
<tr>
<td>RHEL (6.9, 6.7, 7.4)</td>
<td><a href="https://docs.microsoft.com/en-us/azure/virtual-machines/linux/redhat-create-upload-vhd">https://docs.microsoft.com/en-us/azure/virtual-machines/linux/redhat-create-upload-vhd</a></td>
</tr>
</tbody>
</table>

! Important: dracut -f -v should be replaced with dracut -force -v

Moving Protected Virtual Machines to a Remote Site

You can move the virtual machines in a virtual protection group to Azure, where the virtual machines are replicated.

! Important: Due to an Azure limitation, failing over Linux VMs with static IP is not supported.

To initiate a Move:

1. In the Zerto User Interface select ACTIONS > MOVE VPG.
   The Move wizard is displayed.
2. Select the VPGs to move.

At the bottom, the selection details show the amount of data and the total number of virtual machines selected.

The Direction arrow shows the direction of the process: from the protected site to the peer, recovery, site.

3. Click NEXT. The PARAMETERS step is displayed.

You can change the following values to use for the recovery:

- **Commit Policy**
- **Force Shutdown** policy
• **Reverse Protection** settings. For more information see [Reverse Protection For a Moved VPG on page 230](#).

• **Keep Source VMs**: Prevents removal of the protected virtual machines at the protected site.

**Note:** If reverse protection is specified, the **Keep Source VMs** option is grayed out because the virtual disks of the VMs are used for replication and cannot have VMs attached. If **Keep Source VMs** is selected before reverse protection is specified, the **Keep Source VMs** selection is canceled.

4. To change the commit policy, click the field or select the VPG and click **EDIT SELECTED**.
   
a. Select **None** if you do **not** want an automatic commit or rollback. You must manually commit or roll back.

   If some VMs in a VPG fail to recover properly and Auto-Commit was selected for the operation, the commit policy will change to None. You must manually commit or rollback.

b. To test **before** committing or rolling back, specify an **amount of time** to test the recovered machines, in minutes.

   This is the amount of time that the commit or rollback operation is delayed, before the automatic commit or rollback action is performed.

   During this time period, check that the new virtual machines are OK and then commit the operation or roll it back.

   The **maximum** amount of time you can delay the commit or rollback operation is **1440 minutes**, which is **24 hours**.

   Testing that involves I/O is done on **scratch volumes**.

   • The more I/Os generated, the more scratch volumes are used, until the maximum size is reached, at which point no more testing can be done.

   • The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed.

   • The scratch volumes reside on the storage defined for the journal.

5. To specify reverse protection, whereby the virtual machines in the VPG are failed over to the recovery site and then protected in the recovery site, back to the original site, either:

   • Click **REVERSE PROTECT ALL**. This activates reverse protection on all the VPGs that you plan to Failback. The system default values for this procedure will be assigned to all the VPGs.

   - or -

   • Click the **Reverse Protection** field.

   If you want to configure the VPG for reverse protection, click the **REVERSE** link.

   The **Edit Reverse VPG** wizard is displayed and you can edit the reverse protection configuration. The parameters are the same as described when you create a VPG, with the following differences:

   • You cannot add or remove virtual machines from the reverse protected VPG.
By default, reverse protection is to the original protected disks. You can specify a different storage to be used for the reverse protection.

When replicating a VPG from Azure, re-IP is always enabled. If VMware Tools or Microsoft Integration Services are available for vSphere or Hyper-V respectively, for each virtual machine in the VPG, the IP address of the originally protected virtual machine is used. Thus, during failback the original IP address of the virtual machine on the site where the machine was originally protected is reused. However, if the machine does not contain the utility, DHCP is used. The host version must be 4.1 or higher for re-IP to be enabled.

When committing the Failback, you can reconfigure reverse protection, regardless of the reverse protection settings specified here. For more information see Reverse Protection For a Moved VPG on page 230.

6. Click **NEXT**.

   - A warning appears informing the user that the **virtual machines or vCD vApp** will be **removed** from the **other VPGs** that are protecting them.
   - If your VPG has a vCD vApp, or if there are no other virtual machines left to protect, the **entire VPG will be removed**.

7. Click **OK**.

The **MOVE** step is displayed. The topology shows the VPGs and the virtual machines that are about to be moved from the on-premise site to Azure.

8. Click **START MOVE** to start the Move.

   A warning message appears, presenting a summary of your Commit Policy.

9. Review the Commit Policy summary, and either click **Change Settings**, or click **START MOVE** to start the move.

10. If a commit policy was set with a timeout greater than zero, as described in step To change the commit policy, click the field or select the VPG and click EDIT SELECTED. on page 227, you can check the new virtual machines on Azure before they are removed from the protected site.
Note: If a virtual machines exists on the recovery site with the same name as a virtual machine being migrated, the machine is moved and a number is added as a suffix to the name, starting with the number 1.

The status icon changes to orange and an alert is issued, to warn you that the procedure is waiting for either a commit or rollback.

All testing done during this period, before committing or rolling back the Move operation, is written to a copy of the recovery disks created during the Move operation.

Note: You cannot take a snapshot of a virtual machine before the Move operation is committed and the data from the journal promoted to recovery disks, since the virtual machine disks are still managed by the VRA and not directly by the virtual machine. Taking a snapshot of a machine that is in the process of being moved will corrupt that machine.

11. After checking the virtual machines on the recovery site, choose one of the following:

- Wait for the specified Commit Policy time to elapse, and the specified operation, either Commit or Rollback, is performed automatically.
- Click the Commit or Rollback icon (✓ ✓) in the specific VPG tab.
  - Click Commit to confirm the commit.
  - Click Rollback to roll back the operation, removing the virtual machines that were created on the recovery site. If the source VM was powered off, it will power back on when the VPG rolls back. If the source VM is powered on, it will remain as powered on after the rollback. The Rollback dialog is displayed to confirm the rollback.
You can also commit or roll back the operation via the **TASKS** popup dialog in the status bar, or by selecting **MONITORING > TASKS**.

After the new virtual machines are up and running and committed in the recovery site, the powered off virtual machines in the protected site are removed from the protected site. Finally, data is copied from the journal to the recovery disks copies, attached to the new virtual machines in Azure.

- The default instance size for new virtual machines is **Standard_DS1_v2**. If **Standard_DS1_v2** instance size does not meet your needs, you can change this value in the **Policies** tab of the **Site Settings** dialog. For more information, see Configuring Disaster Recovery Policies on page 205. You can also change the instance size of new virtual machines when you create or edit a VPG.

**Note:** If the new virtual machines do not power on, the process continues and the new virtual machines must be manually powered on.

**Note:** By default, every Azure virtual machine is created with an additional temporary volume. This temporary volume is a local SSD disk. The size of the SSD disk depends on the instance size of the virtual machine.

**Note:** If you did not define a private IP for a virtual machine in the VPG definition, during recovery Azure sets the private IP from the defined subnet range.

### Reverse Protection For a Moved VPG

When moving the virtual machines in a VPG you specify whether you want reverse protection from the recovery site back to the original protected site.
Reverse Protection Specified

When you specify reverse protection, the virtual machines are moved to the recovery site and then protected using the values specified during the move. Data is promoted from the journal to the moved virtual machines and then synchronization with the original site is performed so that the VPG is fully protected. When reverse protection is specified, a Delta Sync is performed. A sync is required since the recovered machines can be updated while data is being promoted.

Reverse Protection for VMs protected in multiple VPGs (One-to-Many)

Zerto enables you to protect virtual machines in a maximum of three VPGs. These VPGs cannot be recovered to the same site.

If Reverse Protection is selected, and the virtual machines are already protected in other VPGs, the following occurs:

- The vCD vApp are deleted from the protected site.
- The replication of other VPGs containing these machines is paused.
- The recovery of all the virtual machines, including the virtual machine removed from the protected site, is possible.

To resume replication do the following:

1. Open the Edit VPG wizard.
2. Select the virtual machine that was previously removed from the protected site.
3. Remove the virtual machine from the VPG.

If the protected VPG contains a vCD vApp, and the vCD vApp is protected in other VPGs, Reverse Protection is selected, the following occurs:

- The vCD vApp is deleted from the protected site.
- The checkpoints of the VPG are retained.
- The deleted vCD vApp can no longer be recovered.

In the event of vCD vApp or if no other virtual machines are left to protect, the entire VPG will be removed.

VPGs enter a state of pause, and paused replication if the following conditions apply:

- The ZVM on the protected and recovery sites are of version 5.5 and higher.
- The VRA installed on the recovery site is of version 5.5 and higher.

Protecting virtual machines or a vCD vApp in several VPGs is enabled if:

- The protected site and the recovery site are of version 5.0 and higher
- The VRAs installed on these sites are of version 5.0 and higher.
Reverse Protection Not Specified

If you do not specify reverse protection, the protected disks are removed along with the protected virtual machines at the end of the procedure. In this case, if you want to move the virtual machines back again to the original site, you will not be able to use the original disks and an Initial Sync will have to be performed. The VPG definition is kept with the status Needs Configuration and the reverse settings in the VPG definition are not set.

Clicking EDIT VPG displays the Edit VPG wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the volumes, since the last step of the Move operation is to delete the virtual machines from the original protected site inventory, including the disks. To start replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click DONE. An initial synchronization is performed.

Notes:

- If Keep Source VMs is not selected, and virtual machines or vCD vApp are already protected in several VPGs, the virtual machines or vCD vApp are deleted from the protected site. This will result in the removal of these virtual machines from other VPGs that are protecting them and to the journals of these VPGs to be reset. In the event of vCD vApp or if no other virtual machines are left to protect, the entire VPG will be removed.

  Protecting virtual machines or vCD vApps in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

- You can edit the VPG definition from either of the sites, the site where the VPG virtual machines were initially protected or the site they were moved to.

Reverse Protection Specified

When you specify reverse protection, the virtual machines are moved to the recovery site and then protected using the values specified during the move. Data is promoted from the journal to the moved virtual machines and then synchronization with the original site is performed so that the VPG is fully protected. When reverse protection is specified, a Delta Sync is performed. A sync is required since the recovered machines can be updated while data is being promoted.

Reverse Protection Not Specified

If you do not specify reverse protection, the protected disks are removed along with the protected virtual machines at the end of the procedure. In this case, if you want to move the virtual machines back again to the original site, you will not be able to use the original disks and an Initial Sync will have to be performed. The VPG definition is kept with the status Needs Configuration and the reverse settings in the VPG definition are not set.
Clicking EDIT VPG displays the Edit VPG wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the volumes, since the last step of the Move operation is to delete the virtual machines from the original protected site inventory, including the disks. To start replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click DONE. An initial synchronization is performed.

**Notes:**

- If Keep Source VMs is not selected, and virtual machines or vCD vApp are already protected in several VPGs, the virtual machines or vCD vApp are deleted from the protected site. This will result in the removal of these virtual machines from other VPGs that are protecting them and to the journals of these VPGs to be reset. In the event of vCD vApp or if no other virtual machines are left to protect, the entire VPG will be removed.

Protecting virtual machines or vCD vApps in several VPGs is enabled only if both the protected site and the recovery site, as well as the VRAs installed on these sites, are of version 5.0 and higher.

- You can edit the VPG definition from either of the sites, the site where the VPG virtual machines were initially protected or the site they were moved to.
Migrating a VPG From Public Cloud

This section describes a planned migration of a VPG comprised of VMs that are either created in or moved from Public Cloud, to a recovery site. You can migrate the VPG to the following platforms:

- VMware vSphere
- Microsoft Hyper-V
- Microsoft Azure
- Amazon Web Services (AWS)
- Within Microsoft Azure

The disks all have to exist in the Zerto Storage Account.

The following topics are described in this section:

- The Move Process on page 234
- Moving Protected Virtual Machines From Public Cloud to a Remote Site on page 235
- Reverse Protection For a Moved VPG on page 240

The Move Process

The Migration process uses the MOVE wizard to move groups of protected virtual machines from Public Cloud to a recovery site in a planned migration. You can initiate the MOVE operation from either the Public Cloud site or the recovery site.

The MOVE process differs from a FAILOVER in the following ways:

- You cannot select a checkpoint to restore the virtual machine to.
- To ensure data integrity during a MOVE, the protected virtual machines are powered off completely and a final checkpoint is created so that there is no data loss before the move is implemented.

When you perform a planned migration of virtual machines to a recovery site, Zerto assumes that both sites are healthy and that you plan to relocate the virtual machines in an orderly fashion without loss of data. By setting a commit policy that enables checking the recovered machines before committing the migration, you can check the integrity of the recovered machines. If the machines are in the expected state and functioning correctly, you can commit to the migration.

The migration process has the following basic steps:

- Shutting down the protected virtual machines gracefully. This ensures data integrity.
- Inserting a clean checkpoint. This avoids potential data loss since the virtual machines are not on and the new checkpoint is created after all I/Os have been written to the disk.
- Transferring all the latest changes that are still in the queue to the recovery site, including the new checkpoint.
• Creating the virtual machines at the remote site in the production network and attaching each virtual machine to its relevant virtual disks, configured to the checkpoint specified for the migration. As long as the virtual machines are created, the operation is considered successful, even if the virtual machines are not created with their complete definition, for example if re-IP cannot be performed.

• Powering on the virtual machines making them available to the user. If applicable, the boot order defined in the VPG settings is used to power on the machines.

**Note:** If the virtual machines do not power on, the process continues and the virtual machines must be manually powered on. The virtual machines cannot be powered on automatically in a number of situations, such as when there are not enough resources in the resource pool or the required MAC address is part of a reserved range or there is a MAC address conflict or IP conflict, for example, if a clone was previously created with the MAC or IP address.

• Committing the Move operation. The default is to automatically commit the migration without testing. However, you can also run basic tests on the machines to ensure their validity to the specified checkpoint. Depending on the commit/rollback policy that you specified for the operation, after testing either the operation is committed, finalizing the Move, or rolled back, aborting the operation.

• If **Keep Source VMs** is not selected, the protected virtual machines are removed from Public Cloud.

**Note:** If Keep Source VMs is not selected, and the virtual machines, or vCD vApps are also protected in other VPGs. continuing with the operation will cause the virtual machines or vCD vApp to be deleted from other VPGs that are protecting them and to the journals of these VPGs to be reset. In the event of vCD vApp or if no other virtual machines are left to protect, the entire VPG will be removed.

Moving Protected Virtual Machines From Public Cloud to a Remote Site

You can move the virtual machines in a virtual protection group from Public Cloud to a remote site, where the virtual machines are replicated. As part of the process, you can also set up reverse protection, where you create a VPG on the remote site for the virtual machines being moved, pointing back to the original site. This is commonly use, for example, when the protected site has planned downtime.

Limitations/ Considerations:

• Reverse Protection with One-to-Many is not supported.

• Setting reverse protection when migrating from Azure will initiate an initial sync.

**To initiate a migration:**

1. In the Zerto User Interface select **ACTIONS > MOVE VPG**.

   The **Move** wizard is displayed.
2. Select the VPGs to move. By default, all VPGs are listed.

At the bottom, the selection details show the amount of data and the total number of virtual machines selected.

The Direction arrow shows the direction of the process: From the protected site To the peer, recovery, site.

3. Click NEXT.

The EXECUTION PARAMETERS step is displayed.

You can change the following values to use for the recovery:

- **Commit Policy**

- **VM Shutdown**: Select Yes / No. Selecting YES places the VMs in a Stopped (Deallocated) state.

- **Reverse Protection** settings. For more information see Reverse Protection For a Moved VPG on page 240.
• **Keep Source VMs:** Prevents removal of the protected virtual machines at the Public Cloud site.

**Note:** If reverse protection is specified, the **Keep Source VMs** option is grayed out.

4. To change the **Commit Policy**, click the field or select the VPG and click **EDIT SELECTED**.
   
a. Select **None** if you do not want an automatic commit or rollback. You must manually commit or roll back.

   If some VMs in a VPG fail to recover properly and Auto-Commit was selected for the operation, the commit policy will change to None. You must manually commit or rollback.

b. To test before committing or rolling back, specify an **amount of time** to test the recovered machines, in minutes.

   This is the amount of time that the commit or rollback operation is **delayed**, before the automatic commit or rollback action is performed.

   During this time period, check that the new virtual machines are OK and then commit the operation or roll it back.

   The **maximum** amount of time you can **delay** the commit or rollback operation is **1440 minutes**, which is **24 hours**.

Testing that involves I/O is done on **scratch volumes**.

- The more I/Os generated, the more scratch volumes are used, until the maximum size is reached, at which point no more testing can be done.

- The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed.

- The scratch volumes reside on the storage defined for the journal.

5. To specify reverse protection, whereby the virtual machines in the VPG are failed over to the recovery site and then protected in the recovery site, back to the original site, either:

   - Click **REVERSE PROTECT ALL**. This activates reverse protection on all the VPGs that you plan to Failback. The system default values for this procedure will be assigned to all the VPGs.

   - **or**-

   - Click the **Reverse Protection** field.

   If you want to configure the VPG for reverse protection, click the **REVERSE** link.

   The **Edit Reverse VPG** window is displayed and you can edit the reverse protection configuration. The parameters are the same as described when you create a VPG, with the following differences:

   - You cannot add or remove virtual machines in the reverse protected VPG.

   - *(Azure environments)* By default, reverse protection is to the original protected disks. You can specify a different storage to be used for the reverse protection.
• If VMware Tools or Microsoft Integration Services are available for vSphere or Hyper-V respectively, for each virtual machine in the VPG, the IP address of the originally protected virtual machine is used. Thus, during failback the original IP address of the virtual machine on the site where the machine was originally protected is reused. However, if the machine does not contain the utility, DHCP is used. The host version must be 4.1 or higher for re-IP to be enabled.

• When committing the migration, you can reconfigure reverse protection, regardless of the reverse protection settings specified here. For more information see Reverse Protection For a Moved VPG on page 240.

! Important:
Setting reverse protection when migrating from Azure will initiate an initial sync.

6. Click NEXT.

The MOVE step is displayed. The topology shows the VPGs and the virtual machines that are about to be moved from Public Cloud to the recovery site.

7. Click START MOVE to start the Move.

8. If a commit policy was set with a timeout greater than zero, as described in step To change the Commit Policy, click the field or select the VPG and click EDIT SELECTED. on page 237, you can check the moved virtual machines on the recovery site before they are removed from the protected site.

Note: If a virtual machine exists on the recovery site with the same name as a virtual machine being migrated, the machine is moved and named in the peer site with a number added as a suffix to the name, starting with the number 1

The status icon changes to orange and an alert is issued, to warn you that the procedure is waiting
for either a commit or rollback.

All testing done during this period, before committing or rolling back the Move operation, is written to thin-provisioned virtual disks, one per virtual machine in the VPG. These virtual disks are automatically defined when the machines are created on the recovery site for testing. The longer the test period the more scratch volumes are used, until the maximum size is reached, at which point no more testing can be done. The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed. The scratch volumes reside on the storage defined for the journal. Using these scratch volumes makes committing or rolling back the Move operation more efficient.

9. Check the virtual machines on the recovery site, then either:
   - Wait for the specified Commit Policy time to elapse, and the specified operation, either Commit or Rollback, is performed automatically.
   - Or, in the specific VPG tab, click the Commit or Rollback icon (Commit).  
     - Click Commit to confirm the commit and, if necessary set, or reset, the reverse protection configuration. If the protected site is still up and you can set up reverse protection, you can reconfigure reverse protection by checking the Reverse Protection checkbox and then click the Reverse link. Configuring reverse protection here overwrites any of settings defined when initially configuring the move.
     - Click Rollback to roll back the operation, removing the virtual machines that were created on the recovery site and rebooting the machines on the protected site. The Rollback dialog is displayed to confirm the rollback.
   - You can also commit or roll back the operation in the TASKS popup dialog in the status bar or under MONITORING > TASKS.

After the virtual machines are up and running and committed in the recovery site, the powered off virtual machines in the protected site are removed from Public Cloud. Finally, data is promoted from the journal to the moved virtual machines.
During promotion of data, you cannot move a host on the moved virtual machines. If the host is rebooted during promotion, make sure that the VRA on the host is running and communicating with the Zerto Virtual Manager before starting up the recovered virtual machines.

**Note:** If the virtual machines do not power on, the process continues and the virtual machines must be manually powered on. The virtual machines cannot be powered on automatically in a number of situations, such as when there are not enough resources in the resource pool or the required MAC address is part of a reserved range or there is a MAC address conflict or IP conflict, for example, if a clone was previously created with the MAC or IP address.

### Reverse Protection For a Moved VPG

When you specify reverse protection, the virtual machines are failed over to Public Cloud and then protected using the values specified during the move. Data is promoted from the journal to the failed over virtual machines and then synchronization with the original site is performed so that the VPG is fully protected.

When you specify **Reverse Protection**, the following occurs:

- The virtual machines are recovered on the recovery site and then protected using the values specified during the Move.
- The original virtual machines are removed from the original protected site.
- On the target site the data is promoted from the journal to the recovered virtual machines.
- The recovery site, which is now the protected site, is synchronized with the original protected site so that the VPG is fully protected.
- Reverse protection from Azure results in an Initial sync.

**Notes:**

- When Reverse Protection is specified for a VPG residing on a vCD site that is replicating to either a vSphere or Hyper-V site, the boot order settings will not reserve the start delay vCD vApp settings for virtual machines with the same order number.
- If you do not specify Reverse Protection, the VPG definition is kept with the status Needs Configuration and the reverse settings in the VPG definition are not set.

- Clicking **EDIT VPG** displays the **Edit VPG** wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the
volumes. To start replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click DONE.
Managing Failover Live

This section describes how to perform a failover live to Microsoft Azure after an unforeseen disaster. The following topics are described in this section:

• The Failover Live Process on page 242
• Initiating a Failover Live on page 245
• Reverse Protection for a Failed Over VPG on page 251
• What Happens When the Protected Site is Down on page 252
• Initiating a Live Failover During a Test on page 252

Note: If you need to perform a failover while a retention process is running, first abort the retention process to enable the failover to run.

The Failover Live Process

Use the Failover operation following a disaster to recover protected virtual machines to the recovery site.

Note: You can also move virtual machines from the protected site to the recovery site in a planned migration. For details, see Migrating a VPG to Azure on page 223.

When you set up a failover you always specify a checkpoint to which you want to recover the virtual machines. When you select a checkpoint - either the last auto-generated checkpoint, an earlier checkpoint, or a tagged checkpoint - Zerto makes sure that the new virtual machines on Azure are recovered to this specified point-in-time. By setting a commit policy that enables checking the recovered machines before committing the failover, you can check the integrity of the recovered machines. If the machines are OK, you can commit the failover. Otherwise, you can roll back the operation and then repeat the procedure using a different checkpoint.

The Failover operation has the following basic steps:

• If the protected site or Zerto Virtual Manager is down, the process continues with the next step.
  
  If the protected site or Zerto Virtual Manager is still running, the failover requirements are determined:
  
  • If the default is requested, doing nothing to the protected virtual machines, the Failover operation continues with the next step.
  
