## Omega Gents use coding to move screen characters and robots!

The Omega Gents have spent much of the Fall term learning to code in the Google program Scratch. Using coding, they have been able to create characters and make those characters have movement and speech. They are now learning to use coding to move robots as well and during a class session October 30th, they put their skills to test by navigating a makeshift course designed by Instructor Rodney Johnson.

Students went individually first and then were later paired in teams of two. A competition was created to determine who was the fastest while committing the least amount of errors on the course. The competition was a pre-introduction to the robotics module starting Spring 2020.
