

MEMORANDUM

TO: TOM FREEDMAN, MARY SMITH

FROM: JULIE MIKUTA

RE: STATISTICS ON THE FAMILY

DATE: JULY 27, 1997

SUMMARY

Attached are tables describing various aspects and experiences of families and young people.

I. ATTACHED TABLES

A. Households

Financial

1. Households by size (1970-1995)
2. Households, by total money income (1967-1994)
3. Families, by total money income (1967- 1994)
4. Percentage of households in selected income levels (1969 - 1994)
5. Expenditures on a child by single-parent and husband-wife households: 1992, 1996

Women and Children

1. Characteristics of children's families (1970 - 1994)
2. Women who have had a child in the last year and their percentage in the labor force (1976- 1994)
3. Proportion of children in single-parent living situations living with a divorced or never-married parent (1960-1993)
4. Children of single parents, by marital status (1960- 1993)
5. Children under 18, by presence of parents (1960- 1990): chart and table
6. Families maintained by women (1980- 1992)
7. Mothers in the labor force in selected countries: 1988

B. Poverty

1. Number of persons in poverty (1959- 1994)
2. Poverty status of persons in all families, and in families with female householder (1959 - 1994)
3. Poverty status of persons by age (1959 - 1994)
4. Poverty status of families by type of family (1959 - 1994)

C. Assistance programs

1. AFDC: Average monthly number of recipients, total amount of cash payments, and average monthly payment (1936-1994)
2. Food Stamps: Number of persons participating, and monthly average received per person (1962- 1995)
3. Women, Infants and Children Feeding Program (1975- 1995)

D. Schools and Education

1. School Enrollment (1960- 1994)

Violence/ victimization in school

1. Percentage of 8th grade students who reported that violence is a serious problem: 1988
2. Percentage of high school seniors who reported being victimized at school (1976-1993):
chart and table

Reading proficiency and test scores

1. Student proficiency in reading, by age, amount of time spent on homework, reading habits and reading materials in the home (1971, 1984 and 1992)
2. Average student proficiency in reading, by selected characteristics (1971-1992)
3. Reading scores (1971 - 1992)

College

1. College enrollment of recent high school graduates (1960- 1994)
2. SAT scores of college bound seniors (1970-1995)

3. College enrollment by age and sex (1973 and 1993)

Miscellaneous

1. Long-term benefits of preschool
2. Percentage of students who reported doing at least one hour of homework each day (1978- 1990)
3. Percentage of teachers who feel that certain problems are serious or somewhat serious (1995)
4. Percentage of high school seniors reporting drug use (1975-1995)
5. High school dropouts (1970- 1994)

E. Young People and Television- Watching

1. Average daily television viewing¹ (1960 -1992)
2. Television-related rules: 1991

F. Child Care

1. Hourly cost of child care, employed mother (1975 - 1990)
2. Child care providers, children 5- 14 years (1985 -1991)
3. Employer-supported child care (1982 -1990)

G. Abortion (1976-1992)

H. Infant Mortality (1970-1992)

I. Child Abuse and Neglect (1990- 1994)

J. Homeless Children and Youth (1989 - 1993)

In 1995, five-sixths of these non-family households were people living alone. There was a striking difference between female and male nonfamily householders. Women, who made up three-fifths of the nonfamily householders, often were elderly. Nearly half of these women were 65 or older and 44 percent were widows. In contrast, nearly three-fourths of the male nonfamily householders were aged 25 to 64, and half had never married.

Size of households. In 1995, the average number of people per household was 2.65, down from 3.14 in 1970. Between 1970 and 1990, the share of households with five or more people decreased from 21 percent to 10 percent (see figure 2). During the same period, the share of households with only one or two people increased from 46 to 57 percent. Since 1990, the size distribution of households has remained unchanged.

Only 35 percent of all households contain "own" (birth, adopted, or step-) children of the householder. By definition, nonfamily households contain no own children, although they may include other people under 18 who are not relatives of the householder. Presence of own children in married-couple and other family households is discussed in the next section of this report.