  • If shutting down the protected virtual machines is requested and the protected virtual machines do not have a utility such as VMware Tools or Microsoft Integration Services available, the Failover operation fails.
  
  • If forcibly shutting down the protected virtual machines is requested, the protected virtual machines are shut down and the Failover operation continues with the next step.
• Creating the new virtual machines on Azure in the production network and attaching each virtual machine to its relevant VHD disk, configured to the checkpoint specified for the recovery. The new virtual machines are created without CD-ROM or DVD drives, even if the protected virtual machines had CD-ROM or DVD drives. Also, as long as the virtual machines are created, the operation is considered successful, even if the virtual machines are not created with their complete definition, for example setting a private IP cannot be performed.

The protected virtual machines are created as new instances in Managed Disks. The default value for new virtual machines with Zerto is **Standard_DS1_v2**. If Standard_DS1_v2 instances do not meet your needs, you can change this value in the Policies tab of the Site Settings dialog, see Configuring Disaster Recovery Policies on page 205. You can also change the instance size of new virtual machines when you create or edit a VPG.

**Note:** The original protected virtual machines are not touched since the assumption is that the original protected site is down.

• Powering on the new virtual machines, making them available to the user. If applicable, the boot order defined in the VPG settings is used to power on the machines.

If the virtual machines do not power on, the process continues and the virtual machines must be manually powered on.

• The default is to automatically commit the Failover operation without testing. However, you can also run basic tests on the machines to ensure their validity to the specified checkpoint. Depending on the commit/rollback policy that you specified for the operation after testing either the operation is committed, finalizing the failover, or rolled back, aborting the operation.

• If the protected site is still available, for example, after a partial disaster, the original protected site virtual machines are not powered off and are not removed.

• When you create a virtual machine in Azure you are provided with a temporary volume automatically. This temporary storage is **D:** on a Windows virtual machine and it is **/dev/sdb1** on a Linux virtual machine.
  • Temporary volume size varies according to the instance size you have selected.
  • On Windows, the temporary volume will be using the next available drive letter.

  For example: If you have two volumes connected to the protected virtual machine, Azure will use C and D, and allocate E for the temporary volume drive.

• If the D:/ drive is occupied by the **temporary Azure disk**, recovered virtual machines in Azure require re-mapping the volumes drive letters. See [https://docs.microsoft.com/en-us/azure/virtual-machines/windows-classic-change-drive-letter](https://docs.microsoft.com/en-us/azure/virtual-machines/windows-classic-change-drive-letter)

See also:

• VPGs Recovering to Azure Managed Disks on page 244
• Prerequisites Before Failing Over to Linux Virtual Machines in Azure on page 244
• Reverse Protection with One-to-Many, on page 206
VPGs Recovering to Azure Managed Disks

When recovering VPGs to Azure, the VMs are recovered to Azure Managed Disks. Based on the VPG configuration, VM disks can be recovered to Managed Premium SSD, Managed Standard SSD, or Managed Standard HDD.

Prerequisites Before Failing Over to Linux Virtual Machines in Azure

Before attempting to failover certain Linux virtual machines, preparations to the virtual machine need to be made for the failover to be successful.

The following table lists the name of the supported Linux distribution and the link to follow instructions for preparation:

<table>
<thead>
<tr>
<th>Linux Distribution</th>
<th>Link for Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>CentOS (6.3, 7.0)</td>
<td><a href="https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos">https://docs.microsoft.com/en-us/azure/virtual-machines/linux/create-upload-centos</a></td>
</tr>
<tr>
<td>RHEL (6.9, 6.7, 7.4)</td>
<td><a href="https://docs.microsoft.com/en-us/azure/virtual-machines/linux/redhat-create-upload-vhd">https://docs.microsoft.com/en-us/azure/virtual-machines/linux/redhat-create-upload-vhd</a></td>
</tr>
</tbody>
</table>

**Important:** `dracut -f -v` should be replaced with `dracut -force -v`

**Important:** Make sure you do not perform the following step from the above Microsoft guidelines:

`waagent -force -deprovision`

This command will attempt to clean the system and make it suitable for reprovisioning.

**Important:**

Due to an Azure limitation, failing over Linux VMs with static IP is not supported.
Initiating a Failover Live

You can initiate a failover, whereby the virtual machines in the virtual protection group (VPG) or specific virtual machines in a virtual protection group (VPG) are replicated to a set checkpoint in Azure.

You can initiate a failover to the last checkpoint recorded in the journal, even if the protected site is no longer up. You can initiate a failover during a test, as described in Initiating a Live Failover During a Test on page 252, on page 207.

If you have time to initiate the failover from the protected site you can. However, if the protected site is down, you initiate the failover from Azure. You cannot select specific VMs in a VPG for failover if the protected site is down.

**Note:** Any VPGs that are in the process of being synchronized, cannot be recovered, unless the synchronization is a bitmap synchronization.

**To initiate a failover live:**

1. In the Zerto User Interface set the operation to **LIVE** and click **FAILOVER**.
   
   The **Failover** wizard is displayed.

2. Select the VPGs to failover. By default, all VPGs are listed.

   a. To select specific VMs in a VPG, click the icon next to each VPG to get a list of VMs. The Select VMs to Failover dialog is displayed. By default, all VMs are selected.
b. Select the VMs to failover.

**Note:** Selecting specific VMs in a VPG to failover is not supported when replicating from a vCD site.

At the bottom, the selection details show the amount of data and the total number of virtual machines selected.

The Direction arrow shows the direction of the process: From the protected site To the peer, recovery, site.

3. Click NEXT. If specific VMs are selected for failover, a warning will appear informing the user to review the Pre-recovery and Post-recovery Scripts.

The EXECUTION PARAMETERS step is displayed.

You can change the following values to use for the recovery:
• Commit Policy

• Force Shutdown policy

• Reverse Protection settings. For more information see Reverse Protection for a Failed Over VPG on page 251.

You can also see if Scripts are defined for the VPG.

4. By default, the last checkpoint added to the journal is displayed. If you want to use this checkpoint, go to the next step. If you want to change the checkpoint, click the checkpoint.

The {VPG-Name}: Checkpoints window is displayed.

5. Select the checkpoint to use. Click the refresh button to refresh the list. You can choose from one of the following checkpoints:

6. Click OK. If the selected VMs were not protected when the selected checkpoint was taken, a warning will appear informing the user that these VMs cannot be recovered. If all selected VMs cannot be recovered, an error will appear.

7. To change the commit policy, click on the field or select the VPG and click EDIT SELECTED.

   c. Select None if you do not want an automatic commit or rollback. You must manually commit or roll back.

      If some VMs in a VPG fail to recover properly and Auto-Commit was selected for the operation, the commit policy will change to None. You must manually commit or rollback.

   d. To test before committing or rolling back, specify an amount of time to test the recovered machines, in minutes.

      This is the amount of time that the commit or rollback operation is delayed, before the automatic commit or rollback action is performed.

      During this time period, check that the new virtual machines are OK and then commit the operation or roll it back.
The **maximum** amount of time you can **delay** the commit or rollback operation is **1440 minutes**, which is **24 hours**.

8. **To specify the shutdown policy**, double-click the **VM Shutdown** field and select the shutdown policy:

   - **No**: (default) The protected virtual machines are not touched before starting the failover. This assumes that you do not know the state of the protected machines, or you know that they are not serviceable.

   - **Yes**: If the protected virtual machines have a utility such as VMware Tools or Microsoft Integration Services available, the virtual machines are gracefully shut down, otherwise the Failover operation fails. This is similar to performing a Move operation to a specified checkpoint.

   - **Force Shutdown**: The protected virtual machines are forcibly shut down before starting the failover. This is similar to performing a Move operation to a specified checkpoint. If the protected virtual machines have VMware Tools or Microsoft Integration Services available, the procedure waits five minutes for the virtual machines to be gracefully shut down before forcibly powering them off.

9. **Click NEXT**.

10. Click **OK**. If a virtual machine is deleted from other VPGs, the journals of these VPGs are reset.

    The **FAILOVER** step is displayed. The topology shows the number of VPGs and virtual machines being failed over to each recovery site. In the following example, 2 VPGs will be failed over to Site6-Ent2-R2, and they contain 5 virtual machines; and 1 VPG will be failed over to Site5-Ent2-P2-R2 and it contains 2 virtual machines. **NEED TOPOLOGY FOR FAILOVER TO AZURE**

![FAILOVER Step Example](image)

11. Click **START FAILOVER** to start the failover.

    A warning message appears, presenting a summary of your Commit Policy.

12. Review the Commit Policy summary, and either click **Change Settings**, or click **START FAILOVER** to start the failover.
**Note:** If any of the VPGs have at least one VM configured with a static IP, but the static IP is in use on the recovery site, a warning message appears enabling you to choose whether to continue with a dynamic IP, or to cancel the failover process.

If a commit policy was set with a timeout greater than zero, you can check the new virtual machines at the recovery site before committing the failover operation.

The failover starts by creating the new virtual machines on Azure to the point-in-time specified: either the last data transferred from the protected site or to one of the checkpoints written in the journal.

**Note:** If a virtual machine exists on Azure with the same name as a virtual machine being failed over, the machine is created and named in the peer site with a number added as a suffix to the name, starting with the number 1.

The status icon changes to orange and an alert is issued, to warn you that the procedure is waiting for either a commit or rollback.

All testing done during this period, before committing or rolling back the failover operation, is written to VHD disks. These virtual disks are automatically defined when the virtual machines are created on Azure for testing.

**Note:** You cannot take a snapshot of a virtual machine before the failover operation is committed and the data from the journal promoted to the moved virtual machine disks, since the virtual machine volumes are still managed by the VRA and not directly by the virtual machine. Using a snapshot of a recovered machine before the
failover operation has completed will result in a corrupted virtual machine being created.

13. After checking the virtual machines in Azure, choose one of the following:

- Wait for the specified Commit Policy time to elapse, and the specified operation, either Commit or Rollback, is performed automatically.

- Click the Commit or Rollback icon (✓) in the specific VPG tab.

  Click Commit. The Commit dialog is displayed to confirm the commit. When committing failover, if specific VMs in a VPG are selected, a new VPG will be created in addition to the original VPG. The additional VPG includes only the VMs selected for recovery. The new VPG name is displayed as (Original-VPG-Name-Partial). The original VPG will remain intact with its history.

  Click Rollback to roll back the operation, removing the virtual machines that were created on the recovery site and rebooting the machines on the protected site. The Rollback dialog is displayed to confirm the rollback.

  You can also commit or roll back the operation via the TASKS popup dialog in the status bar, or by selecting MONITORING > TASKS.

The default instance size for new virtual machines is Standard_DS1_v2. If Standard_DS1_v2 instance size does not meet your needs, you can change this value in the Policies tab of the Site Settings dialog. For more information, see Configuring Disaster Recovery Policies on page 205. You can also change the instance size of new virtual machines when you create or edit a VPG.

**Note:** By default, every Azure virtual machine is created with additional temporary volume. This volume is in addition to the volumes associated with each protected virtual machine.

If you did not define a private IP for a virtual machine in the VPG definition, during recovery Azure sets the private IP from the defined subnet range.

**Note:** If the new virtual machines do not power on, the process continues and the virtual machines must be manually powered on.

- If you do not specify Reverse Protection, the VPG definition is kept with the status Needs Configuration and the reverse settings in the VPG definition are not set.

- Clicking EDIT VPG displays the Edit VPG wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the volumes. To start
replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click **DONE**.

- VPGs that are recovered to Azure Premium storage go into Recovered state and cannot be protected. US12211

## Reverse Protection for a Failed Over VPG

When you specify reverse protection, the virtual machines are failed over to Azure and then protected using the values specified during the failover. Data is promoted from the journal to the failed over virtual machines and then synchronization with the original site is performed so that the VPG is fully protected. When reverse protection is specified, a **Delta Sync** is performed. A sync is required since the recovered machines can be updated while data is being promoted.

When you specify **Reverse Protection**, the following occurs:

- The virtual machines are recovered on the recovery site and then protected using the values specified during the failover.
- The original virtual machines are removed from the original protected site.
- On the target site the data is promoted from the journal to the recovered virtual machines.
- The recovery site, which is now the protected site, is synchronized with the original protected site so that the VPG is fully protected.

The synchronization used is either a **Delta Sync** or if there is only one volume to synchronize, a **Volume Delta Sync** is performed. A sync is required since the recovered machines can be updated while data is being promoted.

**Notes:**

- For the Failover operation to complete successfully, when **Reverse Protection** is specified, the original protected site must have enough storage available to fail back the failed over virtual machines.
- When **Reverse Protection** is specified for a VPG residing on a vCD site that is replicating to either a vSphere or Hyper-V site, the boot order settings will not reserve the start delay vCD vApp settings for virtual machines with the same order number.
- If you do not specify **Reverse Protection**, the VPG definition is kept with the status **Needs Configuration** and the reverse settings in the VPG definition are not set.

Clicking **EDIT VPG** displays the **Edit VPG** wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the
volumes. To start replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click **DONE**.

### What Happens When the Protected Site is Down

If the protected site is down, you can initiate the failover from Azure, as described above in [To initiate a failover live: on page 245](#).

The tab for a specific VPG tab for a VPG shows that recovery is possible.

If the Zerto Virtual Manager service is down the actual machines that are being protected can still be up, but they are only recoverable to the last checkpoint written before the Zerto Virtual Manager service went down. If the hypervisor management tool, such as vCenter Server or Microsoft SCVMM, is down, some of the protected virtual machines might not be protected.

When there is no connection with the protected site, the status for recovered VPGs is red with an **Error** status and green while recovery is being performed. If the protected site restarts, the status changes to orange.

### Initiating a Live Failover During a Test

Replication continues during a test. If you need to initiate a failover during a test, you can initiate the failover. The test stops to enable the failover and then a normal failover is performed, as described in [The Failover Live Process on page 242](#). Any changes made to test the failover are not replicated, as only changes to the protected machines in the VPG are replicated.

**Note:** You cannot initiate a failover while a test is being initialized or closed.
Cloning a VPG to Azure

You can create a clone of each virtual machine in a VPG. The clone is a copy of the protected virtual machine, located on the recovery site, while the virtual machine on the protected site remains protected and live.

The following topics are described in this section:

• The Clone Process on page 253
• Cloning Protected Virtual Machines to the Remote Site on page 253

Note: You cannot clone virtual machines in a VPG test while a retention process is running.

The Clone Process

Use the Clone operation to create a copy of virtual machines on the recovery site. The virtual machines on the protected site remain protected and live.

The Clone operation has the following basic steps:

• Creating the cloned disks at the recovery site with the data from the journal to the specified checkpoint.
• Creating the virtual machines at the recovery site in the move/failover network and attaching each virtual machine to its relevant cloned disks, configured to the checkpoint specified for the clone.

Note: The virtual machines are created without CD-ROM or DVD drives, even if the protected virtual machines have CD-ROM or DVD drives.

The cloned machines are named with the names of the protected machines, with the timestamp of the checkpoint used to create the clone. The cloned virtual machines are not powered on and are not protected by Zerto.

• When you create a virtual machine in Azure you are provided with a temporary volume automatically. This temporary storage is D: on a Windows virtual machine and it is /dev/sdb1 on a Linux virtual machine.
  • Temporary volume size varies according to the instance size you have selected.
  • On Windows, the temporary volume will be using the next available drive letter.

  For example: If you have two volumes connected to the protected virtual machine, Azure will use C and D, and allocate E for the temporary volume drive.

Cloning Protected Virtual Machines to the Remote Site

You might want to create a clone if you need to have a copy of the virtual machines saved to a specific point-in-time, for example, when a VPG enters a Replication Paused state, or when testing a VPG in a live
DR test.

To clone a VPG:

1. In the Zerto User Interface, in the VPGs tab click on the name of the VPG to be cloned.
   
   A new tab is added to the Zerto User Interface, with the name of the VPG that you clicked. The tab displays data about the VPG.
   
   **Note:** If the VPG was previously viewed, and the tab for this VPG is still displayed, you can access the details by selecting the tab.

2. Click MORE > Offsite Clone.
   
   The {VPG-Name}: Offsite Clone dialog is displayed.

   ![Offsite Clone dialog](image)

   a. To clone specific VMs, click ADVANCED.
      
      The {VPG-Name}: Select VMs to Clone dialog is displayed. By default, all VMs are selected.
      
      ![Select VMs to Clone dialog](image)

   b. Select the VMs to clone.
      
      **Note:** Zerto 6.0 supports cloning specific VMs if installed on the protected site only.

3. If you intend to use the last checkpoint, which is displayed in the dialog, go to step Click CLONE. on page 255.
   
   To select the checkpoint, click SELECT A CHECKPOINT.
The {VPG-Name}: Checkpoints dialog is displayed.

![Checkpoints dialog](image)

When selecting the point to recover to:

- The refresh button is initially grayed out and is enabled for clicking after 5 seconds. It is also grayed out for 5 seconds after being clicked, before being re-enabled.

- A click the refresh button to view the latest checkpoints reminder is displayed 10 seconds after the refresh button is clicked to remind the user that there is a new Latest Checkpoint.

- If the user has scrolled to, and selected, a checkpoint anywhere in the checkpoints list, clicking the refresh button will automatically return the user to the selected checkpoint in the list.

4. Select the checkpoint to use. Click the refresh button to refresh the list. You can choose from one of the following checkpoints:

   **Latest**: The clone is to the latest checkpoint. This ensures that the data is crash-consistent for the clone. When selecting the latest checkpoint, the checkpoint used is the latest at this point. If a checkpoint is added between this point and starting the clone, the later checkpoint is not used.

   **Latest Tagged Checkpoint**: The recovery operation is to the latest checkpoint added by a user or when a failover test was previously performed on the VPG which includes the virtual machine or when the virtual machine was added to an existing VPG after the added virtual machine was synchronized. Checkpoints added to the virtual machine journals in the VPG ensure that the data is crash-consistent to this point. If a checkpoint is added between this point and starting the operation, this later checkpoint is not used.

5. To use a checkpoint which is not the latest checkpoint, or the latest tagged checkpoint, choose **Select from all available checkpoints**. By default, this option displays all checkpoints in the system. You can choose to display only automatic, or tagged checkpoints, or any combination of these types.

6. Click **OK**.

7. Click **CLONE**.

   The cloning starts and the status is displayed in the VPG details tab.
The cloned machines are named with names of the protected machines with the timestamp of the checkpoint used for the clone. The cloned virtual machines are not powered on.

Virtual machines with disks that are less than 1GB are recovered with disks of 1GB. Additional volumes might be created in the cloned virtual machine, depending on the virtual machines size used for the clone. These volumes can be ignored.
Recovering Files and Folders

You can recover specific files and folders from the recovery site for virtual machines that are being protected by Zerto. You can recover the files and folders from a specific point-in-time. Thus, you can recover files and folders for a virtual machine for as far back as the journal history is configured.

This section describes how to recover files and folders. The following topics are described in this section:

- The File and Folder Recovery Process on page 257
- Recovering Files and Folders on page 258

The File and Folder Recovery Process

Use the RESTORE FILE operation to recover specific files and folders from the recovery site.

When you set up file and folder recovery, you always specify a checkpoint to which you want to recover the files and folders. When you select a checkpoint—either the last automatically generated checkpoint, an earlier automatically generated checkpoint, or a tagged checkpoint—Zerto makes sure that the files and folders replicated at the remote site are recovered to this specified point-in-time.

The file and folder operation has the following basic steps:

1. Select the virtual machine that is protected, on which the files or folders to recover are located.
2. Select the checkpoint, at which the files and folders will be recovered.
3. Mount the selected virtual machine.
4. Select the files and folders on the virtual machine to recover.
5. Download the selected files and folders.
   - The files are downloaded to the machine where you run the Zerto User Interface.
   - Make sure that this machine has enough space for the recovered files.
6. Unmount the selected virtual machine.

Zerto does not support mounting the same virtual machine twice, for example if you want a file from two different checkpoints.

Considerations:

- You cannot recover files or folders from a virtual machine when a test failover, live failover, move, clone, or retention process is being performed on a VPG that contains the virtual machine.
- You cannot recover files or folders from the Zerto plugin.

For additional file and folder recovery considerations or known issues, see the Release Notes > Known Issues > File Level Restore.
Recovering Files and Folders

The procedure to recover files and folders involves the following steps:

1. **Mounting the Virtual Machine that Contains the Required Files and Folders on page 258**

   **Note:** While the virtual machine is mounted:
   - If you start a live failover or move, Zerto Virtual Manager forcibly unmounts the virtual machine so the live failover or move can be performed.
   - *(On-premise environments)* Scheduled retention processes do not start.
   - You can perform a test failover or clone.

2. **Downloading the Files and Folders from the Virtual Machine on page 260**

   **Note:** When downloading, you may see grayed out files. These grayed out files are not supported files, and therefore cannot be selected. For a list of unsupported files see Zerto Virtual Replication - Interoperability Matrix for All Versions.

### Mounting the Virtual Machine that Contains the Required Files and Folders

Before you can recover files or folders, you must first select the virtual machine and checkpoint in time from which you will recover the files or folders.

**To mount a virtual machine that includes files and folders to restore:**

1. From either the protected or recovery site, select **ACTIONS > RESTORE FILE**.

   The File and Folder Restore wizard is displayed.

   ![File and Folder Restore Wizard](image)

   The list of all protected virtual machines is displayed. You can only recover files or folders from one virtual machine at a time.
2. Select the virtual machine on which the file or folder is located and click **NEXT**.

The **CHECKPOINT** step is displayed. By default, all checkpoints are displayed.

3. Select the checkpoint from which to recover the file or folder.

   - **Auto**: Checkpoints generated by the Zerto Virtual Manager are displayed.
   - **Tagged**: Checkpoints that were added by a user, or were added by the Zerto Virtual Manager when a failover test was performed on the VPG that included the virtual machine, or when the virtual machine was added to an existing VPG after the virtual machine was synchronized.

4. Click **NEXT**.

The **MOUNT** step is displayed. The settings you selected are displayed.

5. Click **START MOUNT** to mount the virtual machine

   - When the first part of the restore process is done, icons appear next to the completed task.
     - By clicking the folder icon (Desktop) you can browse the folders and files on the virtual machine.
     - By clicking the unmount icon (Mount) you can unmount the virtual machine without restoring any files or folders.
6. Continue with *Downloading the Files and Folders from the Virtual Machine* on page 260.

**Downloading the Files and Folders from the Virtual Machine**

In this procedure you select the files and folders. The files are downloaded to the machine where you run the Zerto User Interface. Make sure that this machine has enough space for the recovered files.

➢ To download folders or files:

1. Click the folder icon (.Mailbox icon).

   ![Monitoring](image)

   The File and Folder Restore dialog is displayed showing the VM and the point in time selected.
2. Click **NEXT**.

The **FILE/FOLDER** step is displayed.

3. Select the files and folders you want to download.

**Note:**

- Grayed out files are not supported therefore cannot be selected. For a list of unsupported files, see the **Interoperability Matrix**. When hovering over a grayed out item, a message is displayed when there is an error parsing a supported file system. The error does not fail the entire mount task.

- When a selected folder contains unsupported files, only the supported files will successfully download. Meaning, only the supported files will appear in the download folder.

