COMPLAINT
Case Number
CIV '01 0602 PHX EHC

JURISDICTION

The United States District Court, District Of Arizona, is the proper jurisdiction for litigating this matter. The court has jurisdiction and the claim needs no new grounds of jurisdiction to support it.

Being Sued As Individuals

The Defendants, each singular litigant, are being sued as individuals, and any past or present public service office which they may have held, or may now hold, is not relevant to this litigation.

COMPLAINT

The Plaintiff in this action, Mr. Robert Wollner, will NOW introduce the pertinent facts and issues that have risen in order to provoke this lawsuit. The Plaintiff comes forth with dispatch, to present the relevant circumstances pertaining to his complaint.

The Plaintiff, Robert Wollner, is the author\inventor of a new concept in economics named Negative Economics. The new concept has been designated as "*Negative*" Economics, because of the consequences that such a concept would produce on the human race. The destructive capabilities of Negative Economics to damage the human race is profound. The evolution forecast of mankind would be altered, because the incentive to implement Negative Economics is rooted in the basic evil characteristics of man. The human desire that produces the hunger for greed and wickedness is the motivation that justifies the logic to employ Negative Economics pursuits. If the concept of Negative Economics were to reach the sovereign nations of the world, the planet Earth would be transformed into a different world. A world of warring nations would emerge. Aggressive nations would wage war for the ownership of other nations, with the intent being, to impose Negative Economics upon them in order to steal their national income and their nation's wealth. Negative Economics is a concept that has been designed to enrich governments. Governments acquire wealth by imposing Negative Economics upon their own citizens. And by overthrowing other nations and imposing Negative Economics upon them. The more nations they overthrow, and impose Negative Economics upon, the wealthier they become. Stealing the wealth and financial assets of nations is the undertaking of Negative Economics. The primary objective of the concept of Negative Economics is to establish Negative Economics "Empires", that consist of large numbers of nations that produce income and wealth, on a ongoing basis, for the nation, or group of nations, that implement Negative Economics as a means of acquiring wealth. It is even conceivable that the holders of larger Negative Economics "Empires" would overthrow the holder, or holders, of smaller Negative Economics "Empires" and, in doing so, benefit from the wealth that can be acquired. The appetite for wealth and the yearning for power makes Negative Economics an irresistible compulsion to nations who are willing to consider beginning and controlling a Negative Economics empire.

The inability of the Defendants to recognize the threat that Negative Economics imposes upon the world of sovereign nations, and the freedom that can be lost, should the practice of implementing Negative Economics become a reality, is an issue for this court to judge. Their unconcern is undermining the safety and well-being of the human race. The Defendants have made no effort to prevent Negative Economics from reaching the sovereign nations of the world. Their attitude is one of complete disregard. They send no messages or signals that indicate their concern for the captured nations of the world who would become economic slaves to the more powerful nations, who would force Negative Economics upon them. The Defendants possess the experience and the knowledge for evaluating the detrimental consequences that a Negative Economics world would produce, yet their belief and conviction that sovereign nations would not be corrupted by the powerful influence that Negative Economics represents, is without foundation. Greed and the appetite for wealth are the characteristics that fuel Negative Economics. Such greed is demonstrated in the United States. In our economic system, only one percent of the population owns all the wealth of the system. Greed and the desire for wealth has flourished in capitalism. Negative Economics offers a larger path for greed to spread and expand its evil wrongdoing. The wealth of a legion of nations, and the potential for "world domination", now lies at the feet of those bold nations who would extract wealth on a gigantic scale, from captured nations who must submit to Negative Economics. Since the Defendants are unwilling to chose a destiny for Negative Economics to take, this court will decide the outcome. The significance and purpose of this litigation is to prevent our planet from becoming a doomed world that consists of Negative Economics empires.

The Plaintiff had requested that the Defendants provide him with a small government grant for developing his inventions. The Defendants, most of whom, hold positions that grant them the authority to provide government grants. The Defendants have ignored the Plaintiff's request. In exchange for the government grant, the Plaintiff expressed his willingness to forgo his anticipated project of mailing Negative Economics to all the nations of the world. And in doing so, suffer the loss of billions of dollars paid by rouge nations and impoverished nations who would welcome the opportunity to acquire great wealth and power from the implementation of Negative Economics. Negative Economics has a value in excess of ten billion dollars. The Plaintiff feels that his request was not unreasonable. The willingness of the Defendants to prevent Negative Economics from reaching the sovereign nations of the world has not been demonstrated. Thus, the Plaintiff is demanding compensation and

relief from the Defendants for his loss for not providing Negative Economics to the nations of the world.
Attached to this lawsuit is a complete and concise description of Negative Economics. It describes in detail, the methods, the procedures, and the system of Negative Economics, that bold nations could use for stealing the wealth of other nations.
The description also explains the precise methods for establishing Negative Economics Empires. The material is marked ("Exhibit A" Negative Economics).

THE VALUE OF NEGATIVE ECONOMICS

In order to determine the approximate loss of the Plaintiff for not providing Negative Economics to the sovereign nations of the world, the following is given.
Negative Economics is compared in monetary value to some of the major corporations in America. For example. If Time\Warner Corporation has a monetary value of 110 billion dollars, as was stated on the television news, then Negative Economics must have a far greater monetary value. Negative Economics has the capability of abstracting the wealth of entire nations, and moving that wealth into the government revenues bank accounts of the nation who controls Negative Economics. Negative Economics is very efficient at abstracting the wealth of a nation. Undeniably, such a concept has a far greater monetary value then any one corporation. Thus, 10 billion dollars is a very small amount in compensation, for the Plaintiff's loss for not marketing Negative Economics to the world. One rouge nation would gladly pay that amount to purchase such a concept.