Location of households. The geographical distribution of U.S. households has shifted away from the "rust belt" toward the "sun belt" during the past 25 years. In 1970, 52 percent of all households were in the Northeast and Midwest and 48 percent were in the South and West. In 1995, these percentages were 44 and 56, respectively.

Households also have become more urbanized during this period. The share of households in metropolitan areas increased from 69 percent in 1970 to 79 percent in 1995.

Characteristics of Families

In 1995, 78 percent of the 69.3 million American families were maintained by married couples. The remaining 22 percent were maintained by women or men with no spouse present. Nearly four-fifths of the latter group were maintained by women.

The number of families maintained by people with no spouse present is increasing rapidly. Since 1970, the number of female-householder families has increased by 122 percent (from 5.5 million to 12.2 million). The number of male-householder families grew by 163 percent (from 1.2 million to 3.2 million). In contrast, married-couple families grew only 20 percent (from 44.7 million to 53.9 million).

Considerable attention is paid to the problems of one-parent families. They are much more likely to be poor than are married couples with children. Less notice is given to the situation of families with no spouse present and married-couple families without own children at home.

More than half of families had no own children under 18 at home.

In 1995, 51 percent of all families contained no own children under 18 — 7 percentage points more than in 1970, when only 44 percent of families had no own children under 18 at home.

Families without own children under 18 at home are not necessarily "childless." Some contain other related children, for example, children of an adult sibling, or grandchildren. They also may include unrelated foster children. Other families include adult children who are still living at home. Still other families have adult children who are living away from home.

The last case is largely made up of families which are at the "empty nest" stage in their life cycle. In 1995, 81 percent of married couples with a householder 45 years old or older had no own children under 18 at home, compared with 68 percent in 1970.

More younger families are without own children under 18 now than in 1970. Among married-couple

Another device by which evidence of growing income inequality can be observed is by measuring the "dollar distances" between households located at various points along the income distribution. Tables C and D show real household incomes at the 20th, 50th (the median), 80th, and 95th percentiles and various ratios of these incomes. The ratios incorporating the 50th percentile show how incomes changed in certain parts of the distribution relative to the median, while the 95th-to-20th ratio shows the extent to which the lower and upper parts of the distribution have pulled apart.

Household income at the 95th percentile in 1994 was \$109,821 compared to \$13,426 at the 20th percentile, a ratio of 8.18, or in other words, incomes at the top of the distribution were over 8 times as large as those towards the bottom of the distribution. In 1969, this ratio was 6.10. Real incomes at the 95th percentile had grown much faster than those at the 20th.

In 1994, real income at the 50th percentile (median) was \$32,264, and, at the 20th percentile, \$13,426, for an income ratio of .42. Twenty-five years earlier the ratio was .43, indicating little change in the dollar distance between

Source: June Current Population Surveys, 1976, 1978, 1980 to 1988, 1990, 1992 and 1994.

A - Women + Children - 3

White children are less likely to be living with one parent than are Black children or children of Hispanic origin. The proportions living with one parent in 1993 were 21 percent for White children, 57 percent for Black children, and 32 percent for children of Hispanic origin.

Table G and figure 4 show the proportion of children in a one-parent arrangement who lived with a divorced parent compared with those living with a parent who had never been married. Notice the years 1982 and 1983 are highlighted. During these years, improvements were made to the Census Bureau's data collection and processing procedures to help identify parent-child sub-families that might otherwise have been overlooked.⁵ (This accounts for most of the large increase in children of never-married parents between 1981 and 1983.) This analysis, therefore, compares changes in the proportions before and after the improvement period rather than the overall change between the years 1970 and 1993.

Between 1970 and 1981, the proportion of children living with one parent who lived with a divorced parent rose by one-half (from 30.2 to 43.8 percent), while the proportion living with a never-married parent doubled, from 6.8 to 15.2 percent. In the 10 years since the improvements were implemented (between 1983 and 1993), the proportion of one-parent children who lived with a divorced parent declined from 42.0 to 37.1 percent, while the proportion who lived with a never-married parent continued to rise, from 24.0 to 35.0 percent. Thus, a decade ago, a child in a one-parent

situation was almost twice as likely to be living with a divorced parent as with a never-married parent, while today, the child is just slightly more likely to be living with a divorced parent (37 percent) than with a never-married parent (35 percent).