- For NTFS, Zerto will show the drive letter of the volume as it appears in Windows.

- For Linux and other scenarios where drive letter cannot be calculated, Zerto will present `{Volume #1-Filesystem type-label (if it exists)}.`
4. Click **NEXT**.

The **DOWNLOAD** step is displayed. It shows the files and folders you selected for downloading.

By default, when you select multiple files or one or more folders, the data is compressed before it is downloaded. If you select only one file, for download, you can choose whether or not the file is compressed.

5. Click **START DOWNLOAD**.

The files and folders are downloaded by default to the downloads folder on the computer where you run the Zerto User Interface.

When a selected folder contains unsupported files, only the supported files will successfully download. Meaning, only the supported files will appear in the download folder.

**Note:** Saving the files and folders to a network share is dependent on the browser used to display the Zerto User Interface and the settings for this browser.

- When you select one file to download, and do not compress the file, the name of the downloaded file is the name of the file. For example, if you download a file called `Important-file.docx`, the name of the file on your computer will be `Important-file.docx`.

- When you choose one file and choose to compress it, or you select multiple files, the files are zipped into a file called `ZertoDownloads.zip`.

6. Unmount the virtual machine after the files or folders are downloaded. To unmount the virtual machine, click the unmount icon (●).
Failing Back from Public Cloud

If you have moved, or failed over a VPG to Public Cloud, you can failback these VPGs to the following platforms:

- VMware vSphere
- Microsoft Hyper-V
- Microsoft Azure
- Amazon Web Services (AWS)
- Within Microsoft Azure

You can failback both Windows and Linux machines.

The following topics are described in this section:

- The Failback (Move) Process on page 263
- Initiating a Failback (Move) on page 264
- Reverse Protection For a Moved VPG on page 269

The Failback (Move) Process

The failback process uses the MOVE wizard, following a disaster, to recover failed over virtual machines from Public Cloud, back to the original site. You can initiate the MOVE operation from either the Public Cloud site or the recovery site.

The MOVE process differs from a FAILOVER in the following ways:

- You cannot select a checkpoint to restore the virtual machine to.
- To ensure data integrity during a MOVE, the protected virtual machines are powered off completely and a final checkpoint is created so that there is no data loss before the move is implemented.

When you perform a planned migration of virtual machines to a recovery site, Zerto assumes that both sites are healthy and that you plan to relocate the virtual machines in an orderly fashion without loss of data. By setting a commit policy that enables checking the recovered machines before committing the Failback (Move), you can check the integrity of the recovered machines. If the machines are in the expected state and functioning correctly, you can commit the MOVE.

The Failback (MOVE) process has the following basic steps:

- Creating the virtual machines at the remote site in the production network and attaching each virtual machine to its relevant virtual disks, configured to the checkpoint specified for the failback. As long as the virtual machines are created, the operation is considered successful, even if the virtual machines are not created with their complete definition, for example if re-IP cannot be performed.
- Powering on the virtual machines making them available to the user. If applicable, the boot order defined in the VPG settings is used to power on the machines.
**Note:** If the virtual machines do not power on, the process continues and the virtual machines must be manually powered on. The virtual machines cannot be powered on automatically in a number of situations, such as when there are not enough resources in the resource pool or the required MAC address is part of a reserved range or there is a MAC address conflict or IP conflict, for example, if a clone was previously created with the MAC or IP address.

- The default is to automatically commit the Failback (Move) operation without testing. However, you can also run basic tests on the machines to ensure their validity to the specified checkpoint. Depending on the commit/rollback policy that you specified for the operation, after testing either the operation is committed, finalizing the Failback (Move), or rolled back, aborting the operation.
- If **Keep Source VMs** is not selected, the protected virtual machines are removed.
- Based on the Instance Size and Type selected when creating a VPG from on-premise to upon failback from to on-premise, the virtual machine will inherit the CPU and Memory from the selected instance.

**Failback (Move) After the Original Site is Operational**

To Failback (Move) to the original protected site, the VPG that is now protecting the virtual machines at the recovery site have to be configured, if reverse protection was not selected, and then a **Delta Sync** is performed with the disks at the original protected site. Once the VPG is in a protecting state the virtual machines can be moved back to the original protected site, as described in "Migrating a VPG to a Recovery Site", on page 335.

**Initiating a Failback (Move)**

You can initiate a Failback (Move), whereby the virtual machines in the virtual protection group (VPG) are replicated to a set checkpoint in the recovery site. As part of the process you can also set up reverse protection, whereby you create a VPG on the recovery machine for the virtual machines being replicated.

You can initiate a Failback (Move) to the last checkpoint recorded in the journal, even if the protected site is no longer up. You can initiate a Failback (Move) during a test.

If the protected site is operational, the Failback (Move) can be initiated from the protected site, however if the protected site is down, you can initiate the Failback (Move) from the recovery site.

**Limitations/ Considerations:**

- Reverse Protection with One-to-Many is not supported.
- Setting reverse protection when migrating from Azure will initiate an initial sync.

**To initiate a Failback:**

1. In the Zerto User Interface select **ACTIONS > MOVE VPG**.
   
   The Move wizard is displayed.
2. Select the VPGs to failback. By default, all VPGs are listed.

At the bottom, the selection details show the amount of data and the total number of virtual machines selected.

The Direction arrow shows the direction of the process: From the protected site To the peer, recovery, site.

3. Click NEXT.

The EXECUTION PARAMETERS step is displayed.

You can change the following values to use for the recovery:

- **Commit Policy**
- **Force Shutdown**: Select Yes / No. Selecting YES places the VMs in a **Stopped (Deallocated)** state.
- **Reverse Protection** settings. For more information see Reverse Protection For a Moved VPG on page 269.
- **Keep Source VMs**: Prevents removal of the protected virtual machines at the site.
4. To change the **commit policy**, click the field or select the VPG and click **EDIT SELECTED**.
   a. Select **None** if you do **not** want an automatic commit or rollback. You must manually commit or roll back.

   If some VMs in a VPG fail to recover properly and Auto-Commit was selected for the operation, the commit policy will change to None. You must manually commit or rollback.

   b. To test **before** committing or rolling back, specify an **amount of time** to test the recovered machines, in minutes.

   This is the amount of time that the commit or rollback operation is **delayed**, before the automatic commit or rollback action is performed.

   During this time period, check that the new virtual machines are OK and then commit the operation or roll it back.

   The **maximum** amount of time you can **delay** the commit or rollback operation is **1440 minutes**, which is **24 hours**.

Testing that involves I/O is done on **scratch volumes**.

   • The more I/Os generated, the more scratch volumes are used, until the maximum size is reached, at which point no more testing can be done.

   • The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed.

   • The scratch volumes reside on the storage defined for the journal.

5. To specify reverse protection, whereby the virtual machines in the VPG are failed over to the recovery site and then protected in the recovery site, back to the original site, either:

   • Click **REVERSE PROTECT ALL**. This activates reverse protection on all the VPGs that you plan to Failback. The system default values for this procedure will be assigned to all the VPGs.

   -or-

   • Click the **Reverse Protection** field.

If you want to configure the VPG for reverse protection, click the **REVERSE** link.

The **Edit Reverse VPG** window is displayed and you can edit the reverse protection configuration. The parameters are the same as described when you create a VPG, with the following differences:

   • You cannot add or remove virtual machines in the reverse protected VPG.

   • By default, reverse protection is to the original protected disks. You can specify a different storage to be used for the reverse protection.

   • If VMware Tools or Microsoft Integration Services are available for vSphere or Hyper-V respectively, for each virtual machine in the VPG, the IP address of the originally protected
virtual machine is used. Thus, during failback the original IP address of the virtual machine on the site where the machine was originally protected is reused. However, if the machine does not contain the utility, DHCP is used. The host version must be 4.1 or higher for re-IP to be enabled.

When committing the Failback, you can reconfigure reverse protection, regardless of the reverse protection settings specified here. For more information see Reverse Protection For a Moved VPG on page 269.

! Important:

Setting reverse protection when migrating from Azure will initiate an initial sync.

6. Click **NEXT**.

The **MOVE** step is displayed. The topology will show the VPGs and the virtual machines that are about to be moved from to the original site. NEED TO ADD SCREENSHOT FOR AWS

7. Click **START MOVE** to start the Failback.

8. If a commit policy was set with a timeout greater than zero, as described in step To change the commit policy, click the field or select the VPG and click EDIT SELECTED. on page 266, you can check the moved virtual machines on the recovery site before they are removed from the protected site.
Note: If a virtual machine exists on the recovery site with the same name as a virtual machine being migrated, the machine is moved and named in the peer site with a number added as a suffix to the name, starting with the number 1.

The status icon changes to orange and an alert is issued, to warn you that the procedure is waiting for either a commit or rollback.

All testing done during this period, before committing or rolling back the Move operation, is written to thin-provisioned virtual disks, one per virtual machine in the VPG. These virtual disks are automatically defined when the machines are created on the recovery site for testing. The longer the test period the more scratch volumes are used, until the maximum size is reached, at which point no more testing can be done. The maximum size of all the scratch volumes is determined by the journal size hard limit and cannot be changed. The scratch volumes reside on the storage defined for the journal. Using these scratch volumes makes committing or rolling back the Move operation more efficient.

Note: You cannot take a snapshot of a virtual machine before the Move operation is committed and the data from the journal promoted to the moved virtual machine disks, since the virtual machine volumes are still managed by the VRA and not directly by the virtual machine. Taking a snapshot of a machine that is in the process of being moved will corrupt that machine.

9. Check the virtual machines on the recovery site, then either:
   - Wait for the specified Commit Policy time to elapse, and the specified operation, either Commit or Rollback, is performed automatically.
• Or, in the specific VPG tab, click the Commit or Rollback icon ( 
  ).
• Click Commit to confirm the commit and, if necessary set, or reset, the reverse protection configuration. If the protected site is still up and you can set up reverse protection, you can reconfigure reverse protection by checking the Reverse Protection checkbox and then click the Reverse link. Configuring reverse protection here overwrites any of settings defined when initially configuring the failover.
• Click Rollback to roll back the operation, removing the virtual machines that were created on the recovery site and rebooting the machines on the protected site. The Rollback dialog is displayed to confirm the roll back.
• You can also commit or roll back the operation in the TASKS popup dialog in the status bar or under MONITORING > TASKS.

After the virtual machines are up and running and committed in the recovery site, the powered off virtual machines in the protected site are removed from . Finally, data is promoted from the journal to the moved virtual machines.

During promotion of data, you cannot move a host on the moved virtual machines. If the host is rebooted during promotion, make sure that the VRA on the host is running and communicating with the Zerto Virtual Manager before starting up the recovered virtual machines.

**Note:** If the virtual machines do not power on, the process continues and the virtual machines must be manually powered on. The virtual machines cannot be powered on automatically in a number of situations, such as when there are not enough resources in the resource pool or the required MAC address is part of a reserved range or there is a MAC address conflict or IP conflict, for example, if a clone was previously created with the MAC or IP address.

### Reverse Protection For a Moved VPG

When you specify reverse protection, the virtual machines are failed over to and then protected using the values specified during the failback. Data is promoted from the journal to the failed back virtual machines and then synchronization with the original site is performed so that the VPG is fully protected.

When you specify Reverse Protection, the following occurs:

• Reverse protection from Azure results in an Initial sync.
• The virtual machines are recovered on the recovery site and then protected using the values specified during the failover.
• The original virtual machines are removed from the original protected site.
• On the target site the data is promoted from the journal to the recovered virtual machines.
• The recovery site, which is now the protected site, is synchronized with the original protected site so that the VPG is fully protected.

**Notes:**
For the Move operation to complete successfully, when Reverse Protection is specified, the original protected site must have enough storage available to fail back the moved virtual machines.

When Reverse Protection is specified for a VPG residing on a vCD site that is replicating to either a vSphere or Hyper-V site, the boot order settings will not reserve the start delay vCD vApp settings for virtual machines with the same order number.

If you do not specify Reverse Protection, the VPG definition is kept with the status Needs Configuration and the reverse settings in the VPG definition are not set.

Clicking **EDIT VPG** displays the Edit VPG wizard with the settings filled in, using the original settings for the virtual machines in the VPG from the original protected site, except for the volumes. To start replicating the virtual machines in the VPG, specify the disks to use for replication and optionally, make any other changes to the original settings and click **DONE**.
Zerto Reports

The Zerto solution includes reporting for the following:

• Outbound Protection Over Time Report on page 271
• Recovery Reports on page 272
• Resources Report on page 274
• VPG Performance on page 280

Outbound Protection Over Time Report

Information about how much data is actually being protected against the amount configured for any of the sites can be displayed in the Outbound Protection Over Time report under the REPORTS tab.

The data displayed can be up to 30 minutes old, since the Zerto Virtual Manager collects the relevant data every 30 minutes.

You can filter the information by the following:

From and To: The dates for which you want information.

Recovery Site: Select the site for which you want information or select all sites. If all sites are selected, All is displayed. The drop-down list displays all sites paired with the local site.

Click APPLY to apply the selected filtering and produce the report.

Click RESET to reset the display to the default values.
Recovery Reports

Information about recovery operations — failover tests, moves, and failovers — can be displayed in Recovery Reports under the REPORTS tab. The information includes the following:

- The name of the virtual protection group (VPG) on which the operation was done
- The type of operation
- The protected and the recovery sites involved
- When the recovery operation was started
- The RTO
- Whether the operation succeeded or not
- Any notes added during a failover test

Recovery Reports are always kept, and never deleted.

You can filter the tests by the following:

**From** and **To**: The dates for which you want information. Only operations performed between these dates are displayed.

**VPG**: Select the VPGs for which you want information. The number of VPGs you selected is displayed. If you select All, the total number of VPGs is shown.

**Type**: Select the recovery operations for which you want information: Failover, Move, Failover Test. If more than one operation is selected, the number of recovery operations you selected is displayed.

**Status**: Select the statuses for which you want information: Success, Failed. If more than one status is selected, the number of statuses you selected is displayed.
Click **APPLY** to apply the selected filtering.

Click **RESET** to reset the display to the default values.

Click **EXPORT** and choose PDF or ZIP to generate a report.

If the report is exported to a PDF, information is displayed by VPG and then by virtual machine within the VPG. The following information is described in the report:

- The date and time when the report was generated.

The Recovery Operation Details include the following information:

- The name of the person who initiated the operation
- The type of recovery operation
- The point in time
- The start time
- The end time
- RTO
- The result
- Notes

The Virtual Protection Group Recovery Settings includes the following:

- The name of the protected site
- The name of the recovery site

The Virtual Machine Recovery Settings, which include the following:

- The name of the virtual machine
- Any custom settings

The Detailed Recovery Steps, which include the following:

- The step number
- The description of the step (for example, creating a machine and scratch volumes for testing)
- Whether the step was successful or not
- The start and end time of the step
- The time it took to complete the step

**Note:** When failover test (FOT) is still in progress, the **End Time** in the Recovery Report appears as **NA**.

The Recovery Operation Start Time and Recovery Operation End Time values are shown in UTC according to the Zerto Virtual Manager clock in the recovery site. The Point in Time value takes the checkpoint UTC time, which was created in protected site, and converts it to the recovery site time zone.
Branding the Recovery Report

A branded logo can be placed in the report in the top left corner by adding the logo as a .png file to the <ZertoInstallFldr>\Zerto\ZVR\gui\ folder with the name provider_logo.png.
The folder ZertoInstallFldr is the root folder where Zerto in the recovery site is installed. For example, C:\Program Files\Zerto.

Resources Report

Information about the resources used by the virtual machines being recovered to a particular site is displayed in the Resources report under the REPORTS tab. The information is collected at fixed times that are defined in the Reports tab of the Site Settings dialog in the recovery site. Information for the report is saved for 90 days when the sampling period is hourly and for one year when the sampling period is daily.
The report collects the resource information for the virtual machines being recovered to the site where the report is run.
If no virtual machines are recovered to the site where the report is run, the report is empty.
You can filter the information by the following:

From and To: The dates for which you want information.
Click EXPORT to generate the report, which is produced as an Excel file.
The information presented in this report is divided into three tabs:
Details Tab on page 274: Shows information for each protected virtual machine.
Performance Tab on page 279: Shows bandwidth and throughput information for each virtual machine in a table and in a graph.
Target Host Tab on page 280: Shows information per host in the recovery site.

Using a REST API to Generate a Report

Zerto exposes a REST API to produce resource data. The report is generated by passing a URL. For details about the ResourcesReport API (and all other Zerto REST APIs), see the Zerto Virtual Replication RESTful API Reference Guide.

Details Tab

The Details tab includes the names and IDs of the virtual machines being protected and, for each virtual machine, the timestamp for the information, where it is protected, the CPU used, the memory used by the host and the guest, the storage used, and other information.

Interpreting the Details Tab

The Details tab provides a breakdown of every protected virtual machine, identified by its internal identifier and name in the hypervisor manager. The report also includes the name of the VPG that is protecting the virtual machine and information such as the protected and recovery sites.
The Timestamp column displays the time when the last sample, as defined in the Reports tab of the Site Settings dialog, was taken.

The VPG Type column is one of:

- VC2VC: vCenter to vCenter replication
- VC2VCD: vCenter to vCloud Director replication
- VCD2VCD: vCloud Director to vCloud Director replication
- VCD2VC: vCloud Director to vCenter replication

The ZORG column defines organizations set up in the Zerto Cloud Manager that use a cloud service provider for recovery.

The Bandwidth (Bps) and Throughput (Bps) columns display the average between two consecutive samples. With daily samples, these figures represent the average daily bandwidth and throughput. For hourly samples, the timestamp represents an average between the sample at the timestamp and the previous sample. A value of -1 means that the system failed to calculate the value, which can happen for several reasons, for example:

- Sites were disconnected when the sample was collected. Although the protected site measures the throughput and bandwidth, the recovery site logs the results.
- The bandwidth or throughput values at the time of the sample was lower than the bandwidth or throughput value in the previous sample. This can happen, for example, if the protected site VRA is rebooted since the sample values are not stored persistently by the VRA.
- If `valueInLastSample` does not exist, since `currentValue` is the first sample for the virtual machine, the data is not calculated.

Bandwidth is calculated as: \( (currentValue - valueInLastSample)/elapsedTime \)

For example:

<table>
<thead>
<tr>
<th>Time</th>
<th>Action/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2:29:59.999</td>
<td>A virtual machine is placed in a VPG</td>
</tr>
<tr>
<td>2:30</td>
<td>A sample is generated. The total transmitted bytes is zero since the virtual machine was just placed in the VPG</td>
</tr>
<tr>
<td>2:30-2:59.999</td>
<td>The VM is writing data at 1MB/minute</td>
</tr>
<tr>
<td>3:00</td>
<td>The virtual machine lowers its write rate to 0.5MB/minute</td>
</tr>
</tbody>
</table>
### Time | Action/Description
--- | ---
3:30 | A new sample is calculated. Current value of total data transmitted is 45MB:

\[
1\text{MB/minute} \times (30 \text{ minutes}) + (0.5\text{MB/minute}) \times (30 \text{ minutes})
\]

Last value of total data transmitted is 0, from the 2:30 sample.

\[
\text{Bandwidth} = \frac{(45\text{MB}-0)}{(60 \text{ minutes})} = 0.75\text{MB/minute} = 13107\text{Bps}
\]

### Report output fields

The following describes the fields in the **Details** tab.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Active Guest Memory (MB)</strong></td>
<td>The active memory of the virtual machine.</td>
</tr>
<tr>
<td><strong>Bandwidth (Bps)</strong></td>
<td>The average bandwidth used between two consecutive samples, in bytes per second.</td>
</tr>
<tr>
<td><strong>Consumed Host Memory (MB)</strong></td>
<td>The amount of host memory consumed by the virtual machine.</td>
</tr>
<tr>
<td><strong>CPU Limit (MHz)</strong></td>
<td>The maximum MHz available for the CPUs in the virtual machine.</td>
</tr>
<tr>
<td><strong>CPU Reserved (MHz)</strong></td>
<td>The MHz reserved for use by the CPUs in the virtual machine.</td>
</tr>
<tr>
<td><strong>CPU Used (MHz)</strong></td>
<td>The MHz used by the CPUs in the virtual machine.</td>
</tr>
<tr>
<td><strong>CrmId</strong></td>
<td>The CRM identifier specified in Zerto Cloud Manager for an organization that uses a cloud service provider for recovery.</td>
</tr>
<tr>
<td><strong>Memory (MB)</strong></td>
<td>The virtual machine defined memory.</td>
</tr>
<tr>
<td><strong>Memory Limit (MB)</strong></td>
<td>The upper limit for this virtual machine's memory allocation.</td>
</tr>
<tr>
<td><strong>Memory Reserved (MB)</strong></td>
<td>The guaranteed memory allocation for this virtual machine.</td>
</tr>
<tr>
<td><strong>Number Of vCPUs</strong></td>
<td>The number of CPUs for the virtual machine.</td>
</tr>
<tr>
<td><strong>Number Of Volumes</strong></td>
<td>The number of volumes attached to the virtual machine.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Recovery Journal Provisioned Storage (GB)</td>
<td>The amount of provisioned journal storage for the virtual machine. The provisioned journal size reported can fluctuate considerably when new volumes are added or removed.</td>
</tr>
<tr>
<td>Recovery Journal Used Storage (GB)</td>
<td>The amount of journal storage used by the virtual machine. (On-premise environments) Differences might occur between the value displayed in the Used Journal column in the Protection Over Time by Site report and the value displayed here, which is retrieved from vCenter or Hyper-V. The Used Journal value displayed in the Protection Over Time by Site report is calculated by the VRA, based on internal journal allocations for each recovery volume. vcCenter and Hyper-V Resources reports are expected to display a larger size than in the Protection Over Time by Site report, and may reach up to 500MB higher per virtual machine than reported in the Protection Over Time by Site report.</td>
</tr>
<tr>
<td>Recovery Volumes Provisioned Storage (GB)</td>
<td>The amount of provisioned storage for the virtual machine in the target site. This value is the sum of volumes' provisioned size.</td>
</tr>
<tr>
<td>Recovery Volumes Used Storage (GB)</td>
<td>The amount of storage used by the virtual machine in the target site.</td>
</tr>
<tr>
<td>Service Profile</td>
<td>The service profile used by the VPG.</td>
</tr>
<tr>
<td>Source Cluster</td>
<td>The source cluster name hosting the virtual machine.</td>
</tr>
<tr>
<td>Source Host</td>
<td>The source host name hosting the virtual machine.</td>
</tr>
<tr>
<td>Source Organization VDC</td>
<td>The name of the source vDC organization.</td>
</tr>
<tr>
<td>Source Resource Pool</td>
<td>The source resource pool name hosting the virtual machine.</td>
</tr>
<tr>
<td>Source Site</td>
<td>The source protected site name, defined in the Zerto User Interface.</td>
</tr>
<tr>
<td>Source vCD Organization</td>
<td>The name of the source vCD organization.</td>
</tr>
<tr>
<td>Source Volumes Provisioned Storage (GB)</td>
<td>The amount of provisioned storage for the virtual machine in the source site. This value is the sum of volumes' provisioned size.</td>
</tr>
<tr>
<td>Source Volumes Used Storage (GB)</td>
<td>The amount of storage used by the virtual machine in the source site. This value is the sum of the volumes' used size.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source VRA Name</td>
<td>The name of the source VRA used to send data to the recovery site.</td>
</tr>
<tr>
<td>Target Cluster</td>
<td>The target cluster name hosting the virtual machine.</td>
</tr>
<tr>
<td>Target Datastores</td>
<td>The target storage used by the virtual machine if it is recovered.</td>
</tr>
<tr>
<td>Target Host</td>
<td>The target host name hosting the virtual machine when it is recovered.</td>
</tr>
<tr>
<td>Target Organization vDC</td>
<td>The name of the target vDC organization.</td>
</tr>
<tr>
<td>Target Resource Pool</td>
<td>The target resource pool name where the virtual machine will be recovered.</td>
</tr>
<tr>
<td>Target Site</td>
<td>The target site name, defined in the Zerto User Interface.</td>
</tr>
<tr>
<td>Target Storage Profile</td>
<td>The target vCD storage profile used.</td>
</tr>
<tr>
<td>Target vCD Organization</td>
<td>The name of the target vCD organization.</td>
</tr>
<tr>
<td>Target VRA Name</td>
<td>The name of the VRA managing the recovery.</td>
</tr>
<tr>
<td>Throughput (Bps)</td>
<td>The average throughput of the VM used between two consecutive samples, in bytes per second.</td>
</tr>
<tr>
<td>Timestamp</td>
<td>The date and time the resource information was collected. The value can be converted to an understandable date using code similar to the following: var date = new Date(jsonDate);</td>
</tr>
<tr>
<td></td>
<td>or code similar to the Perl code example, jsonDateToString($), described in Zerto Virtual Replication RESTful API Reference Guide.</td>
</tr>
<tr>
<td>VM Hardware Version</td>
<td>The VMware hardware version.</td>
</tr>
<tr>
<td>VM Id</td>
<td>The internal virtual machine identifier.</td>
</tr>
<tr>
<td>VM Name</td>
<td>The name of the virtual machine.</td>
</tr>
<tr>
<td>VPG Name</td>
<td>The name of the VPG.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VPG Type</strong></td>
<td></td>
</tr>
<tr>
<td>VCVpg</td>
<td>VMware vCenter Server</td>
</tr>
<tr>
<td>VCVApp</td>
<td>Deprecated</td>
</tr>
<tr>
<td>VCDvApp</td>
<td>VMware vCloud Director vApp</td>
</tr>
<tr>
<td>PublicCloud</td>
<td>Amazon WebServices or Microsoft Azure</td>
</tr>
<tr>
<td>HyperV</td>
<td>Microsoft SCVMM</td>
</tr>
<tr>
<td><strong>ZORG</strong></td>
<td>The name assigned to an organization using a cloud service provider for recovery. The name is created in the Zerto Cloud Manager. For details, see the Zerto Cloud Manager Administration Guide.</td>
</tr>
</tbody>
</table>

### Performance Tab

The Performance tab shows bandwidth and throughput information for each virtual machine per sampling period in a table and in a graph. The Performance tab enables the user to view the total bandwidth and throughput per sampling period.

