## INETRUCTION MANUAL

230V Class $100.5-3 \mathrm{HP}$ $0.4 ~ 2.2 \mathrm{KW}$

230V Class $3 \varnothing 0.5 \sim 40 \mathrm{HP}$ $0.4 ~ 30 \mathrm{KW}$

460V Class $3 \varnothing 1 \sim 75 \mathrm{HP}$
$0.75 \sim 55 \mathrm{KW}$

## Quick Start Guide

This guide is to assist in installing and running the inverter to verify that the drive and motor are working properly. Starting, stopping and speed control will be from the keypad. If your application requires external control or special system programming, consult the N3 Instruction Manual supplied with your inverter.

## Step 1 Before Starting the Inverter

Please review Preface and Safety Precautions (page 0-1 through 1-4) of the N3 Instruction Manual. Verify that the drive was installed in accordance with the procedures as described in N3 Ambient Environment and Installation on pages 3-1 through 3-8. If you feel this was improper in any way, do not start the drive until qualified personnel have verified proper installation. (Failure to do so could result in serious injury.)

- Check inverter and motor nameplates to determine that they have matched HP and voltage ratings. (Ensure that full load motor amps do not exceed that of the inverter.)
- Remove the terminal cover to expose the motor and power terminals.
a. Verify that AC power is wired to L1, L2, and L3 (pages 3-12).
b. Verify that Motor leads are connected to T1, T2, and T3 (pages 3-12).
(The two leads may need to be reversed if motor rotation is not correct.

1. SEQ LED : 1_00 = 1, LED Lit.
2. FRQ LED : 1_01 = 1/2/3/4, LED Lit
3. FWD LED: Forward Direction, LED action(Flash in stop, solid in Run).
4. REV LED : Reverse Direction, LED action(Flash in stop, solid in Run).
5. Four actions of FUN, Hz/RPM, VOLT, AMP LED and display of four 7-segment display. (Refer to operation description of the keypad.)
6. LCD keypad without FUN, Hz/RPM, VOLT, AMP LED.

## Step 2 Apply Power to the Drive

- Apply AC power to the Drive and observe keypad. Four 7-segments Display should read Power Voltage for 3~5 seconds and then read Frequency/Speed, 05.00. Four 7-segment Display and FWD LED should be flashing all the time.

## Step 3 Check Motor Rotation Without Load

- Press RUN key (FWD LED should light); Four 7-segment Display should run from 00.00 to 05.00 .
- Check motor rotation.

If it is not correct:
Press STOP key. Remove AC power. Wait for LED "charge" lamp to extinguish. Reverse motor leads T1 and T2.Restart the drive and check new rotation.

- Press STOP key to stop rotation.

## Step 4 Check Full Speed at $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$

- FrequencylSpeed can be changed by pressing the up or down Arrow keys. To move right or left for next digit, press SHIFT / RESET key. Press the READ / ENTER key to set the speed.
- Set frequency up to $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ in accordance with the default base frequency.
- Press RUN key. Check drive acceleration up to full speed.
- Press STOP key to stop drive and check deceleration.

## Step 5 Other Operations

For information, see N3 Instruction Manual.

## Preface

## Preface

To extend the performance of the product and ensure personnel safety, please read this manual thoroughly before using the inverter. Should there be any problem in using the product that cannot be solved with the information provided in the manual, contact your nearest Teco's distributor or sales representative who will be willing to help you.

## ※Precautions

The inverter is an electrical product. For your safety, there are symbols such as "Danger", "Caution" in this manual as a reminder to pay attention to safety instructions on handling, installing, operating, and checking the inverter. Be sure to follow the instructions for highest safety.

## I Danger

$\triangle$ Caution Indicates that the inverter or the mechanical system might be damaged
Indicates a potential hazard could cause death or serious personal injury if misused.

## $I$ Danger

- Do not touch any circuit boards or components while the charging indicator is still lit after turned the power off. (The light will fade)
- Do not wire when the inverter is electrified. Do not check parts and signals on circuit boards during the inverter operation.
- Do not disassemble the inverter not and modify any internal wires, circuits, or parts.

Ground the ground terminal of the inverter properly. For 200 V class ground to $100 \Omega$ or below. For 400 v class ground to $10 \Omega$ or below.

## $\triangle$ Caution

- Do not perform a voltage test on parts inside the inverter. High voltage can destroy these semiconductor parts.
- Do not connect T1 (U), T2 (V), and T3 (W) terminals of the inverter to any AC input power supply.
- CMOS ICs on the inverter's main board are susceptible to static electricity. Do not touch the main circuit board

## Product Inspection

TWMC's inverters have all passed the function test before delivery. Please check the following when you receive and unpack the inverter:

- The model and capacity of the inverter are the same as those specified in your purchase order.
- Check for any damages caused by transportation. Please do not apply power, and contact a TWMC sales representative if any of the above problems occurred.

## Chapter 1 Safety Precautions

### 1.1 Operation Precautions

### 1.1.1 Before Power Up

| $\triangle$ Caution |
| :--- |
| The line voltage applied must comply with the inverter's specified input voltage.(See <br> product nameplate) |

## $\boldsymbol{I}$ Danger

Make sure the main circuit connections are correct. L1 (L), L2 and L3 (N) are powerinput terminals and must not be mistaken for T1, T2 and T3. Otherwise, inverter damage can result.

## $\triangle$ Caution

- To avoid the front cover from disengaging or other damage, do not carry the inverter by its cover. Support the drive by its heat sink when transporting. Improper handling can damage the inverter or injure personnel, and should be avoided.
- To avoid the risk of fire, do not install the inverter on flammable objects. Install on nonflammable objects such as metal surfaces.
- If several inverters are placed in the same control panel, provide heat removal means to keep the temperature below $40^{\circ} \mathrm{C}$ to avoid overheat or fire.
- When removing or installing the operator, turn OFF the power first, and manipulate the operator following the instruction of the diagram to avoid operator error or no display caused by bad contact.

## Warning

This product is sold subject to IEC 61800-3. In a domestic environment this product may cause radio interference in which case the user may be required to apply corrective measures.

### 1.1.2 During Power Up

## Danger

- Do not insert or remove input line connectors on the inverter when powered up to avoid the control panel damage resulting from possible voltage surge from contact bounce.
- When momentary power loss is longer than 2 seconds (the larger of horse power, the longer of time), the inverter does not have enough storage power to control the circuit; Therefore, when power is regenerated, the operation of the inverter is based on the setup of B000 / A015 and the condition of external switch, this is considered to be $\ulcorner$ restart $\lrcorner$ in the following paragraphs.
- When the momentary power loss is short, the inverter still has enough storage power to control the circuit. Therefore, when power is regenerated, the inverter will automatically restart depending on the setup of A013/A014.
- When restarting the inverter, the operation of the inverter is based on the setup of B000 and A015 and the condition of external switch (FWD/REV button). Attention: the start operation is irrelevant with A013/A014/A018/A019.

1. When $\mathrm{B} 000=0000$, the inverter will not automatically run after restart.
2. When $\mathrm{B} 000=0001$ and the external switch (FWD/REV button) is OFF, the inverter will not run after restart.
3. When $\mathrm{B} 000=0001$, the external switch ( $\mathrm{FWD} / \mathrm{REV}$ button) is ON, and A015 $=0000$, the inverter will run automatically after restart. Attention: In the sake of safety, please turn off the external switch (FWD/REV button) after power loss to avoid damage to the machine and injury to personnel after sudden regeneration of power.

- To ensure the safety of people and machine, please refer to the description and warnings for A015.

### 1.1.3 Before Operation

## 7 Danger

Make sure the model and inverter capacity match the A175 setting.

## Caution

The inverter will flash display the power voltage set by A007 for 5 seconds when applying power.

### 1.1.4 During Operation

## Danger

Do not connect or disconnect the motor during operation. Otherwise, the over-current will cause the inverter to trip or damage the unit.

## Danger

- To avoid electric shock, do not take the front cover off when power is on.
- The motor will restart automatically after stop when auto-restart function is on. In this case, use caution while working near the drive, motor, or driven equipment.
- Note: The stop switch function is different from the emergency stop switch, which must be set first to be effective.

## Caution

Do not touch heat-generating components such as heat sinks and braking resistors.

- The inverter can drive the motor from low speed to high speed. Verify the allowable capacities range of the motor and the associated machinery.
- Note the settings related to the braking reactor.
- Do not check signals on circuit boards while the inverter is running.

## Caution

Allow 5 minutes after disconnecting power before disassembling or checking the components. The power led should not be illuminated.

### 1.1.5 During Maintenance

## Caution

The inverter should be used in a non-condensing environment with temperature range of $14-104^{\circ} \mathrm{F}\left(-10-40^{\circ} \mathrm{C}\right)$ and a relative humidity of $95 \%$ non-condensing.

## Caution

When the inverter top cover has removed, it can be used in a non-condensing environment with temperature from $14-122^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}\right.$ to $+50^{\circ} \mathrm{C}$ ) and relative humidity of $95 \%$, but the environment should be free from water and metal dust.

## Chapter 2 Definition of model

Figure 2-1 Inverter Nameplate

## Chapter 3 Ambient Environment and Installation

### 3.1 Environment

The environment will directly affect the proper operation and the life span of the inverter, so install the inverter in an environment complying with the following conditions:

- Ambient temperature: $14-104^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}-+40^{\circ} \mathrm{C}\right)$; without cover: $14-122^{\circ} \mathrm{F}\left(-10^{\circ} \mathrm{C}-+50^{\circ} \mathrm{C}\right)$
- Avoid exposure to rain or moisture.
- Avoid direct sunlight.
- Avoid oil mist and salinity.
- Avoid corrosive liquid and gas.
- Avoid dust, lint fibers, and small metal filings.
- Keep away from radioactive and flammable materials.
- Avoid electromagnetic interference (soldering machine, power machine).
- Avoid vibration (stamping, punching machine). Add a vibration-proof pad if the situation cannot be avoided.
- If several inverters are placed in the same control panel, provide heat removal means to maintain temperatures below $40^{\circ} \mathrm{C}$.

Figure 3-1 Panel and enclosure arrangement for N3 inverters

- Place the front side of the inverter onward and top upward to in favor of heat sink.
- Install the inverter according to the following figures: (take the dustproof cover off in favor of heat sinking if it is installed in a box or the environment allows to do so)

Air convection
(a) Front view
(b) Side view

### 3.2 Environmental precautions

Do not use the inverter in an environment with the following conditions:

### 3.3 Inflammable materials

### 3.3.1 Notice for wiring

## A. Tightening torque:

Wine with a screwdriver or other tools per the tightening the torques listed below:

| Tightening torque |  |  |  |
| :---: | :---: | :---: | :---: |
| Horsepower | Power source | Nominal torque for TM1 terminal |  |
| 0.5/1/2(3¢) | 200-240V | 0.59/0.08 | 7.10/8.20 |
| 1/2 | $380-480 \mathrm{~V}$ | (LBS-FT / KG-M) | (LBS-IN/KG-CM) |
| $2(1 \varphi) / 3 / 5 / 7.5 / 10$ | $200-240 \mathrm{~V}$ | $\begin{gathered} 1.5 / 0.21 \\ \text { (LBS-FT/KG-M) } \end{gathered}$ | $\begin{gathered} 18.00 / 20.28 \\ \text { (LBS-IN/KG-CM) } \end{gathered}$ |
| 3/5/7.5/ 10/15 | $380-480 \mathrm{~V}$ |  |  |
| 15/20/25 | $200-240 \mathrm{~V}$ | $\begin{gathered} 1.84 / 0.3 \\ (\text { LBS-FT / KG-M) } \end{gathered}$ | $\begin{gathered} 22.1 / 30 \\ (\text { LBS-IN/KG-CM) } \end{gathered}$ |
| 20/25/30 | $380-480 \mathrm{~V}$ |  |  |
| 30/40 | $200-240 \mathrm{~V}$ | $\begin{gathered} \hline 4.42 / 0.66 \\ \text { (LBS-FT/KG-M) } \end{gathered}$ | $\begin{gathered} 53.1 / 66 \\ (\text { LBS-IN/KG-CM) } \end{gathered}$ |
| 40/50/60/75 | 380-480V |  |  |

## B. Power wires:

Power wires are connecting to L1, L2, L3, T1, T2, T3, P, BR and P1. Select power wire in accordance with the following criteria:
(1) Use copper wires only. Proper diameters of wires should be based on ratings at $105^{\circ} \mathrm{C}$.
(2) For rating voltage of wires, the minimum voltage of 230 VAC type is 300 V , and 460 VAC type is 600 V .
(3) For safety reasons, the power wires should be fixed by terminal type.