The increase in children living with one parent is also reflected in number of births to unmarried women collected by the National Center for Health Statistics. Between 1980 and 1991, the number of births to unmarried women rose by 82 percent. In 1991, there were 1.2 million births to unmarried mothers, representing 3 out of 10 total births in that year. The comparable figures for 1980 were 0.7 million births, fewer than 2 out of 10 total births.⁶

GRANDCHILDREN

In 1993, there were 3.4 million grandchildren under 18 years old living in the home of their grandparent(s). This represented 5 percent of all children under 18, up only slightly from 3 percent of all children in 1970 (table H). The number of grandchildren shown here includes only those situations where the grandparents owned or rented the home; it does not include grandparents living in the home of the child's parent(s).

Most of the increase in grandchildren living with grandparents has been among children with only a mother present in the household. Since 1970, the proportion of grandchildren with neither parent present

⁵For a more detailed discussion of the procedural improvement, see Current Population Reports, Series P-20, No. 399, "Marital Status and Living Arrangements: March 1984," p. 8.

has declined from 43 to 30 percent in 1993, while the proportion with mother only present has increased from 37 to 49 percent. Continued high levels of divorce and the rise in out-of-wedlock childbearing had a substantial role in this change, as did the improvement in data collection and processing mentioned in the preceding section.

Black children were more likely to live in their grandparents' home than White children or children of Hispanic origin. In 1993, 12 percent of Black children lived in the home of their grandparents, compared with 4 percent for Whites and 6 percent for Hispanics.

Similar proportions of Black, White, and Hispanic grandchildren had only their mother present. Black grandchildren were more likely than other grandchildren to have no parent present at all and less likely to have both parents living with them in the grandparent's home. Of the 1.3 million Black grandchildren in 1993, 53 percent had only their mother present (versus 46 and 47 percent for Whites and Hispanics, respectively), 39 percent had neither parent present (versus 25 and 23 percent for Whites and Hispanics), and 4 percent had both parents present (versus 20 and 23 percent for Whites and Hispanics). White and Hispanic grandchildren were as likely to have both parents present as to have neither present.

RELATED REPORTS

Detailed statistics of household type and composition for 1993 and historical data back to 1947 on households and families by type are presented in Series P20-477, *Household and Family Characteristics: March 1993*. Projections for the United States of the number of households and families were published in Series P-25, No. 986, *Projections of the Number of Households and Families: 1986 to 2000*. Estimates of the number and characteristics of households and families that continue, discontinue, and/or are newly formed over 1-year and 2-year periods are presented in Current Population Reports, Series P23-179, *When Households Continue, Discontinue, and Form*. The most up-to-date information on the recent marital history of the population may be found in Current Population Reports, Series P23-180, *Marriage, Divorce, and Remarriage in the 1990's*. A series of graphs and interpretive text illustrating important trends of the past several decades that have influenced household and family circumstances of all persons, with special emphasis on children, is available in chartbook form in Current Population Reports, Series P23-181, *Households, Families, and Children: A Thirty-Year Perspective*. Sixteen graphs and interpretive text focusing on changes for children between 1980 and

Figure 3.
Ratio of Unmarried Men per
100 Unmarried Women: 1990

of unmarried men to unmarried women is much larger at younger ages, suggesting that the marriage prospects for younger women are better than for older women. At older ages, the ratio is considerably smaller because women are more likely to be widowed and are less likely to remarry after either divorce or widowhood.

At peak marrying ages, unmarried men outnumber unmarried women. Among persons under age 25, there were 111 unmarried men for every 100 unmarried women, and in the 25-to-29 age group, there were 127 men for every 100 women. Beginning with the 40-to-44 age group, however, the ratio begins to reverse until there were only 29 unmarried men for every 100 unmarried women in the 65-and-over group.