The graph allows the user to view performance trends over time per VM.

For full explanation of the bandwidth and throughput information, refer to the Details Tab on page 274.

You can filter information by date and VM name.

The following describes the fields in the Performance tab:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Time Stamp</strong></td>
<td>For explanation see the Details tab.</td>
</tr>
<tr>
<td>Bandwidth (Bps)</td>
<td>The average bandwidth of the VM used between two consecutive samples, in bytes per second.</td>
</tr>
<tr>
<td>Throughput (Bps)</td>
<td>The average throughput of the VM used between two consecutive samples, in bytes per second.</td>
</tr>
<tr>
<td>Total Bandwidth</td>
<td>The total bandwidth of all VMs during the measured period.</td>
</tr>
<tr>
<td>Total Throughput</td>
<td>The total throughput of all VMs during the measured period.</td>
</tr>
</tbody>
</table>
Target Host Tab

The Target Host tab shows information per host in the recovery site. This enables the user to perform capacity planning on the recovery host. You can filter information by time and by host.

The following describes the fields in the Target Host tab.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Guest Memory (MB)</td>
<td>The active memory of the virtual machine.</td>
</tr>
<tr>
<td>CPU Used (MHz)</td>
<td>The MHz used by the CPUs in the virtual machine.</td>
</tr>
<tr>
<td>Host</td>
<td>The Target Host's IP address or DNS name.</td>
</tr>
<tr>
<td>Total Bandwidth</td>
<td>The total bandwidth of all VMs replicating to the host during the measured period.</td>
</tr>
<tr>
<td>Total Throughput</td>
<td>The total throughput of all VMs replication to the host during the measured period.</td>
</tr>
<tr>
<td>vCPUs</td>
<td>The number of CPUs for the virtual machine.</td>
</tr>
<tr>
<td>VMs</td>
<td>The number of VMs protected.</td>
</tr>
<tr>
<td>Volumes</td>
<td>The number of volumes attached to the virtual machine.</td>
</tr>
</tbody>
</table>

VPG Performance

Performance graphs for all VPGs or for an individual VPG can be seen in the VPG Performance report under the REPORTS tab. These graphs show more detailed resolution than the corresponding graphs in the DASHBOARD tab.

You can specify the VPGs whose performance should be displayed. When you request information about multiple VPGs, each VPG is shown in a different color, with a key at the top of the report that maps each color to the VPG it represents.

Position the cursor on a graph line to see exact information about that point.

Click APPLY to apply the selected filtering and produce the report.

Click RESET to reset the display to the default values.
Troubleshooting

You can handle problems related to the WAN connecting the protecting or recovery sites, or other problems using a variety of diagnostic and troubleshooting tools.

The following topics are described in this section:

- Ensuring the Zerto Virtual Manager is Running on page 281
- Troubleshooting: “Needs Configuration” Problems on page 281
- Troubleshooting VRA Problems on page 282
- Zerto Diagnostics Utility on page 282
- Collecting Zerto Logs on page 283
- Understanding the Logs on page 289

For details about Zerto Virtual Manager alarms, alerts, and events, refer to Zerto Guide to Alerts and Events.

Ensuring the Zerto Virtual Manager is Running

If you have problems accessing the Zerto User Interface, check under Windows Services, on the machine where Zerto is installed, that the Zerto Virtual Manager Windows service is started.

Troubleshooting: “Needs Configuration” Problems

When the VPG status changes to Needs Configuration, the settings in the VPG need to be checked and, when necessary, updated.
The following scenarios result in the VPG status changing to **Needs Configuration**:

- A protected disk resize operation fails, for example when there is not enough disk space.
- When a volume is added to a protected virtual machine and the VPG settings are not updated because of a site disconnection or a Microsoft Azure error. In some situations, after the sites reconnect, the state corrects itself automatically.
- If the user protects the VM to Azure and then increases the disk size above the Azure limit (currently 4TB), the disk will go into the state **needs configuration**.
  - **Possible Cause:** The user exceeded the disk size limit allowed on Azure
  - **Possible Resolution:**
    - Remove the resized disk from the VM
    - or -
    - Remove the VM with the resized disk from the VPG

### Troubleshooting VRA Problems

**VPG Syncing Takes a Long Time – Network Problems**

Check the network. If the firewall configuration is modified, the VRA TCP connections have to be reset. After a VRA disconnect and reconnect the system can wait for up to fifteen minutes before syncing the sites after the reconnection.

### Zerto Diagnostics Utility

The Zerto solution includes a diagnostics utility to help resolve actual and potential problems. Using the diagnostics tool, you can do the following:

- Collect logs to help Zerto support resolve problems. The Zerto Virtual Manager must be running on each site for which you want logs. See [To collect logs for Zerto support to use when troubleshooting](on page 284)
- Collect local Zerto Virtual Manager logs. Use this option if the Zerto Virtual Manager is not running. See [To collect local Zerto Virtual Manager logs when the Zerto Virtual Manager is not running](on page 287)
- Check the connectivity between Zerto components. See [To check connectivity between Zerto Virtual Manager components](on page 186)
- Export VPG settings to an external file and import these settings.
• Reconfigure access to the Microsoft SQL Server that is used by the Zerto Virtual Manager. This database was specified during the installation of Zerto. See Reconfiguring the Microsoft SQL Server Database Used by the Zerto Virtual Manager on page 192

**Note:** A separate installation kit is available for download from the Zerto Support Portal downloads page that installs the Zerto Diagnostics utility as a standalone utility on any Windows machine that has Microsoft .NET Framework 4.7.2 installed.

### Collecting Zerto Logs

Virtual replication logs can be collected to help Zerto support resolve problems related to Zerto. Virtual replication logs can be collected in the following ways:

- **Using Remote Log Collection on page 283**
- **Using the Zerto Diagnostics application on page 284**

### Using Remote Log Collection

Remote Log Collection allows customers to authorize Zerto support engineers to collect logs from their environment. By using remote log collection customers can avoid having to use the Diagnostic Tool on their ZVM server in order to collect logs for analysis, a potentially complex and time-consuming procedure.

#### To enable Remote Log Collection:

1. In the Zerto User Interface, click **SETTING** (¶) in the top right of the header and select **Remote Support**.

   The Remote Support dialog is displayed.

   ![Remote Support Dialog](image)

2. Click the drop down menu to display the remote log collection options.

3. Select the remote log collection option you wish to allow:

   - **Never**: Remote log collection is not allowed (default). If remote log collection is currently allowed, the remote connection will be terminated if you select this option.

   - **For the next 30 days**: Remote log collection is allowed. This permission will automatically terminate in 30 days unless terminated by selecting the **Never** option.

   - **Only for the duration of a specific case**: You will be prompted to select the Case number from the drop-down list. The list contains all the active cases opened under the account that the Zerto Virtual Manager is registered to.
Remote log collection will be allowed for as long as the case is active or until remote log collection is terminated by selecting the **Never** option.

4. Click **Save**.

**Using the Zerto Diagnostics application**

You can collect logs using the diagnostics tool to help Zerto support resolve problems when the Zerto Virtual Manager is running or when the Zerto Virtual Manager is not running.

- When the Zerto Virtual Manager is running, see To collect logs for Zerto support to use when troubleshooting: on page 284. This option enables you to specify the logs that you want to collect, generated by Zerto, for example VRA logs, as well as logs generated by VMware, for example, vCenter Server logs or host logs. The Zerto generated logs can be filtered by any alerts issued and by the VPGs that require analysis to identify problems.

- When the Zerto Virtual Manager is not running, see To collect local Zerto Virtual Manager logs when the Zerto Virtual Manager is not running: on page 287.

**To collect logs for Zerto support to use when troubleshooting:**

1. Open the **Zerto Diagnostics** application. For example, via **Start > Programs > Zerto > Zerto Diagnostics**.

   The Zerto Diagnostics menu dialog is displayed.

2. Select the **Collect the Zerto logs for use by Zerto support** option.
3. **Click Next.**

   The Initialize dialog is displayed.

   ![Zerto Diagnostics Collection](image1)

4. **Specify the following and click Next.**

   **IP / Host Name:** The IP of the Zerto Virtual Manager where the log collection runs from. Logs are collected from this site and from the paired site.

   **Port:** The port used for inbound communication with the Zerto Virtual Manager.

   **Your Company Name:** A name to identify the log collection for the customer. This information is used by Zerto support. An account name must be entered. After this information is added, it is displayed in subsequent uses of the diagnostics utility.

   **Email:** An email address for use by Zerto support when analyzing the logs. An email address must be entered. After this information is added, it is displayed in subsequent uses of the diagnostics utility.

   **Timeframe:** The amount of time you want to collect logs for. The more time, the bigger the collection package.

   **Case Number:** The case number assigned by Zerto support, if one already exists. Optional.

   **Description:** An optional free text description of the reason for collecting the logs.

   After clicking **Next** the utility connects to Zerto and if any alerts have been issued, they are displayed in the **Select Alerts** dialog.

   If there are no alerts, this dialog is skipped.

   ![Zerto Diagnostics Collection](image2)
5. Select any alerts that need analyzing from the list and click **Next**.
   
The Select VPGs dialog is displayed.

6. Select the VPGs that you want analyzed and click **Next**.
   
The Customize dialogs are displayed. With Azure these values are not relevant.

7. Click **Next** until the Save Log Destinations dialog is displayed.

8. Specify destination for the files that you want collected.
   
   **Destination:** The name and location where the log collection will be saved.
   
   **Automatically upload files to Zerto FTP Server:** When this option is checked, the log collection is automatically uploaded to a specified FTP site.
   
   If you choose to upload the log collection to a site that you specify, make sure that the site is up.

9. Specify the FTP site to send the collection and the protocol to use, either FTP or HTTP.

10. Click **Next**.
    
The Review dialog is displayed.
Review that you have specified everything you want to collect.

11. To make changes, click **Back** to change the selection.

12. To continue, click **Start**.

The data is collected and stored in the destination file which, by default, is timestamped. If specified, the collection is also sent to an FTP site.

**Note:** The log collection is performed on the server. Canceling the collection in the GUI does not stop the collection from continuing on the server and a new log collection cannot be run until the running collection finishes.

When the log collection has completed the result is displayed. For example:

13. Click **Done** to return to the **Zerto Diagnostics** menu dialog.

14. Send the log to Zerto support, unless the **Automatically upload files to Zerto FTP Server** option was specified, in which case it is automatically sent to Zerto.

**To collect local Zerto Virtual Manager logs when the Zerto Virtual Manager is not running:**

1. Open the **Zerto Diagnostics** application. For example, via **Start > Programs > Zerto > Zerto Diagnostics**.

The Zerto Diagnostics menu dialog is displayed.
2. Select the **Local Zerto Virtual Manager diagnostics** option and click **Next**.

You are prompted to use the first option to collect more comprehensive diagnostics. If you continue, the Initialize dialog is displayed.

![Zerto Local Diagnostic Collection](image)

3. Specify the details that you want collected.

   **IP / Host Name:** The IP of the Zerto Virtual Manager where the log collection runs from. Logs are collected from this site and from the paired site.

   **Port:** The port used for inbound communication with the Zerto Virtual Manager.

   **Your Company Name:** A name to identify the log collection for the customer account. This information is used by Zerto support. An account name must be entered.

   **Email:** An email address for use by Zerto support when analyzing the logs. An email address must be entered.

   **Timeframe:** The amount of time you want to collect logs for. The more time, the bigger the collection package.

   **Case Number:** An optional field for the case number assigned to the issue by Zerto.

   **Description:** An optional free text description of the reason for collecting the logs.

4. Click **Next**.

   The Save Log Destinations dialog is displayed.

5. Specify the details that you want collected.

   **Destination:** The name and location where the log collection will be saved.

   **Automatically upload files to Zerto FTP Server:** When this option is checked, the log collection is automatically uploaded to a specified FTP site.

   If you choose to upload the log collection to a site that you specify, make sure that the site is up before clicking **Finish**.

   The data is collected and stored in the destination file which, by default, is timestamped. If specified, the collection is also sent to an FTP site.

6. Click **Next**.

   The collection progress is displayed. When the log collection has completed the result is displayed.
7. Click **Done** to return to the Zerto Diagnostics menu dialog.

8. Send the log to Zerto support, unless the **Automatically upload files to Zerto FTP Server** option was specified, in which case it is automatically sent to Zerto.

### Understanding the Logs

If problems arise with Zerto Virtual Manager, you can view the Zerto Virtual Manager logs to see what is happening.

The current log is called `logfile.csv` and resides in the `<Zerto_Install_Dir>\ZVR\logs` folder, where `Zerto_Install_Dir` is the folder specified during the installation.

When the log reaches 10MB its name is changed to `log.nnnn.csv`, where `nnnn` is a number incremented by one each time `logfile.csv` reaches 10MB. Up to 150 log files are kept.

The log file has the following format:

```
FFFF, yyyy-mm-dd hh:mm:ss, ####, LVL, Component, API, Message
```

where:

- **FFFF** - A HEX code. For internal use.
- **yyyy-mm-dd hh:mm:ss** - Timestamp for the message.
- **####** - Number for internal use.
- **LVL** - Severity level of the message. The more messages written to the log the bigger the impact on performance. The number of messages written to the log decreases from **Debug** to **Error**. The level can be one of the following:
  - **Debug**: All messages are written to the log. This level should only be specified during testing.
  - **Info**: Information messages.
  - **Warn**: Warning messages such as a reconnect ion occurred.
  - **Error**: Error messages that need handling to find the problem.
- **Component** - The specific part in the Zerto Virtual Manager that issued the message.
- **API** - The specific API that issued the message.
**Message** - The message written in the log.