## C. Control wires:

Control wires are wires connecting to TM2 control terminal. Choose the wire in accordance with the following criteria:
(1) Use copper wires only. Proper diameters of wires should be based on ratings at $105^{\circ} \mathrm{C}$.
(2) To avoid noise interference, do not route control wiring in the same conduit with power wires and motor wiring.
D. Nominal electrical specifications of the terminals Block:

The following list is nominal values of TM1:

| Horsepower | Power source | Volts | Amps |
| :---: | :---: | :---: | :---: |
| 0.5/1/2(3 $\varphi$ ) | $200-240 \mathrm{~V}$ | 600 | 15A |
| 1/2 | $380-480 \mathrm{~V}$ |  |  |
| 5/7.5/10 | $200-240 \mathrm{~V}$ |  | 40A |
| $2(1 \varphi) / 3 / 5 / 7.5 / 10 / 15$ | $380-480 \mathrm{~V}$ |  |  |
| 15/20/25 | $200-240 \mathrm{~V}$ |  | 80A |
| 20/25/30 | $380-480 \mathrm{~V}$ |  | 60A |
| 30 | $200-240 \mathrm{~V}$ |  | 100A |
| 40/50 | $380-480 \mathrm{~V}$ |  |  |
| 40 | $200-240 \mathrm{~V}$ |  | 150A |
| 60/75 | $380-480 \mathrm{~V}$ |  |  |

※Note: Nominal values of input and output signals (TM2) - follow the specifications of class 2 wiring.

## E. Fuse types

Drive input fuses are provided to disconnect the drive from power in the event that a component fails in the drive's power circuitry. The drive's electronic protection circuitry is designed to clear drive output short circuits and ground faults without blowing the drive input fuses. Below table shows the N3 input fuse ratings.
To protect the inverter most effectively, use fuses with current-limit function.

## RK5, CC/T TYPE FUSE FOR N3

| 75 | 75 | 55.0 | 110.0 | 128 | 200 | 250 |

*Fuse ratings are based upon 250 V fuses for 230 V inverter, and 600 V for 460 V inverters

## ※Notice

- To avoid shock hazards, do not touch any electrical component when the power is applied or with in five minutes after the power is disconnected. The other action should be performed after the charge indicator goes off.
- Do not perform wiring on the inverter while it is still connected. Disregarding this notice of this notice could cause serious insure or death to personnel.
$※$ This product is designed to use in Pollution Degree 2 environment or equivalent environments.

### 3.3.2 Applicable specification of magnetic contactor and wires

Molded-case circuit breaker/magnetic contactor

- Teco bears no responsibility to service for failures caused by the following conditions:
(1) A molded-case circuit breaker is not installed, or an improper or overrated breaker is used, between the power source and the inverter.
(2) A magnetic contactor, a phase capacitor, or a burst absorber is connected between the inverter and the motor.

- Use three-phase squirrel cage induction motor with capacity suitable for the inverter.
- If one inverter is driving several motors, the total current of all motors running simultaneously must be less than the rated current of the inverter, and each motor has to be equipped with a proper thermal overload relay.
- Do not add capacitive components, such as a phase capacitors, LC or RC, between the inverter and the motor.

### 3.3.3 Precautions for peripheral applications:

Power supply:

- Make sure the correct voltage is applied to avoid damaging the inverter.
- A molded-case circuit breaker or fused disconnect must be installed between the AC source and the inverter
Molded-case circuit breaker:
- Use a molded-case circuit breaker that conforms to the rated voltage and current of the inverter to control the power and protect the inverter.
- Do not use the circuit breaker as the run/stop switch for the inverter.
Leakage breaker:
- Install a leakage breaker to prevent problems caused by electric leakage and to protect personnel.
- Setting current should be 200 mA or above and the operating time at 0.1 second or longer to prevent malfunctions.

## Magnetic contactor:

- Normal operations do not need a magnetic contactor. However a contactor has to be installed in primary side when performing functions such as external control and auto restart after power failure, or when using a brake controller.
- Do not use the magnetic contactor as the run/stop switch of the inverter.
AC Line reactor for power quality improvement:
- When inverters below $200 \mathrm{~V} / 400 \mathrm{~V} 15 \mathrm{KW}$ are supplied with high capacity (above 600 KVA ) power source or an AC reactor can be connected to improve the power performance.
Input noise filter:
- A filter must be installed when there are inductive loads affecting the inverter

## Inverter:

- Input power terminals L1, L2, and L3 can be used in any sequence regardless of phase.

Ground

- Output terminals T1, T2, and T3 are connected to U, V , and W terminals of the motor. If the motor is reversed while the inverter is set to run forward, just swap any two terminals of T1, T2, and T3.
- To avoid damaging the inverter, do not connect the input terminals T1, T2, and T3 to AC input power.
- Connect the ground terminal properly. 230 V series: class 3 grounding, $<100 \Omega ; 460 \mathrm{~V}$ series : $<10 \Omega$.

Figure 3-3 Typical Installation Schematic

Make external connections according to the following instruction. Check connections after wiring to make sure all connections are correct. (Do not use the control circuit buzzer to check connections)

Figure 3-4a Installation Examples

- The inverter uses dedicated power line A general noise filter may not provide correct results

## CORRECT

- Add a noise filter or separation transformer when shaning the power line with other machines.
- the inverter shares the power line with other machines.

Figure 3-4b Installation Examples using a filter

O

Correct
(A) Main circuit's wiring must separate from other high voltage or high current power line to avoid noise interference. Refer to the figures below:

- A noise filter in the output of the main circuit can suppress conductive noise. To prevent radiative noise, the wires should be put in a ferromagnetic metal pipe and sepoorated from all other signal lines by at least 1 ft ..

Figure 3-4c Installation Examples with Adjacent Signal Conductors

- When the connection between the inverter and the motor appears long, factor in the voltage drop of the cables. Phase-to-phase voltage drop $(\mathrm{V})=$ $\sqrt{3} \times$ resistance of wire $(\Omega / \mathrm{km}) \times$ length of line $(\mathrm{m}) \times$ current $\times 10^{-3}$. The number of carriers must be adjusted based on the line length.

| Cable length between the <br> inverter and the motor | Below 75 ft | Below 150 ft | Below 300 ft | Above 300ft |
| :--- | :---: | :---: | :---: | :---: |
| Recommended carrier <br> frequency allowed | Below 16 KHz | Below 12 KHz | Below 8 KHz | Below 5 KHz |
| Setting of parameter 3-22 | 16 | 12 | 8 | 5 |

(B) The control circuit wiring must be separated and routed away from the main circuit control line or other high voltage or current power lines to avoid noise interference

- To avoid erroneous operation caused by noise interference, shield the control circuit wiring with twisted-wires, and connect the shielded wire to a ground terminal. Refer to the figure below.
The wiring distance should not exceed 150 ft .

(C) Ground the ground terminal of the inverter properly. For 230 V class ground $100 \Omega$ or less; for 460 V class ground $10 \Omega$ or less.
- Ground wiring AWG is sized per the electrical equipment specifications. Minimize wire length is recommended.
- Do not share the ground of the inverter with other high current loads (welding machine, high power motor). Connect the terminals to their own ground.
- Do not make a loop when several inverters share a common ground point.

Figure 3-6 Grounding Examples

(a) Good

(b) Good

(c) Bad
(D) To ensure maximum safety, use proper wire gauges (AWG) for the main power circuit and control circuit. (See table in section 3.2.2)
(E) Verify that all wiring is correct, wires are intact, and terminal screws are secured.

## Chapter 4 Software Index

### 4.1 Keypad Description

### 4.1.1Keypad Display and Operation Instruction

1. SEQ LED: Parameter B000 $=1 / 2 / 3$, LED Lit.

Figure 4-1 Keypad Layout
2. FRQ LED: Parameter B004 $=1 / 2 / 3 / 4$, LED Lit
3. FWD LED: Forward Direction, LED action (Flash while stopped, solid during Lit operation).
4. REV LED: Reverse Direction, LED action (Flash while stopped, solid during Lit operation).
5. Four actions of FUN mode: Hz/RPM, VOLT, AMP LED, and display of four 7-segment display. (Refer to operation description of the keypad).
6. LCD keypad in display mode: Hz/RPM, VOLT, AMP, LED and FREQ.SET pot.

## $\triangle$ Caution

To avoid keypad damage, do not operate it with a screwdriver or any sharp and hard tool.

## Remote/Local Mode

- Local mode - Operation Command via RUN/STOP key on keypad
- Frequency Command by $\boldsymbol{\Delta \nabla}$ key on keypad
- Remote mode - Operating Command via B000
- Frequency Command via B004

To Change the Remote/Local mode, you must push FWD/REV and 《/RESETkey at the same time.
The Remote /Local mode of change can be used in STOP mode, but is not allowed in Run mode.

### 4.1.2 Operation Instruction of the keypad

Figure 4-2 Keypad Operations Sequence
*1: The inverter will flash the current setting of A007 (power supply voltage) after power up.
*2: A045, A046 determines the displaying of frequency, speed or line speed.
*3: It is not necessary to press ENTER key when stopped for modification. Refer to example 1, 2.
*4: Whether output current, output voltage, DC voltage is displayed or not is determined by B013 ~ B015 respectively.
4.1.3 Operation Instruction of the LED keypad

Figure 4-3 LED Operations Instruction Keypad

### 4.1.4 Operation Instruction of the LCD keypad

Figure 4-4 LCD Operations Instruction Keypad
4.1.5 Keypad Operating Example

Example 1. Modify frequency while stopped

Example 2. Modify frequency duing Run

Note: XXXX shows the present output frequency. The value ranges
from 59.98 to 0 Hz , depending on the length of time the key $\boldsymbol{\nabla}$ pressed.
Example 3. Modify frequency in ruming

## Example4. Modify the Value of Parameter

Example 5. Operation Control

Figure 4-5 Keypad RUN Sequence

- LED Lit $\bigcirc$ : LED Flashing $\bigcirc$ : LED Off

### 4.2 Control Mode Selection

The N3 Series inverter has three control modes:

1. General Vector Control Mode
2. VT Vector Control Mode (Special for Fans, Blowers, Pumps).
3. V/F Control Mode 。

The user can choose these modes with the digital keypad according to the application characteristics. The factory setting is general vector control mode. Before operation, please set the control mode and the relative parameters of the motor in accordance with the following flow chart. (The Vector control mode only applies when the inverter is power matched to the motor, or varies by 1 HP rating).

1. Use V/F Control Mode:
(1) Use one inverter to drive several motors simultaneously
(2) Motor's nameplate is unknown or motor's specifications are too special, it will cause Auto-tuning fault.
(3) Specification of inverter and motor differ more than 1 class.
2. One inverter drives several motors (Only in V/F mode); set the motor parameters according to the following rules:
(1). Sum the rated current of all motors for total inverter current.
(2). Input correct VF Pattern parameter (A132~A137).
3. When the nameplate of the motor is unknown, the inverter will set the internal parameters according to the standard TWMC motor.
4. When parameter A000 is set to 2, the keypad will display 'Err2' when performing Auto tuning.
5. In VF control, A001~A005 max. \& min. values are determined by the TWMC standard motor specification limit.

