1 OMAP35x-11 SOM-LV Radiated Emissions Scans: 30 MHz – 1 GHz

The OMAP353x-11 SOM-LV was scanned at Northwest EMC in Brooklyn Park, MN.

2 Wi-Fi & Bluetooth Depopulated Test Results

A standard OMAP35x-11 SOM-LV with Wi-Fi (U35), Bluetooth (U12), and the supporting circuitry removed was scanned for unintentional radiated emissions. This testing was completed to provide a baseline scan of the SOM-LV for customers not using these interfaces.

The SOM-LV was connected to a standard SDK2-APP-10 baseboard. The only connection to the baseboard was the power supply.

The unit under test used software that looped through the following interfaces: NOR flash, PMIC, touch, RAM, NAND flash, and ID chip. All tests used the same software, with the exception of the modified register settings noted in Section 2.2.

Table 2.1 lists the known frequencies generated on the OMAP35x-11 SOM-LV with the functional test code running.

Table 2.1: Frequencies Generated while Running Functional Test Code

Source	Frequency
DPLL1	500 MHz
DPLL3	166 MHz
DPLL4	864 MHz
DPLL5	120 MHz
LPDDR interface	166 MHz (332 MHz actual)
GPMC bus	166 MHz (internal frequency)
System oscillator	26 MHz
uP_CLKOUT1_26MHz	26 MHz
uP_CLKOUT2_26MHz	54 MHz

NOTE: The noise around 40 MHz in some of the scans was due to the power supply. Midway through the testing, a ferrite was added to the power supply cable dissipating much of this noise. The ferrite was present on Run #4 and later.

2.1 Run #1

Run #1 shows a baseline scan of the OMAP35x-11 SOM-LV (see Figure 2.1 and Figure 2.2). The software was looping through the peripherals as indicated above. Some of the signals were slightly above the Class B line in this configuration.

Figure 2.2: Run #1—Quasi-Peak Scan

2.2 Run #2

Run #2 included built-in EMI control from the OMAP35x processor. EMI control was turned on using the register settings in Table 2.2.

Table 2.2: EMI Control Register Settings

Register	Address	Value
CONTROL_DSS_DPLL_SPREADING	0x4800_2450	0x0000_0011
CONTROL_CORE_DPLL_SPREADING	0x4800_2454	0x0000_0011
CONTROL_PER_DPLL_SPREADING	0x4800_2458	0x0000_0011
CONTROL_USBHOST_DPLL_SPREADING	0x4800_245c	0x0000_0011

The EMI control of the OMAP35x processor helped reduce much of the noise at the higher end of the spectrum.

Figure 2.3: Run #2—Peak Full Scan

2.3 Run #3

Run #3 improved the EMI results by turning off uP_CLKOUT1_26MHz in addition to setting the built-in EMI control of the OMAP35x processor (see Section 2.2).

Software was turning on the uP_CLKOUT1_26MHz signal, which is only used if Bluetooth is populated or if the signal is used for reference off the SOM. Neither of these cases hold true for the OMAP35x-11 SOM-LV with Wi-Fi and Bluetooth circuitry removed. Turning off this clock allows the OMAP35x-11 SOM-LV to pass class B specification.

Figure 2.4: Run #3—Peak Full Scan

2.4 Run #4

Run #4 was a repeat of Run #3, except a ferrite was added to the power supply cable. Much of the noise around 40 MHz was generated by the power supply; because the power supply was not a focus of this testing, adding a ferrite helped dissipate this noise. Subsequent tests also used this ferrite on the power supply cable.

Figure 2.5: Run #4—Peak Full Scan

2.5 Run #5

Run #5 re-enabled the uP_CLKOUT1_26MHz signal on the OMAP35x-11 SOM-LV while keeping the processor’s EMI control enabled. The uP_CLKOUT1_26MHz signal included a filter to lower radiated emissions; this filter consisted of a 330 ohm resistor populated at R33 and a 1000pF capacitor populated at C111. Adding this filter on the SOM produced noticeable improvement of the 26 MHz harmonics. **NOTE:** Filter values were chosen based on part availability; actual filter values may vary and need to be determined based on the end application.

2.6 Run #6

Run #6 was an extension of Run #5; the same setup was used except the uP_CLKOUT1_26MHz trace was cut on the baseboard at the SOM-LV connector to eliminate the potential for creating an “antenna” on the baseboard.

Test Specifications FCC 15.109(g) (CISPR 22:1997):2010		Class B		Test Method ANSI C63.4:2003	
------------------------------------------------------------------	--	----------------	--	---------------------------------------	--

Run #	6	Test Distance (m)	10	Antenna Height(s)	1, 1.5, 2, 2.5, 3 (m)	Results	Evaluation
--------------	---	--------------------------	----	--------------------------	-----------------------	----------------	------------

Freq (MHz)	Amplitude (dBuV)	Preamp (dB)	Antenna Height (meters)	Transducer (dB)	Cable (dB)	External Attenuation (dB)	Polarity/ Transducer Type	Detector	Distance Adjustment (dB)	Adjusted (dBuV/m)	Spec. Limit (dBuV/m)	Compared to Spec. (dB)

3 Wi-Fi & Bluetooth Populated Test Results

For this test a fully populated OMAP35x-11 SOM-LV (SOMOMAP3530-11-1672IFCR) was placed in a standard SDK2-APP-10 baseboard. A ferrite EMI suppression filter was added to the power supply's cable. The EMI control registers presented in Table 2.2 were set, enabling clock spreading on four of the processor's DPLL clock generation modules.