The following is a sample from a log:

```plaintext

Understanding the Logs
The Zerto Virtual Manager User Interface

Configuration and management of disaster recovery for a site are performed in the Zerto User Interface. The following dialogs and tabs are described in this section:

- About Dialog on page 292
- Add Checkpoint Dialog on page 293
- Add Site Dialog on page 294
- Add Static Route Dialog on page 295
- Advanced Journal Settings Dialog on page 296
- Advanced Journal Settings Dialog (vCD) on page 298
- Advanced VM Recovery Settings Dialog on page 300
- Advanced VM Replication Settings Dialog on page 301
- Advanced VM Replication Settings Dialog (vCD) on page 301
- Advanced VM Settings for Cloud Dialog on page 303
- ALERTS on page 303
- Boot Order Dialog on page 304
- Browse for File Dialog on page 305
- Change Host Password VRA Dialog on page 305
- Change VM Recovery VRA Dialog on page 306
- Checkpoints Dialog on page 307
- Configure and Install VRA Dialog on page 308
- Configure Paired Site Routing Dialog on page 310
- Configure Provider vDCs Dialog on page 310
- Configure VM Settings Dialog on page 313
- Configure Volume Dialog (vCD) on page 313
- Edit NIC Dialog on page 314
- Edit Selected Volumes Dialog on page 315
- Edit VM Dialog on page 316
- Edit VM Dialog (vCD) on page 317
- Edit VM Settings Dialog (AWS) on page 323
- Edit VM Settings Dialog (Azure) on page 324
• Edit vNIC Dialog on page 324
• Edit vNIC Dialog (vCD) on page 326
• Edit Volumes Dialog on page 327
• Edit VRA Dialog on page 344
• License Dialog on page 345

About Dialog

In the About window, you can do the following:

• View the Zerto version being run.
• Enable or disable the Zerto CALLHOME feature. The Zerto CALLHOME feature enables support notification and analytics for the following purposes:
  • To improve Zerto.
  • To send notifications to the user when a new Zerto version is available, or when new hypervisor versions are supported by Zerto.
• Enable or disable Zerto to send data to the SaaS platform for monitoring purposes, using the Zerto Mobile App. This action is done by licensed Zerto Virtual Manager users.

When clicking About, the following options appear:

- Enable Support notification and product improvement feedback.
- Enable Zerto SaaS features. Includes Zerto Analytics, Zerto Mobile App and Remote upgrade.

To perform these actions, do the following:
1. In the Zerto User Interface, in the top right of the header, click [icon], and then click About. The version and build of Zerto installed in the site are displayed.

2. To enable the Zerto CALLHOME feature, click Enable Support notification and product improvement feedback. This is selected by default.

   **Note:** For Microsoft Azure and AWS, this option is grayed out.

   If the user deselects Enable Support notification and analytics, a warning appears notifying the user that deselecting this option will stop Zerto from sending notifications when new Zerto updates are available, or when new hosts are supported.

3. If you want Zerto to send information to our Online Services and Zerto Mobile App, and enable remote upgrade, select Enable Zerto SaaS features. Include Zerto Analytics, Zerto Mobile App and Remote upgrade. This is selected by default.

   This allows licensed Zerto Virtual Manager users to enable or disable data being sent from the Zerto Virtual Manager to the SaaS platform, thereby enabling site monitoring using the Zerto Mobile App. This also enables automatic script upgrade of Zerto's local ZCA scripts. This means that the scripts, which are responsible for configuration and management tasks, will always be up to date.

   - If the user deselects Enable Online Services and Zerto Mobile, a warning appears notifying the user that deselecting this option will stop Zerto from sending information to Online Services and to the Zerto Mobile Application, rendering these services inoperable for the entire installation.

4. If you want to enable automatic script upgrade of Zerto's local ZCA scripts, select Enable Zerto SaaS features. Include Zerto Analytics, Zerto Mobile App and Remote upgrade. This means that the scripts, which are responsible for configuration and management tasks, will always be up to date.

**Add Checkpoint Dialog**

Checkpoints are recorded automatically every few seconds in the journal. These checkpoints ensure crash-consistency and are written to the virtual machine journals by the Zerto Virtual Manager. Each checkpoint has a timestamp set by the Zerto Virtual Manager. In addition to the automatically generated...
checkpoints, you can manually add checkpoints to identify events that might influence the recovery, such as a planned switch over to a secondary generator.

The list of VPGs is displayed. You can select more VPGs to add the same checkpoint.

- **Enter a name for the checkpoint**: The name to assign to the checkpoint.
- **Direction**: The direction of the protection.
- **VPG Name**: The name of the VPG.
- **Protected Site Name**: The name of the site where virtual machines are protected.
- **Recovery Site Name**: The name of the site where protected virtual machines are recovered.

You can filter columns in the list via the filter icon next to each column title. You can also sort the list by each column. Clicking the cog on the right side of the table enables you to change the columns that are displayed and to create a permanent view of the columns you want displayed.

### Add Site Dialog

You can pair to any site where Zerto is installed.

Zerto can be installed at multiple sites and each of these sites can be paired to any other site on which Zerto has been installed. Virtual machines that are protected on one site can be recovered to any paired site.

#### To pair to a site:

1. From the **remote** site to which you will pair, in Zerto Virtual Manager > Sites tab, click the button **Generate Pairing Token**.

2. The Generate Pairing Token window opens.

![Generate Pairing Token](image)

3. Click **Copy**, to copy the token.

   The token **expires** when the earliest of one of the following conditions is met:

   - 48 hours after clicking **Copy**
• At the next ZVM process termination
• After the token is used to authenticate the pairing request

4. From the site which will initiate the pairing, in the Zerto Virtual Manager > Sites tab, click **PAIR**. The Add Site window is displayed.

5. Specify the following:
   • **Host name/IP**: IP address or fully qualified DNS host name of the **remote** site Zerto Virtual Manager to pair to.
   • **Port**: The TCP port communication between the sites. Enter the port that was specified during the installation. The default port during the installation was 9081.
   • **Token**: Paste the token which you copied above.

6. Click **PAIR**.

The sites are paired, meaning that the Zerto Virtual Manager for the local site is connected to the Zerto Virtual Manager at the remote site.

After the pairing completes the content of the SITES tab updates to include summary information about the paired site.

• **Host name/IP**: IP address or fully qualified DNS host name of the remote site Zerto Virtual Manager to pair to.
• **Port**: The TCP port communication between the sites. Enter the port that was specified during installation. The default port during the installation is 9081.

### Add Static Route Dialog

Add a static route for a specified group, when the Zerto Cloud Connector and cloud site Zerto Virtual Manager are on different networks.
The Zerto Virtual Manager User Interface

**Address**: The network address for the static route that you want to route to.

**Subnet Mask**: The subnet mask for the network.

**Gateway**: The gateway address for the network on the local network of the Zerto Cloud Connector cloud network interface.

**Note**: If you change the Zerto Virtual Manager and VRAs cloud network, changing the static route settings for a group to the new network only changes the access for new Zerto Cloud Connectors with the specified group. Existing Zerto Cloud Connectors must be redeployed to use the changed static route.

Also see: Manage Static Routes Dialog on page 347

### Advanced Journal Settings Dialog

![Advanced Journal Settings Dialog](image)

- **Journal History**: 1 Days
- **Default Journal Datastore**: Default

</table>
### Setting & Description

#### Journal Size Warning Threshold

The size of the journal that triggers a warning that the journal is nearing its hard limit.

- **Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.

If Unlimited is selected, Size and Percentage options are **not** displayed.

- **Size** (GB): The size in GB that will generate a warning.

- **Percentage**: The percentage of the virtual machine volume size that will generate a warning.

*The values of Size and Percentage must be **less** than the configured **Journal Size Hard Limit** so that the warning will be generated when needed.

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

1. Click **OK**.

#### Advanced Journal Settings Dialog (vCD)

Appears **only** in environments with **vCD**.

Manage the journal used for recovery in a **vCD** environment.
### Journal History

The time that all write commands are saved in the journal.

- **Number of hours** from 1 to 23
- **Number of days** from 1 to 30

### Default Journal Storage (Hyper-V), or Default Journal Datastore (vSphere)

The storage/datastore used for the journal data for each virtual machine in the VPG.

- Select the storage/datastore accessible to the host.

*Note:* This field is not relevant when replicating to a vCD recovery site.

When you select a specific journal storage/datastore, the journals for each virtual machine in the VPG are stored in this storage/datastore, regardless of where the recovery storage/datastore is for each virtual machine. All protected virtual machines are recovered to the hosts that can access the specified journal storage/datastore.

### Journal Size Hard Limit

The maximum size that the journal can grow, either as a percentage or a fixed amount.

The journal is always thin-provisioned.

*Note:* The Journal Size Hard Limit applies independently both to the Journal History and also to the Scratch Journal Volume.

*For Example:* If the Journal Size Hard Limit is configured to a maximum size of 160 GB limit, then during Failover Test, both the Journal History and the Scratch Journal Volume together can take up to 320 GB. Each one with a maximum size of 160 GB limit.

- **Unlimited:** The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.
  
  If Unlimited is selected, Size and Percentage options are not displayed.

- **Size (GB):** The maximum journal size in GB.

  - The *minimum* journal size, set by Zerto, is 8GB for Hyper-V and vSphere environments, and 10GB for Microsoft Azure environments.

- **Percentage:** The percentage of the virtual machine volume size to which the journal can grow.

  - This value can be configured to more than 100% of the protected VM's volume size.
### Journal Size Warning Threshold

<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td>The size of the journal that triggers a warning that the journal is nearing its hard limit.</td>
<td>• <strong>Unlimited</strong>: The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore. If Unlimited is selected, Size and Percentage options are not displayed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Size</strong> (GB): The size in GB that will generate a warning.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Percentage</strong>: The percentage of the virtual machine volume size that will generate a warning.</td>
</tr>
</tbody>
</table>

*The values of Size and Percentage must be less than the configured Journal Size Hard Limit so that the warning will be generated when needed.

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

1. Click **OK**.

### Advanced VM Recovery Settings Dialog

Displays the recovery settings for the virtual machines in the VPG. You can choose to edit information in one field by clicking the field and updating the information. You can choose to edit information for several virtual machines at the same time by selecting the virtual machines and clicking **EDIT SELECTED**.
Advanced VM Replication Settings Dialog

Displays the replication settings for the virtual machines in the VPG. You can choose to edit information in one field by clicking the field and updating the information. You can choose to edit information for several virtual machines at the same time by selecting the virtual machines and clicking EDIT SELECTED.

For more details, see Edit VM Dialog on page 316.

Advanced VM Replication Settings Dialog (vCD)

Appears only in environments with vCD.
Displays the settings of the virtual machines in the VPG.

- To edit information in one field, click the field and update the information.
- To edit information for several virtual machines at the same time, select the virtual machines and click EDIT SELECTED.

1. When selecting a Storage Policy, consider the following:
   - Zerto will select a datastore from the selected Storage Policy in which to place these files, unless the datastore is excluded in the Configure Provider vDCs Dialog.
   - Zerto will try to determine a default Storage Policy according to:
     - A Storage Policy with the same name as the protected Storage Policy.
     - The default Orgvdc Storage Policy.
     If Zerto did not manage to determine a default Storage Policy, this field appears empty.
   - When you click to edit, a list of Storage Policies appear. These Storage Policies:
     - Were defined in VMware vCloud Director and are configured in the Orgvdc.
     - Have at least one Datastore that was not excluded as a Recovery Volume in the Configure Provider vDCs Dialog.

2. When selecting a Journal Storage Policy, consider the following:
   - Zerto will select a datastore from the selected Storage Policy in which to place the Journal files, unless the datastore is excluded in the Configure Provider vDCs Dialog.
   - The default Journal Storage Policy is the same as the default VM Storage Policy.
   - If Zerto did not manage to determine a default Journal Storage Policy, this field appears empty.
   - When you click to edit, the option Auto Select appears, and a list of Storage Policies.
   - The list of Storage Policies associated with the Journal:
     - Were defined in VMware vCloud Director and are configured in the Orgvdc.
     - Have at least one Datastore that was not excluded as a Journal in the Configure Provider vDCs Dialog.
     - **Auto Select**: Selecting this means that the journal can be placed in any datastore visible to the host that Zerto selected for recovery, unless the datastore is excluded in the Configure Provider vDCs Dialog.

For more details, see Edit VM Dialog on page 316.
Advanced VM Settings for Cloud Dialog

Displays the recovery settings for the virtual machines in the VPG. You can choose to edit information in one field by clicking the field and updating the information. You can choose to edit information for several virtual machines at the same time by selecting the virtual machines and clicking **EDIT SELECTED**.

**ALERTS**

Monitor the recent alerts by clicking the ALERTS area in the status bar at the bottom of the Zerto User Interface. The following information is displayed for the most recent alerts:

- The alert status.
- The site where the alert is issued.
- A description of the alert.
Click **Show All** to access MONITORING > ALERTS.

## Boot Order Dialog

To specify the boot order of virtual machines in a VPG. When machines are started up on recovery, for example, after a move operation, the virtual machines in the VPG are not started up in a particular order. If you want specific virtual machines to start before other machines, you can specify a boot order. The virtual machines are defined in groups and the boot order applies to the groups and not to individual virtual machines in the groups. You can specify a delay between groups during startup.

Initially, virtual machines in the VPG are displayed together under the default group. If you want specific machines to start before other virtual machines, define new groups with one or more virtual machines in each group.

There is no boot order for virtual machines within a group, only between groups.

- **ADD GROUP:** Adds a group. After adding a group you can edit the group name by clicking the Edit icon at the right of the group name and remove the group via the delete icon at the right of the group. You cannot remove the Default group nor a group that contains a virtual machine.

- **Boot Delay:** Specifies a time delay between starting up the virtual machines in the group and starting up the virtual machines in the next group. For example, assume three groups, Default, Server, and Client defined in this order. The Start-up delay defined for the Default group is 10, for the Server group is 100 and for the Client group 0. The virtual machines in the Default group are started together and after 10 seconds the virtual machines in the Server group are started. After 100 seconds the virtual machines in the Client group are started up.
Browse for File Dialog

To select the folder with the preseeded disk to use. Drill-down to select the disk.

Disks that are not viable for preseeding are grayed out.

Change Host Password VRA Dialog

To change the connectivity, VIB or password, used by the VRA to connect to the host. If using a password to connect to the host, to change the password used by the VRA.

- If the VRA is using a password to connect to the host and using VIB is required, check **Use credentials to connect to host**.
- If the VRA is using VIB to connect to the host and using a password is required, uncheck **Use credentials to connect to host** and enter the password. Not in EagleRare: To display the password in plain text, click in the check box next to the field.
- If the VRA is connecting to the host with a password and the password for the host has changed, enter the new password. Not in EagleRare: To display the password in plain text, click in the check box next to the field.
To change the recovery host required by the VRA to access the host:

- **VM Name**: The name of the virtual machine.
- **VPG Name**: The name of the VPG.
- **ZORG**: The Zerto name given to the organization, the ZORG, by a cloud service provider. For details, refer to [Zerto Cloud Manager Administration Guide](#).
- **VM Size GB**: The virtual machine size in gigabytes.
- **# of Volumes**: The number of volumes used by the virtual machine.
- **VM Hardware Version**: The hardware version of the virtual machine.
- **Target Host**: The host in which to move the recovery virtual machines.
- **Select the replacement host**: The name of the host to move the recovery virtual machines.
- **Auto Select the replacement host**: Selects the most suitable host to move the recovery virtual machines to.
Checkpoints Dialog

When selecting the point to recover to, remember the following:

- The refresh button is initially grayed out and is enabled for clicking after 5 seconds. It is also grayed out for 5 seconds after being clicked, before being re-enabled.

- A reminder, **Click the refresh button to view the latest checkpoints** is displayed 10 seconds after the refresh button is clicked to remind the user that there is a new Latest Checkpoint.

- If the user has scrolled to, and selected, a checkpoint anywhere in the checkpoints list, clicking the refresh button will automatically return the user to the selected checkpoint in the list.

Use the following filters:

- **Latest**: Recovery is to the latest checkpoint. This ensures that the data is crash-consistent for the recovery. When selecting the latest checkpoint, the checkpoint used is the latest at this point. If a checkpoint is added between this point and starting the failover, the later checkpoint is not used.

- **Latest Tagged Checkpoint**: The recovery operation is to the latest checkpoint added in one of the following situations:
  - By a user.
  - When a failover test was previously performed on the VPG which includes the virtual machine.
• When the virtual machine was added to an existing VPG after the added virtual machine was synchronized.

• **Select from all available checkpoints:** If you do not want to use the latest checkpoint, latest tagged checkpoint, choose **Select from all available checkpoints.** By default, this option displays all checkpoints in the system. You can choose to display only automatic, or tagged checkpoints, or any combination of these types.

Configure and Install VRA Dialog

➢ To install Zerto Virtual Replication Appliances (VRAs) on ESX/ESXi hosts:

1. In the Zerto User Interface, click **SETUP > VRAs.**
2. Select a host which requires a VRA and click **NEW VRA.**

The Configure and Install VRA dialog is displayed. The dialog displayed depends on the ESXi version:

- **ESXi versions from 5.5**

  *(vSphere only)* From ESXi 5.5, by default, Zerto Virtual Manager creates a **.VIB** *(vSphere Installation Bundle)* which is used to set up a secure communication channel to the host. The .VIB is installed on the host when the VRA is installed. When using VIB:

  • The user does not enter a password.
  • Once a day, Zerto Virtual Manager checks that the VRA and host can connect. If the connection fails, Zerto Virtual Manager re-initiates the connection automatically and logs it.

- **ESXi versions before version 5.5**

  *(vSphere only)* For ESX/i versions earlier than 5.5, when using a password, Zerto Virtual Manager connects to the host using the root password. Once a day, Zerto Virtual Manager checks that the password is valid. If the password was changed, an alert is issued, requesting the user enter the new password.
• **Use credentials to connect to host:** When unchecked, the Zerto Virtual Manager uses VIB to set up a secure communication channel to the host. This field is only relevant for ESXi 5.5 and later.

• **Host Root Password:** When the VRA should connect to the host with a password, check **Use credential to connect to host** and enter the root user password used to access the host. When the box on the right side is checked, the password is displayed in plain text. This field is only relevant for ESXi 5.x hosts.

• **Datastore:** The datastore that contains the OS disks of the VRA VM. You can install more than one VRA on the same datastore.

• **Network:** The network used to access the VRA.

• **VRA RAM:** The amount of memory to allocate to the VRA. The amount determines the maximum buffer size for the VRA for buffering IOs written by the protected virtual machines, before the writes are sent over the network to the recovery VRA. The recovery VRA also buffers the incoming IOs until they are written to the journal. If a buffer becomes full, a **Bitmap Sync** is performed after space is freed up in the buffer. For details, refer to Zerto Scale and Benchmarking Guidelines.

• **VRA Group:** Choose the VRA Group from the dropdown list. To create a new VRA group, type in the name of the new group and click **CREATE.** You can then choose the new group from the dropdown list.

You group VRAs together when VRAs use different networks so they can be grouped by network, for example when the protected and recovery sites are managed by the same vCenter Server and you want to replicate from the branch site to the main site. Within a group the priority assigned to a VPG dictates the bandwidth used and is applicable within a group and not between groups. Thus, a VPG with a high priority is allocated bandwidth before VPGs with lower priorities. VPGs that are on VRAs with different VRA groups, for example, VPG1 on VRA1 in group1 and VPG2 on VRA2 in group2, do not affect each other, as the priority is relevant only within each group.

3. **Specify the following VRA Network Details:**

   • **Configuration:** Either have the IP address allocated via a static IP address or a DHCP server. If you select the **Static** option, which is the recommended option, enter the following:
   
   • **Address:** The IP address for the VRA.
   
   • **Subnet Mask:** The subnet mask for the network. The default value is **255.255.255.0.**

   • **Default Gateway:** The default gateway for the network.

4. **Click INSTALL.**

The VRA installation starts and the status is displayed in the TASKS popup dialog in the status bar and under **MONITORING > TASKS.**

The VRA displayed name, and DNS name, is **Z-VRA-hostname.** If a virtual machine with this name exists, for example when a previous VRA was not deleted, the VRA name has a number appended to it.
Configure Paired Site Routing Dialog

The IP address, subnet mask, and gateway to access the peer site VRAs when access to the peer site VRAs is not via the default gateway.

- **Enable Paired Site Routing:** When checked, enables paired site routing.
- **Address:** The IP address of the next hop at the local site, the router, or gateway address that is used to access the peer site network.
- **Subnet Mask:** The subnet mask for the peer site network.
- **Gateway:** The gateway for the peer site network.

These access details are used to access the VRAs on the peer site.

The settings in the Configure Paired Site Routing dialog apply to all VRAs installed after the information is saved. Any existing VRA is not affected and access to these VRAs continues via the default gateway. If the default gateway stops being used, you must reinstall the VRAs that were installed before setting up paired site routing.

Configure Provider vDCs Dialog

Accessed from Site Settings > Cloud Settings tab > Datastore Configuration area.
Used by Zerto Cloud Service Providers to define provider vDCs, and to define which datastores can be used by Zerto, to which purpose.

Datastores which are not listed in this window may be used by Zerto, unless they are explicitly excluded.

**Note:**

Before setting up Zerto to work with vCD, you must have an AMQP server installed.

- Zerto provides an AMQP installation kit if you do not have one installed for vCD, available as a download from the Zerto Support Portal, from the downloads page.
- Run ZertoAMQPInstallWizard.exe from the kit and when prompted enter the IP or host name of the vCD and the administrator user and password to access this vCD.
- The Zerto Virtual Manager connects to the vCD and checks whether an AMQP server is installed.
  - If an AMQP server is not installed, Zerto recommends using RabbitMQ, which in turn requires Erlang/OTP.
  - Links to the sites to install both Erlang/OTP and RabbitMQ are provided as part of the Zerto AMQP installation. Use these links to install Erlang/OTP and then RabbitMQ, then you can continue with the Zerto AMQP installation.
  - If an AMQP server was already installed, change the connection details displayed to those defined in vCD.
  - If you installed the AMQP server as part of the Zerto AMQP installation, the default settings for these installations are displayed, with a user and password of guest.
At the end of the Zerto AMQP installation, vCD is updated with these settings, in AMQP Broker Settings under Administration > Blocking Tasks > Settings.

To configure access to provider vDCs, and their datastore’s configuration:

1. In the **Provider vDCs** area (top), click **Add**. A list of provider vDCs appear.

   The provider vDCs were created by the Cloud Service Providers according to predefined service levels, storage availability, performance requirements or cost.
   - Add the provider vDCs which will be available for use in Zerto.

2. In the **Provider Datastore** area select one of the following:
   - **Unlisted datastores are not used by Zerto**: Clearly define that datastores which are not listed in this window cannot be used.
   - **Unlisted datastores can be used for all purposes**: Allow unlisted datastores of all provider vDCs, even those provider vDCs that were not added to the list of Provider vDCs can be used for any purpose.

3. In the **Provider Datastore** area, click **Add**, to add datastores.

   - Select the **Recovery Volume** checkbox, if the datastore can be used as a recovery datastore.
   - Select the **Journal** checkbox if the datastore can be used for the journal.
   - Select the **Preseed** checkbox if the datastore can be used for preseeded disks. Only datastores marked as preseeded can be used, preventing different organizations being exposed to datastores of other customers using the preseed option.
   - In order to exclude a datastore, add it to the list, then deselect all checkboxes.
Configure VM Settings Dialog

Specifies the values to use when restoring the selected virtual machines.

- **Restore on Host**: The IP address of the host where you want the virtual machine restored.
- **Restore on Datastore / Storage**: The datastore/storage to use for the restored virtual machine files.
- **Power On**: Select this if you want the restored virtual machine to be powered on.

Configure Volume Dialog (vCD)

Used in **vCD environments only**.

To configure the datastore for recovery. If a cluster or resource pool is selected for the host, only datastores that are accessible by every ESX/ESXi host in the cluster or resource pool are displayed.

