

SPONSOR: VTScada by Trihedral

VTScada is award winning monitoring and control software that is perfect for plant, telemetry, or hosted systems of any size. For 30 years, we have been eliminating frustration from every stage of the HMI / SCADA lifecycle; from pricing and licensing, to development and support.

VTScada natively includes components not commonly found in HMI or SCADA software platforms such as polling management, historian, trends, reports, remote mobile access, application version control, alarm notification, and full system backup. Our unique architecture integrates all these features into one simple install and one license agreement.

Our open connectivity provides maximum flexibility when choosing monitoring & control devices. In addition to OPC and DDE, VTScada's built-in driver library supports most industry standard and even many proprietary I/O protocols at no extra cost.

VTScada is so instantly intuitive that you will be creating your own applications and outstanding looking displays in minutes with the confidence of knowing that the most reliable support team in the business is there when you need them.
