TEXT:

ADMINISTRATION'S SPENDING REQUEST MET WITH SKEPTICISM BY GOP LEADER

The Clinton administration late March 25 asked congressional appropriators for an additional \$1.8 billion in spending for a variety of programs in the omnibus rescissions and appropriations bill (HR 3019), and a \$7.4 billion package of proposals to offset the spending, but the request was met with resistance from some in the GOP leadership.

"The administration always wants to add more money," Senate Majority Whip Trent Lott (R-Miss) told reporters March 26. "I think the Senate went about as far as we're willing to go," he said.

Still, Lott did not flat out reject the administration's request. "We're still working with the administration. We want to work with the administration

to get an agreement," he said.

The White House was eager for the House and Senate Republican leadership to weigh into the process, which has not yet occurred, one administration official said. White House officials were scheduled to meet with key House and Senate leadership aides late March 26.

The request would add \$1.81 billion in spending for more than 20 programs contained in four of the remaining appropriations bills. These funds would be on top of the funding levels already contained in the Senate version of the omnibus bill.

Because the two versions of the omnibus appropriations bills contain either four or five of the remaining appropriations bills not signed into law, emergency appropriations, rescissions, and additional funds "contingent" on achieving entitlement savings, figures vary as to how much additional spending for the administration's priorities has already been accomplished.

Restoring 'Contingent' Funds

The administration is seeking to restore funds to programs in the Senate bill that are now partially funded with so-called "contingent" funds. Out of the \$1.8 billion sought by the administration, about \$879 million would replace the contingent requirement for many programs and the remainder would restore other programs to their fiscal year 1995 levels or higher.

For example, the administration requested \$235 million for the Commerce Department's Advanced Technology Program. The Senate version of the bill contains \$235 million in funds for that program "contingent" on a future budget deal.

But the request also contains, for example, an additional \$119 million for Ryan White AIDS Treatment. The Senate bill contains just \$52 million for that program in "contingent" funds.

White House Submits Offsets

The administration also attached to its spending request more than \$7.4 billion in proposed offsets. The largest of these includes \$5 billion from an assessment on SAIF-insured deposits; \$800 million from Continuing Disability Reviews; \$500 million from the sale of Governor's Island; and \$352 million from federal debt collections.

A Senate leadership aide suggested the reason the administration proposed so much in offsets was the uncertainty of Congressional Budget Office scoring and the uncertainty of when these savings would be achieved. A few of the offsets, he said, would not achieve savings for several years.

A House committee aide said the administration's proposal had been submitted to CBO for scoring.

An administration official said the White House wanted to give Republicans a range of offsets larger than the additional spending Clinton requested to allow them to pick and choose.

Lott, however, rejected the offsets as "smoke and mirrors" and said the Senate already had added enough spending for education and the environment.

"But even if it's offset, I don't want more spending," he said.

"Personally, I wouldn't give them another nickel," he added.

Narrow Path To Compromise

"We have a very narrow little strait through which we must pass. If we add too much for the administration, it fails because it's too much money. If we don't add enough, the administration may veto it. So that's the delicate balance," Lott explained.

Many House Republicans still have not agreed to the Senate levels of spending on education and the environment, Lott said. "I have the impression that they are inclined to try to go along with the Senate numbers," he said.

But if more spending is added, it is unclear whether the bill could get through the House, he suggested.

Lott also did not rule out yet another short-term continuing resolution to keep the government operating while work continued on the omnibus appropriations bill. "Another CR is not particularly attractive to anybody, but it is a more attractive option than a shutdown," he said.

If it becomes evident by March 28 that conferees cannot reach agreement, both the House and Senate will look at their options, Lott said. Another short-term CR would have to cover their two-week Easter recess, which ends April 15, he said. "Friday is the [19th], so we'd look at something like that I'm sure," he said.

-- By Cheryl Bolen and Alexis Simendinger

CLINTON ADMINISTRATION PROPOSALS TO EXPAND TITLE I OF SENATE APPROPRIATIONS BILL (HR 3019) (TEXT)

Advanced Technology Program	235	Senate Title IV
National Telecommunications & Information Administration	20	95 level
Technology Administration	2	Senate Title IV

CLINTON ADMINISTRATION PROPOSED OFFSETS FOR ADDITIONAL SPENDING IN FISCAL YEAR 1996 (TEXT)

Mandatory offsets	SAVINGS
--Collect an assessment on SAIF-insured deposits	5,000
Achieves the required 1.25 percent reserve ratio	
--FHA assignment reform	119
Savings from 1996 mortgages only	
--Sale of oil from the Strategic Petroleum Reserve	178
Options range from zero to \$470 m in Reconciliation; this line is in addition to \$292 m in Specter amendment	
--Limit Section 8 annual rent increases	60
Similar to provision in 1995 approps and 9th CR; no effect on tenants	

--Sale of Governor's Island	500
--Sale of Union Station Air Rights	40
--Veterans -- Housing deficiency judgments	90

Repeals required written consent before collecting a debt; allows salary or income tax offset -- to offset additional spending on Veterans' medical care

--Debt collection (revenues)	352
------------------------------	-----

Tax debt piece for Federal employees and retirees only; not used in education amendment

--Continuing Disability Reviews (CDR's)	800
---	-----

Discretionary offsets

a. HUD incremental housing vouchers	200
Shorten incremental housing contract terms	
b. HUD -- HOPE Grants unobligated balances	30
c. Eliminate excess Flexible Subsidy balances	61

Excess BA under Rental Housing Assistance program

TOTAL, potential offsets ...	7,430 *
------------------------------	---------

* Note: The President's FY 97 Budget includes \$1 billion in FY 96 savings for defense programs. In addition, relative to the Senate-passed bill, we understand there is \$273 million in defense BA and \$1.36 billion (preliminary scoring) in defense and non-defense OL left on the table which would be available for financing the addback package.

DATE: 28 March 1995

SUBJECT: April 4 Conference Call on AIDS Vaccines

Dear All,

The conference call to discuss AIDS vaccine development issues is scheduled for Thursday, 4 April 1996, starting at 9:30 am EST (6:30 am PST). The number to call into is 1-800-403-2028, and the code to dial is 666583.

We have booked nine outstanding and accomplished scientists willing and interested in providing us brief assessments of the problems and obstacles for development of a successful preventive AIDS vaccine from their differing perspectives and experience. We have invited them to advocate specific and concrete steps for potential solutions by Executive Branch action that the Council might consider recommending to the President. It

is understood that last-minute events may preclude some from participating.

Given our prior experience with face-to-face interviews about microbicides on 7 December, and a conference-call interview with one guest researcher on pediatric research on 15 March, this multi-guest format remains a bit of an experiment, and I hope all will bear with the need for brevity, directness, and strictness with the time allocations. If they wish, the guest experts are invited to fax advance brief written statements to the Research Committee members providing relevant biodata on themselves (to supplement the limited information I have provided in the schedule below), plus explanation, supplementation, or background for their verbal assessments and/or advocacy proposals.

Below please find a schedule for the 1-1/2 hour session. Each guest expert is allocated 5 minutes for a statement and 5 minutes for questions from the Committee members. Guest experts are welcome to listen to the entire call and -- when Committee members have no more questions to ask -- to participate in the questions, answers, and discussion.

BECAUSE AT&T CONFERENCE-CALL PORTS ARE LIMITED, GUESTS ARE REQUESTED TO USE ONLY ONE INCOMING PHONE LINE TO CONNECT TO THE SESSION AND NOT TO DIVULGE THE 800 NUMBER AND CODE. However, others at their location may listen to the call using handset extensions or a speakerphone on the same telephone circuit.

SCHEDULE (All times Eastern Standard)

9:30 - 9:35 Committee Housekeeping; Announcements

9:35 - 9:45 Dani Bolognesi, PhD
Professor and Director, Center for
AIDS Research, Duke University;
Co-Director, Human Vaccine Institute.
Prominent researcher in HIV biology,
HIV vaccines, and HIV immune
reconstitution; principal of Central
Immunology Laboratory for AIDS Vaccine
Clinical Trials; Chair of Vaccine R&D
Area Review Panel of the OAR
evaluation committee. Current/past
member: NIH AIDS Vaccine Selection
Committee, NIH AIDS Vaccine Working
Group, WHO Vaccine Steering
Committee.

9:45 - 9:55 Mary-Lou Clements, MD, MPH
Professor, Johns Hopkins University

Center for Immunization Research;
principal investigator in NIH AIDS
Vaccine Evaluation Unit network;
extensive experience in clinical
R & D of vaccines for other human
diseases; current/past member: WHO
steering committee for HIV vaccine
development, CDC Advisory Committee
on Immunization Practices, Institute
of Medicine Committee on Children's
Vaccine Initiative.

9:55 - 10:05 Jose Esparza, MD, PhD
Chief of HIV vaccine development,
Global Program on AIDS, WHO &
UNAIDS. Virologist and
epidemiologist facilitating and
coordinating AIDS vaccine research and
development issues on international
level since 1987.

10:05 - 10:15 Donald P. Francis, MD, ScD
Official of Genevax, Inc., formerly of
Genentech, Inc., manufacturer of a
gp120 "envelope" AIDS vaccine which
has completed phase I and II clinical
trials in the U.S. Former CDC
epidemiologist responsible for
hepatitis B vaccine trials among gay
men in San Francisco, and original
member of CDC task force on AIDS.
Participant in WHO global smallpox
eradication program and CDC
investigation of Ebola virus
outbreaks.

10:15 - 10:25 Maurice R. Hilleman, PhD
Director, Merck Institute of
Therapeutic Research, affiliated with
the Merck pharmaceutical
manufacturer. One of the world's
most productive vaccinologists;
developer of vaccines for measles,
mumps, rubella, hepatitis A & B, and
other diseases. Recipient of
numerous awards and honors, including
Lasker award, National Medal of
Science.

10:25 - 10:35 Margaret "Peggy" Johnston, PhD
Scientific Director, International
AIDS Vaccine Initiative (initially
supported by the Rockefeller and the
Until There's a Cure foundations).