The N3 inverter has a wide variety of programmable functions. They are organized into two categories: 1) Advanced or "A" parameters and 2) Basic or "B" parameters.

Basic parameters are intended for applications that are straightforward. They include the set of parameters that almost all users need to consider. Examples of basic settings are acceleration and deceleration rates (B007 and B008), Run command and frequency sources (B000 and B004), and optional current and voltage displays (B013 - B015). The user can also select whether to allow access to the advanced parameters. (B011). In order to see and change "A" parameters, B011 must be set to enable.

Advanced parameters are intended for specific and more focused applications. They provide the means to set up the N3 inverter to operate in specialized ways, such as applying a PID control mode, Auto-run mode, RS485 communication set-up, Vector control mode plus more. In addition, all analog and digital input and output configurations plus motor parameters are entered in the Advanced Parameters.

The table below summarizes all parameters. They are individually discussed in detail below the table.

### 4.3 N3 Programmable Functions List

| Function Code No. | LCD Display | Description | Range/Code | Factory Setting | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 4.4 Parameter Function Description

```
A000:Control Mode
    0000:Vector mode (General Mode)
    0001:Vector mode (VT Mode)
    0002:V/F mode
```

Select the appropriate vector control mode or V/F mode according to the load characteristics.

1. Vector (general mode) is best suited to control the general load or rapidly-changed torque load.
2. Vector (VT mode) is suitable for Blower/ Pump and HVAC loads. The magnetic current of motor will vary with the torque, which will reduce the current and save energy.
3. If V/F mode is selected, please set parameters, B000 \& A129~A137 to comply with the load features.
A001:Motor Rated Voltage(Vac)
A002:Motor Rated Current (A)
A003:Motor Rated Power (kW)
A004:Motor Rated Speed (RPM)
A005:Motor Rated Frequency (Hz)
A006:Motor Parameter Auto Tuning 0000: Disabled 0001: Enabled

It is necessary to input data on the motor nameplate and auto tune whenever vector mode is selected. Auto tuning: Input the data to A001~A005 according to the nameplate after power off, then set A006=0001 and perform auto tuning; the detected internal data will automatically be written to parameter group 14 when display shows "End".
Ex. If the motor rated speed is 1700 rpm , set A004 to 17.0

| $\triangle$ Precaution |  |  |  |
| :--- | :---: | :---: | :---: |
| 1. The motor parameter auto tuning is stationary auto tuning. During motor auto tuning, the motor |  |  |  |
| does not rotate, and the keypad displays "-AT-". |  |  |  |
| 2. During motor parameter auto tuning, the input signal in the control circuit is invalid. |  |  |  |
| 3. Before motor parameter auto tuning, please confirm the motor is stopped. |  |  |  |
| 4. The motor parameter auto tuning is only available for vector control modes (A000 $=0000 \mathrm{or}$ |  |  |  |
| A000=0001). |  |  |  |

## A007 AC Line Input Voltage (Volts AC) <br> 230V series:170.0~264.0 <br> 460V series:323.0~528.0

To accurately represent the voltage level of inverter, please input the actual on-site line voltage.

## A010 : Keypad Stop Button 0000: Stop Button Enable <br> 0001: Stop Button Disable

A010 $=0000$, The STOP key is available for commanding the inverter to stop.

## A011:Keypad Operation with Up/Down Keys in Run Mode

0000: ‘Enter' must be pressed after frequency changes with the Up/Down Keys on keypad. 0001: Frequency will be changed directly when Up/Down Keys are Pressed

## A012 : Starting Method Selection <br> 0000: Normal Start <br> 0001: Enable Speed Search

1.) A012 $=0000$ : At start, the inverter accelerates from 0 to target frequency in the set time.
2.) A012=0001: At start, the inverter accelerates to target frequency from the detected speed of motor.

## A013: Momentary Power Loss and Restart <br> 0000: Momentary Power Loss and Restart Disable <br> 0001: Momentary Power Loss and Restart is Enable 0002: Momentary Power Loss and Restart Enable while CPU is Operating. <br> A014 : Momentary Power Loss Ride-Thru Time(sec): 0.0-2.0 second

1.) Changing power supply often results in lowering the voltage below the under voltage threshold level and the inverter will stop at once. If the power supply recovers within the A014 preset time, it will spin start from the trip frequency, or the inverter will trip with 'LV-C' displayed.
2.) The allowable power loss time differs with the models ratings. The range is from 1 to 2 seconds.
3.) $\mathrm{A} 013=0000$ : if power is lost, the inverter will not start.
4.) $\mathrm{A} 013=0001$ : if the loss time is less than the value of A014, the inverter will Spin Start in 0.5 second as the power is re-supplied, and restart times are unlimited.
5.) $\mathrm{A} 013=0002$ : the power is lost for on extended time, before the inverter loses control power for the CPU, the inverter will restart according to the B000 and A017 settings and status of external switch as the power re-applied.
※Note: $\mathrm{B} 000=0001, \mathrm{~A} 017=0000, \mathrm{~A} 013=0001$ or 0002 after power is lost for an extended time, please disconnect the power and power switches to avoid injury to personnel and equipment by the re-applied power.

## A015 :Direct run after power up:

0000: Enable Direct Run After Power Up
0001: Disable Direct Run After Power Up

## ! ${ }^{\text {Danger: }}$

1.) $\mathrm{A} 015=0000$ and the inverter is set external terminal control ( $\mathrm{B} 000=0001$ ). If the run switch is ON as power is supplied, the inverter will auto-start. It is recommend to disconnect the power switch and run switch to avoid injury to personnel or equipment as power is re-applied.
2.) $A 015=0001$ and the inverter is set external terminal control ( $B 000=0001$ ). If the run switch is ON as power is supplied, the inverter will not auto start and flash STP1. It is necessary to disconnect the run switch and then restart.

## A016 : Delay-ON Timer (seconds): 0 ~ $\mathbf{3 0 0 . 0}$ second

On power up with $\mathrm{A} 015=0000$, the inverter will perform auto restart after the time for the selected delay.

## A017 : Auto restart method: <br> 0000: Enable Speed Search <br> 0001: Normal Start

1.) $\mathrm{A} 017=0000$ : the inverter will detect motor speed and accelerate to the set frequency.
2.) $A 017=0001$ : the inverter will be accelerated from stop (zero speed) to set frequency.

## A018: Number of Auto restart Attempts :0 ~ 10 times <br> A019: Auto restart Delay Time :0 $\boldsymbol{\sim} \mathbf{8 0 0 . 0}$ second

1.) A018=0: the inverter will not auto restart after fault trip.
2.) $\mathrm{A} 018>0, \mathrm{~A} 019=0$ :

The inverter will conduct SPIN START 0.5 seconds after fault trip. The motor will inertia run to frequency at the trip stop, then according to acceleration or deceleration time to set frequency.
3.) $\mathrm{A} 018>0$, A019 $>0$ :

The output will be stopped for a period which is determined by parameters A019 after fault trip.
Then, the inverter spin starts to present set frequency.
4.) If the inverter is set in braking deceleration or DC braking, it will not perform restart after fault trip.

## A020: Error reset mode setting 0000: Enable Reset Only when Run Command is Off 0001: Enable Reset when Run Command is On or Off

A020 $=0000$ if the inverter trips on fault, remove the Run switch to perform reset, or restarting is not possible unless power is cycled.

```
B007 : Acceleration Time #1 (second): 0.1-3600.0
B008 : Deceleration Time #1 (second): 0.1 - 3600.0
A023 : S Curve of First Acceleration Stage (second): 0.0 - 4.0
A024 : S Curve of Second Acceleration Stage (second): 0.0-4.0
A025 : Acceleration Time #2 (second): 0.1 - 3600.0
A026 : Deceleration Time #2 (second): 0.1 - 3600.0
A027 : Jog Acceleration Time (second): 0.1 -25.5
A028 : Jog Deceleration Time (second): 0.1 - 25.5
```

1.) Formula for calculating acceleration and deceleration time: The denominator is based on the rated frequency of the motor.
Acceleration time $=\mathrm{B} 007($ or A025 $) \times \frac{\text { Preset frequency }}{\mathrm{A} 005}$, Deceleration time $=\mathrm{B} 008($ or A026 $) \times \frac{\text { Preset frequency }}{\mathrm{A} 005}$
2.)When A050 - A056 is set as 06 (the second acceleration and deceleration time), the first acceleration/ deceleration/ S curve or the second acceleration/ deceleration/ S curve will be set by the external input terminal.
3.) When A050 - A056 is set as 05 (Jog), Jog run is controlled by external terminals. The acceleration and deceleration action will be at Jog acceleration and deceleration times.
4.) When $\mathrm{A} 050-\mathrm{A} 056$ is set as $05(\mathrm{Jog})$ and 06 (acceleration and deceleration time $1 / 2$ toggle), to change the acceleration and deceleration times by the external terminals, and the settings as shown:

| preset value | Function <br> Acc/ Dec time <br> (B007/B008) | Acc/ Dec time 2 <br> $(\mathrm{A} 025 / \mathrm{A} 026)$ | JOG Acc/Dec time <br> (A027/A028) |
| :---: | :---: | :---: | :---: |
|  | B004 determines the output <br> frequency | B004 determines the output <br> frequency | Run at A059Jog frequency |
| A050~A056=05 Jog <br> command | Off | Off | On |
| A050~A056=04 <br> Toggle Acc/Dec time. | Off | On | Off |

5.) When $S$ curve time (A023/A024) is set as 0 , the $S$ curve is ignored. Acceleration and deceleration ramps are linear.
6.) When $S$ curve time (A023/A024) is greater than 0 , the acceleration and deceleration action is as shown in figure 4-7.
7.) Regardless of the stall prevention period, actual acceleration and deceleration time = preset acceleration $/$ deceleration time $+S$ curve time. For example: acceleration time $=$ B008+ A023.
8.) During acceleration and deceleration process, there might be residual error in acceleration and deceleration toggling. Please set the $S$ curve time as 0 (A023/A024), if you need to toggle acceleration and deceleration time in acceleration / deceleration process.

Figure 4-7 S-Curve characteristics

```
A029 : DC Injection Brake Start Frequency (Hz) : 0.1 - 10.0
A030 : DC Injection Brake Level (\%) : 0.0-20.0
A031 : DC Injection Brake Time(second) : 0.0-25.5
```

A031 / A029 is the active time and start frequency of DC braking, as shown below:

Figure 4-8 DC Injection Braking Example

A032 : Skip Frequency \#1 (Hz) : 0.00-400.00
A033 : Skip Frequency \#2 (Hz) : 0.00-400.00
A034 : Skip Frequency \#3 (Hz) : 0.00-400.00
A035 : Skip Frequency Bandwidth ( $\pm$ Hz) : 0.00 - $\mathbf{3 0 . 0 0}$
Example: A032is set to 10.0 Hz / A033 to $20.0 \mathrm{~Hz} / \mathrm{A} 034$ to $30.0 \mathrm{~Hz} / \mathrm{A} 035$ to 2.0 Hz

A039: Parameter lock function<br>0000: Enable all Functions<br>0001: A059 - A068 cannot be changed<br>0002: All Functions Except A059-A068 cannot be changed<br>0003: Disable All Functions

## A040: Parameter Copy <br> 0000: Disable <br> 0001: Inverter to Copy Unit <br> 0002: Copy Unit to Inverter <br> 0003: Verify

1.) $\mathrm{A} 040=0000:$ Inverter copy operation not in copy mode.
2.) $\mathrm{A} 040=0001:$ Copy the inverter parameters to keypad module.
3.) $\mathrm{A} 040=0002$ : Copy the keypad module parameters to inverter.
4.) A $040=0003$ : Copy the parameters to inverter or keypad module to mutually verify the parameters.
※Note: The copy function is only available for the models with same ratings.