THE MONETARY VALUE OF SOME OF AMERICA'S CORPORATIONS, COMPARED TO THE VALUE OF COMPENSATION BEING ASKED FOR NEGATIVE ECONOMICS

NAME OF COMPANY		**MARKET VALUE**
Negative Economics	**-**	**10 billion dollars**
Merrill Lynch	-	37 billion dollars
Dimler\Chrysler	-	54 billion dollars
General Motors	-	57 billion dollars
Ford Motor Co.	-	59 billion dollars
Philip Morris Cos.	-	60 billion dollars
Chase Manhattan Bank	-	61 billion dollars
Wells Fargo	-	73 billion dollars
Nestle	-	73 billion dollars
Dean Witter & Cos.	-	81 billion dollars
Bell Atlantic	-	81 billion dollars
Procter & Gamble	-	88 billion dollars
Bank of America	-	91 billion dollars
Howlett-Packard	-	119 billion dollars
AT & T	-	130 billion dollars
Toyota Motor	-	170 billion dollars
IBM	-	190 billion dollars
Wal-Mart Stores	-	258 billion dollars
Exxon\Mobil	-	290 billion dollars
Microsoft	-	329 billion dollars
General Electric	-	405 billion dollars
Citigroup	-	716 billion dollars

SUMMATION

The Plaintiff, Mr. Robert Wollner, is the author\inventor of a new concept in economics called, Negative Economics. This new economic concept can produce a world where nations prey upon other nations for the purpose of abstracting their wealth. Negative Economics can withdraw a nation's riches and transfer them to the government revenues bank accounts of the nation who controls Negative Economics. Imagine a world where prosperity is a disadvantage. A world where prosperous nations fall victim to other nations who desire to harvest their wealth. Military power becomes the implement for robbing affluent nations of their riches. The objective of Negative Economics is to establish Negative Economics "empires". Negative Economics "empires" begin and expand. Consuming more and more nations. Bigger, more powerful nations take and control the Negative Economics empires of smaller nations. The world becomes a planet of Negative Economics empires.

The Plaintiff mailed descriptions of Negative Economics to all of the Defendants, and informed the Defendants about the harmful effects that Negative Economics can produce in the world of sovereign nations. The Plaintiff was willing to accept a small government grant for abandoning his project of selling and marketing Negative Economics to all the countries of the world. Once mailed, Negative Economics cannot be retrieved. The nations of the world would not return it. They would use it. A state of panic would arise amongst the peaceful nations of the world, who would fear that they could become the victims of Negative Economics. Their concern that other nations would be expecting to overthrow them, and to steal their wealth, could be realized. The world would be change indefinitely. The system of Negative Economics would continue on into the future, constantly making the world an unsafe place for prosperous nations. Negative Economics is a threat to prosperous nations. Poor nations have no value in the Negative Economics formula. They have no wealth to steal.

The Defendants were unwilling to recognize the threat that Negative Economics imposed upon a peaceful world. They ignored the Plaintiff's pleas to compensate him with a small sum for not corrupting the world with Negative Economics. Weary of pleading with the Defendants, the Plaintiff has initiated this litigation in order to be compensated. The Plaintiff is asking for compensation from the Defendants who have disregarded the safety and well-being of humanity. This lawsuit is well-founded.

DEMAND

Plaintiff is praying for a judgment, for the following compensation and relief:

$10,000,000,000.00 (Ten Billion Dollars)

Compensation is being sought for the plaintiff's loss for not selling and marketing Negative Economics to the sovereign nations of the world. This is satisfactory compensation for denying an economic concept to rouge nations and impoverished countries who would implement such a concept to enrich themselves.

The judgment prayed for is to be divided up as follows:

George H. Bush	**- 4 billion dollars.**	**($4,000,000,000.00)**
Jeb Bush	**- 1 billion dollars.**	**($1,000,000,000.00)**
George W. Bush	**- 2 billion dollars.**	**($2,000,000,000.00)**
Dick Cheney	**- 1 billion dollars.**	**($1,000,000,000.00)**
Colin Powel	**- 1 billion dollars.**	**($1,000,000,000.00)**
Donald Rumsfelt	**- 1 billion dollars.**	**($1,000,000,000.00)**

Plaintiff has indicated that George H. Bush should bear the biggest obligation should judgment be granted. George H. Bush is the most qualified of the Defendants and has the most experience in foreign affairs. His qualifications include: Director of the CIA, 8 years as Vice President of the United States, and 4 years as President of the United States. The Plaintiff first began his ordeal with Negative Economics by contacting George H. Bush. The Defendant, George H. Bush, has continually ignored the threat that Negative Economics represents to the world. He made no effort to stop Negative Economics from reaching sovereign nations who would implement it with malicious intent.

Dated this 4th day of April, 2001.

WHAT IS NEGATIVE ECONOMICS

Negative Economics is a new system that has been designed for government revenues enrichment. Negative Economics is designed to produce income at the government level. A prosperous government is the goal of Negative Economics. Because Negative Economics can be extended to other countries, additional revenues can be acquired by countries that implement Negative Economics. Negative Economics is a comprehensive blueprint for systematic approaches to broadening government wealth by utilizing techniques that are at the forefront of economic ingenuity. New principles in economics elevate government wealth by manipulating economic factors in an economy that control economic functions. Wealth and revenues are produced at the government level.

THE SYSTEM OF NEGATIVE ECONOMICS

COPYRIGHT © 2000 by Robert Wollner

The Needed Elements That Are Essential For Negative Economics To Work Are As Follows:

1. Businesses That Earn A Profit.

2. Consumers That Spend Money.

3. An Economic Pump That Pumps Money Through An Economy.

Businesses That Earn A Profit

A country's businesses are an essential element in the Negative Economics system. For Negative Economics to function, a system is needed for withdrawing from an economy, money that will contribute to government revenues enrichment. A country's businesses are the instrument that serve the purpose of withdrawing revenues from an economy. Each business in a country that utilizes Negative Economics, supports a "Government Treasure Chest". The enrichment of government revenues is the goal that Negative Economics was designed to achieve.