- **Temp Data Disk**: If the virtual machine to be replicated includes a temp data disk as part of its configuration, you can specify a mirror disk for replication that is marked as a temp data disk. In this case, data is not replicated to the temp data disk after initial synchronization.

- **Use vCD Managed Storage Profile**: The datastore is allocated based on the available free space. You can specify whether the recovery volume is thin provisioned or not. If the Org vDC only supports thin-provisioned volumes, you cannot change the setting. If Zerto cannot find a storage profile that can be used as target storage, the value is set to Zerto.Any. In this case, any of the datastores configured in the **Configure Provider vDCs** dialog can be selected as recovery datastores, provided they are exposed to the relevant recovery hosts. Upon recovery, Zerto chooses a storage profile available to the Org vDC, for the recovered vApp, that contains all of the datastores on which recovery volumes of the VPG reside. If there is no such storage profile, the recovery operation cannot start. The storage profile can be set to Zerto.Any for a number of reasons, such as adding a virtual machine to the VPG which does not have a storage profile that can be used as the target.

- **Preseed**: A virtual disk (the vmdk flat file and header file) in the recovery site that has been prepared with a copy of the protected data, so that the initial synchronization is much faster since a Delta Sync is used to synchronize any changes written to the recovery site after the creation of the preseeded disk. When using a preseeded VMDK, you specify the exact location, the preseed folder configured for the customer and the disk name, of the preseeded disk. A provider datastore must have been specified for preseeded disks in the **Configure Provider vDCs Dialog on page 310** dialog. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA. Note that if the virtual machine has more than one preseeded disk, these disks must reside on the same datastore. If the preseeded disk is greater than 1TB on NFS storage, the VPG creation might fail. This is a known
VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. Refer to the VMware documentation, http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919, which describes the configuration option to tune the RPC timeout parameter using the esxfg-advcfg -s <Timeout> /NFS/SetAttrRPCTimeout command.

If the VPG is being defined for a Zerto Organization, ZORG, the location of the preseeded disk must be defined in the Zerto Cloud Manager. For details, refer to Zerto Cloud Manager Administration Guide.

**Note:** Zerto supports the **SCSI protocol**. Only disks that support this protocol can be specified.

### Edit NIC Dialog

Specify the NIC settings when restoring a retention set to the recovery site.

- **NIC Name:** The name of the selected NIC.
- **Network:** The network to use for the restored virtual machine.
- **Create new MAC address:** The Media Access Control address (MAC address) to use. The default is to use the same MAC address for the restored virtual machine that was used in the protected site. Check the box to create a new MAC address on the restore site.
• **Change vNIC IP Configuration:** Whether or not to keep the default virtual NIC (vNIC) IP configuration. The vNIC IP is changed after the restore has completed when VMware Tools are installed.
  * If **Static** is selected, the IP address, subnet mask, and default gateway must be set.
  * If **DHCP** is selected, the IP configuration and DNS server configurations are assigned automatically, to match the protected virtual machine.

• **IP Address:** The IP for the restored virtual machine. This can be the same IP as the original protected virtual machine.

• **Subnet Mask:** The subnet mask for the network. The default value is **255.255.255.0**.

• **Default Gateway:** The default mask for the network.

• **Preferred DNS Server:** The IP address of the primary DNS server to handle Internet protocol mapping.

• **Alternate DNS Server:** The IP address of the alternate DNS server.

• **DNS Suffix:** The DNS name excluding the host.

**Edit Selected Volumes Dialog**

![Edit Selected Volumes Dialog](image)

If more than one datastore is selected, the path is not displayed.

• **Datastore / Raw Disk / Storage:** The storage or RDM disk where the virtual machine files will be restored.

• **Thin:** Whether the virtual machine disks will be thin-provisioned or not.
Edit the replication settings for a particular virtual machine in a VPG.

- **Recovery Host**: The cluster, resource pool, or host that will host the recovered virtual machine. If the site is defined in Zerto Cloud Manager, only a resource pool can be specified and the resource pool must also have been defined in Zerto Cloud Manager. For details about Zerto Cloud Manager, see Zerto Cloud Manager Administration Guide.

  When a resource pool is specified, Zerto checks that the resource pool capacity is enough for the specified virtual machine.

- **VM Recovery Datastore**: The datastore where the VMware metadata files for the virtual machine are stored, such as the vmx file. If a cluster or resource pool is selected for the host, only datastores that are accessible by every ESX/ESXi host in the cluster or resource pool are displayed. This is also the datastore where RDM backing files for recovery volumes are located. When specifying the recovery datastore for a virtual machine with a storage cluster, specify a datastore in the cluster.

- **Journal Size Warning Threshold**: The size of the journal that triggers a warning that the journal is nearing its hard limit.
  - **Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery datastore. If **Unlimited** is chosen, the fields Size and Percentage are not relevant.
  - **Size (GB)**: The maximum journal size in GB.
  - **Percentage**: The percentage of the virtual machine volume size the journal can grow to.

- **Journal Size Hard Limit**: The maximum size that the journal can grow, either as a percentage or a fixed amount. The minimum journal size set by Zerto is 8GB. The journal is always thin-provisioned.
  - **Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery datastore. If **Unlimited** is chosen, the fields Size and Percentage are not relevant.
  - **Size (GB)**: The size in GB that will generate a warning.
  - **Percentage**: The percentage of the virtual machine volume size that will generate a warning.
Both the value of Size and Percentage must be less than the configured hard limit so that the warning will be generated when needed. In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

- **Journal Datastore:** The datastore used for the journal data for each virtual machine in the VPG. To change the default, specify a host and then select one of the datastores accessible by this host to be used as the journal datastore. When you select specific journal datastore, the journals for each virtual machine in the VPG are stored in this datastore, regardless of where the recovery datastores are for each virtual machine. In this case, all the protected virtual machines must be recovered to hosts that can access the specified journal datastore.

---

**Edit VM Dialog (vCD)**

Appears **only** in environments with vCD.

![Edit VM Dialog](image)

- **Storage Policy:** The Storage Policy in which the **VM configuration files** will reside. See considerations below.

- **Journal Storage Policy:** The Storage Policy in which the **VM Journal files** will reside. See considerations below.

1. When selecting a **Storage Policy**, consider the following:

   - Zerto will select a datastore from the selected Storage Policy in which to place these files, unless the datastore is excluded in the Configure Provider vDCs Dialog.
   
   - Zerto will try to determine a default Storage Policy according to:
     
     - A Storage Policy with the same name as the protected Storage Policy.
     
     - The default Orgvdc Storage Policy.
   
   If Zerto did not manage to determine a default Storage Policy, this field appears empty.

   - When you **click to edit**, a list of Storage Policies appear. These Storage Policies:
     
     - Were defined in VMware vCloud Director and are configured in the Orgvdc.
     
     - Have at least one Datastore that was not excluded as a Recovery Volume in the Configure Provider vDCs Dialog.

2. When selecting a **Journal Storage Policy**, consider the following:
• Zerto will select a datastore from the selected Storage Policy in which to place the Journal files, unless the datastore is excluded in the Configure Provider vDCs Dialog.

• The default Journal Storage Policy is the same as the default VM Storage Policy.

• If Zerto did not manage to determine a default Journal Storage Policy, this field appears empty.

• When you click to edit, the option Auto Select appears, and a list of Storage Policies.

• The list of Storage Policies associated with the Journal:
  • Were defined in VMware vCloud Director and are configured in the Orgvdc.
  • Have at least one Datastore that was not excluded as a Journal in the Configure Provider vDCs Dialog.

• Auto Select: Selecting this means that the journal can be placed in any datastore visible to the host that Zerto selected for recovery, unless the datastore is excluded in the Configure Provider vDCs Dialog.

3. Define the remaining fields as follows:

<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recovery Host (not relevant when replicating to vCD)</td>
<td></td>
</tr>
<tr>
<td>(Hyper-V) The cluster or host that will host the recovered virtual machine.</td>
<td></td>
</tr>
<tr>
<td>(vSphere) The cluster, resource pool, or host that will host the recovered virtual machine.</td>
<td></td>
</tr>
<tr>
<td>If the site is defined in Zerto Cloud Manager, only a resource pool can be specified and the resource pool must also have been defined in Zerto Cloud Manager. For details about Zerto Cloud Manager, see Zerto Cloud Manager Administration Guide.</td>
<td></td>
</tr>
<tr>
<td>When a resource pool is specified, Zerto checks that the resource pool capacity is enough for all the virtual machines specified in the VPG</td>
<td>When a resource pool is specified, Zerto checks that the resource pool capacity is enough for all the virtual machines specified in the VPG. If a resource pool is specified and DRS is disabled for the site later on, all the resource pools are removed by VMware and recovery is to any one of the hosts in the recovery site with a VRA installed on it. All resource pool checks are made at the level of the VPG and do not take into account multiple VPGs using the same resource pool. If the resource pool CPU resources are defined as unlimited, the actual limit is inherited from the parent but if this inherited value is too small, failover, move, and failover test operations can fail, even without a warning alert being issued by Zerto Virtual Manager.</td>
</tr>
<tr>
<td>Setting &amp; Description</td>
<td>Select...</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>For Example:</strong> If the Journal Size Hard Limit is configured to a maximum size of 160 GB limit, then during Failover Test, both the Journal History and the Scratch Journal Volume together can take up to 320 GB. Each one with a maximum size of 160 GB limit.</td>
<td><strong>Size (GB):</strong> The maximum journal size in GB.</td>
</tr>
<tr>
<td><strong>Percentage:</strong> The percentage of the virtual machine volume size to which the journal can grow.</td>
<td>• The minimum journal size, set by Zerto, is <strong>8GB</strong> for Hyper-V and vSphere environments, and <strong>10GB</strong> for Microsoft Azure environments.</td>
</tr>
<tr>
<td>• This value can be configured to more than 100% of the protected VM’s volume size.</td>
<td><strong>Journal Size Warning Threshold</strong></td>
</tr>
</tbody>
</table>
## Setting & Description

The size of the journal that triggers a warning that the journal is nearing its hard limit.

### Select...

**Unlimited**: The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.

If Unlimited is selected, Size and Percentage options are **not** displayed.

**Size** (GB): The size in GB that will generate a warning.

**Percentage**: The percentage of the virtual machine volume size that will generate a warning.

*The values of Size and Percentage must be **less** than the configured Journal Size Hard Limit so that the warning will be generated when needed.*

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.

## Journal Storage (Hyper-V), or Journal Datastore (vSphere) (not relevant when replicating to vCD)

The storage/datastore used for the journal data for each virtual machine in the VPG.

**(vSphere)** To change the default, specify a host and then select one of the datastores accessible by this host to be used as the journal datastore. When you select specific journal datastore, the journals for each virtual machine in the VPG are stored in this datastore, regardless of where the recovery datastores are for each virtual machine. In this case, all the protected virtual machines must be recovered to hosts that can access the specified journal datastore.

**(Hyper-V)** To change the default, specify a host and then select the storage location accessible by this host to be used as the journal storage. When you select specific journal storage, the journals for each virtual machine in the VPG are stored in this storage, regardless of where the recovery storage is for each virtual machine. In this case, all the protected virtual machines must be recovered to hosts that can access the specified journal storage.
To review site-specific configurations, see Configure Provider vDCs Dialog on page 310.

<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Journal History</strong></td>
<td></td>
</tr>
<tr>
<td>The time that all write commands are saved in the journal.</td>
<td>• Number of <strong>hours</strong> from 1 to 23</td>
</tr>
<tr>
<td>The longer the information is saved in the journal, the more space is required for each journal in the VPG.</td>
<td>• Number of <strong>days</strong> from 1 to 30</td>
</tr>
<tr>
<td><strong>Default Journal Storage</strong> (Hyper-V), or <strong>Default Journal Datastore</strong> (vSphere)</td>
<td></td>
</tr>
<tr>
<td>The storage/datastore used for the journal data for each virtual machine in the VPG.</td>
<td>• Select the storage/datastore accessible to the host.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is not relevant when replicating to a <strong>vCD</strong> recovery site.</td>
<td>When you select a specific journal storage/datastore, the journals for each virtual machine in the VPG are stored in this storage/datastore, regardless of where the recovery storage/datastore is for each virtual machine. All protected virtual machines are recovered to the hosts that can access the specified journal storage/datastore.</td>
</tr>
</tbody>
</table>
### Journal Size Hard Limit

The maximum size that the journal can grow, either as a percentage or a fixed amount.

The journal is always **thin-provisioned**.

**Note:** The Journal Size Hard Limit applies independently both to the Journal History and also to the Scratch Journal Volume.

*For Example:* If the Journal Size Hard Limit is configured to a maximum size of 160 GB limit, then during Failover Test, both the Journal History and the Scratch Journal Volume together can take up to 320 GB. Each one with a maximum size of 160 GB limit.

- **Unlimited:** The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.
  
  If Unlimited is selected, Size and Percentage options are not displayed.

- **Size (GB):** The maximum journal size in GB.
  
  The minimum journal size, set by Zerto, is **8GB** for Hyper-V and vSphere environments, and **10GB** for Microsoft Azure environments.

- **Percentage:** The percentage of the virtual machine volume size to which the journal can grow.
  
  This value can be configured to more than 100% of the protected VM's volume size.

### Journal Size Warning Threshold

The size of the journal that triggers a warning that the journal is nearing its hard limit.

- **Unlimited:** The size of the journal is unlimited and it can grow to the size of the recovery storage/datastore.
  
  If Unlimited is selected, Size and Percentage options are not displayed.

- **Size* (GB):** The size in GB that will generate a warning.

- **Percentage*: The percentage of the virtual machine volume size that will generate a warning.

*The values of Size and Percentage must be less than the configured Journal Size Hard Limit so that the warning will be generated when needed.

In addition to the warning threshold, Zerto will issue a message when the free space available for the journal is almost full.
4. Click **OK**.

**Edit VM Settings Dialog (AWS)**

![Edit VM Settings Dialog](image)

Edit the network settings for one or more virtual machines in a VPG that will be recovered to AWS. There are recovery settings for failovers and moves, and for failover tests.

**Import Method**

- **AWS Import**: The method that has been used in all past implementations.
- **Zerto Import for all volumes**: This is the fastest import method and uses a zImportVM for all volumes. A zImport virtual machine is created, per volume. For each recovered volume, the zImport virtual machine is terminated when all the data has been imported and its disk has been attached to the recovered virtual machine.
- **Zerto Import for data volumes**: Uses the zImport method for data volumes only. This is the default setting and has a faster RTO than AWS Import.

**VPC Network**: A virtual network dedicated to your AWS account.

**Subnet**: A range of IP addresses in your VPC.

**Security Group**: The AWS security to be associated with the virtual machines in this VPG. You can associate one or more security groups with the virtual machines.

**Instance Family**: The instance family from which to select the type. AWS instance families are optimized for different types of applications. Choose the instance family appropriate for the application in the virtual machine protected in the VPG.

**Instance Type**: The instance type, within the instance family, to assign to recovered instances. Different types within an instance family vary primarily in vCPU, ECU, RAM, and local storage size. The price per instance is directly related to the instance size.
**Private IP:** The private IP of an instance from the selected subnet. If you do not set the private IP, during recovery, AWS sets the private IP from the defined subnet range.

### Edit VM Settings Dialog (Azure)

Edit the network settings for one or more virtual machines in a VPG that will be recovered to Azure. There are recovery settings for failovers and moves, and for failover tests.

- **VNet:** A virtual network dedicated to your Azure subscription.
- **Subnet:** A range of IP addresses in your VPC.
- **Network Security Group:** The Azure network security to be associated with the virtual machines in this VPG. You can associate one or more network security groups with the virtual machines.
- **Recovery Disk Type:** Select the Azure recovery storage type to which the selected virtual machines will be recovered to; Managed Premium SSD, Managed Standard SSD or Managed Standard HDD. The Virtual Machine Series and Virtual Machine Size fields are updated with the relevant options based on the selected Recovery Disk Type.
- **Virtual Machine Series:** The virtual machine series from which to select the size. Azure virtual machine series are optimized for different types of applications. The default is set to DSv2. You can choose the virtual machine series appropriate for the application being protected in the VPG.
- **Virtual Machine Size:** The virtual machine size, within the virtual machine series, to assign to recovered virtual machines. Different sizes within a virtual machine series vary, for example in a number of cores, RAM, and local storage size. The default is set to Standard_DS1_v2. You can choose the virtual machine size appropriate for the application being protected in the VPG. The price per virtual machine is related to the virtual machine configuration.
- **Private IP:** The private IP of an instance from the selected subnet. If you do not set the private IP, during recovery, Azure sets the private IP from the defined subnet range.

### Edit vNIC Dialog

To configure the NIC used for the replicated VM disks. You can configure a maximum of four NICs.
Note: You can only change the vNIC IP for virtual machines with VMware Tools running.

Specify the network details to use for the recovered virtual machines after a failover or move operation, in the Failover/Move column, and for the recovered virtual machines when testing replication, in the Test column.

1. In each column, specify the following:
   - **Network**: The network to use for this virtual machine.
   - **Create new MAC address?**: Whether the Media Access Control address (MAC address) used on the protected site should be replicated on the recovery site. The default is to use the same MAC address on both sites. Note that if you check this option, to create a new MAC address, and the current IP address is not specified, the protected virtual machine static IP address might not be used for the recovered virtual machine.
   - **Change vNIC IP Configuration?**: Whether or not to keep the default virtual NIC (vNIC) IP configuration. The vNIC IP is only changed after recovery for virtual machines with VMware Tools running.

   See the [Zerto Interoperability Matrix](#) for the list of operating systems for which Zerto supports Re-IPing.

   - To change the vNIC IP, in the Failover/Move or Test column, select **Yes**. If you select to use a static IP connection, set the **IP address**, **subnet mask**, and **default gateway**.
   - Optionally, change the preferred and alternate DNS server IPs and the DNS suffix.
   - If you leave the DNS server and suffix entries empty, or select to use DHCP, the IP configuration and DNS server configurations are assigned automatically, to match the protected virtual machine. You can change the DNS suffix.
• If the virtual machine has multiple NICs but is configured to only have a single default gateway, fill in a 0 for each octet in the Default gateway field for the NICs with no default gateway.

During a failover, move, or test failover, if the recovered virtual machine is assigned a different IP than the original IP, then after the virtual machine has started, it is automatically rebooted so that it starts up with the correct IP. If the same network is used for both production and test failovers, Zerto recommends changing the IP address for the virtual machines started for the test, so that there is no IP clash between the test machines and the production machines.

• **Copy to failover test:** Select this to copy the settings in the Failover/Move column to the Test column.

• **Copy to failover/move:** Select this to copy the settings in the Test column to the Failover/Move column.

**Edit vNIC Dialog (vCD)**

![Edit vNIC Dialog](image)

Appears *only* in environments with vCD.

To configure the network details to use for the **recovered** virtual machines after a Failover or Move or Test operation:

• **Network:** The network to use for this virtual machine.

• **MAC Address:** Whether the Media Access Control address (MAC address) used on the protected site should be replicated on the recovery site. The default is to use the same MAC address on both sites.

• **vNIC IP Mode:** Which IP mode to use. If you define **static IP pool**, also specify the **IP address**.

**Note:**

During a Failover, Move, or Test failover:
• If the recovered virtual machine is assigned a different IP than the original IP, then after the virtual machine has started, it is automatically rebooted so that it starts up with the correct IP.

• If the same network is used for both production and test failovers, Zerto recommends changing the IP address for the virtual machines started for the test, so that there is no IP clash between the test machines and the production machines.

• **Copy to failover test:** Copies the settings in the Failover/Move column to the Test column.

• **Copy to failover/move:** Copies the settings in the Test column to the Failover/Move column.

## Setting & Description

<table>
<thead>
<tr>
<th>Select...</th>
<th>Volume Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Hyper-V) Select a Volume Source for recovery from one of the drop-down options:</td>
<td>Volume Source &gt; Storage: A new volume is used for replicated data.</td>
</tr>
<tr>
<td>Storage</td>
<td>From the Storage drop-down list, specify the storage to use to create disks for the replicated data.</td>
</tr>
<tr>
<td>Preseeded volume</td>
<td>The storage specified for the replication must have at least the same amount of space as the protected volume and then an additional amount for the journal.</td>
</tr>
<tr>
<td></td>
<td>The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.</td>
</tr>
<tr>
<td></td>
<td>For more details, see Zerto Scale and Benchmarking Guidelines, in the section Estimating WAN Bandwidth for VMware and Hyper-V.</td>
</tr>
<tr>
<td></td>
<td>Volume Source &gt; Preseeded volume: Whether to copy the protected data to a virtual disk in the recovery site.</td>
</tr>
<tr>
<td></td>
<td>Zerto recommends using this option particularly for large disks so that the initial synchronization will be faster since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>When not using a preseeded disk, the initial synchronization phase must copy the whole disk over the WAN.</td>
</tr>
<tr>
<td></td>
<td>When using a preseeded virtual disk, you select the storage and exact location, folder, and name of the preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.</td>
</tr>
<tr>
<td></td>
<td>Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.</td>
</tr>
<tr>
<td></td>
<td>The storage where the preseeded disk is placed is also used as the recovery storage for the replicated data.</td>
</tr>
</tbody>
</table>
(vSphere) Select a Volume Source for recovery from one of the drop-down options:

- **Datastore**
- **RDM**
- **Preseeded volume**

**Volume Source > Datastore:** A new volume is used for replicated data.

- Specify the **Datastore** to use to create disks for the replicated data.
- If the **source disk is thin provisioned**, the default for the recovery volume is also thin provisioned.
- The datastore specified for replication must have at least the same amount of space as the **protected volume** and an additional amount for the **journal**.
- The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.

Zerto supports the SCSI protocol. Only disks that support this protocol can be specified.

Then, define the following:

- **Datastore:** The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.

For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section *Estimating WAN Bandwidth for VMware and Hyper-V*.
**Volume Source > RDM:** The VMware RDM (Raw Device Mapping) which will be used for the replication.

By default, **RDM is recovered as thin-provisioned VMDK** in the datastore specified in the **VM Recovery Datastore/Storage** field in the Edit VM dialog, and not to RDM.

Only a raw disk with the **same size as the protected disk** can be selected from the list of available raw disks. Other raw disks with different sizes are not available for selection.

The RDM is always stored in the recovery datastore, used for the virtual machine.

The following **limitations** apply to protecting RDM disks:

- RDM disks with an even number of blocks can replicate to RDM disks of the same size with an even number of blocks and to VMDKs.
- RDM disks with an odd number of blocks can only replicate to RDM disks of the same size with an odd number of blocks and not to VMDKs.
- You cannot define an RDM disk to be protected to a cloud service provider via a Zerto Cloud Connector nor if the virtual machine uses a BusLogic SCSI controller, nor when protecting or recovering virtual machines in an environment running vCenter Server 5.x with ESX/ESXi version 4.1 hosts.
### Setting & Description

<table>
<thead>
<tr>
<th>(vSphere) Volume Source continued</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Volume Source</strong> continued</td>
</tr>
</tbody>
</table>

| **Volume Source > Preseeded volume:** | Select this when you want to copy the protected data to a virtual disk in the recovery site. |

Consider the following, then proceed to define the Datastore and the Path:

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- If you use a preseeded virtual disk, you select the datastore and exact location, folder, and name of the preseeded disk, which cannot be an IDE disk. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

- The datastore where the preseeded disk is placed is also used as the recovery datastore for the replicated data.

- If the preseeded disk is **greater than 1TB on NFS storage,** the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. See VMware documentation, [link](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the **command:**