Former Deputy Director, Division of AIDS, NIAID, NIH; planner, implementer, and manager of NIAID activities in discovery and preclinical evaluation of therapies for HIV infection ('87-'91), and extramural research in pathogenesis, drug, and vaccine R&D for HIV/AIDS. Biochemical research on antiviral action of interferon and nucleic acid immunochemistry.

10:35 - 10:45 John "Jack" Y. Killen, MD
Director, Division of AIDS, NIAID, NIH
(additional background unavailable)

10:45 - 10:55 Philip K. Russell, MD
Professor, Johns Hopkins University; President, Albert Sabin Vaccine Foundation. Former Army Surgeon General responsible for the military vaccine development program. A leading vaccinologist involved with the R&D of many vaccines used in both military and civilian sectors. Former member of Institute of Medicine Committee on Microbial Threats to Health and the Presidential Advisory Council on Human Radiation Experiments; special advisor to the Children's Vaccine Initiative of UNICEF, UNDP, World Bank and the Rockefeller Foundation.

10:55 - 11:05 Sten Vermund, MD, PhD
Professor of Epidemiology, University of Alabama; President, Gorgas Memorial Institute for Tropical and Geographic Medicine. Former Chief, Vaccine Trials and Epidemiology Branch, Division of AIDS, NIAID, NIH. Member of Institute of Medicine Committee on Social and Behavioral Sciences in HIV Biomedical Research.

"Across the USA: Tennessee"

USA Today (03/28/96) P. 11A

Tennessee's health care program Tenn-Care will cover protease inhibitors, new AIDS drugs that experts say are particularly promising. Tenn-Care covers about 2,000 HIV-infected individuals.

"Across the USA: Massachusetts"

USA Today (03/28/96) P. 11A

AIDS-related deaths in Massachusetts increased 21 percent from 1993 to 1994, and doubled from 1990 to 1994, according to a new report. The 1994 total was 938. AIDS was the leading cause of death among Hispanics in the state that year.

"Health-Insurance Measure Is Running Into Problems"

Wall Street Journal (03/28/96) P. A4

The chances of a health-insurance reform bill, aiming to restrict insurance companies' ability to refuse coverage to people with pre-existing conditions and guarantee continued coverage to those who lose or change jobs, may be complicated by amendments from Senate Republicans. The bill's sponsors, Sens. Nancy Kassebaum (R-Kan.) and Edward Kennedy (D-Mass.), urged lawmakers not to amend the legislation. Amendments may be proposed to raise the health-insurance tax deduction for the self-employed and to add provisions for medical savings accounts and medical-malpractice awards.

"Zimbabwe's AIDS Orphans to Reach 600,000 by 2000"

Xinhua News Service (03/28/96)

Zimbabwe will have more than 600,000 orphans due to AIDS by the year 2000, Margaret Mehlomakulu, deputy director of the National AIDS Coordinating Program, said at a workshop Wednesday. She said that AIDS would be a heavy burden on the government and the community as they would be forced to stretch available resources to take care of the orphans. Mehlomakulu called for health officials to work with the community to help prevent young people from becoming HIV-infected. An estimated 1 million Zimbabweans, of a total 10.5 million, have the virus.

"Death Rates High Among New York Welfare Recipients--Study"

Reuters (03/27/96)

Rates of AIDS, tuberculosis (TB), and death are much higher among New York City welfare recipients and applicants who have been abusing alcohol, drugs, or both, an eight-year survey has found. The research, led by Lloyd Friedman of the Yale University School of Medicine, found that between 1984 and 1992, 5.5 percent of the 858 people studied developed TB, 10 percent had AIDS, and 21 percent died. All 858 had a history of abusing drugs, alcohol, or both. The TB rate for these individuals, the majority of whom are single black men, is nearly 15 times the usual rate in New York City, while the AIDS rate is 10 times the average, and the death rate is five times the usual. Ninety-three percent of the participants agreed to undergo a two-part medical exam, which the researchers hoped would result in treatment for people at high risk for AIDS or TB.

"Influenza Immunization in HIV-Positive Children Does Not Enhance HIV Replication"

Reuters (03/27/96)

Although some researchers have suggested that influenza vaccination may activate T-cells and enhance HIV replication, new research has revealed only short-term increases in viral load in children following immunization. Octavio Ramillo and colleagues at the University of Texas Southwestern Medical Center in Dallas saw the increased HIV RNA in five of 16 children, and said the viral load returned to baseline in four of those five children within eight weeks. The findings add to the evidence that the

viral burden increases after immunization more often in HIV-positive adults than in children.

"Zimbabwe's Maternal Mortality Deaths Rising"

PANA News Service (03/27/96)

The incidence of maternal mortality has increased in Zimbabwe as the number of HIV-infected pregnant women has risen, a local gynecologist reported Wednesday. Kudakwashe Kangwende said the infant mortality rate has been made worse by pre-natal mortality associated with HIV infection and AIDS among pregnant women. Kangwende said that frequent and unwarranted pregnancies among women with AIDS contribute to the increasing maternal mortality rate, and suggested that women with AIDS should be allowed to have abortions. He also said the AIDS pandemic was causing the spread of other diseases uncommon in Zimbabwe, including genital herpes and cervical cancer.

"Physicians' Experience with the Acquired Immunodeficiency Syndrome as a Factor in Patients' Survival"

New England Journal of Medicine (03/14/96) Vol. 334, No. 11, P. 701; Kitahata, Mari M.; Koepsell, Thomas D.; Deyo, Richard A.; et al.

Mari Kitahata and colleagues examined the link between physicians' experience with AIDS and the survival of their AIDS patients. They studied the cases of 403 men enrolled in a health maintenance organization who were diagnosed with AIDS between 1984 and mid-1994. The patients' 125 primary care physicians were separated into three levels of AIDS experience, based on experience with AIDS during residency training and the cumulative number of patients with AIDS they had treated in practice. The authors concluded that patients cared for by doctors with the most experience had a 31 percent lower risk of death than patients cared for by physicians with the least experience. Among the 224 patients diagnosed with AIDS between 1989 and 1994, the risk of death was 43 percent lower for patients of the most experienced doctors than for patients of the least experienced. The study suggests that physicians who treat AIDS patients go through a similar learning period and begin to improve their management skills early in their experience. The authors found that certain methods of treatment and a tendency to follow HIV-infected patients more closely were associated with higher levels of physicians' experience and longer patient survival.

"Rogue Science or Reality?"

Insight (03/11/96) Vol. 12, No. 10, P. 16; Goode, Stephen

Peter Duesberg, biology professor at the University of California at Berkeley, member of the National Academy of Sciences, and federal grant recipient, is criticized by many scientists because he opposes the accepted belief that HIV causes AIDS. Duesberg's book "Inventing the AIDS Virus" outlines his arguments and challenges his colleagues to answer them. He says the HIV-AIDS theory was announced hastily by federal health officials in 1984 because groups like the National Institutes of Health were under intense pressure to come up with an answer to

the growing AIDS epidemic. No one questioned the connection later, he says, because billions in federal funding was being spent on confirming it. Furthermore, Duesberg criticizes AIDS researchers for abandoning long-held principles about viruses. In other viral infections, antibodies are a sign of the body's defense, but with HIV, antibodies are looked at as a sign that the virus is still potent. AIDS researcher Robert Gallo has said that because AIDS was completely new, redefining the rules was necessary. Other researchers argue that HIV's ability to mutate rapidly makes it a special case. Duesberg says that lifestyle factors--including drug use, repeated cases of sexually transmitted diseases, and malnutrition--are to blame for AIDS. Duesberg is not alone in his beliefs--the 100-member Group for the Scientific Reappraisal of the HIV-AIDS Hypothesis supports him.

"Principals in HIV Blood Scandal Should be Summoned by Diet"
Nikkei Weekly (03/11/96) Vol. 34, No. 1713, P. 6

In an editorial in the Nikkei Weekly, the authors note the Diet's lack of involvement in Japan's tainted blood scandal, which caused some 1,800 Japanese hemophiliacs to be infected with HIV. An investigation by the Ministry of Health and Welfare revealed that contaminated blood products were distributed even though members of government and industry knew of the HIV threat. However, the investigation's interim report fails to answer whether or not the ministry proposed emergency imports of safe, heat-treated blood products. The editors question the actions of Takeshi Abe, who headed the AIDS task force, as well as those of his associate, Mutsumi Kazama, and the pharmaceutical companies who continued to ship the untreated products even after the threat of contamination was known. The editors claim that the ministry investigation is not likely to provide satisfactory answers and that the participants should testify before the Diet.

Dear Jeff,

When I got back to Oklahoma I had a certified mail return from the White House Mail Room. They received my packet March 1st.

Since the internship is pre-approved by your office, I would hope it would move through the pipeline a little faster, but have heard nothing from anyone. I'd appreciate it if you might be able to make a call and help if it is bogged down. The Director of Internships is now Madge Henning, 456-2742.

I'm working up a paper to send you by mail with some thoughts on the various projects we discussed - and also an article which was written about our family's experience with AIDS.

Am really excited about working with you! As you said, this will be fun!

Thanks and take care,

MC

"Rogue Science or Reality?"

"Principals in HIV Blood Scandal Should be Summoned by Diet"

"Across the USA: Tennessee"

USA Today (03/28/96) P. 11A

Tennessee's health care program Tenn-Care will cover protease inhibitors, new AIDS drugs that experts say are particularly promising. Tenn-Care covers about 2,000 HIV-infected individuals.

"Across the USA: Massachusetts"

USA Today (03/28/96) P. 11A

AIDS-related deaths in Massachusetts increased 21 percent from 1993 to 1994, and doubled from 1990 to 1994, according to a new report. The 1994 total was 938. AIDS was the leading cause

of death among Hispanics in the state that year.

"Health-Insurance Measure Is Running Into Problems"

Wall Street Journal (03/28/96) P. A4

The chances of a health-insurance reform bill, aiming to restrict insurance companies' ability to refuse coverage to people with pre-existing conditions and guarantee continued coverage to those who lose or change jobs, may be complicated by amendments from Senate Republicans. The bill's sponsors, Sens. Nancy Kassebaum (R-Kan.) and Edward Kennedy (D-Mass.), urged lawmakers not to amend the legislation. Amendments may be proposed to raise the health-insurance tax deduction for the self-employed and to add provisions for medical savings accounts and medical-malpractice awards.

