

Will '94 be the Missouri River's turn to stage a great flood?

It was just over a year ago that we came across a provocative story: the possible coming of a severe winter. Most of the first 10 months of 1992 had been unusually warm, as had most of the period since 1988. And even though precipitation was just about average during 1992, most of the country, and especially the West and Northwest, had been dry for almost three years. So the prediction for a severe winter was something of a turnaround. In asking the question, "Will this season turn out to be a ghost of the winter of '48?" we pub-

The Weather Observer

By Cliff Nielsen

lished a forecast by a scientist named Charles Perry calling for an end to the western drought and a return to wetter, colder conditions.

So how did it all turn out? To be honest, the winter of 1993 was not quite as fierce as that of 1948. In fact, in Perry's words, the winter of 1993 was much more like the winter of 1951, which was also cold and snowy. And obviously, last winter will be remembered as a severe one in most parts of the country, ranking as the 25th coldest in the 98 years since records began in 1895. What set the winter of 1993 apart was all of the rain, and particularly the snow, falling as far south as the Gulf coast. By the first of April, the year 1993 had already become the eighth wettest year on record, following what had been an equally cold and wet December in 1992. But it was only the beginning of what would become something of a record year.

Even with all of the additional carbon dioxide in the atmosphere and in the face of continued talk of global warming, the 12 months ending last Nov. 1 were among the wettest and coldest in a century. According to the October Issue of the *Climate Variations Bulletin* published by the National Oceanographic and Atmospheric Administration (NOAA), that period was the second wettest on record. It was also cold, the eighth coldest 12-months in nearly a century.

The question to be answered is whether this was merely a freak cold snap caused by the eruption of Mount Pinatubo in 1991, or is it the beginning of a new trend? Perry thinks it is the latter, even though he does not discount the effects of the Pinatubo eruption, particularly its contribution to overall cooling.

If you have read about Perry's ideas here before, you know he bases his studies of climate change on fluctuations of incoming solar irradiance. "Studies," by the way, is a word he prefers to forecasts.

The science itself is interesting. One factor is heating of tropical waters, particularly in the equatorial Pacific by increased solar irradiance during what is popularly known as a "sunspot." The second is the time lag of at four years required

for the warmer tropical waters to get into the Gulf of Alaska where they begin to influence precipitation in North America. The third is the detailed statistical studies Perry completes on each of 344 climate regions in the U.S. based on almost 50 years of weather and solar records. From these, he derives correlation coefficients of the probability of increased precipitation in any given year after a sunspot peak. These correlation coefficients are somewhat like the "probabilities" you see on the evening TV weather shows. The difference is that they are derived from past "analog" years, years in which the solar data and weather records most resemble the present.

So, you are probably asking, what do the studies show about this winter and the remainder of the year?

The appraisal is for another wet year. "The warm Pacific water has moved to the east," Perry said recently. So its influence can be expected to move east. "His report calls for heavy snowfall in the northern Midwest in the Dakotas, Minnesota, and Wisconsin. 'The belt of heavy precipitation should extend all the way to Pennsylvania and result in heavy rainfall in the Ohio River Valley,'" he said. "But other parts of the country should also expect greater than normal precipitation. These include the Northwest, northern California and the High Sierras, and much of the West." The rest of the country, according to Perry's study, is expected to be normal with a tendency to being wet, except for the South Central regions and the Southwest. "These areas," he said, "may be on the dry side, but there will probably be no drought."

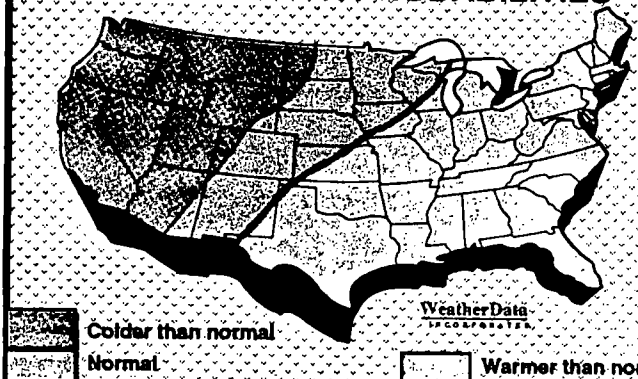

If the analogy between 1951 and 1993 holds up during the coming months, it could even be a year for the record books. In case you're too young to remember, the winter snowfall in the West and upper Midwest during the winter of 1952 led to the greatest flooding of the Missouri River in history. The property loss caused by that 1952 flooding made it the most expensive natural disaster on record at the time.

This November, the NOAA report will tell us how accurate the study has been. Naturally, Perry will be pleased if the results mirror the results of the last 12 months. But making a successful forecast is really the least of his concerns. Perry defines his work as finding a possible causative mechanism between solar cycles and weather patterns. "All my research has given us is a possible very general pattern," he said. "And if it proves to be correct, it is only a tiny piece of the puzzle. The next thing to look at is possible changes in the speed and direction of the Pacific ocean currents and equatorial winds high in the atmosphere. Both of these patterns may be somewhat different than they were four decades ago. Knowing more about the changes would give us a much greater insight into how solar changes influence climate in the Northern Hemisphere."