  ```plaintext```
esxcfg-advcfg -s <Timeout>
/NFS/SetAttrRPCTimeout
```

- If the protected disks are **non-default geometry,** configure the VPG using preseeded volumes.

- If the protected disk is an **RDM disk,** it can be used to preseed to a recovery VMDK disk. Zerto makes sure that the VMDK disk size is a correct match for the RDM disk.

- If the VPG is being defined for a Zerto Organization, ZORG, the
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td>location of the preseeded disk must be defined in the Zerto Cloud Manager. See Zerto Cloud Manager Administration Guide.</td>
<td></td>
</tr>
</tbody>
</table>

Then, define the following:

- **Datastore**: The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.
- **Path**: The full path to the preseeded disk.
<table>
<thead>
<tr>
<th>Setting &amp; Description</th>
<th>Select...</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>(vCD) Select a Volume Source</strong> for recovery from one of the drop-down options:</td>
<td><strong>Volume Source &gt; vCD managed storage policy</strong>: Zerto will select a datastore, from the list of available datastores, in the selected Storage Policy in which to place the Volume, unless the datastore is excluded in the Configure Provider vDCs Dialog.</td>
</tr>
<tr>
<td>• <em>vCD managed storage policy</em></td>
<td>• If there are several valid datastores, the datastore with the most available space is selected.</td>
</tr>
<tr>
<td>• <em>Preseeded volume</em></td>
<td>• Zerto recalculates the datastore available space for each volume sequentially, taking into consideration previously allocated volumes.</td>
</tr>
</tbody>
</table>

**Volume Source > Preseeded volume:**

Select this when you want to copy the protected data to a virtual disk in the recovery site.

- Zerto recommends using this option particularly for **large disks** so that the initial synchronization is faster since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is not selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- The preseeded volume is a virtual disk (the VMDK flat file and descriptor) in the recovery site that has been prepared with a copy of the protected data.

- Browse to the preseed folder configured for the customer and the disk name, of the preseeded disk.

In order to use a preseeded VMDK, do the following:

- Create a folder in vCD to use for the preseeded disks in the datastore you want to use for the customer.

- Specify this datastore as a provider datastore for preseeded disks in the Configure Provider vDCs window, from the Advanced Settings window, as described in Zerto Cloud Manager Administration Guide.

- In the Zerto Cloud Manager specify the Preseed Folder Name for the ZORG, in the Manage ZORG tab.

- Zerto searches for the preseeded folder in the available datastores in the Org vDCs specified in the vCD Cloud Resources for the ZORG in the Zerto Cloud Manager and takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

If the virtual machine has more than one preseeded disk, these disks must reside on the same datastore.
### Setting & Description

<table>
<thead>
<tr>
<th>Select...</th>
</tr>
</thead>
</table>
| • If the preseeded disk is **greater than 1TB on NFS storage**, the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out.  

The timeout default value is 10 seconds. See VMware documentation, [http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the command: `esxcfg-advcfg -s <Timeout> /NFS/SetAttrRPCTimeout`  

• If the VPG is being defined for a Zerto Organization, ZORG, the location of the preseeded disk must be defined in the Zerto Cloud Manager. See Zerto Cloud Manager Administration Guide.  

• Zerto supports the SCSI protocol. Only disks that support this protocol can be specified. Virtual machine RDMs in a vCenter Server are replicated as VMDKs in a vCD environment. |

### (vCD) continued

**Storage Policy:** Specify the Storage Policy for recovery from one of the options:

- Storage Policy per volume is supported only in vCD supported versions, and when the selected Orgvdc is not configured for fast provisioning.

- Zerto will select a datastore from the selected Storage Policy in which to place these files, unless the datastore is excluded in the Configure Provider vDCs Dialog.

- The Storage Policies which appear in the drop-down list:

  - Include the **Use VM Default** option (default), which will apply the VM's storage policy to this volume. This is also the Storage Policy default value.

  - Were defined in VMware vCloud Director and are configured in the Orgvdc.

  - Have at least one Datastore that was not excluded as a Recovery Volume in the Configure Provider vDCs Dialog.

</table>

- Specify the **Datastore** to use to create disks for the replicated data.
- If the **source disk is thin provisioned**, the default for the recovery volume is also thin provisioned.
- The datastore specified for replication must have at least the same amount of space as the **protected volume** and an additional amount for the **journal**.
- The amount of additional space needed for the journal can be fixed by specifying a maximum size for the journal, or can be calculated as the average change rate for the virtual machines in the VPG, multiplied by the length of time specified for the journal history.
- Zerto supports the SCSI protocol. Only disks that support this protocol can be specified.

Then, define the following:

- **Datastore**: The Datastore where the preseeded disk is located. Only disks with the same size as the protected disk can be selected when browsing for a preseeded disk.

For more details, see *Zerto Scale and Benchmarking Guidelines*, in the section **Estimating WAN Bandwidth for VMware and Hyper-V**.
### Setting & Description

| Volume Source > RDM: | The VMware RDM (Raw Device Mapping) which will be used for the replication. |

By default, **RDM is recovered as thin-provisioned VMDK** in the datastore specified in the **VM Recovery Datastore/Storage** field in the Edit VM dialog, and not to RDM.

Only a raw disk with the **same size as the protected disk** can be selected from the list of available raw disks. Other raw disks with different sizes are not available for selection.

The RDM is always stored in the recovery datastore, used for the virtual machine.

The following **limitations** apply to protecting RDM disks:

- RDM disks with an even number of blocks can replicate to RDM disks of the same size with an even number of blocks and to VMDKs.
- RDM disks with an odd number of blocks can only replicate to RDM disks of the same size with an odd number of blocks and not to VMDKs.
- You cannot define an RDM disk to be protected to a cloud service provider via a Zerto Cloud Connector nor if the virtual machine uses a BusLogic SCSI controller, nor when protecting or recovering virtual machines in an environment running vCenter Server 5.x with ESX/ESXi version 4.1 hosts.
The Zerto Virtual Manager User Interface

### Setting & Description

**(vSphere) Volume Source** continued

**Volume Source > Preseeded volume:** Select this when you want to copy the protected data to a virtual disk in the recovery site.

Consider the following, then proceed to define the Datastore and the Path:

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.

- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.

- If you use a preseeded virtual disk, you select the datastore and exact location, folder, and name of the preseeded disk, which cannot be an IDE disk. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

- The datastore where the preseeded disk is placed is also used as the recovery datastore for the replicated data.

- If the preseeded disk is **greater than 1TB on NFS storage**, the VPG creation might fail. This is a known VMware problem when the NFS client does not wait for sufficient time for the NFS storage array to initialize the virtual disk after the RPC parameter of the NFS client times out. The timeout default value is 10 seconds. See VMware documentation, [http://kb.vmware.com/selfservice/microsites/search.do?language=en-US&cmd=displayKC&externalId=1027919](http://kb.vmware.com/selfservice/microsites/search.do?language=en-US&cmd=displayKC&externalId=1027919), which describes the configuration option to tune the RPC timeout parameter by using the command: `esxcfg-advcfg -s <Timeout>/NFS/SetAttrRPCTimeout`

- If the protected disks are **non-default geometry**, configure the VPG using preseeded volumes.

- If the protected disk is an **RDM disk**, it can be used to preseed to a recovery VMDK disk. Zerto makes sure that the VMDK disk size is a correct match for the RDM disk.

- If the VPG is being defined for a Zerto Organization, ZORG, the.

</tr>
<tr>
<td>• <strong>Preseeded volume</strong></td>
<td>• Zerto recalculates the datastore available space for each volume sequentially, taking into consideration previously allocated volumes.</td>
</tr>
</tbody>
</table>

**Volume Source > Preseeded volume:**

Select this when you want to copy the protected data to a virtual disk in the recovery site.

- Zerto **recommends** using this option particularly for **large disks** so that the initial synchronization is **faster** since a Delta Sync can be used to synchronize any changes written to the recovery site after the creation of the preseeded disk.
- If a preseeded disk is **not** selected, the initial synchronization phase must copy the **whole disk** over the WAN.
- The preseeded volume is a virtual disk (the VMDK flat file and descriptor) in the recovery site that has been prepared with a copy of the protected data.
- Browse to the preseed folder configured for the customer and the disk name, of the preseeded disk.

In order to use a preseeded VMDK, do the following:

- Create a folder in vCD to use for the preseeded disks in the datastore you want to use for the customer.
- Specify this datastore as a provider datastore for preseeded disks in the Configure Provider vDCs window, from the Advanced Settings window, as described in Zerto Cloud Manager Administration Guide.
- In the Zerto Cloud Manager specify the Preseed Folder Name for the ZORG, in the Manage ZORG tab.
- Zerto searches for the preseeded folder in the available datastores in the Org vDCs specified in the vCD Cloud Resources for the ZORG in the Zerto Cloud Manager and takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.

If the virtual machine has more than one preseeded disk, these disks must reside on the same datastore.

---

**Edit VRA Dialog**

To change the network settings for a VRA, for example when the gateway to the VRA is changed.

- **Host**: The IP of the host on which the VRA is installed.

  For ESXi 5.5 and later hosts, by default, Zerto Virtual Manager uses a vSphere Installation Bundle,
VIB, to connect to the host. When using VIB:

- The user does not enter a password.
- Once a day, Zerto Virtual Manager checks that the VRA and host can connect. If the connection fails, Zerto Virtual Manager re-initiates the connection automatically and notes this in the log.

When using a password, root access is required if the Zerto host component is down and needs an automatic restart. Once a day, Zerto Virtual Manager checks that the password is valid. If the password was changed, an alert is triggered, requesting the user enter the new password.

- (vSphere only) **Use credentials to connect to host**: When unchecked, the Zerto Virtual Manager uses VIB to connect to the host. This field is only relevant for ESXi 5.5 and later.

  **Note**: In Zerto Enterprise Government Edition (EGE), this field is unavailable.

- (vSphere only) **Host Root Password**: When the VRA should connect to the host with a password, select **Use credentials to connect to host**, then enter the root user password used to access the host. When the box on the right side is selected, the password is displayed in plain text. This field is only relevant for ESXi 4.x and 5.x hosts. This field is disabled for ESX 4.x hosts.

  **Note**: In Zerto Enterprise Government Edition (EGE), the **Show password** field is unavailable.

- **VRA Bandwidth Group**: The free text to identify the group to which a VRA belongs. If you create a group and then change the name when editing the VRA so that there is no VRA in the site that belongs to the originally specified group, the group is automatically deleted from the system.

  To create a new group, enter the new group name over the text **New group** and click **CREATE**.

- **Configuration**: Either have the IP address allocated via a static IP address or a DHCP server. If the VRA was originally installed with a static IP, you cannot change this to DHCP. If the VRA was originally installed to use a DHCP server, you can change this to use a static IP.

- **Address**: The static IP address for the VRA to communicate with the Zerto Virtual Manager.

- **Subnet Mask**: The subnet mask for the network. The default value is **255.255.255.0**.

- **Default Gateway**: The default gateway for the network.

**License Dialog**

The Zerto license includes information such as the number of virtual machines that can be protected and the license expiry date. You can see these details by clicking ☐ in the top right of the header and selecting **License**.
The Zerto license includes the following details:

- **License**: The license key itself.
- **License Type**: What is licensed: whether the license restricts the number of virtual machines that can be protected or the number of sockets used.
- **Expiry Date**: The license expiry date.
- **Quantity**: The maximum amount licensed, either virtual machines or sockets, based on the license type. If blank, the quantity is unlimited.
- **Usage**: The sites using the license and the number of protected virtual machines in each site.

A warning is generated when either the license expires or more than the licensed number of virtual machines are being protected. Protection continues but the license should be updated. After getting a new license key you can update Zerto with this key.
Manage Static Routes Dialog

When providing DR as a Service, the cloud service provider needs to ensure complete separation between the organization network and the cloud service provider network. The cloud service provider needs to be able to route traffic between an organization network and the cloud replication network, in a secure manner without going through complex network and routing setups.

The cloud service provider can define a Zerto Cloud Connector per organization site, that has two Ethernet interfaces, one to the organization’s network and one to the cloud service provider’s network. If the cloud service provider wants to add additional security, considering both cloud connector interfaces as part of the organization network, the cloud service provider can define a static route that will hop to a different cloud network, specifically for use by the Zerto Virtual Manager and VRAs in the cloud site.

- **ADD**: Click this field to add an entity and to define the static route it will use. Once you click ADD, the dialog changes:
• **NEW GROUP**: Defines a group that will use a static route to the subnet used by the Zerto Virtual Manager. Enter the name of the organization that will use this static route.

**Add Static Route**: Opens the *Add Static Route Dialog on page 295.*

**New Repository Dialog**

Zerto keeps the retention sets in Repositories. As the retention process is running on the recovery site, the repositories are connected to the recovery VRAs. Zerto can connect to these repositories using NFS, SMB (CIFS) or HPE StoreOnce Catalyst protocols, where the underlying storage can be either standard storage appliances or Purposely Built Backup Appliances (PBBAs) such as ExaGrid or HPE StoreOnce.

Once the repository has been configured, it can be selected as a target in the VPG retention policy configuration. Before you proceed, read the *Considerations: on page 348*

**Considerations:**

- **HPE StoreOnce Catalyst Considerations:**
  - The Catalyst Store on the HPE StoreOnce appliance must support LBW as the “Transfer policy”.
  - Catalyst API server version should be v9 and above.
  - The Catalyst Store on the HPE StoreOnce appliance must allow access to the recovery VRA. The default setting is No Access. A user with Administrator Role can enable access through the Catalyst User Interface.
  - The Catalyst Store on the HPE StoreOnce appliance must have credentials already defined. These credential are used when setting up the Repository in the Zerto User Interface.
  - The HPE StoreOnce Catalyst repository requires increasing the VRAs RAM to 4GB. 1GB will be allocated for Catalyst usage.

**To create a repository for Long Term Retention:**
1. In the Zerto User Interface, click **SETUP > REPOSITORIES > NEW REPOSITORY**.

![New Repository window](image)

The New Repository window is displayed.

2. In the General area, specify the following:

   - **Name**: A unique name for the repository.
   - **Storage Type**: The type of storage can be a network share, selected PBBAs or other deduplicating appliance. See the [Interoperability Matrix](#) for supported versions.

<table>
<thead>
<tr>
<th>Storage Type</th>
<th>Network Share</th>
<th>Other De-Duplicating Storage Appliances</th>
</tr>
</thead>
<tbody>
<tr>
<td>HPE StoreOnce</td>
<td>ExaGrid</td>
<td>Dell EMC DataDomain</td>
</tr>
<tr>
<td>Purposely Built Backup Appliances (PBBAs):</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

New Repository Dialog

### Connection Type:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NFS</strong></td>
<td>The network share is connected on top of NFS protocol.</td>
</tr>
<tr>
<td><strong>SMB</strong></td>
<td>The network share is connected on top of SMB (CIFS) protocol. Username and password must be provided to access the share.</td>
</tr>
</tbody>
</table>

**Username:** The username can be entered using either of the following formats:
- username
- domain\username

**Password:** Password to access the Network Share.

**HPE StoreOnce Catalyst**

**Username:** The username can be entered using either of the following formats:
- username
- domain\username

**Password:** Password to access the Catalyst store.

**Catalyst Server:** IP of the HPE StoreOnce appliance that holds the Catalyst store.

**Catalyst store name:** The Catalyst store name in HPE StoreOnce appliance.

3. In the Location area, define the **Path.** This is the path where the Repository will reside. This field does not apply to HPE StoreOnce Catalyst connection type. Zerto recommends using an empty folder when creating a new Repository.

   The path must be accessible from the VRA, so if the Repository is on a different domain, the domain must be included in the path.

4. In the Properties area, you can check the **Set as default repository** checkbox. This will use the Repository as the default when defining the Retention policy in a VPG.

5. Click **SAVE.** The repository is created.

After setting up a Repository, you can protect virtual machines for longer periods of times, enabling Zerto's Long Term Retention.

After setting up a repository, you can protect virtual machines with extended recovery, enabling Zerto Long Term Retention.
Offsite Clone Dialog

To create a clone of each virtual machine in a VPG on the recovery site in the production network. The clone is a copy of the protected virtual machines on the recovery site, while the virtual machines on the protected site remain protected and live.

- **SELECT A CHECKPOINT**: Opens the Checkpoints Dialog to select the checkpoint to use to make the clone.

  The Using checkpoint field is updated with your selection.

- **(On-Premise) Recovery Datastore**: Select the datastore to use for the recovery virtual machines.

- **Advanced**: Select specific VMs to clone.

For more details, see *Checkpoints Dialog on page 307*.

Open Support Ticket Dialog

Support cases can be opened directly in the Zerto User Interface.

Creating a support case in the Zerto User Interface simplifies the submission process since much of the information that is required when entering a case using the Zerto Support Portal, such as the version and build numbers, is automatically added to the case when it is submitted via the Zerto User Interface.

In addition, when the case is submitted, a snapshot of the current environment is also attached to the case. The snapshot information includes the lists of alerts, events, tasks, VPGs, and virtual machines that are protected.

This information is used to help Zerto resolve the case quickly and, whenever possible, without the need to request more information from you.

**Note:** The clocks on the machines where Zerto is installed must be synchronized with UTC and with each other (the timezones can be different). Zerto recommends synchronizing the clocks using NTP. If the clocks are not synchronized with UTC, submitting a support case can fail.

To open a support case:
1. In the Zerto User Interface, click in the top right of the header and select Open a Case.

The Open Support Case window for the site opens.

![Open Support Case Window](image)

2. Specify the case details:
   - **Subject**: The subject of the support case.
   - **Type**: The type of case being opened. Available options are:
     - Problem
     - Question
   - **Description**: A description of the problem or question in addition to the information supplied in the subject.
   - **Allow remote log collection**: How many logs is Zerto allowed to collect. Available options are:
     - Only for this case
     - For the next 30 days
     - Never
   - **SSP Email Address**: A valid email address registered with Zerto, with permission to open cases.

3. Click **Submit**.

The case is processed and its progress is displayed. If the email address is not valid, the case is rejected. Once the case submission starts, it cannot be canceled.
Remote Support Dialog

Remote Log Collection allows customers to authorize Zerto support engineers to collect logs from their environment. By using remote log collection customers can avoid having to use the Diagnostic Tool on their ZVM server in order to collect logs for analysis, a potentially complex and time-consuming procedure.

- **Never**: Remote log collection is not allowed (default). If remote log collection is currently allowed, the remote connection will be terminated if you select this option.
- **For the next 30 days**: Remote log collection is allowed. This permission will automatically terminate in 30 days unless terminated by selecting the Never option.
- **Only for the duration of a specific case**: You will be prompted to select the Case number from the drop-down list. The list contains all the active cases opened under the account that the Zerto Virtual Manager is registered to. Remote log collection will be allowed for as long as the case is active or until remote log collection is terminated by selecting the Never option.
Restore VPG - NICs Dialog

When restoring a retention set to the recovery site, this dialog shows the NIC settings for the virtual machines in the VPG. You can choose to edit information in one field by clicking the field and updating the information. You can choose to edit the NIC settings for several virtual machines at the same time by selecting the NICs and clicking **EDIT SELECTED**.

**Restore VPG - Volumes Dialog**

When restoring a retention set to the recovery site, this window shows the datastores for a selected virtual machine in the VPG.

- You can edit information in one field by clicking the field and updating the information.
- You can edit several datastore settings at the same time by selecting the datastores and clicking **EDIT SELECTED**.

**Site Settings Dialog**

Contains site-wide settings:
To update information about the local site:

1. In the Zerto User Interface (top right), click **SETTING** (≡) and select **Site Settings**. The Site Settings dialog is displayed.

   - In **vSphere** and **Hyper-V** sites, the following fields are displayed:

   ```
   SITE DETAILS
   Site Name* site-1 at Zerto
   Site Location* site-1
   Contact Name* site-1@zerto.com
   Contact Email site-1@zerto.com
   Contact Phone 066-6666666
   