## A041: Fan Run Control

0000: Auto (Depend on temp.)
0001: Operate while in RUN Mode
0002: Always Running
0003: Always Stopped
1.) A041=0000: The fan runs as the inverter senses temperature, extending the service period.
2.) $\mathrm{A} 041=0001$ : The fan runs while the inverter is running.
3.) A $041=0002$ : The fan is continuously running regardless of the action of the inverter.
4.) A041=0003: The fan is always stopped regardless of the action of the inverter.
※Note: Depending on the hardware; the function is disabled at and above 15 HP for 230 V class and
above 20 HP for 460 V class. The fan is running after the inverter power on.

## A042: Energy Saving Mode Operation 0000: Disabled

0001: Controlled by MFIT at Set Frequency
A043: Energy saving operation gain (\%): 0-100 (see Note 1)
1.) With FANS, PUMPS or other heavy inertia loads, starting torques are typically high, while at speed torque demand is less. Consequently, the output voltage can be lowered to save energy by setting A042.
2.) A050 ~A056 (Multifunction input terminal) set to 10 to enable energy saving.
3.) $A 042=0001$, If the multifunction terminal is set as 10 (energy saving control terminal), the output voltage will gradually decline to 'original voltage' $\times$ 'A043' preset value as the terminal' is ON. The output voltage will rise to original voltage if the input is low.
※Note:1. The declining and rising speeds of voltage for energy saving are the same as those for SPEED SEARCH.
2. Energy saving mode is only available in V/F mode. $(\mathrm{A} 000=0002)$.

## A044: Carrier Frequency (KHz) : 2-16

| A044 | Carrier <br> Frequency | A044 | Carrier <br> Frequency | A044 | Carrier <br> Frequency | A044 | Carrier <br> Frequency |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 2 KHz | 6 | 6 KHz | 10 | 10 KHz | 14 | 14 KHz |
| 3 | 3 KHz | 7 | 7 KHz | 11 | 11 KHz | 15 | 15 KHz |
| 4 | 4 KHz | 8 | 8 KHz | 12 | 12 KHz | 16 | 16 KHz |
| 5 | 5 KHz | 9 | 9 KHz | 13 | 13 KHz |  |  |

※ Note: Increasing the carrier frequency will generally result in quieter operation of the motor. However, increased carrier frequencies can potentially cause electrical interference on other equipment operating in proximity to the N3 inverter.

```
A045 : Custom Units (Line Speed) Display Mode 0000:Drive Output Frequency is Displayed 0001:Line Speed is Displayed as an Integer (xxxx) 0002:Line Speed is Displayed with One Decimal Place (xxx.x) 0003:Line Speed is Displayed with Two Decimal Places (xx.xx) 0004:Line Speed is Displayed with Three Decimal Places (x.xxx)
```

The preset frequency is displayed when the inverter is stopped while the operation line speed is displayed while the inverter is running.

## A046:Custom Units (Line Speed) Value : 0-9999

The max preset line value of A046 is equal to the rated frequency (A005) of the motor. For instance, line speed at 1800 RPM is equal to 900 RPM when output is 30 Hz while the base frequency is 60 Hz .

```

    0023: Analog Input (Terminal AIN)
    0024: Multi-Sequence Control
```

A. The terminals S1-AIN on terminal block (TM2) are multifunction input terminals. The 30 functions shown above can be set in these terminals.
B. Function Description for A050~A056:

1. A050~A056=0/1(Forward/Reverse/Stop)

If forward command is ON, the inverter runs and stops when the command is OFF. The A050 factory setting is forward.
As reverse command is ON, the inverter runs stops when the command is OFF. The A051 factory setting is reverse.
2. A050~A056=2-4 (Frequency Command 2/3/4 at A062/A063/A065)

When External multifunction input terminals are ON, the inverter operates at the preset speed, and the duration is determined by the time the input is ON. The corresponding frequency parameter match to the terminal input states is shown in the table on the next page.
3. A050~A056=5(Jog)

When Jog operation, is selected, the inverter operates at the Jog acceleration and deceleration times. The corresponding jog frequency parameter is shown below:
The priority order of frequency: Jog Speed $\rightarrow$ Preset Speed $\rightarrow$ Keypad frequency or external frequency signal

| Multifunction <br> terminal3 <br> Preset value $=04$ | Multifunction <br> terminal 2 <br> Preset value $=03$ | Multifunction terminal 1 <br> Preset value $=02$ | Jog Command <br> terminal <br> Preset value $=05$ | Output frequency <br> preset value |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | $6-00$ |
| X | X | X | 1 | A 059 |
| 0 | 0 | 1 | 0 | A 061 |
| 0 | 1 | 0 | 0 | A 062 |
| 0 | 1 | 1 | 0 | A 063 |
| 1 | 0 | 0 | 0 | A 064 |
| 1 | 0 | 1 | 0 | A 065 |
| 1 | 1 | 0 | 0 | A 066 |
| 1 | 1 | 1 | 0 | A 067 |

4. A050~A056=6 (toggle acceleration and deceleration time)

This input selects the acceleration 1/ deceleration 1/S curve 1 or acceleration 2/deceleration
2/ S curve 2.
5. A050~A056=7: External Emergency Stop Contact A.

The inverter will decelerate to stop and Flash E.S as the emergency stop signal is received regardless of B003 setting. After the signal is released, toggle the run input or press the run key in keypad mode and the inverter will restart from the start frequency. If the emergency signal is released before the inverter stops completely, the inverter still carries out the emergency stop. The A105/A106 determines the action of the error terminal. If A105/A106=0: the fault is not enabled when the external emergency signal is input. If $\mathrm{A} 105 / \mathrm{A} 106=9$, the fault is actuated when the emergency signal is input.

## 6. A050~A056=8: Base Block

The inverter immediately stops sending output voltage, and the motor does a Coast stop.
7. A050~A056=9: Speed Search Stop

When starting, the inverter detects the present speed of the motor, then accelerates from that present speed to preset speed.
8. A050~A056=10: Energy-saving operation With FANS, PUMPS, or other heavy inertia loads, starting torques are typically higher while at speed, torque demand is less. Consequently the output voltage is reduced to save energy.
The output voltage gradually declines as the input is ON. It will gradually increase (to the original voltage) as the input is OFF.
※Note: The acceleration and deceleration speed of energy saving operation is the same as the speed of SPEED SEARCH.
9. A050~A056=11: Switch of the control signal

OFF: B000/B001 determines the operation signal and frequency signal.
ON: Keypad controls the operation signal and frequency signal.
※ NOTE: Switch of control signal via A050~A056=11 is allowed while the drive is running (on the fly). Please exercise caution around operating equipment when operating in this mode.
10. A050~A056=12: Switch of the inverter control (RS485) communication

OFF: in communication, the master (PC or PLC) can control the inverter operation and frequency signal and allow modification or the parameters. The operation signals from Keypad and TM2 are idle. Furthermore, the keypad can only display the voltage, current and frequency; the parameters are read-only, while Emergency Stop is valid.
ON : in communication, the inverter is controlled by the keypad regardless of the settings of B000/B004 and master. Under such circumstance, the RS485 master still can read and write the inverter parameters.
11. A050~A056=13: Disable acceleration and deceleration

The acceleration and deceleration action is unavailable until the disable signals are released.
The action is illustrated in the graph below:

Figure 4-9 Acceleration and deceleration Prohibit
12. A050~A056=14,15: UP / DOWN Function (Actual ACC/DEC time is based on the setting):
(1) $\mathrm{B} 004=3$ to use the UP/DOWN Function. The other frequency signals are useless.
(2)Set A058 $=0$ and A060 $=0$. The inverter accelerates to the preset value of A061 when in RUN, then it maintains a constant speed. As the inverter receives either the UP/DOWN command, it will accelerate / decelerate until the command is released. The inverter runs at the speed setting at the time of release. The inverter will ramp stop or Free-Fun stop which is determined by the B003 as long as the inverter receives the STOP command. The frequency at Stop time will be stored in A061. The UP/DOWN KEY is invalid when the inverter is stopped. It is necessary to use the Keypad to modify the preset parameters.
(3)Set $\mathrm{A} 058=1$, the inverter will operate from 0 Hz when the operation terminal is ON. The action of UP/DOWN is the same as above. The inverter will ramp stop or free-run stop as determined by B003 setting when it receives the Stop Command. The next operation will start at 0 Hz .
(4) UP/Down Signals simultaneously pressed are invalid
(5) A $060 \neq 0$, the inverter accelerates to the setting of A061 and maintains speed. When the UP/Down terminal is ON, setting frequency is the value $\mathrm{A} 061 \pm \mathrm{A} 060$, and the inverter will accelerate/ decelerate to frequency A061. The upper frequency limit and lower frequency limit also restrict the operation. If the signal of UP/ DOWN is maintained over 2 seconds, the inverter will begin to accelerate/ decelerate. If A $060=0$, the operation is the same, until the UP/ DOWN signal is released. Please refer to the time diagram of A060.

Figure 4-10 UP/DOWN key sequencing
13. A050~A056=16 Principal/Auxiliary speed toggle

OFF: the frequency is set by the potentiometer (Master Speed) on the Keypad. ON: the frequency is set by the analog signal terminal (Auxiliary Speed) on TM2.

## 14. A050~A056=17(PID Function Disable)

When the PID Function Disable is ON, PID is not controlled by A140.
15. A050~A056=18(Reset Command)

The Reset command is same as the Reset Key on the panel. When the command is OFF, the inverter does not respond. The factory default of A055 is Reset command.
16. A054=19 (Pulse Input Terminal)

The multifunction terminal S 5 is set at 19 and becomes the input terminal for encoder signals.
17. A $055=20$ (PID feedback input terminal)

The multifunction terminal S6=20 becomes the PID feedback input terminal and $0 \sim 10 \mathrm{~V}$ ( $0 \sim$ $20 \mathrm{~mA})$ or $2 \sim 10 \mathrm{~V}(4 \sim 20 \mathrm{~mA})$ is available by the setting of A140.
18. A055=21/22(Bias signal $1 / 2$ input)

To regulate the Offset of the Keypad Potentiometer or AIN analog input (only $0 \sim 10 \mathrm{~V}(0 \sim 20 \mathrm{~mA})$ or $2 \sim 10 \mathrm{~V}(4 \sim 20 \mathrm{~mA})$ is available $)$.

A055=21 Function

A055=22Function $\quad *$ The value is 0 when AIN $+(\mathrm{S} 6-5 \mathrm{~V})<0$

Figure 4-11 Bias signal characteristics
19. A056=23 (Analog input AIN)

The multifunction terminal AIN $=23$. This is provided for setting the frequency.
20. A050~A056=24 (Multi-Sequence Control)

The Multi-Sequence control is set at 24 to become the input terminal for the Auto_Run Mode.

## Digital /Analog input signal scan times:

A057: Multifunction terminal S1~S6 and AIN signal confirm the scan times (mSec X 4),1~100 times
1.TM2 terminal is used for scanning. If there are the same signals continuously input for N times, the inverter will treat the signal as normal. During the signal evaluation, if the scan times are less than N , the signal will be treated as noise.
2. Each scan period is 4 ms .
3. The user can specify the scan times interval duration according to the noise environment. If the noise is serious, increase the value of A057, however the response will be slower.
4. Note: If the S 6 and AIN is digital, the voltage level for digital signal above 8 V is treated as ON , below 2 V is OFF .

## Stop Mode Using Up/Down:

A058:
0000: When Up/Down is used, the preset frequency is held as the inverter stops, and the UP/Down is idle.