"Zimbabwe's AIDS Orphans to Reach 600,000 by 2000"

Xinhua News Service (03/28/96)

Zimbabwe will have more than 600,000 orphans due to AIDS by the year 2000, Margaret Mehlomakulu, deputy director of the National AIDS Coordinating Program, said at a workshop Wednesday. She said that AIDS would be a heavy burden on the government and the community as they would be forced to stretch available resources to take care of the orphans. Mehlomakulu called for health officials to work with the community to help prevent young people from becoming HIV-infected. An estimated 1 million Zimbabweans, of a total 10.5 million, have the virus.

"Death Rates High Among New York Welfare Recipients--Study"

Reuters (03/27/96)

Rates of AIDS, tuberculosis (TB), and death are much higher among New York City welfare recipients and applicants who have been abusing alcohol, drugs, or both, an eight-year survey has found. The research, led by Lloyd Friedman of the Yale University School of Medicine, found that between 1984 and 1992, 5.5 percent of the 858 people studied developed TB, 10 percent had AIDS, and 21 percent died. All 858 had a history of abusing drugs, alcohol, or both. The TB rate for these individuals, the majority of whom are single black men, is nearly 15 times the usual rate in New York City, while the AIDS rate is 10 times the average, and the death rate is five times the usual. Ninety-three percent of the participants agreed to undergo a two-part medical exam, which the researchers hoped would result in treatment for people at high risk for AIDS or TB.

"Influenza Immunization in HIV-Positive Children Does Not Enhance HIV Replication"

Reuters (03/27/96)

Although some researchers have suggested that influenza vaccination may activate T-cells and enhance HIV replication, new research has revealed only short-term increases in viral load in children following immunization. Octavio Ramillo and colleagues at the University of Texas Southwestern Medical Center in Dallas saw the increased HIV RNA in five of 16 children, and said the viral load returned to baseline in four of those five children.

within eight weeks. The findings add to the evidence that the viral burden increases after immunization more often in HIV-positive adults than in children.

"Zimbabwe's Maternal Mortality Deaths Rising"
PANA News Service (03/27/96)

The incidence of maternal mortality has increased in Zimbabwe as the number of HIV-infected pregnant women has risen, a local gynecologist reported Wednesday. Kudakwashe Kangwende said the infant mortality rate has been made worse by pre-natal mortality associated with HIV infection and AIDS among pregnant women. Kangwende said that frequent and unwarranted pregnancies among women with AIDS contribute to the increasing maternal mortality rate, and suggested that women with AIDS should be allowed to have abortions. He also said the AIDS pandemic was causing the spread of other diseases uncommon in Zimbabwe, including genital herpes and cervical cancer.

"Physicians' Experience with the Acquired Immunodeficiency Syndrome as a Factor in Patients' Survival"
New England Journal of Medicine (03/14/96) Vol. 334, No. 11, P. 701; Kitahata, Mari M.; Koepsell, Thomas D.; Deyo, Richard A.; et al.

Mari Kitahata and colleagues examined the link between physicians' experience with AIDS and the survival of their AIDS patients. They studied the cases of 403 men enrolled in a health maintenance organization who were diagnosed with AIDS between 1984 and mid-1994. The patients' 125 primary care physicians were separated into three levels of AIDS experience, based on experience with AIDS during residency training and the cumulative number of patients with AIDS they had treated in practice. The authors concluded that patients cared for by doctors with the most experience had a 31 percent lower risk of death than patients cared for by physicians with the least experience. Among the 224 patients diagnosed with AIDS between 1989 and 1994, the risk of death was 43 percent lower for patients of the most experienced doctors than for patients of the least experienced. The study suggests that physicians who treat AIDS patients go through a similar learning period and begin to improve their management skills early in their experience. The authors found that certain methods of treatment and a tendency to follow HIV-infected patients more closely were associated with higher levels of physicians' experience and longer patient survival.

"Rogue Science or Reality?"
Insight (03/11/96) Vol. 12, No. 10, P. 16; Goode, Stephen

Peter Duesberg, biology professor at the University of California at Berkeley, member of the National Academy of Sciences, and federal grant recipient, is criticized by many scientists because he opposes the accepted belief that HIV causes AIDS. Duesberg's book "Inventing the AIDS Virus" outlines his arguments and challenges his colleagues to answer them. He says the HIV-AIDS theory was announced hastily by federal health officials in 1984 because groups like the National Institutes of

Health were under intense pressure to come up with an answer to the growing AIDS epidemic. No one questioned the connection later, he says, because billions in federal funding was being spent on confirming it. Furthermore, Duesberg criticizes AIDS researchers for abandoning long-held principles about viruses. In other viral infections, antibodies are a sign of the body's defense, but with HIV, antibodies are looked at as a sign that the virus is still potent. AIDS researcher Robert Gallo has said that because AIDS was completely new, redefining the rules was necessary. Other researchers argue that HIV's ability to mutate rapidly makes it a special case. Duesberg says that lifestyle factors--including drug use, repeated cases of sexually transmitted diseases, and malnutrition--are to blame for AIDS. Duesberg is not alone in his beliefs--the 100-member Group for the Scientific Reappraisal of the HIV-AIDS Hypothesis supports him.

"Principals in HIV Blood Scandal Should be Summoned by Diet"
Nikkei Weekly (03/11/96) Vol. 34, No. 1713, P. 6

In an editorial in the Nikkei Weekly, the authors note the Diet's lack of involvement in Japan's tainted blood scandal, which caused some 1,800 Japanese hemophiliacs to be infected with HIV. An investigation by the Ministry of Health and Welfare revealed that contaminated blood products were distributed even though members of government and industry knew of the HIV threat. However, the investigation's interim report fails to answer whether or not the ministry proposed emergency imports of safe, heat-treated blood products. The editors question the actions of Takeshi Abe, who headed the AIDS task force, as well as those of his associate, Mutsumi Kazama, and the pharmaceutical companies who continued to ship the untreated products even after the threat of contamination was known. The editors claim that the ministry investigation is not likely to provide satisfactory answers and that the participants should testify before the Diet.

"Pediatrician May Have Spread TB"

Philadelphia Inquirer (03/29/96) P. B2

An Allentown, Pa., pediatrician may have spread tuberculosis (TB) in a local hospital. Nearly 1,400 patients who stayed at Sacred Heart Hospital from Nov. 1 to Feb. 14 are at risk of exposure from Nestor Rios, health officials said Wednesday. Parents are being notified by letters, and officials are recommending skin tests, chest X-rays, and nine months of treatment with an antibiotic for children. No active infectious cases of TB have been found, but 71 people did have the bacteria in their bodies. Rios' medical license has been suspended pending an investigation that he disregarded requests to wear a mask after being diagnosed. Related Story: USA Today (03/29) P. 10A

"Cancer Drugs to Get FDA Review"

Wall Street Journal (03/29/96) P. B1; Stout, Hilary; McGinley, Laurie

In a move to give new cancer therapies the same expediency granted AIDS drugs, the Food and Drug Administration (FDA) is revising its approval process for cancer drugs. Officials hope the changes, expected to be announced Friday by President Clinton and to go into effect at once, will cut FDA review time of new cancer drugs by more than half, from an average of about 12 months to six months. Changes made in 1992 to speed approvals of drugs for life-threatening illnesses led to the rapid approval of the new AIDS drugs called protease inhibitors, including one developed by Merck & Co. which was approved in only six weeks. Some cancer activists say the disease has not gotten as much attention as AIDS because AIDS activists have been more organized and politically active. Related Story: USA Today (03/29) P. 1A

"Some Blood Cells Resistant to AIDS Virus"

USA Today (03/29/96) P. 2D

Some people with blood cells that are unusually resistant to HIV may avoid infection with the virus despite repeated exposure to it, a new study suggests. In these people, the cells usually targeted by HIV seem to actively resist infection, perhaps by having a high production of virus-fighting chemicals. In laboratory tests, the resistant cells required about 200 times the normal dose of HIV to become infected, reported researcher William A. Paxton of the Aaron Diamond Research Center and New York University School of Medicine. A separate study found a link between certain immune system genes and the amount of time HIV-infected individuals can go before developing AIDS. Men with the best genetic profiles were AIDS-free some seven years longer than men with the least favorable profiles, reported Richard Kaslow of the University of Alabama at Birmingham.

"AIDS Community Coping With a Big Cut in Funding"

Philadelphia Inquirer (03/29/96) P. B1; Santiago, Denise-Marie

The AIDS community in Philadelphia is trying to cope with the announcement that it will lose \$1.8 million of federal

funding for AIDS services. The region will get 19 percent less under the Ryan White Title I Act in the 1996 fiscal year, reducing funding from \$9.8 million to \$7.95 million. The city's office on AIDS has already cut \$431,000, mostly in administrative costs, and the city will contribute \$156,000 to continue existing services through the beginning of May. AIDS activist David Fair said the cuts mean "an already dysfunctional system is getting worse." Last fall, city health officials said the number of AIDS cases had been under-reported, costing the area \$2.7 million in federal funding over the previous two years. One kind of funding under the Ryan White Act is based on the number of AIDS cases in the region. Supplemental funding, meanwhile, is distributed on a competitive basis, based on applications from different regions. The Philadelphia region's supplemental funding was cut from \$5.7 million last year to \$3.8 million in 1996.

"Physicians Taking A Closer Look at HIV Clearance by Neonates"
Reuters (03/28/96)

Several cases of infants who were perinatally infected with HIV and subsequently tested HIV-negative have been reported since Yvonne J. Bryson of the University of California at Los Angeles first reported the phenomenon. Bryson estimates that about 24 cases have been documented, but said she does not know how the infants clear the virus. She also said it would be surprising if the same clearance did not occur in adults. Adults, however, are not tested in the same way that infants born to HIV-positive women are. Bryson says she expects testing of infants to become more rigorous in light of the clearance cases.