The Government Treasure Chest Program

In countries that utilize Negative Economics for the purpose of government revenues enrichment, all the businesses are required by law to participate in the Government Treasure Chest program. The program requires that every business enterprise well have two checking accounts for their business. One checking account is for their regular business checking. The other checking account is for the Government Treasure Chest program. Example below.

Russian National Supermarkets 1171 Passhui St. Moscow, Russia **Check Book**	Government Treasure Chest Account Russian National Supermarkets **Check Book**

The business checking account is for regular business deposits. The Government Treasure Chest account is for deposits mandated by the government for the Treasure Chest program. The monies deposited into the Government Treasure Chest account goes directly into the government revenues accounts. The checking account concept is used because the money goes immediately into government bank accounts. If businesses have to be relied upon to mail the money, the system becomes less reliable.

An Economic Pump

An economic pump has been designed for pumping money through a country's economy. A portion of the money will be channeled into government revenues bank accounts.

The Economic Pump In Action --- It Works Good

This "Consumer Spending Program" model is being used to demonstrate how money can be pumped through a country's economy and can be channeled into government revenues bank accounts.

How The Program Works

The government has decided that the economic pump will be utilized to pump money into the economy.

The money will come from various sources. The objective of the program is to create increased consumer spending and heightened business activity. Increased economic activity will boost business incomes. As previously stated, a country's businesses are the instrument that serve the purpose of withdrawing revenues from an economy. The Government Treasure Chest program is utilized for channeling revenues into government revenues bank accounts. It will now be demonstrated how this works.

EMPLOYEE WAGES

One of the sources for pumping money into an economy is employee wages. In this consumer spending program model the government has mandated that 2\3rds of each employee's pay check that they receive for one week will be pumped into the economy. All employees in the country will participate in the program.

On Friday night when working people get their pay checks there will be two (2) different items in their pay check envelope. One item will be their pay check for 1\3 of the normal amount they receive. The other 2\3rds of their pay check will consist of Dated Money. Example. An employee earns $300.00 a week. $200.00 will be Dated Money. $100.00 will be a company pay check. Dated Money is currency that has been printed by the government for the spending program. The Dated Money looks like regular currency printed in a different color. A large DATE is printed on the money in a large colorful box that is quite visible. The color of the Dated Money can be changed each time there is a Spending Program. The workers\employees inspect their Dated Money to see when the date expires. The date printed on the Dated Money is the following Monday. This indicates that the Dated Money will expire on Sunday at midnight. The country's citizens will have Friday night, Saturday and Sunday until midnight to spend the Dated Money. Monday morning the Dated Money is worthless. Might as well throw it in the trash. Any Dated Money that is not spent is lost. The government could determine any period of time to spend the Dated Money. A weekend, a week, 2 weeks, or whatever is decided.

People who are self-employed, own a business, are retired, and so forth, will pick up their Dated Money at their bank. Or arrangements can be made for their bank to mail it to them. Everyone in the country, if it is a national spending program, will have Dated Money to spend. The government will decide how far-reaching the program will be. The program could embody the entire country, a section of the country, a city or cities, or whatever they decide. The government will decide how much Dated Money people will be required to spend. The amount could be based on their income, their total wealth, their job, occupation or profession, or whatever method they decide. The government might charge a fee for the Dated Money which would be paid either by the employee or by the employer. This is to cover the cost of printing and distributing the Dated Money. If the employee pays the fee, there would be less Dated Money in the pay envelope. Example. Instead of receiving $200.00 in Dated Money, the Dated Money amount would be $192.00.

The Program Starts

Some citizens will begin spending their Dated Money as quickly as possible because they know that those who shop later will find that store merchandise stocks can become depleted from massive consumer spending. The early shoppers will have the better choices before stocks begin to deplete. The country's manufactures, distributors and retailers have prepared for the program by overstocking stores with merchandise for the crowds of shoppers who will be looking for things to buy with their Dated Money. The police, fire department and volunteers will be available to assist with the traffic problem that will exist when consumers take to the streets in pursuit of their spending spree.

The Government Treasure Chest Program

Negative Economics is a system that has been designed to promote government revenues enrichment. A nation's businesses are an essential part of the system because they deposit money into government revenues accounts, designated as the Government Treasure Chest bank account.

In the consumer spending program model example that is being demonstrated here, the government mandated tax that businesses will pay for the Government Treasure Chest program is: 25% of their business income during normal times. 35% of their business income during Date Money spending programs. During normal times each business, factory, corporation, etc. in the country will deposit 25% of their income on a weekly basis, into their Government Treasure Chest account at their bank. When spending programs occur, because there are costs related to the programs, such as the printing of Dated Money, administering the program, etc., each business will deposit 35% of their business income into their Government Treasure Chest account at their bank. At the conclusion of each spending program these deposits are made. Money will be pumped into the economy, and will be spent at the nation's businesses. 35% of the money will reach the government's revenues accounts. Since the government decides how much Dated Money people will be required to spend, and what percentage of their income businesses will be required to deposit into their Government Treasure Chest account at their bank, the government can regulate its revenues growth.

Inflation During The Spending Programs

The 35% Government Treasure Chest tax mandated to businesses during spending programs could be reflected in an increase in prices that consumers pay. Because of inflation during spending programs (businesses increasing prices to cover the 35% tax) the buying power of consumers could be reduced. Dated Money doesn't buy much in these spending programs", consumers might complain. Prices are just to high, they might say. Inflated prices on consumer goods and services during the spending programs drives up business incomes, which means more money for the government. These spending programs generate consumer spending in an economy. Increased spending in the economy is good for businesses who profit from such spending programs. While 25% or 35% of a business's income, (the Government Treasure Chest program) is a lot of taxation, usually such taxes are passed on to consumers who pay higher prices. Higher prices (inflation) can result in reduced consumer spending in an economy. Economies that operate with inflation are flawed and can result in a slowed down economy. Factories produce less, retailers sell less, consumers buy less, because of inflation. Consumer spending can be increased in an economy by utilizing these spending programs which will defeat inflation by creating volume sales. The programs result in consumers who must go out to spend, because of Dated Money that will expire. The money is forfeited if not spent.