0001: When Up/Down is used, the preset frequency is reset to 0 Hz as the inverter stops.
0002: When Up/Down is used, the preset frequency is held as the inverter stops, and the UP/Down is available.
(1) 0 : the inverter will accelerate to the speed set in parameter 6-00 upon receiving the Run command and run at commanded speed. The inverter begins to accelerate (decelerate) as the UP (Down) terminal is energized. The inverter will hold the speed as the UP/DOWN command released. When the Run Signal releases, the inverter will ramp stop or stop as determined by the B003. It will store the frequency when the run signal is removed. UP/DOWN keys are idle when the inverter is stopped. The keypad is available to modify the preset frequency (6-00). If A058=0002, the UP/Down is available as the inverter stops.
(2) 1: as the Run terminal is energized, the inverter operates from 0 Hz , the Function of UP/DOWN is same as the above description. When the Run signal is released, the inverter will ramp stop or stop output (determined by B003) to 0 Hz . The next run command will always begin from 0 Hz .

## Jog and Preset (MFIT) Speed Setting on Keypad: <br> A059 \& A061~A068: Set Jog and preset speed by Keypad

## A. A050~056=2-4(preset speed 1~3)

ON: the inverter operates at preset speed. The operation time of the 8 stages is based on the bit pattern of the three available inputs. Please refer to the corresponding parameters list:
B. A050~056=5(Jog terminal)

ON: the inverter operates in Jog acceleration time/ Jog decelerate time/ON

| Function <br> Code No. | LCD <br> Display | Description | Range/Code |

## Step of Up/Down Function (Hz): <br> A060: Up/Down (Hz) 0.00 - 5.00

There are two modes covered below:
(1) A060 $=0.00$, The operation is just as the original one. When the UP terminal is ON, the frequency increases; while the DOWN terminal is ON, the frequency decreases. (Refer to the following graph).

Figure 4-12 UP/DOWN profile example
(2) $\mathrm{A} 060=0.01$ to 5.00 , and UP/ DOWN terminal ON , is equivalent to a step increase/ decrease at the increment frequency in A060. If UP/DOWN is pressed over 2 seconds, the original UP/DOWN mode is restored (Please refer to the following diagram)

Figure 4-13 UP/DOWN with incremental steps

(1) Auto_Run Mode Selection (A091)
(2) Auto_Run Mode Setting Selection (A061~A068, A071~A078 , A081~A088)

- A PLC operation mode is ready to use with the following settings of the multi-step frequency command 1~8 (A061~A068), Auto_Run mode time setting (A071~A078) under the Auto_Run mode selection (A091). The FWD/REV direction can be set with the setting of (A081~A088).
- In the Auto_Run mode, the multi-step frequency commands $2 \sim 4$ are ineffective.
- Some examples in auto_run mode follow :
(A) Single Cycle Running (A091=1,4)

The inverter will run for a single full cycle based upon the specified setting mode. Then, it will stop.
For example:
A091 $=1$
A081~83=1(FWD)
A084=2(REV)
A085~88 = 0
$\mathrm{A} 061=15 \mathrm{~Hz}$
$\mathrm{A} 071=20 \mathrm{~s}$
$\mathrm{A} 062=30 \mathrm{~Hz}$
$\mathrm{A} 063=50 \mathrm{~Hz}$
$\mathrm{A} 064=20 \mathrm{~Hz}$
$\mathrm{A} 072=25 \mathrm{~s}$
$\mathrm{A} 073=30 \mathrm{~s}$
$\mathrm{A} 074=40 \mathrm{~s}$
$\mathrm{A} 065 \sim 68=0 \mathrm{~Hz}$

Figure 4-14 Single cycle auto run
(B) Periodic Running ( $\mathrm{A} 091=2,5$ )

The inverter will repeat the same cycle periodically.
For example:
$\mathrm{A} 091=2$
A061~68, A071~78, A081-88 : same setting as the example (A)

Figure 4-15 Periodic cycle auto run
(C) Auto_Run Mode for Single Cycle (A091 = 3, 6)

The speed of final step will be held to run.
For example:

$$
\begin{aligned}
& \mathrm{A} 091=3 \\
& \mathrm{~A} 081 \sim 84=1(\mathrm{FWD}) \quad \mathrm{A} 085 \sim 88=0 \\
& \mathrm{~A} 061 \sim 68, \quad \mathrm{~A} 071 \sim 78 \quad: \quad \text { same setting as the example }(\mathrm{A})
\end{aligned}
$$

Figure 4-16 Single cycle auto run: final step hold

- A091 = 1~3 : If the inverter stops and re-starts, it will continue running from the unfinished step, according to the setting of A091.
$=4 \sim 6$ : If the inverter stops and re-starts, it will begin a new cycle and continue running according to the setting of A091.

Figure 4-17 AUTO_RUN cycle with interrupt

- ACC/DEC time follow the setting of B007, B008 in Auto_Run Mode.

A113: Trip Prevention Selection During Deceleration:
0000: Enable Trip Prevention During Deceleration
0001: Disable Trip Prevention During Deceleration
A114: Trip Prevention Level During Deceleration: 50\% ~ 300\%(based by Motor HP A003)
A115: Trip Prevention Selection in Run Mode:
0000: Enable Trip Prevention in Run Mode
0001: Disable Trip Prevention in Run Mode
A116: Trip Prevention Level in Run Mode: 50\% ~ 300\%(based by Motor HP A003)
A117: Trip Prevention Deceleration Time Selection in Run Mode:
0000: Trip Prevention Deceleration Time Set by B008
0001: Trip Prevention Deceleration Time Set by A118
A118: Deceleration Time in Trip Prevention Mode (sec): 0.1 ~ 3600.0

1. During acceleration, the inverter will delay the acceleration time if the acceleration time is too short, and otherwise resulting in the over current trip.
2. During deceleration, the inverter will delay the deceleration time if the deceleration time is too short, otherwise resulting in the over voltage of DC BUS trips with 'OV' displayed.
3. Some mechanical equipment (such as a press) or unusual breakdown (seizing due to insufficient lubrication, uneven operation, impurities of processed materials, etc.) will cause the inverter to trip. When the operating torque of the inverter exceeds the setting of A116, the inverter will lower the output frequency following the deceleration time set by A117, and return to the normal operation frequency after the torque level stabilizes.
```
A119: Electronic Motor Overload Protection Operation Mode:
        0000: Enable Electronic Motor Overload Protection
    0001: Disable Electronic Motor Overload Protection
A120: Motor Type Selection:

    0001: Electronic Motor Overload Protection Set for Inverter Duty Motor
A121: Motor Overload Protection Curve Selection:
    0000: Constant Torque (OL=103%)(150%,1 minute)
    0001: Variable Torque (OL=113%)(123%,1 minute)
A122: Operation After Overload Protection is Activated:
    0000: Coast-to-Stop After Overload Protection is Activated
    0001: Drive Will not Trip when Overload Protection is Activated (OL1)
```

Description of the thermal relay function:

1. $\mathrm{A} 121=0000$ : protect the general mechanical load. If the load is less than $103 \%$ rated current, the motor continues to run. If the load is larger than $150 \%$ rated current, the motor will run for 1 minute. (Refer to curve (1).
$=0001$ : protect HVAC load (FAN , PUMP...so on): If the load is less than $113 \%$ rated current, the motor continues to run. If the load is larger than $123 \%$ rated current, the motor will run for 1 minute.
2. The heat sink function will diminish when the motor runs at low speed. The thermal relay action level will diminish at the same time. (The curve 1 will change to curve 2 ).
3. $\mathrm{A} 120=0000$ : set A 005 as the rated frequency of the motor.
$\mathrm{A} 122=0000$ : the inverter coasts to stop as the thermal relay acts and flash OL1. Press the 'reset' or the external reset terminal to continue to run
$=0001$ : the inverter continues to run as the thermal relay acts and the display flashes OL1. Until the current declines to $103 \%$ or $113 \%$ ( determined by A121), then OL1 disappears.

Figure 4-24 Thermal Overload Curves

Inverter Duty Motor OL1 Protection Cwve $\mathrm{OL}=103 \%$ Start, $150 \% / 1 \mathrm{Min}$.

Invester Duty Motor OL1 Frotection Curve OL $=113 \%$ Start, $123 \% / 1 \mathrm{Min}$.

```
A123: Over/Under Torque Detection Selection:00
    = 0000: Disable Over/Under Torque Operation
    = 0001: Enable Over/Under Torque Operation Only if at Set Frequency
    = 0002: Enable Over/Under Torque Operation while the Drive is in Run Mode
A124: Operation After Over/Under Torque Detection is Activated:
    = 0000: Drive will Continue to Operate After Over/Under Torque is Activated
    = 0001: Coast-to-Stop After Over/Under Torque is Activated
```

A125: Over Torque Threshold Level (\%): 100-200\%
A126: Over Torque Activation Delay Time (s): 0.0-25.0

## A127: Under torque Threshold Level (\%): 0-100\%

A128: Under torque activation Delay Time (Seconds): 0.0-25.0
The over torque is defined as the output torque is active for longer than parameter A126 and, the voltage level (the inverter rated torque is $100 \%$ ) exceeds over A125 parameter.

Over Torque:
A124 $=0000$ : If there is over torque, the inverter can continue to run and flashes OL3 until the output torque is less than the A125 setting value.
$=0001$ : If there is over torque, the inverter coasts to stop and flashes OL3. It is required to press 'RESET' or external terminal to continue running.
Parameter A105, A106 (Multifunction output terminal) $=05$, the output terminal is output over torque signal.

The Under torque is defined as the output torque is active for longer than parameter A126 and the voltage level (the inverter rated torque is $100 \%$ ) is less than A125 parameter.
Under Torque:
A124 $=0000$ : If there is under torque, the inverter can continue to run and flashes OL4 until the output torque is over than the A125 setting value.
$=0001$ : If there is under torque, the inverter coasts to stop and flashes OL4. It is required to press 'RESET' or external terminal to continue running.
Parameter A105, A106 (Multifunction output terminal) $=15$, the output terminal is output under torque signal.
※ Note: Over torque output signal will be output as the parameter A123=0001or 0002 when the set level and time are over the range.

## V/F PATTERN Selection

B009: V/F PATTERN Selection $=0-18$
A129: Torque boost gain(V/F pattern modulation) $\%=0.0-\mathbf{3 0 . 0} \%$
A130: Motor no load current(Amps AC)

| A131: Motor rated slip compensation(\%) | $=0.0-100.0 \%$ |
| :--- | :--- |

|  |  |  |  |  |  | 10 11 12 |  |
|  |  | $4$ |  | Hz |  | 13 |  |
|  |  | 6 <br> 7 <br> 8 |  |  |  | 15 16 17 |  |

Figure 4-26 Custom V/F Patterns

| B009 | B | C |
| :---: | :---: | :---: |
| $0 / 9$ | $50.0 \%$ | $1.0 \%$ |
| $1 / 10$ | $60.0 \%$ | $1.0 \%$ |
| $2 / 11$ | $65.0 \%$ | $1.0 \%$ |
| $3 / 12$ | $70.0 \%$ | $1.0 \%$ |
| $4 / 13$ | $40.0 \%$ | $1.0 \%$ |
| $5 / 14$ | $35.0 \%$ | $1.0 \%$ |
| $6 / 15$ | $45.0 \%$ | $1.0 \%$ |
| $7 / 16$ | $55.0 \%$ | $1.0 \%$ |
| $8 / 17$ | $65.0 \%$ | $1.0 \%$ |

3. The inverter will output the value of $\mathrm{B}, \mathrm{C}$ voltage (refer to B 009 ) points according the $\mathrm{A} 129 \mathrm{~V} / \mathrm{F}$ pattern setting. The starting torque will be raised as shown.