"HIV Subtypes and Disease Transmission: Scientists Taking a Hard Look at the Data"
Reuters (03/28/96)

Scientists gathered in Berlin this week for a two-day workshop organized by the Joint United Nations Program on HIV/AIDS (UNAIDS) to discuss the effects of various subtypes of HIV on the AIDS epidemic worldwide. Recent findings have suggested that some HIV subtypes are more easily transmitted via heterosexual contact. Dr. Peter Piot, director of UNAIDS, said prevention methods will remain the same, regardless of the ease of transmission of various viral subtypes. The AIDS epidemic is moving slowly in North America and Europe, but is spreading rapidly in Africa and Asia, where most cases are heterosexually transmitted. Harvard researcher Max Essex has shown that HIV subtypes-E and -C are more likely to be spread heterosexually, but the epidemic in different parts of the world is not always as expected. In Africa, the epidemic has been worsened by the prevalence of other STDs, while in Southeast Asia, the prevalence of STDs is lower and HIV-E has spread rapidly regardless. Also, HIV in the Caribbean is spread primarily through heterosexual sex, but the cases mostly involve HIV-B. Prevention campaigns may be revised to target specific populations at risk.

"Japan Haemophiliacs in Out-of-Court Settlement"
Reuters (03/29/96)

Japanese hemophiliacs infected with HIV through contaminated blood products accepted an out-of-court settlement Friday, ending their seven-year legal dispute against the government and five drug companies. Under the agreement, the 458 plaintiffs will each receive a one-time payment of \$424,000, and those with full-blown AIDS will receive additional monthly payments of \$1,415. The pharmaceutical companies involved include Green Cross Corp., Baxter Ltd., and Bayer Ltd. Between 1,800 and 2,000 hemophiliacs are believed to have been infected by the tainted blood products.

"HIV-1 Dynamics in Vivo: Virion Clearance Rate, Infected Cell Life-Span, and Viral Generation Time"

Science (03/15/96) Vol. 271, No. 5255, P. 1582; Perelson, Alan S.; Neumann, Avidan U.; Markowitz, Martin; et al.

To track the dynamics of HIV in vivo, as well as the impact of a protease inhibitor, David Ho of the Aaron Diamond AIDS Research Center in New York and colleagues used a mathematical model and viral load data from five infected individuals. Ritonavir was given to five infected patients, and the resulting HIV-1 RNA plasma concentrations were measured. The patients showed similar patterns of viral decay--an initial lag followed by an exponential decline. The delay is explained by the mechanism of protease inhibitors, which make newly produced viruses noninfectious but do not inhibit already infected cells or previously produced viruses. The researchers concluded that the rapid replication of HIV-1 accounts for more than 99 percent of the plasma viruses in infected individuals and the high destruction rate of CD4 cells. They therefore suggest that an effective AIDS treatment should detectably lower the viral load in plasma within a few days. Furthermore, they recommend early and aggressive combination therapy because HIV replicates rapidly, noting that more information is needed about the decay rate of long-lived virus-producing cells and the activation rate of cells carrying viruses.

"'Shoe Leather Therapy' Is Gaining on TB"

Journal of the American Medical Association (03/13/96) Vol. 275, No. 10, P. 743; Voelker, Rebecca

About 1,200 public health outreach workers in U.S. cities go door-to-door to track down poor, homeless, or mentally ill tuberculosis (TB) patients, conducting directly observed therapy (DOT) to ensure that each patient takes their medication. DOT is an important strategy to control the spread of TB, because without the outreach workers, many patients would not complete their treatment program, and would contribute to the rise and spread of drug-resistant disease. The Centers for Disease Control and Prevention (CDC) notes that a resurgence in TB has caused 54,000 more cases since the mid-1980s than would have occurred if previous TB morbidity patterns had continued. To handle the epidemic, funds for the CDC's TB project increased from \$5 million in 1986 to \$114.9 million in 1995. Much of the additional money went to outreach programs, which now employ an estimated 1,000 to 1,200 workers nationwide. Now, the CDC says,

deaths from TB are starting to decrease, as the number of patients who complete treatment increases.

"Drug of Choice"

Insight (03/11/96) Vol. 12, No. 10, P. 17; Goode, Stephen

Peter Duesberg believes that treatment with the commonly used AIDS drug AZT is the worst thing for AIDS patients.

He says that the drug is too damaging for people with the disease, because their bodies have been harmed by drug abuse. In his book, "Inventing the AIDS Virus," Duesberg compares a disease known as SMON, which broke out in Japan in the 1950s, to AIDS. "For 15 years the syndrome was mismanaged by the Japanese science establishment, in which virtually all research efforts were controlled by virus hunters. Ignoring strong evidence to the contrary, researchers continued to assume the syndrome was contagious and searched for one virus after another," he states. Scientists eventually found that SMON was not caused by a virus, but by the misuse and overuse of the drug clioquinol for treating stomach disorders.

AIDS activist David Fair said the cuts mean "an already dysfunctional system is getting worse." Last fall, city health officials said the number of AIDS cases had been under-reported, costing the area \$2.7 million in federal funding over the previous two years. One kind of funding under the Ryan White Act is based on the number of AIDS cases in the region. Supplemental funding, meanwhile, is distributed on a competitive basis, based on applications from different regions.

The Philadelphia region's supplemental funding was cut from \$5.7 million last year to \$3.8 million in 1996.

"Physicians Taking A Closer Look at HIV Clearance by Neonates"
Reuters (03/28/96)

Several cases of infants who were perinatally infected with HIV and subsequently tested HIV-negative have been reported since Yvonne J. Bryson of the University of California at Los Angeles first reported the phenomenon. Bryson estimates that about 24 cases have been documented, but said she does not know how the infants clear the virus. She also said it would be surprising if the same clearance did not occur in adults. Adults, however, are not tested in the same way that infants born to HIV-positive women are. Bryson says she expects testing of infants to become more rigorous in light of the clearance cases.

"HIV Subtypes and Disease Transmission: Scientists Taking a Hard Look at the Data"
Reuters (03/28/96)

Scientists gathered in Berlin this week for a two-day workshop organized by the Joint United Nations Program on HIV/AIDS (UNAIDS) to discuss the effects of various subtypes of HIV on the AIDS epidemic worldwide. Recent findings have suggested that some HIV subtypes are more easily transmitted via heterosexual contact. Dr. Peter Piot, director of UNAIDS, said prevention methods will remain the same, regardless of the ease of transmission of various viral subtypes. The AIDS epidemic is moving slowly in North America and Europe, but is spreading rapidly in Africa and Asia, where most cases are heterosexually transmitted. Harvard researcher Max Essex has shown that HIV subtypes-E and -C are more likely to be spread heterosexually, but the epidemic in different parts of the world is not always as expected. In Africa, the epidemic has been worsened by the prevalence of other STDs, while in Southeast Asia, the prevalence of STDs is lower and HIV-E has spread rapidly regardless. Also, HIV in the Caribbean is spread primarily through heterosexual sex, but the cases mostly involve HIV-B. Prevention campaigns may be revised to target specific populations at risk.

"Japan Hemophiliacs in Out-of-Court Settlement"
Reuters (03/29/96)

Japanese hemophiliacs infected with HIV through contaminated blood products accepted an out-of-court settlement Friday, ending their seven-year legal dispute against the government and five drug companies. Under the agreement, the 458 plaintiffs will each receive a one-time payment of \$424,000, and those with full-blown AIDS will receive additional monthly payments of \$1,415. The pharmaceutical companies involved include Green Cross Corp., Baxter Ltd., and Bayer Ltd. Between 1,800 and 2,000 hemophiliacs are believed to have been infected by the tainted blood products.

"HIV-1 Dynamics in Vivo: Virion Clearance Rate, Infected Cell Life-Span, and Viral Generation Time"

Science (03/15/96) Vol. 271, No. 5255, P. 1582; Perelson, Alan S.; Neumann, Avidan U.; Markowitz, Martin; et al.

To track the dynamics of HIV in vivo, as well as the impact of a protease inhibitor, David Ho of the Aaron Diamond AIDS Research Center in New York and colleagues used a mathematical model and viral load data from five infected individuals. Ritonavir was given to five infected patients, and the resulting HIV-1 RNA plasma concentrations were measured. The patients showed similar patterns of viral decay--an initial lag followed by an exponential decline. The delay is explained by the mechanism of protease inhibitors, which make newly produced viruses noninfectious but do not inhibit already infected cells or previously produced viruses. The researchers concluded that the rapid replication of HIV-1 accounts for more than 99 percent of the plasma viruses in infected individuals and the high destruction rate of CD4 cells. They therefore suggest that an effective AIDS treatment should detectably lower the viral load in plasma within a few days. Furthermore, they recommend early and aggressive combination therapy because HIV replicates rapidly, noting that more information is needed about the decay rate of long-lived virus-producing cells and the activation rate of cells carrying viruses.

"Shoe Leather Therapy' Is Gaining on TB"

Journal of the American Medical Association (03/13/96) Vol. 275, No. 10, P. 743; Voelker, Rebecca

About 1,200 public health outreach workers in U.S. cities go door-to-door to track down poor, homeless, or mentally ill tuberculosis (TB) patients, conducting directly observed therapy (DOT) to ensure that each patient takes their medication. DOT is an important strategy to control the spread of TB, because without the outreach workers, many patients would not complete their treatment program, and would contribute to the rise and spread of drug-resistant disease. The Centers for Disease Control and Prevention (CDC) notes that a resurgence in TB has caused 54,000 more cases since the mid-1980s than would have occurred if previous TB morbidity patterns had continued. To handle the epidemic, funds for the CDC's TB project increased from \$5 million in 1986 to \$114.9 million in 1995. Much of the additional money went to outreach programs, which now employ an estimated 1,000 to 1,200 workers nationwide. Now, the CDC says, deaths from TB are starting to decrease, as the number of patients who complete treatment increases.

"Drug of Choice"

Insight (03/11/96) Vol. 12, No. 10, P. 17; Goode, Stephen

Peter Duesberg believes that treatment with the commonly used AIDS drug AZT is the worst thing for AIDS patients.

