Chapter 14 includes diseases of the urinary system and kidneys, male genital organs, female pelvic organs and the breasts, and begin with the letter N. Many diagnoses in this section will require additional codes to fully describe the condition and identify:

- Infectious agent
- Stage of chronic kidney disease
- Causal conditions
- Poisoning or adverse effects
- Transplant or dialysis status
- Associated symptoms

**Neurogenic Bladder**

- Uninhibited neuropathic
- Reflux neuropathic
- Flaccid neuropathic
- Other neuromuscular dysfunction
- Unspecified

**Urinary Tract Infection**

Infections can occur anywhere along the urinary tract. If site is specified (for example the bladder with cystitis), the more specific code is used and not the unspecified code. An additional code to identify the infectious agent should be coded when known.

**Kidney Failure**

- Acute (n17)
  - 4th character identifies the effects of the acute kidney failure
- Chronic (chronic renal insufficiency) (N18)
  - 4th character indicates the stage
  - Use an additional code for dialysis status (Z99.2) with ESRD, if applicable
  - Code first:
    - Diabetic kidney disease
      - Can assume causal relationship
    - Hypertensive kidney disease
      - Can assume causal relationship

**Incontinence (N39)**

Specific codes exist to designate the type of incontinence. Note that stress incontinence is one code regardless of patient gender. Urinary incontinence that is not otherwise specified (NOS) is coded to R32.
Enlarged Prostate (N40)

- Code associated lower urinary tract symptoms (LUTS) immediately following N40 code (e.g., urinary obstruction)
- Prostatic neoplasm present
  - Benign: Do not code enlarged prostate diagnosis from N40
  - Malignant: Can be coded in the same list as the diagnosis from N40

Complications of Stoma of the Urinary Tract (N99.5)

- 5th character will indicate the type of stoma
- 6th character the complication