※Note: A129=0, Torque boost function is invalid
4. When the induction motor is in running, there must be slip due to the load. It is necessary to boost voltage to improve the precision of the speed.
Slip frequency boost $=\frac{\text { Output Current-(A130) }}{(\mathrm{A} 002)-(\mathrm{A} 130)} \times(\mathrm{A} 131) \quad \begin{array}{r}\text { Note }: \mathrm{A} 002=\text { motor rated current } \\ \mathrm{A} 130=\text { motor no load current }\end{array}$

## A131 approximate value $=$ <br> (Motor synchronization speed- Rated speed) / Motor synchronization speed $\uparrow$ Marked on the motor nameplate <br> Motor synchronization speed $($ RPM $)=\frac{120}{\text { Motor Poles }} \times$ Motor rated frequency $(50 \mathrm{~Hz}$ or 60 Hz$)$

Example: 4 Poles,60Hzinduction motor synchronization speed $=\frac{120}{4} \times 60=1800 \mathrm{RPM}$
※Note: Motor no load current (A130) differs with the inverter capacities (A175) (Refer to A002 note). It should be regulated according to actual conditions.

## A140: PID Operation Selection

0000: PID disable
0001: PID enable (Deviation is D-controlled)
0002: PID Feedback D-controlled
0003: PID D Reverse characteristic controlled
0004: PID Feedback D characteristic controlled
0005: PID, Frequency command + D controlled
0006: PID, Frequency command + Feedback D controlled
0007: PID, Frequency Command + D reverse Characteristic controlled.
0008: PID, Frequency Command + Feedback D reverse Characteristic controlled.
See figure 4-28 for
A140 $=1, \mathrm{D}$ is the deviation of the process error signal in unit time (A144).
$=2, D$ is the deviation of the feedback in unit time (A144).
$=3$, $D$ is the deviation of the process error signal in the unit time (A144). If the deviation is positive, the output frequency decreases and vice versa.
$=4, \mathrm{D}$ is the deviation of feedback in unit time (A144). When the deviation is positive, the frequency decreases, and vice versa.
$=5, \mathrm{D}$ is equal to the deviation of the process error signal in unit time (A144) +Frequency command.
$=6, D$ is equal to the deviation of feedback in unit time + Frequency command.
$=7, \mathrm{D}$ is equal to the deviation of the process error signal in unit time + Frequency command. If the deviation is positive, the output frequency decreases, and vice versa.
$=8, \mathrm{D}$ is equal to the deviation of feedback in unit time + Frequency command. When the deviation is positive, the frequency decreases, vice versa.

## A141: Feedback Calibration Gain(\%) : 0.00-10.00

A141 is the calibration gain. Deviation $=($ set point - feedback signal $) \times$ A141

## A142: Proportion Gain(\%) : 0.00-10.00

A142: Proportion gain for P control.

A143: Integrate Time ( s ) : 0.0-100.0
A143: Integrate time for I control

A144: Differential Time (s) : 0.00-10.00
A144: Differential time for D control

A145: PID Offset : 0000 : Positive Direction
0001 :Negative Direction
A146: PID Offset Adjust (\%) : -109\% ~ +109\%
A145/A146: PID the calculated result pluses A146 (the sign of A146 is determined by A145).

## A147: Output Lag Filter Time ( s ) : 0.0-2.5

A147: Update time for output frequency.
Note: PID Function is available for controlling the output flow, external fan flow and temperature.
The PID block diagram is as follows:

Figure 4-28 PID BLOCK DIAGRAM

1. To enable PID control, set $\mathrm{A} 055=20$, AI2 (S6) on TM2 is defined as the PID feedback signal.
2. The set point in the above diagram is the B004 input frequency.
3. There are two ways to view the PID feedback signal: one is using the Keypad switch display (B016 must be set to 1), the other is using analog output FM + (A103 must be set to 5 ).

## A148: Feedback Loss Detection Mode: 0000:Disable 0001:Enable - Drive Continues to Operate After Feedback Loss 0002:Enable - Drive "STOPS" After Feedback Loss

A148= 0: Disable; A148= 1: detect, continue running, and display 'PDER' ; A148= 2: detect, stop, and display 'PDER'。

## A149: Feedback Loss Detection Mode (\%): 0-100

A149 is the level for signal loss. Error $=($ Set point - Feedback value $)$. When the error is larger than the loss level setting, the feedback signal is considered lost.

## A150: Feedback Loss Detection Delay Time (s): 0.0-25.5

A150: the minimum time window to consider the feedback signal lost.

## A151: Integrate Limit Value (\%): 0-109

A151: the Limiter to prevent the PID from saturating.

## A152: Integrator Reset to 0 when Feedback Signal Equals the set point: 0000:Disable <br> 0001:1 second <br> 0030: 30 seconds

A152=0: As PID feedback value reaches the set point, the integrator will not be reset to 0 .
A152 $=1 \sim 30$ : As PID feedback value reaches the set point, reset to 0 in $1 \sim 30$ seconds and inverter stops. The inverter will run again when the feedback value differs from the set point value.

## A153: Allowable Integration Error Margin (Unit Value) (1 Unit = 1/8192): 0-100

A153 $=0 \sim 100 \%$ unit value: Restart the tolerance after the integrator reset to 0 .

## A154: PID Feedback Signal: 0000: 0~10V or 0~20mA

0001: $\mathbf{2 \sim 1 0 V}$ or $\mathbf{4 \sim 2 0 m A}$
A154: Feedback signal selection, A154=0: $0 \sim 10 \mathrm{~V}$ or $0 \sim 20 \mathrm{~mA}$ (signal V or I set by SW3)

$$
\text { A154=1: } 2 \sim 10 \mathrm{~V} \text { or } 4 \sim 20 \mathrm{~mA} \text { (signal V or I set by SW3) }
$$

## A155, A156: PID Sleep Mode

PID SLEEP MODE:
A140=1(PID Enable)
A055=20(PID FEEDBACK Enable)
B004=PID setting frequency source (Target Value)
A155: set the sleep threshold frequency, Unit: HZ
A156: set the time for sleep delay, Unit: sec
When PID output frequency is less than the sleep threshold frequency and exceeds the time of sleep delay, the inverter will decelerate to 0 and enter PID sleep mode.

When PID output frequency is larger than the sleep threshold frequency for sleep start the inverter will reactivate and enter PID wake mode. The time diagram is as follow:

- INV out frequence
-     -         - PID out frequence
sleep level (set from 12-7 unit is HZ)

$$
\| \text { A155: sleep levl }
$$

## A163: RS485 Communication Station Drop Number: 1-254

A163: to set the RS485 communication station codes which are suitable for driving multi drop situations on inverter networks.

## A164: Baud Rate setting (bps): <br> 0000: 4800 <br> 0001: 9600 <br> 0002: 19200 <br> 0003: 38400

## A165: Stop Bit Selection: 0000: 1 stop bit

0001: 2 stop bit
A166: Parity Selection : 0000 : no parity
0001 : even parity
0002 : odd parity
A167: Data Format Selection: 0000 : 8 bit data
0001 : 7 bit data

1. RS-485 Communication:
(1)1 vs. 1 Control: to control one inverter by a PC or PLC or controller. ( $\operatorname{set} \mathrm{A} 163=1 \sim 254$ )
(2) 1 vs. Multiple Drop Control: to control more than one inverter by PC, PLC, or Host Controller (The max number of inverter drops is 254 . Set A163 = 1~254). When the inverter receives the host communication (station code $=0$ ), the communication command is followed regardless the setting value of A163.
2. RS-232communication: (RS232 interface is required)

1vs1 control only: to control one inverter by a PC, PLC, or controller. (Set A163 = 1~254)
※Note:
a. The BAUD RATE (A164) of PC (or PLC or Controller) has to match the inverter baud rate setting. Communication format (A165/A166/A167) should also be set as the same.
b. The inverter will confirm and acknowledge commands as PC modifies the parameters of the inverter.
c. Please refer to the N3 Communication PROTOCOL.

## A168: Stator Resistance(Ohms) Gain <br> A169: Rotator Resistance(Ohms) Gain <br> A170: Equivalent Inductance(mH) Gain <br> A171: Magnetized Current(Amps AC) Gain <br> A172: Ferrite Loss Conduction (gm) Gain

1. If $\mathrm{A} 000=0$ or 1 (vector control mode), when powered up, set $\mathrm{A} 006=1$. The motor will run while the inverter performs auto tuning. Once the motor stops, auto tuning is finished. The inverter will write the internal parameters of the motor to A168~A172, and auto reset the A006 to 0 .
2. Auto tuning must be carried out whenever the motor is changed. If the internal parameters are known already, they can be input to A168~A172 directly.
3. Set A006=1 to perform auto tuning. When finished, A006 auto resets to 0 . The Keypad displays END.
4. The parameter group is only effective in current vector mode.
5. Never perform the auto tune when the inverter and motor are not connected.

## A175: Drive Horsepower Code

| A175 | Inverter Model |  |

| 475 |  | $475-\mathrm{N} 1$ |

## A176: Software Version

## A177: Fault Jog (Latest 3 times)

1. When the inverter trips on a fault, the former fault $\log$ stored in2.xxxx will be transferred to 3.xxxx, the one in 1.xxxx to $2 . x x x x$. The present fault will be stored in the blank 1.xxxx. The fault stored in 3.xxxx is the earliest one of the most recent three, while the one 1.xxxx is the latest.
2. When pressing 'ENTER' at A177, the fault 1.xxxx will be displayed first. Press $\boldsymbol{\Delta}$, to read 2. $\mathrm{xxx} \rightarrow 3 . \mathrm{xxx} \rightarrow 1 . \mathrm{xxx}$ press $\boldsymbol{\nabla}$, and the order is $3 . \mathrm{xxx} \rightarrow 2 . \mathrm{xxx} \rightarrow 1 . \mathrm{xxx} \rightarrow 3 . \mathrm{xxx}$.
3. When pressing 'ENTER' at A177, the three fault log will be cleared when the reset key is pressed.

The $\log$ content will change to $1 .---, 2 .---3 .---$.
4. E.g. the fault $\log$ content is ' $1 . O C C$ ', this indicates the latest fault is OC-C, etc.

## A178: Accumulated Operation Time 1 (Hours): 0 - 9999

A179: Accumulated Operation Time 2 (Hours X 10000): 0-27
A180: Accumulated Operation Time Mode: 0000: Power on time

## 0001: Operation time

1. When the operation time is to 9999 as the elapsed time 1 is set. The next hour will be carried to operation A179. Meanwhile, the recorded value will be cleared to 0000 , and the record value of operation duration 2 will be 01 .
2. Description of operation time selection:

| Preset value | Description |
| :---: | :--- |
| 0 | Power on, count the accumulated time. |
| 1 | Inverter operation, count the accumulated operation time |

## A181: Reset to the factory setting: 1110: Reset to the 50 Hz factory setting 1111: Reset to the $\mathbf{6 0 H z}$ factory setting

When A181 is set to 1111, the parameter will be reset to the factory setting. The max output voltage will comply with the voltage and frequency (A001/A005) on the nameplate of the motor. The output frequency is 60 Hz if the upper frequency limit is not set.

## ※Note:

Motor parameters (A168~A172) will be modified under V/F control mode when reset factory setting is performed.
Motor parameters (A168~A172) will not be modified under vector control mode when reset factory setting is performed.

## B000 : Run Command Source Selection <br> 0000:Keypad <br> 0001:External terminal control <br> 0002:Communication control

1.) $\mathrm{B} 000=0000$ the inverter is controlled by the keypad.
2.) $\mathrm{B} 000=0001$ the inverter is controlled by the external terminals. The Stop key for emergency will function. (Refer to A010 description).
Note: B000 $=0001$, please refer to parameter group A013, A014, A019 and A018 for detail description for safety of persons and machines.
3.) $B 000=0002$ the inverter is Rs 485 communication controlled.

## B001 : Operation modes for external terminals

0000:Forward/stop-reverse/stop
0001:Run/stop-forward/reverse
0002:3-wire control mode -run/stop
1.) When operation command $\mathrm{B} 000=0001$ (external terminal), B 001 is valid.
2.) When operation command $B 000=0001$ (external terminal control), the stop button for emergency is available. (Refer to A010 for detail description).
3.) When both forward and reverse commands are ON will be treated as STOP.