He says that the drug is too damaging for people with the disease, because their bodies have been harmed by drug abuse. In his book, "Inventing the AIDS Virus," Duesberg compares a disease known as SMON, which broke out in Japan in the 1950s, to AIDS. "For 15 years the syndrome was mismanaged by the Japanese science

establishment, in which virtually all research efforts were controlled by virus hunters. Ignoring strong evidence to the contrary, researchers continued to assume the syndrome was contagious and searched for one virus after another," he states. Scientists eventually found that SMON was not caused by a virus, but by the misuse and overuse of the drug clioquinol for treating stomach disorders.

"Across the USA: Tennessee"

USA Today (03/28/96) P. 11A

Tennessee's health care program Tenn-Care will cover protease inhibitors, new AIDS drugs that experts say are particularly promising. Tenn-Care covers about 2,000 HIV-infected individuals.

"Across the USA: Massachusetts"

USA Today (03/28/96) P. 11A

AIDS-related deaths in Massachusetts increased 21 percent from 1993 to 1994, and doubled from 1990 to 1994, according to a new report. The 1994 total was 938. AIDS was the leading cause of death among Hispanics in the state that year.

"Health-Insurance Measure Is Running Into Problems"

Wall Street Journal (03/28/96) P. A4

The chances of a health-insurance reform bill, aiming to restrict insurance companies' ability to refuse coverage to people with pre-existing conditions and guarantee continued coverage to those who lose or change jobs, may be complicated by amendments from Senate Republicans. The bill's sponsors, Sens. Nancy Kassebaum (R-Kan.) and Edward Kennedy (D-Mass.), urged lawmakers not to amend the legislation. Amendments may be proposed to raise the health-insurance tax deduction for the self-employed and to add provisions for medical savings accounts and medical-malpractice awards.

"Zimbabwe's AIDS Orphans to Reach 600,000 by 2000"

Xinhua News Service (03/28/96)

Zimbabwe will have more than 600,000 orphans due to AIDS by the year 2000, Margaret Mehlomakulu, deputy director of the National AIDS Coordinating Program, said at a workshop Wednesday. She said that AIDS would be a heavy burden on the government and the community as they would be forced to stretch available resources to take care of the orphans. Mehlomakulu called for health officials to work with the community to help prevent young people from becoming HIV-infected. An estimated 1 million Zimbabweans, of a total 10.5 million, have the virus.

"Death Rates High Among New York Welfare Recipients--Study"

Reuters (03/27/96)

Rates of AIDS, tuberculosis (TB), and death are much higher among New York City welfare recipients and applicants who have been abusing alcohol, drugs, or both, an eight-year survey has found. The research, led by Lloyd Friedman of the Yale University School of Medicine, found that between 1984 and 1992, 5.5 percent of the 858 people studied developed TB, 10 percent had AIDS, and 21 percent died. All 858 had a history of abusing drugs, alcohol, or both. The TB rate for these individuals, the majority of whom are single black men, is nearly 15 times the usual rate in New York City, while the AIDS rate is 10 times the average, and the death rate is five times the usual.

Ninety-three percent of the participants agreed to undergo a

two-part medical exam, which the researchers hoped would result in treatment for people at high risk for AIDS or TB.

"Influenza Immunization in HIV-Positive Children Does Not Enhance HIV Replication"

Reuters (03/27/96)

Although some researchers have suggested that influenza vaccination may activate T-cells and enhance HIV replication, new research has revealed only short-term increases in viral load in children following immunization. Octavio Ramillo and colleagues at the University of Texas Southwestern Medical Center in Dallas saw the increased HIV RNA in five of 16 children, and said the viral load returned to baseline in four of those five children within eight weeks. The findings add to the evidence that the viral burden increases after immunization more often in HIV-positive adults than in children.

"Zimbabwe's Maternal Mortality Deaths Rising"

PANA News Service (03/27/96)

The incidence of maternal mortality has increased in Zimbabwe as the number of HIV-infected pregnant women has risen, a local gynecologist reported Wednesday. Kudakwashe Kangwende said the infant mortality rate has been made worse by pre-natal mortality associated with HIV infection and AIDS among pregnant women. Kangwende said that frequent and unwarranted pregnancies among women with AIDS contribute to the increasing maternal mortality rate, and suggested that women with AIDS should be allowed to have abortions. He also said the AIDS pandemic was causing the spread of other diseases uncommon in Zimbabwe, including genital herpes and cervical cancer.

"Physicians' Experience with the Acquired Immunodeficiency Syndrome as a Factor in Patients' Survival"

New England Journal of Medicine (03/14/96) Vol. 334, No. 11, P. 701; Kitahata, Mari M.; Koepsell, Thomas D.; Deyo, Richard A.; et al.

Mari Kitahata and colleagues examined the link between physicians' experience with AIDS and the survival of their AIDS patients. They studied the cases of 403 men enrolled in a health maintenance organization who were diagnosed with AIDS between 1984 and mid-1994. The patients' 125 primary care physicians were separated into three levels of AIDS experience, based on experience with AIDS during residency training and the cumulative number of patients with AIDS they had treated in practice. The authors concluded that patients cared for by doctors with the most experience had a 31 percent lower risk of death than patients cared for by physicians with the least experience. Among the 224 patients diagnosed with AIDS between 1989 and 1994, the risk of death was 43 percent lower for patients of the most experienced doctors than for patients of the least experienced. The study suggests that physicians who treat AIDS patients go through a similar learning period and begin to improve their management skills early in their experience. The authors found that certain methods of treatment and a tendency to follow

HIV-infected patients more closely were associated with higher levels of physicians' experience and longer patient survival.

"Rogue Science or Reality?"

Insight (03/11/96) Vol. 12, No. 10, P. 16; Goode, Stephen

Peter Duesberg, biology professor at the University of California at Berkeley, member of the National Academy of Sciences, and federal grant recipient, is criticized by many scientists because he opposes the accepted belief that HIV causes AIDS. Duesberg's book "Inventing the AIDS Virus" outlines his arguments and challenges his colleagues to answer them. He says the HIV-AIDS theory was announced hastily by federal health officials in 1984 because groups like the National Institutes of Health were under intense pressure to come up with an answer to the growing AIDS epidemic. No one questioned the connection later, he says, because billions in federal funding was being spent on confirming it. Furthermore, Duesberg criticizes AIDS researchers for abandoning long-held principles about viruses. In other viral infections, antibodies are a sign of the body's defense, but with HIV, antibodies are looked at as a sign that the virus is still potent. AIDS researcher Robert Gallo has said that because AIDS was completely new, redefining the rules was necessary. Other researchers argue that HIV's ability to mutate rapidly makes it a special case. Duesberg says that lifestyle factors--including drug use, repeated cases of sexually transmitted diseases, and malnutrition--are to blame for AIDS. Duesberg is not alone in his beliefs--the 100-member Group for the Scientific Reappraisal of the HIV-AIDS Hypothesis supports him.

"Principals in HIV Blood Scandal Should be Summoned by Diet"
Nikkei Weekly (03/11/96) Vol. 34, No. 1713, P. 6

In an editorial in the Nikkei Weekly, the authors note the Diet's lack of involvement in Japan's tainted blood scandal, which caused some 1,800 Japanese hemophiliacs to be infected with HIV. An investigation by the Ministry of Health and Welfare revealed that contaminated blood products were distributed even though members of government and industry knew of the HIV threat. However, the investigation's interim report fails to answer whether or not the ministry proposed emergency imports of safe, heat-treated blood products. The editors question the actions of Takeshi Abe, who headed the AIDS task force, as well as those of his associate, Mutsumi Kazama, and the pharmaceutical companies who continued to ship the untreated products even after the threat of contamination was known. The editors claim that the ministry investigation is not likely to provide satisfactory answers and that the participants should testify before the Diet.

PRINTER FONT 12_POINT_ROMAN

March 28, 1996

Gregg Gonsalves
Policy Director
Treatment Action Group
200 East 10th Street
New York, New York 10003

by fax

Dear Gregg:

Even though I am not one of the addressees of your memo regarding the discussion of OAR in conference yesterday, I feel compelled personally to respond to you -- since I have been unable to reach you by phone.

First, perhaps we have not been doing as good a job as we could at our end of communicating all that the Administration is doing on behalf of OAR -- but it would have been nice if you had called here before writing (and widely disseminating) memos that accuse us of having been insufficiently supportive of the OAR in this latest round of negotiations. In fact, the Pelosi language has been supported in each round of negotiations, at various levels of Administration interaction with the appropriations committee leadership.

Second, if Mr. Porter said that Drs. Varmus and Paul were fully satisfied with the resolution of the FY 1996 situation, we both know this is inaccurate. Both Dr. Varmus and Dr. Paul made clear that they strongly support -- and need -- the consolidated appropriation. But I am sure they also made clear that the funds being spent in the current fiscal year are being spent according to the OAR plan -- something we all know to be true and support. Thus, I do not think any of us can answer your question -- that is written, frankly, more as an accusation than an inquiry -- as to how the Administration's views can be so easily misrepresented.

Third, it sometimes seems to me that the only measure of adequate support on this issue is success. We get no credit for our advocacy and our support -- if Mr. Porter does not change his position, then somehow we are to blame. I don't think I need to

remind you of the politics of this Congress for you to recognize that this is not a fair standard.

Fourth, the Administration continues to support -- in this round of negotiations, in the FY 1997 budget, in the reauthorization process, and in our response to the Levine Report -- the full authorities of the OAR.

Gregg, what has happened in this budget cycle is certainly an indication of how hard a fight we have in front of us. I think we have a much greater chance to succeed in preserving the OAR's authority if we work together and don't have to spend lots of time questioning the

Gregg Gonsalves

depth of this Administration's support. I think the record shows that throughout the budget fight this year, the President and everyone in the Administration has gone to the well again and again for the OAR and for all AIDS programs.

Sincerely,

Jeffrey Levi
Deputy Director
Office of National AIDS Policy

Thanks for making yesterday's search committee meeting work.

My schedule for June is quite clear at the moment -- seize it while you can!!! Actually, this committee is a high priority for me, so I will do everything I can to be available whenever the committee needs to meet.

Thanks.

As we discussed ever so briefly this a.m.:

New York: I will be in South Carolina on those dates. I am delighted Jeremy is able to go.