How effective was the Consumer Spending Program.

It is Monday morning and the spending program has ended. The country's banks are getting all the expired Dated Money ready to be returned to the government. The country's businesses are making their bank deposits. The banks are ensuring that bank deposits are being made in both of the checking accounts that businesses must maintain. The business's regular checking account and the Government Treasure Chest account. Both deposits are made at the same time. 65% of the total deposit is deposited into the business account. 35% is deposited into the Government's Treasure Chest account. All of the country's businesses will make these 65% - 35% bank deposits at the conclusion of each spending program. Banks and government employees may be verifying each business's cash register receipts which show a record of business sales and income during the spending program. The effect of the program is being analyzed by the program administrators. They are deciding if the consumer spending program had the effect on the government revenues accounts that they had hoped for. And that the government received ample financial resources from the spending program that contributed to the government's stockpile of wealth. The government can regulate their revenues income, by governing the amounts that employees spend in Dated Money, and by controlling the tax that businesses pay into their Treasure Chest checking account. The purpose of the spending programs is to pump money through the economy that ends up in government revenues accounts. Normally 25% of each business's income is deposited into the Government Treasure Chest account at their bank on a weekly basis. (used as an example for this spending program model). During spending programs the amount is increased to 35% of a business's income. Because the government decides how much Dated Money citizens must spend, and the amount of tax businesses will pay during the spending program, the government can pump as much money into the economy as they desire, and regulate how much of the money will end up in their revenues bank accounts. During certain selected Dated Money spending programs, the government could impose a tax on business incomes as high as 50% or 65% of each business's income. This would boost government revenues.

Other Resources That Can Be Utilized To Increase Spending In Spending Programs

Negative Economics is a system that was designed for government revenues production. The greater the amount of Dated Money that can be pumped through the economy, the more profoundly the government benefits. By adding more methods to increase Dated Money spending during spending programs, adds to government revenues intake. Some methods for consideration could be:

Match The Dated Money, Program

Profitable businesses, factories and corporations could be required to "Match" the amount of Dated Money that employees receive in their pay envelope. Or even "Double" the amount. This would increase the amount of Dated Money being spent in the spending program.

Example. Mr. Smith, a production supervisor, normally earns $630.00 a week after tax deductions. This week's pay envelope contained a pay check for $210.00 (1\3rd of his normal pay check) and $420.00 in Dated Money. (2\3rds of his pay check mandated by the government for the spending program). A second envelope contained another $420.00 in Dated Money, with a statement from his employer showing that they had met their obligation under the government mandate to match the Dated Money amount employees receive for the spending program. Mr. Smith now has a total of $840.00 in Dated Money to spend before the spending program expires. The Dated Money may be spent at any business in the country, unless certain types of businesses have been excluded from the spending program. $294.00 will end up in government revenues accounts (35%). $546.00 (65%), the country's businesses will benefit from.

Money Stored In Bank Accounts

Depending on the government. And the country. Banks would provide lists of bank balances over the "Target Balance" amounts. Businesses and individuals who have bigger bank account balances might be relied upon for boosting Dated Money spending in spending programs. They may be required to contribute to the spending program by spending more Dated Money. The strategy is to free up

money stored in bank accounts and pump it into the economy so that the economy and the government revenues bank accounts will benefit.
Example. Mr. Smith, the production supervisor, has $840.00 in Dated Money to spend in the spending program. $420.00 came from his own pay check. An additional $420.00 came from his employer. Because his bank account balance is over the government targeted amount, he will receive from his bank a government mandated, "Dated Money Voucher" that will be good for $150.00 in Dated Money. The $150.00 has already been withdrawn from his bank account and was used to purchase the voucher from the government. The Voucher can be cashed in for Dated Money at any location that has Dated Money available. He now has $990.00 in Dated Money available that him and his family will spend in the spending program. $346.50 will end up in government revenues bank accounts (35%). $643.50 (65%), the country's businesses will benefit from.

Credit Card Indebtedness Program

Other targeted moneys for spending programs could be reviewed as well. Depending on which government is implementing the programs. Credit Cards are another source for generating Dated Money spending in spending programs. Citizens would be required to spend money during spending programs that is taxed onto their credit card and is designated as Dated Money. An amount would be determined for each credit card account. That amount of money would be defined as Dated Money to be used for that spending program. The amount determined would have to be spent with that credit card during the spending program. If not spent by the time the spending program ended, the money is forfeited. The date printed on Dated Money being used for each spending program, is the date the program expires. Any part of the money that remains on the credit card when the spending program expires is credited to the government revenue accounts. The credit card holder is notified that on the date the spending program begins $200 (for example) will be credited to their credit card. When the spending program begins they have until the end of the program to spend the $200. This may be in addition to any other Dated Money they may have received through their employer, or bank if they are self-employed. The $200 will appear on their credit card statement when they receive it. They can make monthly payments on the $200 as they normally do other charges on their credit card.
Example. Mr. Smith, the production supervisor, now has $990.00 in Dated Money to spend in the spending program. $420.00 came from his own pay check. An

additional $420.00 came from his employer. $150.00 was mandated by the government from his savings account. Mr. Smith's credit card account has been selected by the government for increasing Dated Money spending in the spending program. He has received notification by Certified Mail that $350.00 in Dated Money credits are available on his credit card for spending during the spending program. That the $350.00 must be spent in its entirety before the spending program expires. Any portion that is remaining on the credit card will be forfeited. Mr. Smith now has $1,340.00 in Dated Money for him and his family to spend during the spending program. $469.00 will end up in government revenues accounts (35%). $871.00 (65%) the country's businesses will benefit from. The Certified Mail letter that Mr. Smith received, also informed him that certain items will not be available for Dated Money spending in this spending program. Food items at the supermarkets and other stores, new or used cars, professional services such as Dentists, Doctors, Hospitals and other medical services, new or used home purchases, and other items are listed that are excluded from the spending program.