B001 $=0000$, Control mode is as below:
(1).Input signal is NPN:

(2). Input signal is PNP:

B001 $=0001$, Control mode is as below:
(1). Input signal is NPN:

(2). Input signal is PNP:

Figure 4-31 Terminal Board Drive Operation Modes
$\mathrm{B} 001=0002$, Control mode is as below:

Figure 4-32 3-Wire start/stop wiring

Note: As 3 wire control mode is selected, the terminal S3 is not controlled by A052.

Figure 4-33 Drive start/stop operation sequences
Note: B002 $=0001$, the reverse command is unavailable.

## B002 : Prohibition of Reverse Operation 0000: Enable Reverse Command 0001: Disable Reverse Command

B002 $=0001$, the reverse command is invalid.

B003 : Stopping Method
0000: Controlled Deceleration-to- Stop with DC Injection Braking (Rapid Stop)
0001: Free run stop (Coast stop)
1.) $\mathrm{B} 003=0000$ : the inverter will decelerate to 0 Hz within configured deceleration time after receiving the stop command.
2.) $B 003=0001$ : the inverter will stop after receiving the stop command. The motor will coast to stop.

## B004 : Frequency Command Source Selection

0000: Set the Frequency with Keypad
0001: Potentiometer on Keypad
0002: External Analog Signal Input or Remote Potentiometer
0003: Up/Down Frequency Control Using MFIT (S1-S6)
0004: Communication Setting Frequency
0005: Impulse frequency (S5) setting frequency (ver2.3)
1.) $\mathrm{B} 004=0001$ : if one of the parameters in group $\mathrm{A} 050 \sim \mathrm{~A} 056$ is set to 16 and the multifunction terminal is OFF, the frequency is set by the potentiometer (VR for principal speed) on keypad. While the multifunction is ON, the frequency is set by analog signal (auxiliary speed) on terminal block (TM2).
2.) $\mathrm{B} 004=0002$ : if one of the parameters in group $\mathrm{A} 050 \sim \mathrm{~A} 056$ is set to 16 and the multifunction terminal is OFF, the frequency is set by the analog signal (principal speed) on terminal block (TM2), While the input is ON, the frequency is set by the potentiometer (VR for auxiliary speed) on the keypad.
3.) Please refer to the description of parameter group A050~ A056 (multifunction input terminals) for the function Up/Down terminal.
4.) The priority in reading frequency is Jog $>$ preset speed $>\boldsymbol{\Delta} \boldsymbol{\nabla}$ on keypad or Up / Down or communication control.

B005: Frequency Upper limit(Hz) : 0.01-400.00
B006: Frequency Lower limit(Hz) : 0.01-400.00

Figure 4-34 Frequency reference limits
※Note: When B006 = 0 Hz and frequency command is 0 Hz , the inverter will stop at 0 speed. When $\mathrm{B} 006>0 \mathrm{~Hz}$ and frequency command $\leqq \mathrm{B} 006$, the inverter will output the B006 preset value.

| B010 : Parameter Lock(except B010) : 0000: Disable |
| ---: |
| 0001: Enable |

0000: Disable parameter lock.
0001: Enable parameter lock.

| B011 : Advanced Display : 0000: Disable |
| ---: |
| 0001: Enable |

0000: Disable advanced display.
0001: Enable access to advanced functions (A000~A181).

## B012 Language Selection <br> 0000: English <br> 0001: German <br> 0002: French <br> 0003: Italian <br> 0004: Spanish

The function is only available for the products with LCD operation keypad. The operation is not valid with the LED keypad.

## B013:Motor Current Display Selection: 0000: Disable Motor Current Display <br> 0001: Enable Motor Current Display

## B014:Motor Voltage Display Selection: 0000: Disable Motor Voltage Display

0001: Enable Motor Voltage Display

## B015:DC Bus Voltage Display Selection: 0000: Disable Bus Voltage Display 0001: Enable Bus Voltage Display

## B016:PID Feedback Display 0000:Disabled <br> 0001:Enable

Keypad displays PID feedback value:
Parameter A055=20 (When S6 is set as the PID feedback analog terminal, refer to PID), A140 $=1$ (PID is enabled), and B016 $=1$ (Displays S6 as PID analog feedback value $0 \sim 100$, the formula is as follows:

If feedback signal is $0 \sim 10 \mathrm{~V}$, (A154=0000), the keypad display value $=(\mathrm{S} 6 / 10 \mathrm{~V}) * 100$
If feedback Signal is $4 \sim 20 \mathrm{~mA},(\mathrm{~A} 154=0001)$, the keypad display value $=(\mathrm{S} 6 / 20 \mathrm{~mA})^{*} 100$
※Note: Please press DSP Key to switch between the output frequency and PID feedback value.
※Note: The inverter displays XXXF when in Run mode, while XXXr when stopped.

## Chapter 5 Troubleshooting and maintenance

### 5.1. Error display and corrective action 5.1.1. Faults which can not be recovered manually

|  | Display | Fault | Cause | Corrective action |
| :---: | :---: | :---: | :---: | :---: |
|  | CPF | Program problem | External noise interference | Connect a parallel RC suppressor across the magnetizing coil of the magnetic contactor that causes the interference |
|  | EPR | EEPROM problem | Faulty EEPROM | Replace EEPROM |
| @ | -OV- | Voltage too high when stopped | Detection circuit malfunction | Return the inverter |
| @ | -LV- | Voltage too low when stopped | 1. Power voltage too low <br> 2. Pre-charge resistor or fuse burnt out. <br> 3. Detection circuit malfunction | 1. Check if the power voltage is correct <br> 2. Replace the pre-charge resistor or the fuse <br> 3. Return the inverter |
| @ | -OH- | The inverter is overheated when stopped | 1. Detection circuit malfunction <br> 2. Ambient temperature too high or bad ventilation | 1. Return the inverter <br> 2. Improve ventilation conditions |
|  | CTER | Current Sensor detection error | Current sensor error or circuit malfunction | Return the inverter |

※ Note: "@" the Failure contact does not function.
5.1.2. Faults which can be recovered manually and automatically

| Display | Fault | Cause | Corrective Action |
| :---: | :---: | :---: | :---: |
| OC-S | Over current at start | 1. the motor winding short circuit <br> 2. motor contacts and ground short circuit <br> 3. the IGBT module damaged | 1.inspect the motor <br> 2.inspect the wiring <br> 3.replace the transistor module |
| OC-D | Over-current at deceleration | The preset deceleration time is too short. | Set a longer deceleration time |
| OC-A | Over-current at acceleration | 1. Acceleration time too short <br> 2. The capacity of the motor exceeds the capacity of the inverter <br> 3. Short circuit between the motor coil and the case <br> 4. Short circuit between motor wiring and ground <br> 5. IGBT module damaged | 1. Set a longer acceleration time <br> 2. Replace inverter with one that has the same rating as that of the motor <br> 3. Check the motor <br> 4. Check the wiring <br> 5. Replace the IGBT module |
| OC-C | Over-current at fixed speed | 1. Transient load change <br> 2. Transient power change | 1.Increase the capacity of the inverter <br> 2. Repeat parameter auto tuning (A006 = 1) <br> 3.Reduce stator resistance (A168) if the above actions are ineffective |
| OV-C | Excessive Voltage during operation/ deceleration | 1. Deceleration time setting too short or excessive load inertia <br> 2. Power voltage varies widely (fluctuates) | 1. Set a longer deceleration time <br> 2. Add a brake resistor or brake module <br> 3. Add a reactor at the power input side <br> 4. Increase inverter capacity |
| Err4 | Illegal interrupt of CPU | Outside noise interference | Return unit if this happens regularly |
| OVSP | Over speed during operating | 1. Motor load too big or Inverter capacity too small <br> 2. Motor parameter error (vector mode) <br> 3. The gain is excessive in vector mode <br> 4. Current detection circuit fault | 1. Increase acceleration / deceleration time (B007/B008) <br> 2. Input correct motor Parameter <br> 3.Change stator Resistance gain and Rotor resistance gain (A168/A169), (suggest incremental Decrease of 50~100) <br> 4. (Return unit) |

5.1.3 Faults which can be recovered manually but not automatically

| Display | Fault | Cause | Corrective Action |
| :---: | :---: | :---: | :---: |
| OC | Over-current during stop | 1. Detection circuit malfunction <br> 2. Bad connection for CT signal cable | 1.Check the noise between Power line and motor line <br> 2.Return the inverter for repair |
| OL1 | Motor overload | 1. Excessive load <br> 2. Inappropriate settings on A002, A119~A122 | 1. Increase the motor capacity <br> 2. set A002, A119~A122 properly |
| OL2 | Inverter overload | Excessive Load | Increase the inverter capacity |
| OL3 | Over torque | 1. Excessive Load <br> 2. Improper settings on A125, A126 | 1. Increase the inverter capacity <br> 2. set A125, A126 properly |
| LV-C | Voltage too low during operation | 1. Power voltage too low <br> 2. Power voltage varies widely (fluctuates) | 1. Improve power quality or increase the value of A014 <br> 2. Set a longer acceleration time <br> 3. Add a reactor at the power inpu side |
| OH-C | Heat-sink temperature too High during operation | 1. Excessive load <br> 2. Ambient temperature too high or bad ventilation | 1. Check if there are any problems with the load <br> 2. Increase inverter capacity <br> 3. Improve ventilation conditions |

### 5.1.4 Special conditions

| Display | Fault | Description |
| :---: | :---: | :---: |
| STP0 | Zero speed stop | Occurs when preset frequency $<0.1 \mathrm{~Hz}$ |
| STP1 | Fail to start directly | 1. If the inverter is set for external terminal control mode $(\mathrm{B} 000=1)$ and direct start is disabled ( $\mathrm{A} 017=0001$ ) The inverter cannot be started and will flash STP1. The run input is active at power-up (refer to descriptions of A017). <br> 2. Direct start is possible when $\mathrm{A} 017=0001$. |
| STP2 | Keypad emergency stop | 1. If the inverter is set in external control mode ( $\mathrm{B} 000=0001$ ) and the Stop key is enabled (A010=0000), the inverter will stop according to the setting on B003. When the Stop key is pressed, 'STP2' flashes after stop. Release and re-assert the run contact to restart the inverter. <br> 2. If the inverter is in communication mode and the Stop key is enabled (A $010=0000$ ), the inverter will stop in the way set by B 003 when Stop key is pressed during operation and then flashes STP2. The Host controller has to send a Stop command then a Run command to the inverter for it to be restarted. <br> 3. Stop key cannot perform an emergency stop when $\mathrm{A} 010=0001$ |
| E.S. | External emergency stop | The inverter will ramp stop and then flash E.S., when input external emergency stop signal via the multifunctional input terminal activates (refer to descriptions of A050~A056). |
| b.b. | External base block | The inverter stops immediately and then flashes b.b., when external base block is input through the multifunctional input terminal activates (refer to descriptions of A050~A056). |
| ATER | Auto-tuning faults | 1. Motor data error resulting in for auto-tuning failure <br> 2. Stopping the inverter during Auto-tuning before completion |
| PDER | PID feedback loss | PID feedback loss detect |