Florida: our original dates as Pat has entered them on my calendar are May 3 and 4; your list today shows May 2 and 3 with Ft. Lauderdale on May 2 and Miami on 3? These two are "possibles" on my schedule if 2 and 3....I can't be there on the 4th. Will let you know as plans firm up.

California: I am hopeful of getting to LA in time for townhall on May 22, then I will go into Las Vegas for a women's meeting on 23, back to San Francisco on 24th for AIDS Townhall.

Cleveland/Chicago: I can't do Cleveland, am hopeful of doing Chicago.

As I mentioned this a.m. it is too early for me to know anything about North Carolina or Atlanta.

If you'll confirm the Florida dates with me we'll try to let you know something very soon on those.

Thanks!

"Across the USA: Illinois"

USA Today (04/01/96) P. 12A

Florence Schieben, 75, received HIV-infected blood during 1994 hip replacement surgery and is now suing Heartland Blood Centers. The Aurora, Ill., blood bank has rejected her claim that the blood was not tested correctly.

"2nd-Grader Stabs 5 Others with Found Medical Tools"

Washington Post (03/30/96) P. H3; Kyriakos, Marianne

A second-grader at Stanton Elementary School in Washington, D.C., discovered a dozen lancets, needlelike medical devices, in a field near the school and used them to stab five classmates. Some parents are concerned that their children may have been infected with HIV as a result. Lancets, which are not hollow and are not used to inject drugs, are used to prick fingers and ear lobes when blood is drawn. "We know that in the transmission of HIV, hollow needles are much more likely to transmit the virus than solid needles," said Peter Hawley, medical director for the Whitman-Walker Clinic, the area's largest AIDS clinic. The school's principal said several students involved in the incident have been tested for HIV.

"Unwelcome Donations"

Washington Post (03/30/96) P. A15; Davey, Richard J.

In a Washington Post letter to the editor, Richard J. Davey, chief medical officer at the American Red Cross, takes issue with a Washington Post article that suggested that some men donate blood as a way of getting tested for HIV. Davey objects to the article, saying it may have unnecessarily scared people who receive blood transfusions. He argues that the Red Cross opposes the practice of donating blood for the purpose of getting an HIV test, a practice which he says could jeopardize the safety of the blood supply.

"Virus Research Drawing International Attention"

Xinhua News Service (03/29/96)

The Harbin Veterinary Institute of the Chinese Academy of Agricultural Science, which has gained recognition for developing a cure for horse infectious anemia, has now attracted global attention because of similarities between the horse virus and HIV. The institute developed the vaccine for the horse virus in 1982, and it remains the only vaccine to prevent the disease. The virus is similar to HIV in its mechanism and mutability. Researchers from Japan and the United States are seeking to cooperate with the Chinese scientists on research to compare the two viruses.

"Cognitive Impairment Linked to Early Death in HIV-Infected Patients"

Reuters (03/29/96)

New research shows that cognitive impairment is an independent risk factor for early death from AIDS. Ronald Ellis and colleagues at the HNRC Group in San Diego reported the results of a study of 414 HIV-positive patients. During the

seven-year study, 106 patients died. Risk of death was 1.2 times greater in the globally impaired group, and 3.9 times higher in those who were found to have cognitive-motor disorder. In a related study, N.C. Sacktor and colleagues in Baltimore and Los Angeles found that a decline in psychomotor performance in HIV patients predicted the onset of dementia, but not AIDS or death. In another study, the incidence of multifocal leukoencephalopathy in AIDS patients was found to be increasing.

"No Benefits Seen in AIDS Patients After Fish Oil Supplementation" Reuters (03/29/96)

Taking dietary supplements of fish oil for management of advanced AIDS-related weight loss does not seem to have any beneficial clinical effects, new research suggests. Previous studies in normal patients indicated that the supplements reduced the production of interleukin-1 and tumor necrosis factor by peripheral blood mononuclear cells. Research also showed that the supplements prevented interleukin-1 and tumor necrosis anorexia in animals. Marc K. Hellerstein and colleagues at the University of California at San Francisco followed 20 patients with weight loss associated with advanced HIV infection. The patients' body weight, percent fat, and fat-free mass stayed the same. Hellerstein concluded that fish oil cannot overcome AIDS-related wasting, but may have an effect in stable AIDS patients.

"EU Wants Back Money Sank into S. African AIDS Play" Reuters (03/29/96)

The European Union (EU) said on Friday that it wants the South African health ministry to return \$3.5 million it wrongly used to fund a lavish but controversial AIDS awareness musical. Erwan Fouere, the EU envoy to South Africa, said the money was not authorized for the production of "Sarafina 2." Furthermore, the EU said the ministry had used too much money for the play and the health ministry did not follow normal procedures before allocating the money.

"The Trials of a Home HIV Test" Business Week (03/18/96) No. 3467, P. 56; Freundlich, Naomi; Hamilton, Joan O'C.

The first home test for HIV was developed by Elliot Millenson in 1985, but faced opposition from AIDS activists and the American Medical Association, and was refused for consideration by the Food and Drug Administration (FDA) in 1987. Now the test, which Millenson sold to Johnson & Johnson in 1993, has been submitted to the FDA and could be approved within three months. If approved, the test would be sold without prescription for less than \$50. Users would mail a blood sample to a lab for analysis. Test results and counseling would be available over the phone. The change in attitude has come in part from lobbying by J&J, dissatisfaction with current testing, and the belief that home tests will help curb HIV infection. The FDA reviewed the home test in 1990; however, it did not approve it, citing the

lack of face-to-face counseling. After buying the test from Millenson, J&J launched an aggressive public relations campaign, which was boosted by evidence that 42 percent of people at risk for HIV would use a home test. Some claimed that J&J paid travel expenses for doctors and AIDS activists to attend a FDA meeting at which they supported the test; however, an investigation found no wrongdoing, though questions about the company's methods were raised.

"Case for Behavioral Studies for AIDS Prevention"

Lancet (03/16/96) Vol. 347, No. 9002, P. 750; Rowe, Paul M.

Studies indicate that cutting rates of risky sexual behavior in half could stop the AIDS epidemic, Thomas J. Coates, director of the Center for AIDS Prevention Studies at the University of California, San Francisco said in a lecture at the National Institutes of Health. Coates cited research that shows that behavioral interventions can achieve such reductions. For example, when condom-use rules were implemented at gay sex clubs in San Francisco, rates of unprotected sex dropped to almost zero. In India and Thailand, programs to educate prostitutes to negotiate condom use led to sharp decreases in rates of venereal disease. Behavioral studies help explain risky sexual practices, while scientific studies are needed to influence public policy. Coates acknowledged that political barriers thwart research on sexual behaviors, but noted that "we're talking about things we didn't talk about 15 years ago."

Anita and Joe:

I want to reopen for discussion this issue of DC and its handling of Ryan White money. It seems that despite numerous efforts to clean up their act, they can never get caught up with paying vendors. This has dragged on a long time, and I think it may be time to consider stronger action -- so that the services are getting delivered. Any suggestions? I am happy to help be something of an intermediary with the Mayor's office if that will be helpful -- given my ties there.

Thanks.

TEXT:

The National Minority AIDS Council represents 600 minority community based organizations doing HIV prevention and services work.

Their annual Washington meeting is called Our Place at the Table.

It brings together several hundred community leaders, policy makers, advocates, service providers, and individuals involved in the fight against AIDS in communities of color across the nation.

This year's focus is on the appropriate role of the federal government in domestic policy.

The dinner for which the video is requested is on May 20th; it is at the National Museum for Women in the Arts; it will benefit NMAC's Women and Families Program -- which serves to broaden the national AIDS agenda by including the perspectives of women of color and empower them to speak on their own behalf.

Hope this is enough background.

thanks.

Ed -- I got Regina's memos -- I actually think that the Medicaid letter, while probably more detailed than the Council is used to -- is entirely on target. If we weren't already taking these positions, I might argue it is too detailed. The one suggestion I would make is that rather than just diving into what is demanded or recommended -- that some serious acknowledgement be made of the firm stance the President has taken in defending Medicaid. It's not an accident that the threat to Medicaid has "dwindled" -- to use Regina's term in her cover memo.

With regard to housing -- I understand the first recommendation (and know that it's going to be hard for us to meet); I'm not exactly sure what the expected outcome of the second one would be. I have asked Roberta Achtenberg to look at it so that we can have HUD's perspective on the call on Thursday.

Thanks for letting me know these were out there....otherwise I would never have known.

Hope Florida is warmer than here!

Jeff

April 2, 1996

MEMORANDUM FOR THE PRESIDENT

FROM: Carol Rasco, Assistant to the President for Domestic Policy

Patricia S. Fleming, Director, Office of National AIDS

Policy

SUBJECT: Amendment regarding mandatory HIV testing of newborns
House

-Senate conferees met last week to try to resolve differences regarding an amendment on HIV testing of newborns that was added to the Ryan White CARE Act reauthorization bill during House consideration. The Coburn

-Waxman amendment would trigger mandatory HIV testing of newborns if certain conditions are not met. Leading medical groups (such as the American Academy of Pediatrics, the American College of Obstetricians and Gynecologists, and the Pediatric AIDS Foundation) oppose mandatory testing of newborns and support voluntary HIV testing of pregnant women. In addition, AIDS advocacy organizations are nearly universally opposed to mandatory testing.
The Coburn

-Waxman amendment would require the Secretary of Health and Human Services to determine if HIV testing of newborns is the standard of care when the HIV status of the mother is unknown. If it is the standard of care, the Secretary must then determine that newborn testing is occurring voluntarily in 95 percent of the infants born to mothers who have not been tested. If the Secretary determines that 95 percent of such newborns have not been voluntarily tested, then mandatory HIV testing of newborns would be required in those states not in compliance. The states would have three

-and

-a

-half years to reach the 95 percent level through voluntary testing.

During Senate consideration of the Ryan White CARE Act, an amendment offered by Senator Kassebaum was approved that would require states to adopt the Public Health Service's guidelines making routine counseling and voluntary testing of all pregnant women the standard of care. The emphasis on the prenatal period, of course, has the greatest potential for preventing transmission to newborns. Newborn testing will have virtually no impact on HIV transmission to newborns. Prenatal HIV testing would permit HIV infected mothers to take AZT during pregnancy and childbirth, which has been demonstrated to reduce the likelihood of transmission by as much as two

-thirds.