CHILDREN UNDER 18 YEARS OLD

As marital circumstances of the adult population change, so do the living arrangements of children. With the rise in divorce and increased delay in first marriage, the proportion of children living with two parents is declining. In 1990, 73 percent of children under 18 years lived with two parents, compared with 85 percent in 1970 (table E and figure 4). These two parents are not

A - Women + Chn - 5

always the natural parents of the child; they may include stepparents and parents by adoption. It has been estimated that about 15 percent of children living with two parents are stepchildren.²

The proportion of children under 18 living with only one parent has doubled in the past two decades, from 12 percent to 25 percent. While the majority of children in a one-parent situation still live with their mothers (87 percent), the proportion living with their fathers has risen 4 percentage points in the past decade, from 9 percent to 13 percent in 1990.

Although the largest proportion of single-parent children lived with a divorced parent (39 percent), this is slightly lower than the 1980 proportion of 42 percent. The next highest, and fastest growing, percentage lived with a parent who had never married. Between 1960 and 1990, the proportion living with a never-married parent rose from 4 percent to 31 percent (table F), as childbearing among never-married women has increased as they have postponed marriage.

Part of this striking increase in the number of children with a never-married parent is a result of a procedural improvement in the Census Bureau's data collection

and processing in 1982-83.³ This procedural change helped to identify parent-child subfamilies that might otherwise have been overlooked. At least two-thirds of the measured increase between 1981 and 1983 resulted from the improvement in data collection and processing. Nevertheless, the percentage of children living with a never-married parent was increasing before the procedural change and has continued since (table G and

figure 5). Between 1970 and 1981, the proportion rose 8.4 percentage points (0.8 percentage points per year) and 6.6 percentage points between 1984 and 1990 (1.1 percentage points per year). The proportion of children living with a divorced parent rose 13.6 percentage points in the 11 years prior to the change and declined

³For a more detailed discussion of the procedural improvement, see Current Population Reports, Series P-20, No. 399, *Marital Status and Living Arrangements: March 1984*, p. 8.

Families Maintained by Women: 1980-1992

Women who maintain families, by race, Hispanic origin, and presence of children, 1980, 1985, and 1992. Because of the absence of a husband or a second earner, these women are very active in the labor force.

the middle and lower part of the income distribution. On the other hand, when the income ratios between the 80th and the median and the ratio between the 95th and the median are examined over the 1969-94 period, a significant widening is observed. In the former case, the ratio widened from 1.66 to 1.95 and in the latter, from 2.60 to 3.40. These ratios confirm the fact that to the extent that household incomes were rising in the 1969 to 1994 period, they were rising fastest in the upper half of the household income distribution.

State Income Data

Table E of this report shows information on median household income by State. These data are being made available to meet the large number of requests received from data users for subnational income estimates. The CPS is designed to collect reliable data on income primarily at the national level and secondarily at the regional level. When the income data are tabulated by State, the estimates are considered less reliable and, therefore, particular caution should be used when trying to interpret the results. To reduce the chances of misinterpreting annual changes in State income estimates, the Census Bureau chose to evaluate changes based on 2-year averages.

Median income of households and the respective standard errors for States for 1992, 1993, and 1994 (in 1994 constant dollars) are shown in table E. This table also

includes two 2-year averages of median household income, for 1992-1993 and 1993-1994 along with the numerical differences and percent changes between the 2-year averages by State.

Based on the two 2-year averages, real median household income declined significantly for three States, California, Kansas, and New Hampshire. The same type of comparison shows that the median household income increased for four States, Colorado, Iowa, Mississippi, and Tennessee. The median household income for the remaining 43 States and the District of Columbia did not change significantly.

The Census Bureau also chooses to use 3-year averages to evaluate the relative standing of each State. This was done, again, to reduce the chances of misinterpreting the results. Comparing the income among the States using the 3-year average of 1992-1994 shows that the median household income of Alaska, although not statistically different from that of Hawaii, was higher than the remaining 48 States and the District of Columbia. Conversely, the median household income of West Virginia, although not statistically different from the median for Mississippi, was lower than the remaining 48 States and the District of Columbia. The relative standing of the remaining States and the District of Columbia is less clear because of sampling variability surrounding the estimates.