### 5.1.5 Operation errors

| Display | Error | Cause | Corrective Action |
| :---: | :---: | :---: | :---: |
| LOC | Parameter and frequency reverse already locked | 1.Attempt to modify frequency parameter while A039>0000 <br> 2.Attempt to reverse while B002 $=0001$ | 1. Set A039=0000 <br> 2. Set B002=0000 |
| Err1 | Keypad operation error | 1. Press $\boldsymbol{\Delta}$ or $\boldsymbol{\nabla}$ while B004>0 or running at preset speed. <br> 2. Attempt to modify the parameter can not be modified during operation (refer to the parameter list). | 1.The $\mathbf{\Delta}$ or $\boldsymbol{\nabla}$ is available for modifying the parameter only when B004=0 <br> 2.Modify the parameter while STOP |
| Err2 | Parameter setting error | 1. B006 is within the range of A032 $\pm$ A035 or A033 $\pm$ A035or A034 $\pm$ A035 <br> 2. $\mathrm{B} 005 \leqslant \mathrm{~B} 006$ <br> 3. Setting error while performing Auto tuning(e.g. $\mathrm{B} 000 \neq 0, \mathrm{~B} 004 \neq 0$ ) | 1.Modify A032~A034 or A035 <br> 2. B005>B006 Set $B 000=0$, B004 $=0$ during Auto tuning |
| Err5 | Modification of parameter is not available in RS485 communication | 1.Issue a control command during RS485 communication disallowed <br> 2.Modify the function A164 ~ A167 during RS485 communication | 1.Issue enable command before communication 2. Set parameters 164-167 function before RS485 communication |
| Err6 | Communication failed | 1. Wiring error <br> 2.Communication parameter setting error. <br> 3.Sum-check error <br> 4. Incorrect communication protocol | 1.Check hardware and wiring <br> 2.Check Functions A161~ <br> A164 |
| Err7 | Parameter conflict | 1.Attempt to modify the function A175. <br> 2.Voltage and current detection circuit is abnormal | If Reset is not available, please contact TWMC |
| EPr1 | Parameter setting error copy unit failed | 1. Set $\mathrm{A} 040=1 / 2$ to without connecting copy unit. <br> 2. Copy unit failed. | 1.Modify A040 <br> 2.Replace copy unit |
| EPr2 | Parameter mismatch | Problem during copying of the parameter to inverter to | 1.Retry copy command 2.Replace copy unit |

### 5.2 General troubleshooting

| Status | Checking point | Remedy |
| :---: | :---: | :---: |
| Motor can not run | Is power applied to $\mathrm{L} 1(\mathrm{~L}), \mathrm{L} 2$, and $\mathrm{L} 3(\mathrm{~N})$ terminals (is the charging indicator lit)? | - Is the power applied? <br> - Turn the power OFF and then ON again. <br> - Make sure the power voltage is correct. <br> - Make sure screws are secured firmly. |
|  | Is there voltage across the output terminals T1, T2, and T3? | - Turn the power OFF and then ON again. |
|  | Is overload causing the motor to stall? | - Reduce the load so the motor will run. |
|  | Are there any abnormalities in the inverter? | - See error descriptions to check wiring and correct if necessary. |
|  | Is forward or reverse run command issued? |  |
|  | Has the analog frequency signal been input? | - Is analog frequency input signal wiring correct? <br> - Is voltage of frequency input correct? |
|  | Is the operation mode setting correct? | - Operate through the digital keypad . |
| Motor runs in wrong direction | Is the wiring for output terminals $\mathrm{T} 1, \mathrm{~T} 2$, and T 3 correct? | - Wiring must match $\mathrm{U}, \mathrm{V}$, and W terminals of the motor. |
|  | Is the wiring for forward and reverse signals correct? | - Check wiring are correct if necessary. |
| The motor speed can not be regulated. | Is the wiring for the analog frequency inputs correct? | - Check wiring are correct if necessary. |
|  | Is the setting of operation mode correct? | - Check the operation mode of the operator. |
|  | Is the load too excessive? | - Reduce the load. |
| Motor running speed too high or too low | Are specifications for the motor (poles, voltage...) correct? | - Confirm the motor specifications. |
|  | Is the gear ratio correct? | - Confirm the gear ratio. |
|  | Is the setting of the highest output frequency correct? | - Confirm the highest output frequency. |
| Motor speed varies unusually | Is the load too excessive? | - Reduce the load. |
|  | Does the load vary excessively? | - Minimize the variation of the load. <br> - Increase capacities of the inverter and the motor. |
|  | Is the input power erratic or is a phase loss occurring? | - Add an AC reactor at the power input side if using single-phase power. <br> - Check wiring if using three-phase power. |

### 5.4 Routine inspection and period inspection

To ensure stable and safe operations, check and maintain the inverter at regular intervals.
The table below lists the items to be checked to ensure stable and safe operations. Check these items 5 minutes after the "Charge" indicator goes out to prevent injury to personnel by residual electric power.

| Items | Details | Checking period |  | Methods | Criteria | Remedies |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Daily | 1Year |  |  |  |
| Ambient conditions around the machine | Confirm the temperature and humidity at the machine | $\bigcirc$ |  | Measure with thermometer and hygrometer according to installation notices. | $\begin{aligned} & \text { Temperature: } \\ & -10-40^{\circ} \mathrm{C}(14- \\ & \left.120^{\circ} \mathrm{F}\right) \\ & \text { Humidity: Below } \\ & 95 \% \text { RH } \\ & \hline \end{aligned}$ | Improve the ambient or relocate the drive to a better area. |
|  | Are there inflammable materials in the vicinity? | $\bigcirc$ |  | Visual check | Keep area clear |  |
| Installation and grounding of the inverter | Any unusual vibration from the machine | $\bigcirc$ |  | Visual, hearing check | No vibration | Secure screws |
|  | Is the grounding resistance correct? |  | $\bigcirc$ | Measure the resistance with a multi-tester | $\begin{aligned} & 200 \mathrm{~V} \text { series: below } \\ & 100 \Omega \\ & 400 \mathrm{~V} \text { series: below } \\ & 10 \Omega \end{aligned}$ | Improve the grounding |
| Input power voltage | Is the voltage of the main circuit correct? | $\bigcirc$ |  | Measure the voltage with a multi-tester | Voltage must conform with the specifications | Improve input voltage |
| External terminals and internal mounting screws of the inverter | Are secure parts loose? |  | $\bigcirc$ | Visual check Check with a screwdriver | Secure terminals and no rust | Secure or send back for repair |
|  | Is the terminal base damaged? |  | $\bigcirc$ |  |  |  |
|  | Visual rust stains present? |  | $\bigcirc$ |  |  |  |
| Internal wiring of the inverter | Any unusual bends or breaks? |  | $\bigcirc$ | Visual check | No abnormalities | Replace or send back for repair |
|  | Any damage of the wire insulation? |  | $\bigcirc$ |  |  |  |
| Heat sink | Excessive dust or debris | $\bigcirc$ |  | Visual check | No abnormalities | Clean up debris or dust |
| Printed circuit board | Excessive conductive metal shavings or oil sludge |  | $\bigcirc$ | Visual check | No abnormalities | Clean or replace the circuit board |
|  | Discolored, overheated, or burned parts |  | $\bigcirc$ |  |  |  |
| Cooling fan | Unusual vibration and noise |  | $\bigcirc$ | Visual or hearing check | No abnormalities | Replace the cooling fan |
|  | Excessive dust or debris | $\bigcirc$ |  | Visual check |  | Clean fan |
| Power component | Excessive dust or debris |  | $\bigcirc$ | Visual check | No abnormalities | Clean component |
|  | Check resistance between each terminals |  | $\bigcirc$ | Measure with a multi-tester | No short circuit or broken circuit in three-phase output | Replace power component or inverter |
| Capacitor | Any unusual odor or leakage | $\bigcirc$ |  | Visual check | No abnormalities | Replace capacitor or inverter |
|  | Any deformity or protrusion | $\bigcirc$ |  |  |  |  |

## Chapter 6 Peripherals Components

### 6.1 Reactor specification at Input side

| Model |  | AC inductance at input side |  |
| :---: | :---: | :---: | :---: |
|  | Current (A) | Inductance <br> $(\mathrm{mH})$ |  |
| N3- | 2 P 5 | 5.0 | 2.1 |
|  | 201 | 5.0 | 2.1 |
|  | 202 | 10.0 | 1.1 |
|  | 203 | 15.0 | 0.71 |
|  | 205 | 20.0 | 0.53 |
|  | 207 | 30.0 | 0.35 |
|  | 210 | 40.0 | 0.265 |
|  | 215 | 60.0 | 0.18 |
|  | 220 | 80.0 | 0.13 |
|  | 225 | 90.0 | 0.12 |
|  | 230 | 120.0 | 0.09 |
|  | 240 | 160.0 | 0.07 |

| Model | AC inductance at input side |  |  |
| :---: | :---: | :---: | :---: |
|  | Current (A) | Inductance <br> $(\mathrm{mH})$ |  |
|  | 401 | 2.5 | 8.4 |
|  | 402 | 5.0 | 4.2 |
|  | 403 | 7.5 | 3.6 |
|  | 405 | 10.0 | 2.2 |
|  | 407 | 15.0 | 1.42 |
|  | 410 | 20.0 | 1.06 |

Formula for brake resistor: W=(Vpnb * Vpnb ) * ED\% / R

1. $\mathbf{W}$ : braking resistor power (Watts)
2. Vpnb: braking voltage ( $220 \mathrm{~V}=380 \mathrm{VDC}, 440 \mathrm{~V}=760 \mathrm{VDC}$ )
3. ED\%: braking effective period
4. R: braking resistor rated ohms
5. Alternative selection choice: $\quad 450$ : (JNTBU- $430+J N B R-4 R 8 K W 32) \times 2$

460: (JNTBU-430 + JNBR-4R8KW27R2) $\times 2$
Above 25HP, please add Braking Transistor Units: 200V JNTBU-230

### 6.4 Digital operator and extension cable

## A. Remote Cable Kit

| Inverter Model | Extension Cable Kit | Cable Length FT (Meter) |
| :---: | :---: | :---: |
| All models | JNSW-30P5 | $1.6(0.5)$ |
|  | JNSW-3001 | $3.3(1.0)$ |
|  | JNSW-3002 | $6.6(2.0)$ |
|  | JNSW-3003 | $9.8(3.0)$ |
|  | JNSW-3005 | $16.4(5.0)$ |

Figure 6-1 Digital Operator Extension Cable

## B. Content

(1) Inverter
(2) LED (N3-LED) or LCD (N3-LCD) Keypad
(3)REMOTE Cable for Keypad

## C. Operation procedure:

Warning: Disconnect the power supply. The following procedures should be performed after there is no display on the keypad.

1. Remove the keypad from the Inverter.
2. Please refer to Figure 6-1 before mounting the keypad to your machine or Panel.
3. Connect the inverter and the keypad with the remote cable in accordance with the Figure 6-1.
Supply power ONLY after all components are secured.

## 6. 5 EMC Filter

The inverter adopts rapid switching components to improve the efficiency of the motor and to reduce the motor noise. Using the EMC Filter allows the EMI (Electromagnetic Interference) and RFI (Radio Frequency interference) to be controlled within ranges compliant with the directives as shown.

## EMC Directives

The inverter with optional filter complies with the EMC directives 89/336/EEC, limiting the environmental EMI and RFI. Independent tests have demonstrated compliance to the following standards when the optional filters are used.
EMI radio standard , EMS immunity standard
EN 61800-3 1996/A11: 2000: First Environment Unrestricted Distribution (Class B).
EN 61800-3 1996/A11: 2000: First Environment Restricted Distribution

### 6.6 Interface Card

### 6.6.1 RS-485 Interface Card (Model: JNSIF-485)

Figure 6-7 JNSIF-485 Wiring Diagram:

Note:
Please reinstall the cover of inverter to avoid electrical noise disturbances on the Interface Card.
Please use isolated RS232 / RS485 converter to link the PC and interface card to avoid equipment damage.

### 6.6.2 RS-232 Interface Card (Model: JNSIF-232)

## Appendix 1: N3 Motor Internal Parameter List

Factory Setting of the Motor Internal Parameters :

## ※Note :

1. The above motor internal parameters are not used in V/F Control Mode. These parameters are used for vector control mode only.
2. The motor parameters (A168~A172) are not be modified when factory setting under vector mode. The internal parameters will be maintained after auto tuning (refer to Auto Tuning and Description on motor Internal Parameter).
3. The motor parameters (A168~A172) will be modified to factory setting completely under any operation mode. When conducting factory setting, change the Drive Horsepower code (A175).

## Appendix 2: N3 parameter setting list