Consumers Assistance Program

The government prints extra Dated Money and sells it to consumers during spending programs. The incentive to purchase the Dated Money is to increase their spending power which helps consumers with inflation.
See chart below.

PURCHASE DATED MONEY FROM THE GOVERNMENT AND INCREASE YOUR SPENDING POWER

AMOUNT PAID IN CASH	DATED MONEY AMOUNT YOU RECEIVE
$10.00	**$12.00**
$15.00	**$18.00**
$20.00	**$25.00**
$40.00	**$54.00**
$60.00	**$78.00**
$100.00	**$135.00**

Example. Mr. Smith, the production supervisor, and his family, decide to purchase $300.00 in Dated Money from the government. This gives them $405.00

additional in Dated Money to spend. They now have $1,745.00 in Dated Money to spend in the spending program. Mr. Smith supports a wife and three children who are overjoyed about the spending they will do during the spending program. The $420.00 in Dated Money that Mr. Smith received from his employer, through the government mandated program will help them out considerably.

Who Benefits From All The Spending

The government benefits with increased revenues. The nation's businesses benefit from increased sales and income. The economy benefits from increased employment and business activity.

MAKING CHANGE

Making change for purchases made with Dated Money at businesses during the Spending Programs. When consumers receive their Dated Money, businesses would not have change to give for purchases made with Dated Money. The government does not provide businesses with Dated Money for the purpose of making change. That would require to much Dated Money to be printed for the Spending Program. As cash registers in businesses fill up with Dated Money from purchases, that money would be used for giving change.
Example. SHOWN IN U.S. DOLLARS

<u>No Dated Money In Cash Register Yet</u>
A $3.00 purchase is made. $5.00 is given to the cashier in Dated Money. Change given back is $2.00 in cash.

<u>With Dated Money In Cash Register</u>
A $3.00 purchase is made. $5.00 is given to the cashier in Dated Money. Change given back is $2.00 in Dated Money.

No coins such as nickels, dimes, quarters, are made for Consumer Spending Programs. If the change is $3.75, the customer gets $3.00 in Dated Money and 75¢ in normal change.

A MARRIED COUPLE GET A SURPRISE

It's Friday night and workers everywhere are opening their pay envelops. OH, NO. Say the married couple. It's mostly all Dated Money. We didn't plan on going out this weekend, they say. The couple now has to decide if they want to forfeit their Dated Money. Or head out to the businesses and shopping areas and spend. Spend it or lose it, is their motto. Might as well spend, they say. 35% of what is being spent goes into the government's revenues bank accounts. Besides spending Dated Money during the program, many people will run out of Dated Money and keep on spending when they find things they need. This helps to increase economic productivity.

Negative Economics Can Be Expanded To Other Countries (optional) (May be used by some countries)

One of the benefits that Negative Economics offers is that it can be expanded to other countries.
The first consideration is to decide which nations are the best candidates for expanding Negative Economics to.

Evaluating A Country's Potential For Negative Economics

In considering which countries are good candidates for expanding Negative Economics to, the economic productivity of nations is appraised. The chart on the next page gives information for Gross Domestic Product and Income Per Capita figures for ten simulated countries. They are being used for an example and are not the figures of any country.

Country	Gross Domestic Product	Income Per Capita
Country A	$4.15 Trillion	$3,260 a year
Country B	$674 Billion	$5,700 a year
Country C	$4.08 Trillion	$22,000 a year
Country D	$302 Billion	$5,200 a year
Country E	$690.2 Billion	$16,700 a year
Country F	$20.4 Billion	$900 a year
Country G	$6.031 Trillion	$32,600 a year
Country H	$264 Billion	$2,200 a year
Country I	$4.6 Billion	$3,200 a year
Country J	$50 Billion	$3,000 a year

On the chart shown above, the Gross Domestic Product figures can be used for determining a nation's economic productivity. The Gross Domestic Product figures can be used to help estimate the income that Negative Economics might provide if expanded to that nation.

Gross Domestic Product Figures

Country A	$4.15 Trillion
Country B	$674 Billion
Country C	$4.08 Trillion
Country D	$302 Billion
Country E	$690.2 Billion
Country F	$20.4 Billion
Country G	$6.031 Trillion
Country H	$264 Billion
Country I	$4.6 Billion
Country J	$50 Billion

In reviewing the Gross Domestic Product figures above we can make some comparisons.

Country C has a large Gross Domestic Product. $4.08 trillion a year. This indicates that it is a good candidate for expanding Negative Economics to.

Country C $4.08 Trillion

Country E generates twice as much wealth as Country D. Country E is the better choice for expanding Negative Economics to.

Country D	$302 Billion
Country E	$631.2 Billion

Between Countries H, I and J. Country H is the best choice for expanding Negative Economics to. It has a Gross Domestic Product of $264 billion. Country I is hardly worth bothering with. It only has a Gross Domestic Product figure of $4.6 billion.

Country H	$264 Billion
Country I	$4.6 Billion
Country J	$50 Billion

In comparing Country E and Country F. Country F has such a small Gross Domestic Product that it is a poor choice for expanding Negative Economics to.

Country E	$631.2 Billion
Country F	$20.4 Billion

Another comparison is that of Country B and Country E. Both countries have about the same Gross Domestic Product figures. Country B is a country with only 45 million people. Country E has 200 million people. The country with the smaller population is the better choice for Negative Economics. It generates more wealth with fewer people.

Country B	$674 Billion	45 million people
Country E	$690.2 Billion	200 million people

Country G has by far the highest Gross Domestic Product figure. It is the best choice for expanding Negatives Economics to.

Country G	$6.031 Trillion

The Gross Domestic Product a nation produces tells how much wealth it generates. For example, compare Example A, with a Gross Domestic Product of 7.9 billion, to Example B, with a Gross Domestic Product of 4.03 Trillion. If your income from Negative Economics consists of 25% of each business's income, (or whatever percentage amount is decided), in an entire country, which country will have businesses that earn higher incomes, Example A or Example B. Example

B's Gross Domestic Product is so small that it hardly pays to bother with it. By selecting countries with higher Gross Domestic Product amounts means more wealth can be obtained.