   USER CREDENTIALS
   Username Invalid
   Password
   ```

   - In **AWS** sites, the following fields are displayed:

   ```
   SITE DETAILS
   Site Name* ZCAHLandin_AWS016
   Site Location* AWSlocation
   Bucket Name Zerto-6227f2031-49a4-41bd-89fe-506f47747f
   Contact Name* Password
   Contact Email Unconfigured contact email
   Contact Phone 5400000000
   
   USER CREDENTIALS
   Access Key ID
   Secret Access Key
   ```

   - In **Microsoft Azure** sites, the following fields are displayed:
2. Define general information about the site.
   - (Mandatory) **Site Name**: The name used to identify the site.
   - (Mandatory) **Site Location**: Information such as the address of the site or a significant name with which to identify the site location.
   - (AWS environments only) **Bucket Name**: The name of the bucket that was created when Zerto was installed. This cannot be changed.
   - (Mandatory) **Contact Name**: The name of the person to contact if a need arises. Mandatory.
   - **Contact Email**: An email address to use if a need arises.
   - **Contact Phone**: A phone number to use if a need arises.

3. (On premise environments) To change the **User Credentials** to access the vCenter or Hyper-V SCVMM server from the Zerto Virtual Manager:
   - **User Name**: The administrator name used to access the vCenter or SCVMM server. The name can be entered using either of the following formats:
     - `username`
     - `domain\username`
   - **Password**: The password used to access the vCenter or SCVMM server for the given user name. To ensure security, after saving the settings, the password field is cleared.

4. (Azure environments only) **Azure Settings**:
   - **Application Name**: The name used to access Azure.
   - **Client ID**: A unique identifier that is associated with the access name.
   - **Subscription**: The subscription associated with the user.
   - **Resource Name**: The name of the resource the user created.
   - **Storage Account Name**: The name of the storage account created or selected for this site during installation. (TA14986)
5. **AWS Settings**:
   - **Access Key ID**: A unique identifier that is associated with a secret access key.
   - **Secret Access Key**: A key that is used with the access key ID.

6. Click **SAVE**.

In the **Disaster and Recovery** area:

- **Failover/Move Commit Policy**: The commit policy to use during a failover or move operation. The value set here is the default for all failover or move operations from this point on but can be changed when defining a failover or move operation. The following options are available:
  - **None**: The failover or move operation must be manually committed or rolled back by the user.
  - **Commit**: After the time specified in the **Default Timeout** field, the failover or move operation is committed. During the specified time you can check the recovered VPG virtual machines, and you can manually commit or roll back.
  - **Rollback**: After the time specified in the **Default Timeout** field the failover or move operation is rolled back, unless you manually commit it or roll it back before the time out value is reached. During the specified time you can check the recovered VPG virtual machines.
- **Default Timeout**: The time-out in minutes after which a **Commit** or **Rollback** is performed. A value of zero indicates that the system automatically performs the commit policy, without waiting for any user interaction.
- **Virtual Machine Series**: The virtual machine series from which to select the size. Azure virtual machine series are optimized for different types of applications. The default is set to DSv2. You can choose the virtual machine series appropriate for the application being protected in the VPG.
- **Virtual Machine Size**: The virtual machine size, within the virtual machine series, to assign to recovered virtual machines. Different sizes within a virtual machine series vary, for example in a number of cores, RAM, and local storage size. The default is set to Standard_DS1_v2. You can choose the virtual machine size appropriate for the application being protected in the VPG. The price per virtual machine is related to the virtual machine configuration.
• **Default Script Execution Timeout**: The length of time in seconds after which a script times out.

• **Replication Pause Time**: The time to pause when synchronizing a VPG if continuing the synchronization will cause all the checkpoints in the journal to be removed.

**Email Settings Dialog**

Define an email address to receive Zerto alerts and retention reports.

• **SMTP Server Address**: The SMTP server address. The Zerto Virtual Manager must be able to reach this address.

• **SMTP Server Port**: The SMTP server port, if it was changed from the default, 25.

• **Sender Account**: A valid email address for the email sender name.

• **To**: A valid email address where you want to send the email.

• **SEND TEST EMAIL** button: Tests that the email notification is set up correctly. A test email is sent to the email address specified in the **To** field.

• **Enable sending alerts**: Check to be notified by email about any Zerto alerts issued. An email is sent when the alert is issued, and after it has been successfully handled and the alert is no longer valid.

**Reports Dialog**

Configures the Resource Report.
• **Sampling Rate:** When to take resource samples to identify resource usage, either daily at a specific hour and minute or hourly at a specific minute within each hour. Note that collecting a sample hourly provides a higher resolution picture of replication traffic than if samples are only collected once a day.

• **Sampling Time:** The time that the sample is taken.

### Stop Failover Test Dialog

![Stop Failover Test Dialog](image)

Stops the testing of the selected VPG.

• **Result:** Whether the test passed or failed.

• **Notes:** A description of the test. For example, defines where external files that describe the tests are saved. Notes are limited to 255 characters.

• Clicking the Stop button stops the testing. After stopping a test, the virtual machines in the recovery site are powered off and then removed, and the checkpoint that was used for the test has the following tag added to identify the test: Tested at startDateAndTimeOfTest.

### TASKS

![TASKS](image)

Monitor the recent tasks by clicking the TASKS area in the status bar at the bottom of the Zerto User Interface. The following information is displayed for the most recent tasks:

• The task status.

• The name of the task.

• A description of the task.

Also, actions, such as stopping a failover test, can be performed from this dialog.
Click **SHOW ALL** to access MONITORING > TASKS.

### Bitmap Sync

Synchronization after a recovery starts after the promotion of data from the journal to the virtual machine disks ends. Thus, synchronization of virtual machines can start at different times, dependent on when the promotion for the virtual machine ends. All synchronizations are done in parallel, whether a delta sync or full sync, etc. on page 364.

A change tracking mechanism of the protected machines during a disconnected state when Zerto starts to maintain a smart bitmap in memory to track and record changed storage areas. Since the bitmap is kept in memory, Zerto does not require any LUN or volume per VPG at the source side.

The bitmap is small and scales dynamically, containing references to the areas of the source disk that have changed but not the actual I/O. The bitmap is stored locally on the VRA within the available resources. For example, when a VRA goes down and is then rebooted.

When required, Zerto starts to maintain a smart bitmap in memory, to track and record storage areas that change. When the issue that caused the bitmap sync is resolved, the bitmap is used to check updates to the source disks and send any updates to the recovery site. A bitmap sync occurs during the following conditions:

- Synchronization after WAN failure or when the load over the WAN is too great for the WAN to handle, in which case the VPGs with the lower priorities will be the first to enter a Bitmap Sync.
- When there is storage congestion at the recovery site, for example when the VRA at the recovery site cannot handle all the writes received from the protected site in a timely fashion.
- When the VRA at the recovery site goes down and is then rebooted.

During the synchronization, new checkpoints are not added to the journal but recovery operations are still possible. If a disaster occurs requiring a failover during a bitmap synchronization, you can recover to the last checkpoint written to the journal.

**Note:** For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.

### Bucket (AWS)

Amazon buckets are like a container for your files. You can name your buckets the way you like but it should be unique across the Amazon system.

### Business Continuity & Disaster Recovery (BC/DR)

An organization’s ability to recover from a disaster and/or unexpected event and resume or continue operations. A disaster recovery, DR, plan is a subset of a Business Continuity plan. Organizations should have a business continuity, BC, plan in place that outlines the logistics and business operations. The key metrics to be measured in a disaster recovery environment are the Recovery Point Objective (RPO) on page 370 and Recovery Time Objective (RTO) on page 370.
<p>| Business Continuity Management (BCM) | Holistic management process that identifies potential threats to an organization and the impacts to business operations that those threats, if realized, might cause, and which provides a framework for building organizational resilience with the capability for an effective response that safeguards the interests of its key stakeholders, reputation, brand and value-creating activities. (ISO 22313, formerly BS 25999-1). |
| Business Continuity Plan | Contains the instructions, procedures and guidelines that are developed and maintained in readiness for use during and after any potentially disruptive event in order to enable the organization to continue to deliver its critical activities at an acceptable, predefined level. |
| Business Impact Analysis (BIA) | The process of analyzing business functions and processes and the effects that a business disruption might have upon them. |
| Checkpoint | Zerto ensures crash consistency by writing checkpoints to the journal every few seconds. These checkpoints ensure write order fidelity and crash-consistency to each checkpoint. During recovery you pick one of these crash-consistent checkpoints and recover to this point. Additionally, checkpoints can be manually added by the administrator, with a description of the checkpoint. For example, when an event is going to take place that might result in the need to perform a recovery, you can pinpoint when this event occurs as a checkpoint in each journal. |
| Cloud Service Provider (CSP) | A service provider that offers customers storage or software services available via a private (private cloud) or public network (cloud). Usually, it means the storage and software is available for access via the Internet. Typically Infrastructure as a Service (IaaS), Software as a Service (SaaS), or Platform as a Service (PaaS) - are offered to their customers. Zerto enables them to offer Disaster Recovery As A Service (DRaaS) on page 364 and In-Cloud DR (ICDR) on page 366, too. |
| Crisis Management Plan | Provides the overall coordination of the organization’s response to a crisis (which is a critical event that needs to be handled appropriately to prevent a damaging impact to the organization’s profitability, reputation or ability to operate). |</p>
<table>
<thead>
<tr>
<th><strong>Delta Sync</strong>&lt;sup&gt;1&lt;/sup&gt;</th>
<th>The <em>Delta Sync</em> uses a checksum comparison to minimize the use of network resources. A Delta Sync is used when the protected virtual machine disks and the recovery disks should already be synchronized, except for a possible few changes to the protected disks, for example, when the target recovery disk is defined as a preseeded (not available in the cloud) disk or after a VRA upgrade, or for reverse protection after a move or failover. During the synchronization, new checkpoints are not added to the journal but recovery operations are still possible. If a disaster occurs requiring a failover during a delta synchronization, you can recover to the last checkpoint written to the journal. It is <strong>not possible</strong> to perform a move during a delta sync.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.</td>
</tr>
</tbody>
</table>

| Disaster | The occurrence of one or more events which, either separately or cumulatively, activate disaster recovery. |
| Disaster Recovery | The ability to restart operations after an interruption to the business according to a plan that ensures an orderly and timely restoration. |

| Disaster Recovery Plan | The disaster recovery, DR, plan is a component of the Business Continuity plan that details the process and procedures to recover the organization’s resources to continue business operations. The Technology DR plan focuses on the IT disaster recovery. Also see *Business Continuity Plan on page 363.* |

| Disaster Recovery As A Service (DRaaS) | A disaster recovery solution that incorporates a service provider to replace or augment the organization’s data protection implementation. In a DRaaS scenario, the customer may manage and have complete control over the production data. The Cloud Service Provider (CSP) may provide a partial or completely managed service. In either case, the CSP must ensure the availability of the data and adapt as the customers infrastructure changes. An advantage of this model is the CSP has dedicated resources skilled in DR operations. |

<p>| DRS (vSphere) | Enables balancing computing workloads with available resources in a VMware vCenter cluster. |</p>
<table>
<thead>
<tr>
<th>Emergency Management</th>
<th>Covers the immediate response to a situation or set of circumstances that present a clear and present threat to the safety of personnel or other assets of the organization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimated Recovery Time (ERT)</td>
<td>This is the estimated timings based on full resource provision available during a live invocation. This time typically sits between the Net Recovery Time on page 369 and the Recovery Time Achieved (RTA) on page 370 time.</td>
</tr>
<tr>
<td>ESX/ESXi (vSphere)</td>
<td>Bare-metal hypervisor from VMware, meaning it installs directly on top of the physical server and partitions it into multiple virtual machines that can run simultaneously, sharing the physical resources of the underlying server. ESXi is the most recent version.</td>
</tr>
<tr>
<td>Extended DR</td>
<td>Extended DR includes the ability to configure both disaster recovery and Long Term Retention for the protected virtual machines in the VPG, according to a user-defined data retention policy.</td>
</tr>
<tr>
<td>High Availability (VMHA)</td>
<td>VMware high availability decreases downtime and improves reliability with business continuity by enabling another ESX/ESXi host to start up virtual machines that were running on another ESX/ESXi host that went down. High availability is automatically disabled by Zerto while updating recovered virtual machines in the recovery site from the VRA journal. After the promotion of the data from the journal to the virtual machine completes, high availability is automatically re-enabled. The HA configuration can include admission control to prevent virtual machines being started if they violate availability constraints. If this is the case, then a failover, test failover or migration of the virtual machines in a VPG to the cluster with this configuration will fail, if the availability constraints are violated when the virtual machines are recovered.</td>
</tr>
<tr>
<td>Hyper-V</td>
<td>A hybrid hypervisor, which is installed in the operating system. However, during installation it redesigns the operating system architecture and becomes just like a next layer on the physical hardware.</td>
</tr>
<tr>
<td>Hypervisor</td>
<td>The host for multiple VMs in a virtualized environment. vSphere, ESX/ESXi, is the VMware brand hypervisor. The hypervisor is the virtualization architecture layer that allows multiple operating systems, termed guests, to run concurrently on a host computer.</td>
</tr>

</tr>
<tr>
<td>I/O (Input/Output)</td>
<td>Describes any operation, program, or device that transfers data to or from a computer. Typical I/O devices are printers, hard disks, keyboards, and mouses. In fact, some devices are basically input-only devices (keyboards and mouses); others are primarily output-only devices (printers); and others provide both input and output of data (hard disks, diskettes, writable CD-ROMs). In computer architecture, the combination of the CPU and main memory (memory that the CPU can read and write to directly, with individual instructions) is considered the brain of a computer, and from that point of view any transfer of information from or to that combination, for example to or from a disk drive, is considered I/O.</td>
</tr>
<tr>
<td>In-Cloud DR (ICDR)</td>
<td>A disaster recovery solution that incorporates a service provider to replace or augment the organization’s data protection implementation. When customers leverage an ICDR service, the CSP hosts the production and DR sites. The virtual machines (VMs) are typically replicated from one CSP datacenter to another CSP datacenter as a managed service or as managed co-located datacenters. The customers have the ability to interact with their applications as if they were locally hosted.</td>
</tr>
</tbody>
</table>
| **Initial Sync** | Synchronization performed after creating the VPG to ensure that the protected disks and recovery disks are the same. Recovery operations cannot occur until after the initial synchronization has completed.

Adding a virtual machine to a VPG is equivalent to creating a new VPG and an initial synchronization is performed. In this case, any checkpoints in the journal become unusable and only new checkpoints added after the initial synchronization completes can be used in a recovery. The data in the journal however remains and is promoted to the recovered virtual machine as part of a recovery procedure.

**Note:** For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks. |

<p>| Synchronization after a recovery starts after the promotion of data from the journal to the virtual machine disks ends. Thus, synchronization of virtual machines can start at different times, dependent on when the promotion for the virtual machine ends. All synchronizations are done in parallel, whether a delta sync or full sync, etc. on page 364 |</p>
<table>

</tr>
</thead>
<tbody>
<tr>
<td><strong>iSCSI</strong></td>
<td>An Internet Protocol (IP)-based storage networking standard for linking data storage facilities. By carrying SCSI commands over IP networks, iSCSI is used to facilitate data transfers over intranets and to manage storage over long distances.</td>
</tr>
</tbody>
</table>
| **Journal** | Every write to a protected virtual machine is intercepted by Zerto and a copy of the write is sent, asynchronously, to the recovery site, while the write continues to be processed on the protected site. On the recovery site the write is written to a journal managed by the Virtual Replication Appliance. Each protected virtual machine has its own journal.  
Each journal can expand to a size specified in the VPG definition and automatically shrinks when the expanded size is not needed. |
| **Long Term Retention** | Providing Zerto customers a comprehensive Data Protection solution - preserve their virtualized environment production data, for a long period - from months to several years.  
The data is copied from the Recovery site, to a local or remotely attached storage repository, without any impact on production data or performance, via a single management platform.  
Data Retention is enforced by built-in scheduling and retention mechanisms. Data can later be restored easily, and with minimal RTO. |
<p>| <strong>LUN</strong> | Disk drives are the foundation of data storage, but operating systems cannot use physical disk storage directly. The platters, heads, tracks and sectors of a physical disk drive must be translated into a logical space, which an OS sees as a linear address space comprised of fixed-size blocks. This translation creates a logical entity that allows operating systems to read/write files. Storage networks must also partition their physical disks into logical entities so that host servers can access storage area network (SAN) storage. Each logical portion is called a logical unit number (LUN). A LUN is a logical entity that converts raw physical disk space into logical storage space, which a host server's OS can access and use. Any computer user recognizes the logical drive letter that has been carved out of their disk drive. For example, a computer may boot from the C: drive and access file data from a different D: drive. LUNs do the same basic job. |
| <strong>Level of Business Continuity</strong> | The reduced level of service that has been agreed if there is an interruption to business operations. |
| <strong>Managed Service Provider (MSP)</strong> | See Cloud Service Provider (CSP) on page 363. |
| <strong>Maximum Tolerable Data Loss</strong> | The maximum tolerable data loss an organization can endure without compromising its business objectives. |</p>
<table>
<thead>
<tr>
<th><strong>Maximum Tolerable Outage (MTO)</strong></th>
<th>The maximum time after which an outage will compromise the ability of the organization to achieve its business objectives.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Maximum Tolerable Period of Disruption</strong></td>
<td>The duration after which an organization’s viability will be irrevocably threatened if product and service delivery cannot be resumed.</td>
</tr>
<tr>
<td><strong>NAS</strong></td>
<td>A network-attached storage (NAS) device is a server that is dedicated to nothing more than file sharing. NAS does not provide any of the activities that a server in a server-centric system typically provides, such as e-mail, authentication or file management. NAS allows more hard disk storage space to be added to a network that already utilizes servers without shutting them down for maintenance and upgrades. With a NAS device, storage is not an integral part of the server. Instead, in this storage-centric design, the server still handles all of the processing of data but a NAS device delivers the data to the user. A NAS device does not need to be located within the server but can exist anywhere in a LAN and can be made up of multiple networked NAS devices.</td>
</tr>
<tr>
<td><strong>Net Recovery Time</strong></td>
<td>The net time achieved in recovering one or more VPGs after a disaster.</td>
</tr>
<tr>
<td><strong>Operational Level Agreement (OLA)</strong></td>
<td>The agreement between the service management and the Service Provision Partners. It defines the responsibilities for support and delivery of the services provided.</td>
</tr>
<tr>
<td><strong>Pair</strong></td>
<td>Zerto can be installed at one or more sites and each of these sites can connect to any of the other sites enabling enterprises to protect virtual machines across multiple vCenters or within the same vCenter. Two sites connected to each other are considered <em>paired</em>. Also see Replication to Self on page 370.</td>
</tr>
<tr>
<td><strong>Preseed</strong></td>
<td>A virtual disk (a. vmdk flat file and descriptor or a .vhdx file) in the recovery site that has been prepared with a copy of the protected data. Using this option is recommended particularly for large disks so that the initial synchronization is much faster. When not using a preseeded disk the initial synchronization phase has to copy the whole disk over the WAN. Zerto takes ownership of the preseeded disk, moving it from its source folder to the folder used by the VRA.</td>
</tr>
<tr>
<td><strong>Quiesce</strong></td>
<td>Pausing or altering the state of running processes on a computer, particularly those that might modify information stored on disk during a backup, in order to guarantee a consistent and usable backup. Critical applications, such as databases have quiescent mechanisms that Zerto can use to get application consistent checkpoints.</td>
</tr>
<tr>
<td><strong>RBAC</strong></td>
<td>Role-based Access control, available in the Zerto Cloud Manager via the Permissions tab.</td>
</tr>
<tr>
<td>Glossary</td>
<td>Definition</td>
</tr>
<tr>
<td>----------</td>
<td>------------</td>
</tr>
<tr>
<td>RDM (vSphere)</td>
<td>RDM is a mapping file in a separate VMFS volume that acts as a proxy for a raw physical storage device. The RDM allows a virtual machine to directly access and use the storage device. The RDM contains metadata for managing and redirecting disk access to the physical device. The file gives you some of the advantages of direct access to a physical device while keeping some advantages of a virtual disk in VMFS. As a result, it merges VMFS manageability with raw device access. Zerto supports both physical and virtual mode RDMs.</td>
</tr>
<tr>
<td>Recovery Point Objective (RPO)</td>
<td>The maximum amount of data that may be lost when the activity or service is restored after an interruption. Expressed as a length of time before the interruption.</td>
</tr>
<tr>
<td>Recovery Time Achieved (RTA)</td>
<td>The actual times achieved during a DR test.</td>
</tr>
<tr>
<td>Recovery Time Objective (RTO)</td>
<td>Related to downtime. The metric refers to the amount of time it takes to recover from a data loss event and how long it takes to return to service. The metric is an indication of the amount of time the system's data is unavailable or inaccessible, thus preventing normal service.</td>
</tr>
<tr>
<td>Replication, Asynchronous</td>
<td>Technique for replicating data between databases or file systems where the system being replicated does not wait for the data to have been recorded on the duplicate system before proceeding. Asynchronous Replication has the advantage of speed, at the increased risk of data loss during due to communication or duplicate system failure.</td>
</tr>
<tr>
<td>Replication to Self</td>
<td>When a single vCenter is used, for example with remote branch offices, when replicating from one datacenter to another datacenter, both managed by the same vCenter Server, you have to enable replication to the same vCenter Server and pairing is not required.</td>
</tr>
<tr>
<td>Resource</td>
<td>The elements (such as staff, site, data, IT systems) that are required to deliver an activity or service.</td>
</tr>
<tr>
<td>Resource Recovery Plan</td>
<td>Contains the instructions, procedures and guidelines to recover one or more resources and return conditions to a level of operation that is acceptable to the organization. Recovery Plans include detailed recovery procedures for IT equipment and infrastructure.</td>
</tr>
<tr>
<td>Rolling Back</td>
<td>Rolling back to an initial status, for example, after canceling a cloning operation on the VPG.</td>
</tr>
<tr>

<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RTO</td>
<td>See Recovery Time Objective (RTO) on page 370.</td>
</tr>
<tr>
<td>SAN</td>
<td>A storage area network (SAN) is any high-performance network whose primary purpose is to enable storage devices to communicate with computer systems and with each other. A SAN is a machine that contains nothing but a disk or disks for storing data. A SAN’s architecture works in a way that makes all storage devices available to all servers on a LAN or WAN. As more storage devices are added to a SAN, they too will be accessible from any server in the larger network. In this case, the server merely acts as a pathway between the end user and the stored data. Because stored data does not reside directly on any of a network’s servers, server power is utilized for business applications, and network capacity is released to the end user.</td>
</tr>
<tr>
<td>SCSI</td>
<td>Acronym for Small Computer System Interface. SCSI is a parallel interface standard used by many servers for attaching peripheral devices to computers. SCSI interfaces provide for faster data transmission rates (up to 80 megabytes per second) than standard serial and parallel ports. In addition, you can attach many devices to a single SCSI port, so that SCSI is really an I/O bus rather than simply an interface.</td>
</tr>
<tr>
<td>SCVMM</td>
<td>A Microsoft management solution for the virtualized datacenter, enabling you to configure and manage your virtualization host, networking, and storage resources in order to create and deploy virtual machines and services to private clouds that you have created.</td>
</tr>
<tr>
<td>Secret Access Key (AWS)</td>
<td>A password. The Secret Access Key with the Access Key forms a secure information set that confirms the user’s identity.</td>
</tr>
<tr>
<td>Security Group</td>
<td>A virtual firewall that controls the traffic for one or more instances.</td>
</tr>
<tr>
<td>Service Continuity Plan</td>
<td>The continuity plan that acts as an umbrella document for a service, referencing other plans as required and providing service-specific emergency management and recovery plans.</td>
</tr>
<tr>
<td>Service Level Agreement (SLA)</td>
<td>The agreement between the customer and service provider which defines the service that is to be delivered to the customer.</td>
</tr>
<tr>
<td>Service Profile</td>
<td>A predefined set of default properties to use when VPGs are defined or edited. Zerto provides a default service profile and the option for the organization to specify their own requirements. The cloud service provider can define service profiles to manage specific service level agreements (SLAs) with its customers.</td>
</tr>
<tr>
<td>Service Test Plan</td>
<td>Detailed plan defining the activities required to test the recovery of an individual IT service to meet business requirements documented in the RTO and RPO.</td>
</tr>
</tbody>
</table>
**Shadow VRA**

During normal operation, a VRA might require more disks than a single virtual machine can support. If this situation arises, the VRA creates new shadow VRA virtual machines, used by the VRA to maintain additional disks. These virtual machines must not be removed. A VRA can manage a maximum of 1500 volumes, whether these are volumes being protected or recovered.

**Snapshots**

A snapshot is a block device which presents an exact copy of a logical volume, frozen at some point in time. Typically this would be used when some batch processing, a retention process for instance, needs to be performed on the logical volume, but you don't want to halt a live system that is changing the data. Zerto does NOT use a snapshot mechanism, but is constantly replicating data writes.

**Storage Account (Azure)**

Storage accounts re like a container for your files. You can name your storage account the way you like but it should be unique across the Azure system.

**Subnet**

A logical, visible subdivision of an IP network.[1] The practice of dividing a network into two or more networks is called subnetting.

**Subscription (Azure)**

The description uses information derived from the following site:

https://blogs.msdn.microsoft.com/arunrakwal/2012/04/09/create-windows-azure-subscription/

An Azure subscription grants access to Azure services and Platform Management Portal. A subscription has two aspects:

- The Windows Azure account, through which resource usage is reported and services are billed.
- The subscription itself, which governs access to and use of the Azure services that are subscribed to.

**System Center Virtual Machine Manager**

See SCVMM on page 371.

**Virtual Machine (VM)**

A virtual machine (VM) is an environment, usually a program or operating system, which does not physically exist but is created within another environment. In this context, a VM is called a *guest* while the environment it runs within is called a *host*.

**Virtual Network (VNet) (Azure)**

A virtual network dedicated to an Azure subscription.
### Virtual Private Cloud (VPC) (AWS)
An on demand configurable pool of shared computing resources allocated within a public cloud environment, providing a certain level of isolation between the different organizations (denoted as users hereafter) using the resources. The isolation between one VPC user and all other users of the same cloud (other VPC users as well as other public cloud users) is achieved normally through allocation of a Private IP Subnet and a virtual communication construct (such as a VLAN or a set of encrypted communication channels) per user.

### Virtual Protection Group
See VPG on page 376.

### Virtual Replication Appliance
See VRA on page 376.

### VMDK, Virtual Machine Disk
Virtual Machines created with VMware products typically use virtual disks. The virtual disks, stored as files on the host computer or remote storage device, appear to the guest operating systems as standard disk drives.
**Volume Delta Sync**

Synchronization when only delta changes for a volume needs synchronizing, for example, when a virtual machine is added to a VPG using a preseeded disk. During the synchronization, new checkpoints are not added to the journal. Also, recovery operations are not possible during a Volume Delta Sync.

For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.

<table>
<thead>
<tr>
<th>Volume Delta Sync</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronization when only delta changes for a volume needs synchronizing, for example, when a virtual machine is added to a VPG using a preseeded disk.</td>
</tr>
<tr>
<td>During the synchronization, new checkpoints are not added to the journal. Also, recovery operations are not possible during a Volume Delta Sync.</td>
</tr>
<tr>
<td>For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.</td>
</tr>
</tbody>
</table>
Volume Full Sync
Synchronization after a recovery starts after the promotion of data from the journal to the virtual machine disks ends. Thus, synchronization of virtual machines can start at different times, dependent on when the promotion for the virtual machine ends. All synchronizations are done in parallel, whether a delta sync or full sync, etc. on page 364.

Synchronization when a full synchronization is required on a single volume. During the synchronization, new checkpoints are not added to the journal. Also, recovery operations are not possible during a Volume Full Sync.

Note: For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.
Synchronization when a full synchronization is required on a single volume, for example, when changing the target datastore or adding a virtual machine to the VPG without using a preseeded (not available in the cloud) disk.

During the synchronization, new checkpoints are not added to the journal. Also, recovery operations are not possible during a Volume Initial Sync.

For the synchronization to work, the protected virtual machines must be powered on. The VRA requires an active IO stack to access the virtual machine data to be synchronized across the sites. If the virtual machine is not powered on, there is no IO stack to use to access the source data to replicate to the target recovery disks.

Virtual machines are protected in virtual protection groups. A virtual protection groups (VPG) is a group of virtual machines that you want to group together for replication purposes. For example, the virtual machines that comprise an application like Microsoft Exchange, where one virtual machine is used for the software, one for the database and a third for the Web Server, require that all three virtual machines are replicated to maintain data integrity.

A virtual machine installed on each hypervisor hosting virtual machines to be protected or recovered, that manages the replication of protected virtual machine writes across sites. A VRA must be installed on every hypervisor that hosts virtual machines that require protecting in the protected site and on every hypervisor that will host the replicated virtual machines in the recovery site.

VMware’s server virtualization platform for building a cloud infrastructure.
| **Zerto Cloud Connector (ZCC)** | A virtual machine installed on the cloud side, one for each customer organization replication network. The Zerto Cloud Connector requires both cloud-facing and customer-facing static IP addresses. The ZCC routes traffic between the customer network and the cloud replication network, in a secure manner ensuring complete separation between the customer network and the cloud service provider network. The ZCC has two Ethernet interfaces, one to the customer’s network and one to the cloud service provider’s network. Within the cloud connector a bidirectional connection is created between the customer and cloud service provider networks. Thus, all network traffic passes through the ZCC, where the incoming traffic on the customer network is automatically configured to IP addresses of the cloud service provider network. |
| **Zerto Cloud Manager (ZCM)** | A Windows service, which enables managing all the cloud sites offering disaster recovery using a single interface. The ZCM manages the DR either as a service (DRaaS) or completely within the cloud environment, protecting on one cloud site and recovering to a second site (ICDR). |
| **Zerto User Interface** | Recovery using Zerto is managed via a user interface: in a browser via the Zerto Virtual Manager Web Client, or in either the vSphere Web Client or vSphere Client console in the Zerto tab. |
| **Zerto Self-service Portal (ZSSP)** | An out-of-the-box DR portal solution with a fully functioning browser-based service portal to enable cloud service providers to quickly introduce disaster recovery as part of their portal offering. |
| **Zerto Virtual Backup Appliance (VBA)** | A Windows service that manages File Level Recovery operations within Zerto. These repositories can be local or on a shared network. |
| **Zerto Virtual Manager (ZVM)** | A Windows service, which manages everything required for the replication between the protection and recovery sites, except for the actual replication of data. The ZVM interacts with the vCenter Server to get the inventory of VMs, disks, networks, hosts, etc. The ZVM also monitors changes in the VMware environment and responds accordingly. For example, a vMotion operation of a protected VM from one host to another is intercepted by the ZVM so the Zerto User Interface is updated accordingly. |
| **ZORG, Zerto Organization** | Cloud customers are defined to Zerto Cloud Manager as Zerto organizations, ZORGs. A ZORG is defined with the cloud resources it can use, the permissions that it has to perform operations, such as testing a failover or defining a VPG. |