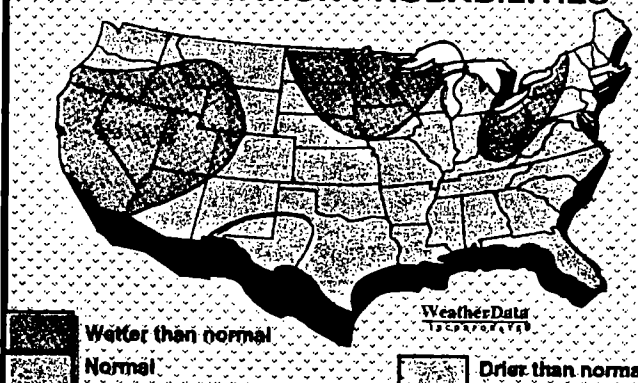

USA's 3 - month weather outlook

90-day outlook for January through March, 1994

TEMPERATURE PROBABILITIES

PRECIPITATION PROBABILITIES

This exclusive 90-day forecast is offered on a preliminary basis to U.S. Water News and its readers. The finalized 90-day forecast is available from WeatherData, Inc., Wichita, KS (316) 265-9217.

Satellite-linked weather network in Northwest water management too

BOISE, Idaho — As the world's first and only satellite linked agricultural weather reporting system, the Agricultural-Meteorological (AgriMet) telemetry weather network directly translates weather data into improved water management, according to a developer of the network that serves agriculture in the Pacific Northwest.

The AgriMet network, which has been operational for seven years and is constantly being expanded, serves as a catalyst, uniting growers, scientists, farming consultants, and utility companies into a team, said Allan Ingram, a mechanical engineer with the Bonneville Power Administration who was involved in initial system development. Growers use the system's real-time data to raise more than 35 different crops in the region where between 80 to 90 percent of total water usage goes to agriculture.

With the installation of six new stations last year, the satellite-linked system consists of a network of 41 stations spread throughout Idaho, Oregon, Washington, northern California, and the western regions of Wyoming and Montana. The AgriMet network is unique because it is the only such system transmitting meteorological data through the NASA-developed Geostationary

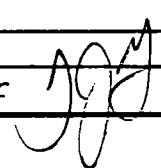

Operational Environmental Satellite (GOES) spacecraft and the National Environmental Satellite. Each AgriMet station consists of a data collection platform equipped with sensors and antenna to transmit data. The collected data are transmitted through the GOES spacecraft to a computer at the Bureau of Reclamation's office in Boise.

Station sensors automatically collect data on air temperature, relative humidity, and wind direction at minute intervals, while wind speed, precipitation, and solar radiation are reported on an hourly basis. In addition, some of the newer stations provide data on evaporation and surface temperature. The weather information is fed into a computer programmed with models of more than 35 crop files. The computer transforms the data into crop evapotranspiration (ET) tables based on a calculated reference crop ET and attendant crop coefficients for each particular crop.

"As the demand for water increases, so will competition for water, water and energy costs, and the need for higher quality and more technical data," said James Wright, research soil scientist with the U.S. Department of Agriculture at Kimberly, Idaho.

Remarks

Re: Federal Spending on the Mid West Flood Recovery

Attached is a package of materials on actual-to-date and projected Federal spending obligations for the Mid-West flood recovery effort.

The package includes:

- a 2 page summary;
- a state by state breakout for appropriate NGA state representatives; and
- the database detail.

Please let me know if you need more information.

Summary

Divider Title: _____

February 17, 1994

Federal Spending¹ on the Mid-West Flood Recovery

- Through December 31, 1993, Federal agencies report obligations totalling \$2.7 billion in the nine states affected by the flood. Through FY 1994, these agencies currently project that \$5.2 billion will be obligated. They are also projecting some additional spending in FY 1995.
- The main Federal agencies involved in the Mid-West flood recovery effort include USDA (mostly crop disaster payments); FEMA (public and individual assistance); SBA (loans to individuals and businesses); the U.S. Army Corps of Engineers (infrastructure rebuilding); and HUD (grants to states). A total of 16 Federal agencies are involved directly.
- Iowa, Missouri, Minnesota and Illinois together are projected to receive most (over 65%) of the direct Federal assistance. Kansas, South Dakota, Wisconsin, North Dakota, and Nebraska will receive the rest.
- Of the totals projected through FY 1994, USDA is projected to provide just over half of the flood recovery assistance; FEMA 18%; SBA 12%; and all of the other 13 agencies providing 5% or less. USDA is projected to provide the bulk (over two thirds) of the assistance in Minnesota, South Dakota, Wisconsin, and North Dakota; and over half of the assistance in Iowa.

¹ Federal spending obligations include outlays for which obligations have not been recorded previously plus outlay precursors such as orders placed, contracts awarded, services received and similar transactions that require outlays during the same or future period. This does not include indirect spending (e.g., Federal income maintenance programs), nor changes in Federal tax liabilities (i.e., losses claimed against 1992 or 1993 taxes).