The next consideration is Income Per Capita. This discloses the average income that people earn in a country. These figures are important because Consumer Spending Programs pump money into an economy that ends up in government revenues bank accounts. The higher the incomes that people earn in a country, the more money that can be pumped into the economy on a regular basis.

Income Per Capita Figures (The amount of money people earn per year on a national average)

Country A	$3,260 a year	- Low
Country B	$5,700 a year	- Low
Country C	$22,000 a year	- Very High
Country D	$5,200 a year	- Low
Country E	$16,700 a year	- High
Country F	$900 a year	- Lowest
Country G	$32,600 a year	- Very High
Country H	$2,200 a year	- Low
Country I	$3,200 a year	- Low
Country J	$3,000 a year	- Low

The Income Per Capita figures shown above designate which countries are the more promising choices for expanding Negative Economics to. The more money people earn in a country, the greater the amount that can be pumped into the economy during Dated Money spending programs. A percentage of the money is channeled to government revenues bank accounts. Example: People in Country F earn only $900 a year. People in Country C earn $22,000 a year.

Income from Negative Economics is generated by implementing Consumer Spending Programs in countries that Negative Economics has been expanded to. Dated Money is used as a tool for creating intense consumer spending. Intense consumer spending results in increased business incomes. The Negative Economics income during Dated Money spending programs is a 35% tax (or whatever amount is decided upon) of each business's income. Each business will deposit 35% of their income earned from the spending program into their government Treasure Chest account at their bank. The money goes directly into government revenues bank accounts. The higher the incomes that people earn in a country, the more money that can be pumped into the economy. Much of which will end up in government revenues accounts. The money is collected by banks in each country. Banks receive deposits from local businesses which is deposited into their government Treasure Chest account. The money is then transferred by "electronic bank money transfers" to banks in the country that controls Negative Economics. The Internet can be used to keep track of business incomes in countries where Negative Economics is present. Accounting technicians would sit in front of computers and analyze business incomes from Negative Economics governed nations. The Government Treasure Chest checking account that each business entity maintains is the tool for collecting money from businesses. Banks make regular electronic money transfers so that the cash keeps flowing out of the country and into the governing country's bank accounts. When the Income Per Capita figures are low for a country, less Negative Economics income is possible from Consumer Spending Programs. How much money can be pumped into an economy when people only earn $2000 or $3000 a year. Very little.

How To Begin And Expand A Negative Economics Empire

The first requirement is to purchase the rights to use Negative Economics from the owner, Robert Wollner. The second step is to decide which countries are worth expanding Negative Economics to. Perhaps neighboring countries are more convenient because they are closer and easier to access.
In order to impose Negative Economics upon a country, it is necessary to capture the country through military engagement. Military conflicts are common in the world today. Selecting weaker, yet economically healthy nations is beneficial. Once captured, the nation will continue to produce income for your government indefinitely. While capturing a nation is not such a pleasant act, the wealth that can be obtained makes it a potential consideration. The more nations that are captured, the greater the wealth that is obtained. After a nation has been captured, then Negative Economics begins. All the businesses, factories, corporations and so forth, in the captured country are informed that they are now

required to open, and make regular bank deposits into, a second checking account at the bank where they do business. This is the ruling government's Treasure Chest account. The Treasure Chest, as it is called, is the channel through which revenues pass to reach the ruling government's bank accounts. At first the amounts businesses must deposit into their Treasure Chest account is small. So small that few businesses complain. This gets them acquainted with the process of depositing moneys into the Treasure Chest account. As the amounts increase, businesses are informed that, while their business income is shared with the Treasure Chest bank account, the ruling government will be implementing consumer spending programs on a regular basis that will generate increased spending in the economy. The result will be increased business activity. Business incomes will rise nationally. As the spending programs are implemented, the tax mandated for the government Treasure Chest program increases to reach 50% of the income of each business, factory, corporation and so forth in the entire country. This money passes through the Treasure Chest bank accounts and is transferred via bank money transfers into the government bank accounts in the ruling country. This money keeps piling up. The ruling country's government then informs the businesses in the captured nation that there are costs involved in running the spending programs. And that each business, factory, corporation etc. will help to shoulder the cost by paying their fair share. Before long the ruling government is getting 60% of the spending during spending programs, as well as 50% of business incomes during normal times. Other programs are implemented, such as targeting larger bank accounts of individuals and businesses, mandating employers to double and triple the Dated Money amounts that employees receive, charging up people's credit card accounts, and so forth. Before long the national income and the wealth of the captured nation is moved over to the ruling government's bank accounts. Such wealth supports an ever increasing military force that captures more nations to impose Negative Economics upon them, and for military forces that are maintained in captured nations. As the empire grows larger, the inventor of the concept, Robert Wollner, claims more riches for himself. Everyone benefits except the captured nations who work and toil with few rewards because the wealth of their nation keeps disappearing.

Negative Economics Coalitions And Alliances

By combining forces with other nations, Negative Economics coalitions can achieve greater wealth. Many nations working together can establish large empires by working together as partners in Negative Economics.

Expanding The Vast Network Of Wealth

New nations can be added to the Negative Economics empire regularly when coalitions and alliances combine their military forces. Vast wealth can be achieved rapidly and easily.

