

SQUINT™ Special Report

Since the election, we have received numerous SQUINTs that allege that Dominion Voting Systems machines were implicated in a vote altering scheme to favor the Biden candidacy. To examine the allegation, we compared vote percentages in 2020 for former Vice President Biden with Secretary Clinton's percentages in 2016 for counties in the states of PA, GA, AZ, MI, FL, NC, OH, and WI. The hypothesis we examined is that if voting machines artificially inflated results to Biden's advantage, there would be significant increases in his vote percentages in counties that used Dominion machines compared to counties that did not use Dominion machines.

The graph below shows how Democratic support changed in 2020 for each county in the eight states. The boxes represent half of the values surrounding the median line. The vertical lines show the extent of most of the values, with the exception of the outliers which are shown as dots. A positive value on the y-axis indicates that Biden received a greater percentage of votes than Clinton did in that county.

Ballot machine type

The result is that there is no statistically significant difference in the results from the counties that used Dominion machines in 2020 and the counties that did not. There are seven counties that had large enough increases to possibly be considered outliers (7% to 9% increases): Cobb, Douglas, Fayette, Forsyth, Henry, and Rockdale counties in Georgia and Antrim County, Michigan. Despite being outliers, the analysis revealed nothing unusual or suspicious in the data for the counties. In fact, in 2020 none of the seven counties flipped their support from 2016 when no Dominion machines were used in Georgia.

The seven outlier counties can be explained by new voters resulting from “get out the vote” efforts and decreased impact of third-party candidates. The new voters increased the support of the major parties by 25 percent in the seven counties and provided 169,271 new votes. The increase in Democratic support can be explained by multiple scenarios such as Biden winning 60-70 percent of the new votes and 4-8 percent of 2016 Trump voters flipping to Biden in 2020.

Therefore, because there is no statistical difference in the results from different ballot machine manufacturers and the outlier counties can be explained with realistic scenarios, the claim that Dominion machines artificially inflated results to Biden’s advantage is not supported in the election results data.