Various functional tests were looped in attempt to activate as many interfaces on the SOM as possible. These tests include: Bluetooth, Ethernet, PMIC, NOR flash, touch controller, NAND flash, RAM and ID chip.

Similar to the previous test setups, Table 2.1 lists the known frequencies generated on the OMAP35x-11 SOM-LV with the functional test code running.

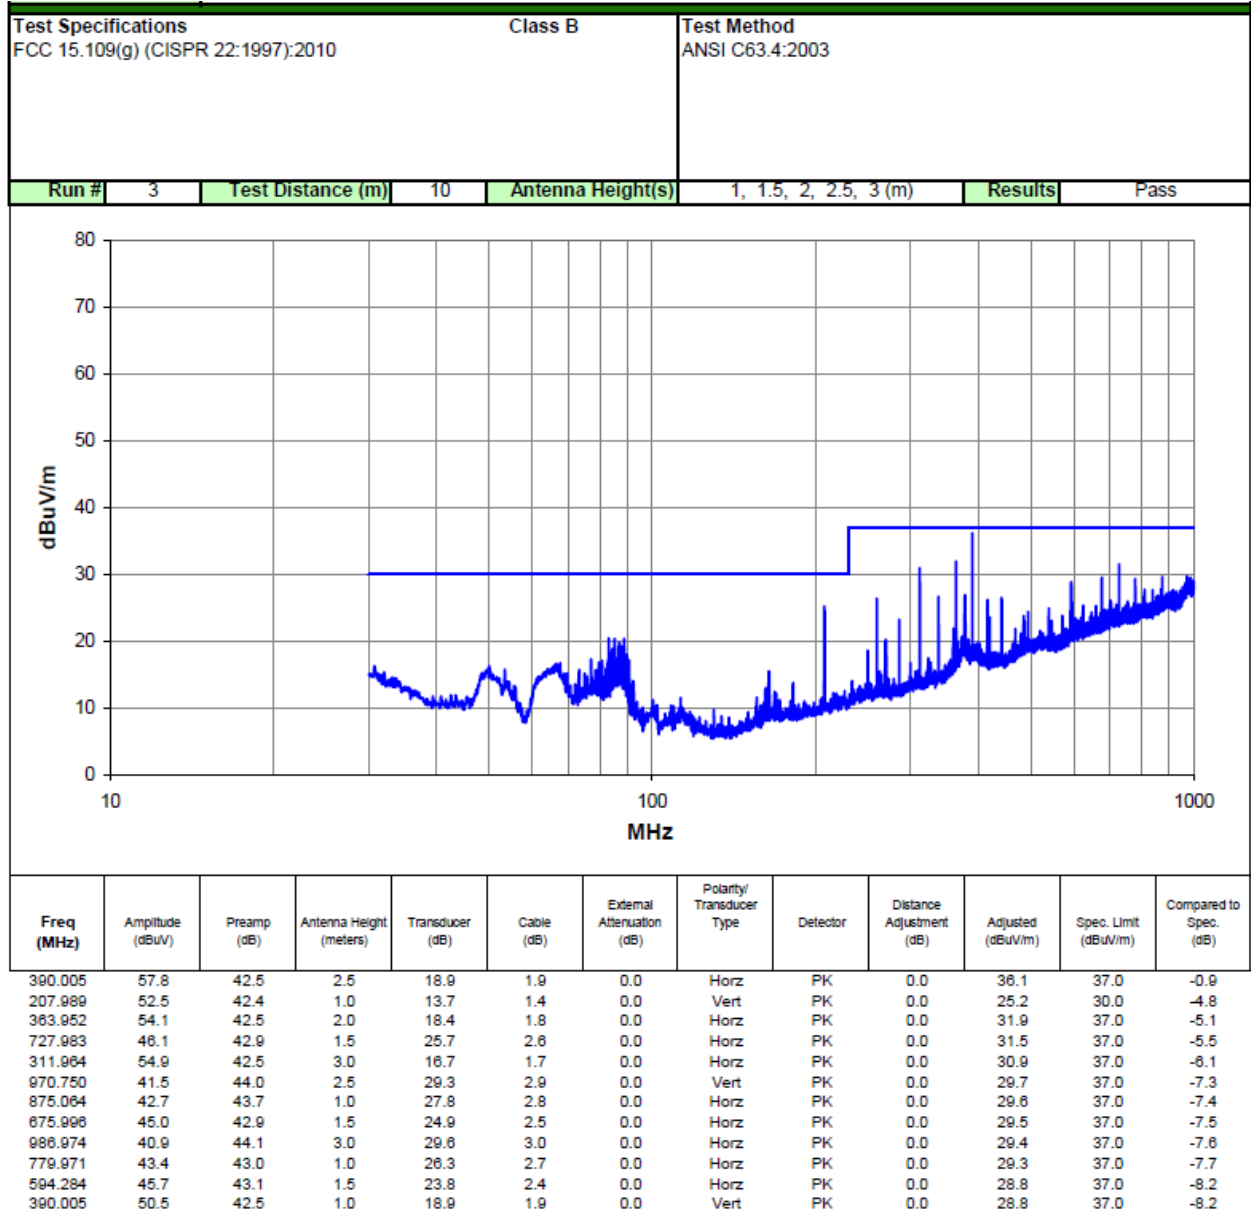

Figure 3.1: OMAP35x-11 SOM-LV with Wi-Fi and Bluetooth Populated

4 Summary

These radiated emissions scan provide a baseline for the performance of the OMAP35x-11 SOM-LV alone. Radiated emissions testing of a final product designed around the OMAP35x-11 SOM-LV is the responsibility of the developer.