The Basic Rules Of Negative Economics

Negative Economics is a concept that was designed for channeling money into government revenues bank accounts. A nation's businesses are essential for abstracting money that a nation possess. Business incomes are easy to tax and funnel into government revenues bank accounts. A checking account concept referred to as the Treasure Chest account is used to collect the money. If businesses had to be relied upon to mail the money, the system would be less reliable. During normal times each business is required to deposit a percentage of their weekly income into their government Treasure Chest account. This provides the government with constant revenues. When the government needs to acquire additional revenues consumer spending programs are implemented. Dated Money is used to generate consumer spending. Consumer spending programs boost business incomes. Money flows into government revenues bank accounts when consumer spending programs are implemented. A percentage of the income businesses earn during spending programs is deposited into their government Treasure Chest bank account. This goes directly to the government. Other resources a nation has can be utilized for boosting Dated Money spending during spending programs. Employee wages, business monetary assets, funds in bank accounts, and credit card accounts are some examples. The more Dated Money that is spent in spending programs, the greater the government benefits. By consuming other nations and forcing Negative Economics upon them, adds to the wealth that a nation can achieve. As more and more nations are consumed, through military superiority, those nations become contributors to the abundant riches that a nation who controls Negative Economics can attain. Imposing Negative Economics on other nations, affords the dominating nation the opportunity to abstract the wealth of their nation on an ongoing basis. The businesses in those countries are required to deposit a percentage of their weekly income into the Treasure Chest checking account at their bank. Implementing consumer spending programs boosts business incomes which channels greater amounts of money through the Treasure Chest accounts to the ruling nation's banks. Such vast wealth acquired continuously and relentlessly, contributes to an ever increasing military force that dominates nations for the productive endeavor of utilizing Negative Economics as a tool for achieving great and abounding wealth. Negative Economics does not impose enslavement or tyranny upon a nation, it simply abstracts its wealth. While it is difficult to capture a nation, once captured it continues to provide revenues. Looking for weaknesses in leadership, a reduction in military capabilities, economic distress, loss of friendship with other nations, etc. pays off in acquiring nations for Negative Economics.

Dated Money Programs In Captured Countries.

Low Incomes In A Country Reduces Dated Money Spending During Spending Programs.

When the Income Per Capita of a country is low, additional methods are needed in order to increase the amount of money that will be pumped into the economy. If the bulk of the money being spent in the consumer spending program consists of employee's wages, and the weekly income of employees in a country is small, the government revenues yield from the spending program will be reduced. In order to increase the Dated Money amounts that will be spent in the spending program, additional sources can be utilized to boost spending during the program. Other financial resources a nation owns can be pumped into the economy so that increased revenues are gained for government revenues accounts. No assets are exempt in the Negative Economics formula. Worker's wages, business and personal checking and savings accounts, business financial assets, credit card accounts, are just some of the many sources the government can regard as obtainable resources in Negative Economics. Some examples are given:

Match The Dated Money Program

Businesses, factories, corporations, etc., will match the amount of Dated Money that employees receive in their pay envelope. Or even "Double" the amount. This will increase the amount of money being spent in the program.

Money Stored In Bank Accounts

Business bank accounts and personal bank accounts are considered for examination. Banks will provide lists of bank balances over the "Target Balance" amounts. Businesses and individuals who have bigger bank account balances may be relied upon for boosting Dated Money amounts in spending programs. The objective is to move the wealth of the nation into government revenues accounts. This is the purpose of Negative Economics. The wealth of the government is more significant then the wealth of its citizens. The idea is to free up money stored in bank accounts and pump it through the economy so that government revenues accounts will benefit.

Credit Card Indebtedness Program

Credit Cards are another source for boosting Dated Money spending. Citizens would be required to spend money during spending programs that is charged on their credit card and designated as Dated Money. This has already been explained on page 8.

Dated Money Giveaway Program

The government intentionally executes an overprinting of Dated Money with the intention of giving it to special government employees and government officials and their families as a reward for their faithful service to the government. The overprint of Dated Money is spent during the spending program and much of it ends up in government revenues accounts.

Government Credits Program

The program is designed to extend loans to people who need to buy things they can't afford. The loan is given to them in Dated Money when consumer spending programs occur. The money is paid back to the government by low weekly payments removed from their pay check by their employer and mailed to the government.

Employee Bonus Program

The program encourages businesses to give bonuses to their employees in Dated Money. The Dated Money is spent in the economy and is good for the nation's businesses. And adds to the government revenues stockpile of wealth.

Bank Loans Program

This program encourages banks to loan money to people that is paid to them in Dated Money that can be spent in consumer spending programs.

Printing Billions In Dated Money And Sell It To The Public

This program is a method for turning printed money into cash. The public is encouraged to increase their spending power by purchasing Dated Money. In ruled countries this is effective for turning printed paper into cash. The ruling government prints the Dated Money themselves. This gives them control over its use.

PURCHASE DATED MONEY FROM THE GOVERNMENT AND INCREASE YOUR SPENDING POWER

AMOUNT PAID IN CASH	DATED MONEY AMOUNT YOU RECEIVE
$10.00	$12.00
$15.00	$18.00
$20.00	$25.00
$40.00	$54.00
$60.00	$78.00
$100.00	$135.00

Buying Merchandise With Dated Money, Program

Dated Money that the ruling government prints is used by their "Team Buyers" to purchase tons of merchandise in the captive country. The merchandise is warehoused, and then sold back to the merchants for the next spending program, at a 100% profit.

These and other ideas, no matter how trivial they might sound, could boost government revenues accounts. All the ideas that can be invented add up to more Dated Money being spent in spending programs.

How Negative Economics Develops From Peaceful Beginnings

The country of Russia is being used for this example model. The Russian government and its embassies around the world receive a description of Negative Economics. In the earliest review of Negative Economics the Russian government rejects the concept. More copies of Negative Economics reach the Russian government and its embassies as the months go by. As winter approaches the Kremlin decides that the concept of Negative Economics contains definite parts of the plan that could contribute to an improved Russian economy. Russia's winters are long, and extremely cold climate is the explanation for a slowed down economy. Russian consumers are not active during the colder months and business activity is reduced. Reduced business activity during the long Russian winters is devastating to the economy. Government revenues are reduced and national business profits suffer. The concept of Negative Economics offers a consumer spending plan that utilizes Dated Money to generate consumer spending. Consumers are compelled to shop and spend money because of Dated Money that expires. If not spent, the Dated Money expires and becomes worthless. The Russian government decides that Dated Money spending programs could increase consumer spending during the long winter season. Another part of the Negative Economics plan the Russian government finds desirable is the "Match the Dated Money" program. In this concept Russian businesses would be required to match the Dated Money that workers receive in their pay envelope. This would force businesses in Russia to put back into the economy some of the money they withdraw from the economy and store in their bank accounts. For the free enterprise system to work, money must constantly flow through the system. Worker's wages are often not sufficient to produce an ample flow of money through the system. The Match the Dated Money program in Russia would provide enhanced spending capabilities for consumers who contribute to the economic well-being of the system. Economists worldwide have concluded that consumer spending is 70% of the free market system.