It is worth noting that there are already encouraging results confirming that the combination of routine HIV counseling, voluntary testing, and AZT by choice is highly effective at reducing perinatal transmission. A study from North Carolina indicates that, after being counseled about HIV, most women choose to be tested and that, if positive, most choose to take AZT. The rate of perinatal transmission fell from 21 percent of all infants born to HIV

-positive mothers in 1993 to just 8.5 percent in 1994, on a par with the original NIH study. Results from hospitals in major urban centers -- such as Miami, Atlanta, and Harlem, show similar high rates of testing and AZT use. Discussions in conference have focused on possible changes to the Coburn

-Waxman amendment, such as changing the trigger for mandatory HIV testing of newborns to a failure to achieve a 50 percent reduction in perinatal transmission. But the underlying mandatory nature of the amendment remains. The Administration has deliberately not taken a position on Coburn

-Waxman. Instead, we have consistently emphasized the importance of implementing the PHS recommendations for voluntary prenatal testing as the most effective intervention and the various HHS agencies have taken major steps to assure that testing and treatment are readily available to those women who need it. At the White House Conference on HIV/AIDS on December 6th, you stated that this is an issue that should be left to the public health officials to resolve, not politicians. It is not clear how the conferees will resolve this issue, but it is quite possible that the final bill will contain something along the lines of the Coburn

-Waxman amendment. While all the

AIDS groups oppose the amendment, it is quite likely that they will be very divided over the issue of whether the CARE Act should be vetoed if it comes with a mandatory testing amendment. Some will consider reauthorization of Ryan White to be a higher priority; others will be more concerned about the precedent of signing mandatory testing legislation. At this time, we are giving no indication of future action until it is clear what the conference will do.

TEXT:

thanks for your note. i will call her and see if i can move it along.
otherwise i guess we just must move ahead. in preparing for thursday, i
want ot make sure you both got the fax of the recommendation re housing from
regina aragon and the proposed medicaid letter. my concern re housing in
their part 2 is that this recommendation seems to need our planned meeting in
April to fully move ahead and i hope you will both think about how we should
repsond on thursday. with regard to the medicaid letter, i think it may get
into too much detail than is appropriate for our council. if i am off base
here let me know but this letter seems to get into more policy than is our
charge. i am in florida at 407-482-4819 if you want to discuss ths before
the meeting. i am "out of pocket" from about 10:30 am to 3pm eastern time on
wed but otherwise available.

"Gene Therapy and AIDS"

Washington Post (04/02/96) P. A6

A new study suggests that gene therapy may be able to keep critical immune cells active in HIV-infected individuals. In the study, which is reported in the Proceedings of the National Academy of Sciences, T cells usually attacked by HIV were removed from three HIV-positive patients, genetically modified with an antiviral gene, and returned to the patients. The procedure kept the T cells alive four to five times longer than the unmodified cells. The therapy may be able to prolong the time before an HIV-infected person develops AIDS, said author Gary Nabel of the Howard Hughes Medical Institute at the University of Michigan. Related Story: USA Today (04/02) P. 2D

"FDA Approves the Testing of Drug for AIDS Patients"

Wall Street Journal (04/02/96) P. B5

Unimed Pharmaceuticals Inc. said its drug to treat HIV wasting syndrome has been cleared for testing by the Food and Drug Administration. The new product, Androgel-DHT, will be tested in Phase II clinical trials at Beth Israel Hospital in Boston. The drug also qualifies for orphan-drug status, which would give Unimed exclusive rights to sell the drug for a number of years if it is approved.

"Blood Banks Adopt Stricter AIDS Test"

Washington Post--Health (04/02/96) P. 6; Squires, Sally

As of March 14, some U.S. blood banks are beginning to use an expensive new test that is more sensitive at detecting HIV. The new test detects p24 antigens, proteins on the surface of HIV, while the standard tests detect human immune system cells that are made by the body in response to the virus. The risk of getting HIV from a blood transfusion in the United States has dropped from 6 in every 100,000 donations in 1993 to 1 in 450,000 in 1995. Researchers from the Centers for Disease Control and Prevention and the American Red Cross estimate that the new test will decrease the risk to 1 in every 660,000 donations. In addition, the new test will detect HIV about 16 days after infection, while the old test takes about 22 days. The Food and Drug Administration says that since 1989, four cases of HIV infection have been the result of blood donations that tested negative for HIV. The new test is required for all blood banks by June 14.

"The Tuberculosis Emergency"

Toronto Globe and Mail (04/01/96) P. A12

In a Toronto Globe and Mail editorial, the authors urge countries to follow World Health Organization (WHO) tuberculosis recommendations and increase resources spent on battling the disease. TB, the cause of one-quarter of all preventable deaths in developing countries, infects 30 percent of homeless people using downtown shelters in Toronto, according to a new study. Furthermore, the disease has been increasing in parts of Africa

and Asia as a result of AIDS, which weakens the body's defense to infection. New drug-resistant strains of TB are also appearing and spreading, infecting an estimated 50 million people worldwide. Although drugs for TB are effective and cheap, they must be taken for at least six months and many patients do not complete the therapy, thereby allowing drug-resistant strains to develop. Patients receiving directly observed treatment, in which health workers watch patients to make sure they take their medicine, have a 95 percent cure rate. The WHO says, however, that most TB patients are not supervised, especially in Third World countries. The editorial concludes that the WHO's recommendation to double the money allocated for TB, which would add \$350 million to the cause, is worth the expense.

"Mild Cytologic Atypia Associated with CIN in HIV-Positive Women"
Reuters (04/01/96)

A study of 453 HIV-positive women and 401 controls revealed an association between mild cytologic atypia and cervical intraepithelial neoplasia (CIN). In the multicenter study, conducted by Thomas C. Wright Jr. of Columbia University, 112 HIV-positive women developed mild cytologic atypia, compared with 36 control subjects without HIV. CIN was found in 38 percent of the 112 HIV-infected women, compared to 14 percent of the 36 HIV-negative women. The HIV-positive women with mild cytologic atypia were 2.7 times more likely to have CIN and 12 percent of the Pap smears from these women were classified as high-grade. Wright believes the high prevalence of CIN in this group indicates a need for colposcopy referral.

"Human Herpes Virus 6 Linked to Disease Progression in AIDS Patients"
Reuters (04/01/96)

Human herpesvirus 6 (HHV-6) plays an important role in the progression of HIV infection, a new study says. Konstance Kehl Knox and colleagues at the Medical College of Wisconsin at Milwaukee report that HIV appears to use HHV-6 as a tool for destruction. The researchers took lymph node samples from 10 HIV-positive patients and HIV-negative controls. The samples from those with HIV contained a large number of cells that were actively infected with HHV-6, while none of the samples from the HIV-negative patients were infected with HHV-6. Knox theorized that HIV infection may be dependent on activation by HHV-6, and that drugs to block HHV-6 and HIV simultaneously in the early stages of HIV infection could slow or stop the progression to AIDS.

"Major Opportunistic Infections Are Developing Later in HIV Disease Progression"
Reuters (04/01/96)

Opportunistic infections and AIDS-related cancers are developing at a more advanced stage of immunosuppression than previously reported, according to new analysis by Johns Hopkins researchers. Compared with late 1980s estimates, the incidence of *Pneumocystis carinii* pneumonia (PCP) and Kaposi's sarcoma have

decreased. Richard D. Moore and colleagues analyzed data from more than 1,200 HIV patients who were treated at an urban university clinic between July 1989 and April 1995. The most common opportunistic disease was *Candida esophagitis*, followed by PCP, *Mycobacterium avium* complex bacteremia, cytomegalovirus and AIDS dementia complex. The least common complications were non-Hodgkin's lymphoma, *M. tuberculosis*, progressive multifocal leukoencephalopathy, and cryptosporidiosis.

"Invasive Pneumococcal Disease in a Cohort of Predominantly HIV-1 Infected Female Sex Workers in Nairobi, Kenya"
Lancet (03/16/96) Vol. 347, No. 9002, P. 718; Gilks, Charles F.; Ojoo, Sylvia A.; Ojoo, Josephine C.; et al.

To assess the interaction of pneumococcal disease and HIV infection in sub-Saharan Africa, Charles F. Gilks, of the Center for Tropical Medicine at Oxford University, and colleagues followed a group of 719 female sex workers in Nairobi between 1989 and 1992. Of the total, 587 were seropositive and 132 remained seronegative. Among those who were HIV positive, 79 had pneumococcal disease, compared to just one in the HIV seronegative group. The researchers were surprised that pneumococcal disease, not tuberculosis, was the earliest serious complication in the HIV-infected women, as well the most common. The overall risk for developing pneumococcal disease with HIV infection was 17.8. The incidence rate in seropositive women was 42.5 per 1000 person-years, while the recurrence rate was 264 per 1000 person-years. According to the researchers, pneumococcus is an early, yet relatively treatable complication of HIV infection in sub-Saharan Africa.

"Home HIV Tests Raise Issues of Counseling, Prevention"
American Medical News (03/18/96) Vol. 39, No. 11, P. 10; Shelton, Deborah L.

A 1992 National Health Interview Survey found that 8 percent of Americans said they would probably take an HIV test within the year for reasons other than blood donation, insurance, or military service. One-third of them said they would rather use a home collection kit than visit a physician or clinic. As the Food and Drug Administration considers three companies' applications to sell HIV home test kits, the South Carolina legislature is considering a bill to allow the sale of such kits. Public health officials in the state oppose the home test kits because they say the kits would make it more difficult to track HIV and provide counseling and referrals, and partner notification. Although the state requires doctors and laboratories to report by name people who test positive for HIV, the requirement would be waived under the proposed bill. Texas has already passed a law that requires home HIV test kits to be sold as part of a package of services, including pre- and post-test counseling, testing by a qualified facility, verification of positive results, and verbal notification of results to the person tested, with referrals for care and treatment if needed.

"Face to Face with TB"

Federal Times (03/18/96) Vol. 32, No. 6, P. 13; Rivenbark, Leigh

Mary Ann Goeller, a Social Security Administration claims representative, believes she contracted tuberculosis (TB) from a customer she interviewed at work. The customer had HIV and TB and was coughing during their interview in her small cubicle. Goeller tested positive for TB, and was treated aggressively for a year to prevent active TB from developing. Social Security paid for her initial test, while workers' compensation paid for her time away from work for monthly tests and doctor visits. Goeller now wants to warn other federal workers to protect themselves while working. Furthermore, she believes that Social Security should protect its employees by allowing them to wear masks or by requiring customers with TB to wear masks.

Anita will be back in a week. Id like to sit down with her and the dc project officer before commenting on the need for stronger action. Do you want us to set up a briefing for you, including administrative options we could take etc?

Also, the response for the presidential council is in final draft after getting comments from all bureaus. We can have it to you in final the day after tomorrow or earlier if you need. Let me know.

Joe

Anita and Joe:

I want to reopen for discussion this issue of DC and its handling of Ryan White money. It seems that despite numerous efforts to clean up their act, they can never get caught up with paying vendors. This has dragged on a long time, and I think it may be time to consider stronger action -- so that the services are getting delivered. Any suggestions? I am happy to help be something of an intermediary with the Mayor's office if that will be helpful -- given my ties there.

Thanks.

Washington Post (04/02/96) P. A6

A new study suggests that gene therapy may be able to keep critical immune cells active in HIV-infected individuals. In the study, which is reported in the Proceedings of the National Academy of Sciences, T cells usually attacked by HIV were removed from three HIV-positive patients, genetically modified with an antiviral gene, and returned to the patients. The procedure kept the T cells alive four to five times longer than the unmodified cells. The therapy may be able to prolong the time before an HIV-infected person develops AIDS, said author Gary Nabel of the

Howard Hughes Medical Institute at the University of Michigan.
Related Story: USA Today (04/02) P. 2D

"FDA Approves the Testing of Drug for AIDS Patients"
Wall Street Journal (04/02/96) P. B5

Unimed Pharmaceuticals Inc. said its drug to treat HIV wasting syndrome has been cleared for testing by the Food and Drug Administration. The new product, Androgel-DHT, will be tested in Phase II clinical trials at Beth Israel Hospital in Boston. The drug also qualifies for orphan-drug status, which would give Unimed exclusive rights to sell the drug for a number of years if it is approved.

"Blood Banks Adopt Stricter AIDS Test"
Washington Post--Health (04/02/96) P. 6; Squires, Sally

As of March 14, some U.S. blood banks are beginning to use an expensive new test that is more sensitive at detecting HIV. The new test detects p24 antigens, proteins on the surface of HIV, while the standard tests detect human immune system cells that are made by the body in response to the virus. The risk of getting HIV from a blood transfusion in the United States has dropped from 6 in every 100,000 donations in 1993 to 1 in 450,000 in 1995. Researchers from the Centers for Disease Control and Prevention and the American Red Cross estimate that the new test will decrease the risk to 1 in every 660,000 donations. In addition, the new test will detect HIV about 16 days after infection, while the old test takes about 22 days. The Food and Drug Administration says that since 1989, four cases of HIV infection have been the result of blood donations that tested negative for HIV. The new test is required for all blood banks by June 14.

"The Tuberculosis Emergency"
Toronto Globe and Mail (04/01/96) P. A12

In a Toronto Globe and Mail editorial, the authors urge countries to follow World Health Organization (WHO) tuberculosis recommendations and increase resources spent on battling the disease. TB, the cause of one-quarter of all preventable deaths in developing countries, infects 30 percent of homeless people using downtown shelters in Toronto, according to a new study. Furthermore, the disease has been increasing in parts of Africa and Asia as a result of AIDS, which weakens the body's defense to infection. New drug-resistant strains of TB are also appearing and spreading, infecting an estimated 50 million people worldwide. Although drugs for TB are effective and cheap, they must be taken for at least six months and many patients do not complete the therapy, thereby allowing drug-resistant strains to develop. Patients receiving directly observed treatment, in which health workers watch patients to make sure they take their medicine, have a 95 percent cure rate. The WHO says, however, that most TB patients are not supervised, especially in Third World countries. The editorial concludes that the WHO's recommendation to double the money allocated for TB, which would add \$350 million to the cause, is worth the expense.

"Mild Cytologic Atypia Associated with CIN in HIV-Positive Women"
Reuters (04/01/96)

A study of 453 HIV-positive women and 401 controls revealed an association between mild cytologic atypia and cervical intraepithelial neoplasia (CIN). In the multicenter study, conducted by Thomas C. Wright Jr. of Columbia University, 112 HIV-positive women developed mild cytologic atypia, compared with 36 control subjects without HIV. CIN was found in 38 percent of the 112 HIV-infected women, compared to 14 percent of the 36 HIV-negative women. The HIV-positive women with mild cytologic atypia were 2.7 times more likely to have CIN and 12 percent of the Pap smears from these women were classified as high-grade. Wright believes the high prevalence of CIN in this group indicates a need for colposcopy referral.

"Human Herpes Virus 6 Linked to Disease Progression in AIDS Patients"
Reuters (04/01/96)

Human herpesvirus 6 (HHV-6) plays an important role in the progression of HIV infection, a new study says. Konstance Kehl Knox and colleagues at the Medical College of Wisconsin at Milwaukee report that HIV appears to use HHV-6 as a tool for destruction. The researchers took lymph node samples from 10 HIV-positive patients and HIV-negative controls. The samples from those with HIV contained a large number of cells that were actively infected with HHV-6, while none of the samples from the HIV-negative patients were infected with HHV-6. Knox theorized that HIV infection may be dependent on activation by HHV-6, and that drugs to block HHV-6 and HIV simultaneously in the early stages of HIV infection could slow or stop the progression to AIDS.

"Major Opportunistic Infections Are Developing Later in HIV Disease Progression"
Reuters (04/01/96)

Opportunistic infections and AIDS-related cancers are developing at a more advanced stage of immunosuppression than previously reported, according to new analysis by Johns Hopkins researchers. Compared with late 1980s estimates, the incidence of *Pneumocystis carinii* pneumonia (PCP) and Kaposi's sarcoma have decreased. Richard D. Moore and colleagues analyzed data from more than 1,200 HIV patients who were treated at an urban university clinic between July 1989 and April 1995. The most common opportunistic disease was *Candida* esophagitis, followed by PCP, *Mycobacterium avium* complex bacteremia, cytomegalovirus and AIDS dementia complex. The least common complications were non-Hodgkin's lymphoma, *M. tuberculosis*, progressive multifocal leukoencephalopathy, and cryptosporidiosis.

"Invasive Pneumococcal Disease in a Cohort of Predominantly HIV-1 Infected Female Sex Workers in Nairobi, Kenya"
Lancet (03/16/96) Vol. 347, No. 9002, P. 718; Gilks, Charles F.; Ojoo, Sylvia A.; Ojoo, Josephine C.; et al.

To assess the interaction of pneumococcal disease and HIV infection in sub-Saharan Africa, Charles F. Gilks, of the Center for Tropical Medicine at Oxford University, and colleagues followed a group of 719 female sex workers in Nairobi between 1989 and 1992. Of the total, 587 were seropositive and 132 remained seronegative. Among those who were HIV positive, 79 had pneumococcal disease, compared to just one in the HIV seronegative group. The researchers were surprised that pneumococcal disease, not tuberculosis, was the earliest serious complication in the HIV-infected women, as well the most common. The overall risk for developing pneumococcal disease with HIV infection was 17.8. The incidence rate in seropositive women was 42.5 per 1000 person-years, while the recurrence rate was 264 per 1000 person-years. According to the researchers, pneumococcus is an early, yet relatively treatable complication of HIV infection in sub-Saharan Africa.

"Home HIV Tests Raise Issues of Counseling, Prevention"
American Medical News (03/18/96) Vol. 39, No. 11, P. 10;
Shelton, Deborah L.

A 1992 National Health Interview Survey found that 8 percent of Americans said they would probably take an HIV test within the year for reasons other than blood donation, insurance, or military service. One-third of them said they would rather use a home collection kit than visit a physician or clinic. As the Food and Drug Administration considers three companies' applications to sell HIV home test kits, the South Carolina legislature is considering a bill to allow the sale of such kits. Public health officials in the state oppose the home test kits because they say the kits would make it more difficult to track HIV and provide counseling and referrals, and partner notification. Although the state requires doctors and laboratories to report by name people who test positive for HIV, the requirement would be waived under the proposed bill. Texas has already passed a law that requires home HIV test kits to be sold as part of a package of services, including pre- and post-test counseling, testing by a qualified facility, verification of positive results, and verbal notification of results to the person tested, with referrals for care and treatment if needed.

"Face to Face with TB"
Federal Times (03/18/96) Vol. 32, No. 6, P. 13; Rivenbark, Leigh

Mary Ann Goeller, a Social Security Administration claims representative, believes she contracted tuberculosis (TB) from a customer she interviewed at work. The customer had HIV and TB and was coughing during their interview in her small cubicle. Goeller tested positive for TB, and was treated aggressively for a year to prevent active TB from developing. Social Security paid for her initial test, while workers' compensation paid for her time away from work for monthly tests and doctor visits. Goeller now wants to warn other federal workers to protect themselves while working. Furthermore, she believes that Social Security should protect its employees by allowing them to wear

masks or by requiring customers with TB to wear masks.

TEXT:

Jeff

I just spoke with Steve Abel regarding his concerns around the ADAP program.

I don't want to establish a parallel track of information to the council and would prefer not to field calls such as this. On the other hand, if it helps you out for me to do so, I will be happy to accommodate.

Also, Patsy and I have had a hard time connecting to talk about Philadelphia - that is the reason for my call to her today. She can call me at home tonight if it is hard to get ahold of me today
410-418-5463

Thanks.

Joe

Re DC -- whatever works -- if you need me to request a formal briefing, I am requesting it. If that's not necessary -- just let me know what you think.

by the end of the week is fine on the Council response.

Thanks.