The Russian Foreign Minister makes arrangements with the inventor of Negative Economics to meet at the Russian Embassy in Washington D.C.. The deal is consummated and Russia begins their new winter economic improvement program. Russian businesses are overjoyed about the increased consumer spending in the Russian economy. The economy benefits from the spending and the economy grows. Economic expansion, increased employment, and the beginning of new industries in Russia is the result of the increase in consumer spending. The Kremlin decides that the Dated Money spending programs are costly to the government and are becoming a burden on the government. Dated Money has to be constantly printed and the programs have to be administered. They decide to charge a tax to businesses in Russia who benefit from the spending programs. They mandate that all businesses in Russia will open a second checking account at their bank for depositing taxes into that are related to the Dated Money spending programs. Money deposited into these accounts will go directly into Russian government revenues bank accounts. At first the amounts businesses are required to deposit are low. As the tax is increased each business in Russia is required to deposit 25% of their business income into the government's bank account. The second bank account businesses maintain might be called the "Dated Money Spending Program" tax account. Even thought businesses are required to make deposits on a weekly bases weather spending programs are implemented that week, or not. The government then increases the tax that businesses must pay to 45% of their business income during the Dated Money spending programs. The Kremlin discovers that new wealth is reaching their revenues bank accounts. Instead of burdening the Russian businesses with additional increased taxes, the Kremlin decides to add more businesses to the formula that will contribute to the Russian government revenues accounts. In order to increase the number of businesses that contribute to the Russian government's wealth, other countries are considered for the Dated Money spending programs agenda. The Kremlin informs the countries of Ukraine, Kazakhstan, Belarus, Estonia, Lithuania, Moluova, Romania and Bulgaria about the remarkable Dated Money spending programs that have produced such incredible results in Russia's economy. That Russia wants to assist them with their economy so that they also will benefit from this remarkable new economic wonder. Eager to improve their economy, they agree to a trial period. The Kremlin's plan works. The businesses in these countries are soon paying 25% of their business income during normal times, and 45% of their business income during Dated Money spending programs. This money is deposited into the second bank account that businesses must maintain at their bank. The money is transferred to Russian government revenues bank accounts in Russia, via electronic money transfers by the many banks in those countries that collect the money. Russia's greed is now beyond hope. More nations must be added the

Kremlin says. The Russian president, Mr. Putin, meets with the president of China and North Korea and informs them that easy money is to be made with Negative Economics. And that prosperous nations have wealth to plunder. Japan, Great Britain, France, Germany, the United States, Canada and others are looked upon as potential revenue providers for the Russia\China\North Korea Coalition.

But then, the Federal Judge who is adjudicating this case is to responsible to permit Negative Economics to reach these countries. He points his finger at the Defendants and says: Judgment For Plaintiff, for the amount stated in the complaint. END OF STORY

MOTION

REQUEST FOR DEFAULT JUDGMENT

FEDERAL RULES OF CIVIL PROCEDURE
RULE 55. DEFAULT

REQUEST FOR DEFAULT JUDGMENT

The Plaintiff in this action does herewith inform the court that the defendants have willfully and deliberately defaulted. The Defendants have failed to plead, answer or otherwise defend the claim against them. Proof of service has been effected in accordance with F.R.C.P. Rule 4. No answer or effort to respond to the Complaint is evident. The Defendants have declined to acknowledge the Plaintiff's declaration in asserting his claim for relief. And in doing so, Defendants have compromised the invitation to defend this action. Plaintiff believes that Defendants have no intention of acknowledging this civil action. Their defiance to this lawsuit is basis for a default judgment. The Plaintiff believes that the Defendants deem themselves exempt from such a proceeding. That they will pursue no Defense other then to insist that they be excused because of their standing in public office. That they be granted the privilege to adjourn this case and suspend court procedures predicated upon their conviction that public office affords one the right to exemption from public regulations and that government administrations are not subject to judicial civil processes. The foundation for this lawsuit is seated in the premise that public officials have ignored a concept that is detrimental to the prosperous nations of the world. That their inappropriate behavior has endangered the continued freedom of the United States, and other countries could undergo a loss of freedom because of their actions. Exhibit A, Negative Economics has recently been rewritten and upgraded and is now more potent and more deadly then before. Negative Economics is a threat to the world. This can be proven in court through testimony from competent professionals who possess knowledge of the ruthlessness of sovereign nations who would stop at no end to implement Negative Economics in order to acquire great wealth. The Defendants have sanctioned such a ruthless course of action by disregarding all possibilities that any nation would undertake a concept such as Negative Economics. This is an issue that is of importance to the courts, the American people and the Congress. While this lawsuit is an annoyance to the Defendants it is in the public's interest.

The Plaintiff appeals to the court to enter judgment against Defendants who are in default under federal statutes. The Defendants will not defend this lawsuit and legal remedy should be undertaken.

All of the Defendants received a Summons which states that an answer to the Complaint must be served upon the Plaintiff and the court within the stated time period or judgment by default will be taken against Defendants for the relief demanded in the Complaint. The time has expired and no answer has been dispatched. Plaintiff believes that Defendants have contempt for this lawsuit and deem themselves exempt from this proceeding. Plaintiff has mailed a copy of this Motion and Request for Default Judgment to all of the Defendants. At the court's discretion please enter Default Judgment when appropriate.

Dated this 30th day of April, 2001.