¹ Between 1974 and 1979, SSI recipients were made ineligible for food stamps in Massachusetts, Wisconsin, California and selected counties in New York and Virginia because those areas supplemented SSI payments in amounts that included the value of food stamps. As of 1983 and 1992, SSI recipients were returned to the Food Stamp Program in Massachusetts and Wisconsin, respectively, when these States chose to stop including a value for food stamps in the SSI supplement.

² That portion of the food stamp allotment, before the elimination of the purchase requirement, represented the government's share of total food stamps received. Since January 1979, only the bonus portion of the total food stamp allotment is received by participants.

³ Excludes participants and benefits under the Puerto Rico Nutrition Assistance Program after July 1, 1982.

Women, Infants, and Children Feeding Program: 1975-1988

WIC participation and costs. Participation requires an income of less than 185% of the poverty level, with some states requiring a lower income than this. WIC participation also includes a "nutritional risk" requirement. In 1988 there were about 7.5 million persons at risk (either nutritionally or income-wise), but only 3.6 million participants. Children and infants comprised three-quarters of participants and pregnant women comprised the other quarter.

¹ Excludes persons not enrolled in school.² The 4 items in the scale were: newspaper subscription, magazine subscription, more than 25 books in the home, and encyclopedia in the home.

NOTE.—These test scores are from the National Assessment of Educational Progress (NAEP). The NAEP scores have been evaluated at certain performance levels. A score of 300 implies an ability to find, understand, summarize, and explain relatively complicated literary and informational material. A score of 250 implies an ability to search for and understand relatively simple material.

¹ All participants of this age were in school.

² Test scores of Hispanics were not tabulated separately.

—Data not available.

NOTE.—These test scores are from the National Assessment of Educational Progress (NAEP). The NAEP scores have been evaluated at certain performance levels. A score of 300 implies an ability to find, understand, summarize, and explain relatively complicated literary and informational material. A score of 250 implies an ability to search for specific information, interrelate ideas, and make generalizations about literature, science, and social studies materials. A score of 200 implies an ability to understand, combine ideas, and make inferences based on short uncomplicated

A score of 200 implies an ability to understand, combine ideas, and make inferences based on short uncomplicated passages about specific or sequentially related information. A score of 150 implies an ability to follow brief written directions and carry out simple, discrete reading tasks. Scale ranges from 0 to 500.

¹ As measured by the National Assessment of Educational Progress (NAEP).

² All participants of this age were in school.

³ Able to follow brief written directions and carry out simple, discrete reading tasks.

⁴ Able to understand, combine ideas, and make inferences based on short uncomplicated passages about specific or sequentially related information.

⁵ Able to search for specific information, interrelate ideas, and make generalizations about literature, science, and social studies materials.

⁶ Able to find, understand, summarize, and explain relatively complicated literary and informational material.

⁷ Able to understand the links between ideas even when those links are not explicitly stated and to make appropriate generalizations even when the texts lack clear introductions or explanations.

⁸ Data for 1971 include persons of Hispanic origin.

—Data not available.

1990	1026	424	476
1995	1068	428	482

School Enrollment

ROSALIND R. BRUNO

Enrollment levels have fluctuated over the last two decades.

In 1993, 65.4 million students were enrolled in school. 63 percent of these students were enrolled in either elementary school (47 percent) or in high school (21 percent). Children enrolled in nursery school or kindergarten made up 11 percent of enrollees. College students accounted for 21 percent of enrollees.

In general, the number of students enrolled in kindergarten through grade 12 mirrors the population 5 to 17 years old, because nearly all persons in that age group are enrolled in school. Nursery school and college enrollment trends reflect changes in the size of the age-eligible population and the rates of enrollment.

In the 20-year period between 1973 and 1993, enrollment in kindergarten through high school declined by 3 percent, while nursery school enrollment more than doubled and college enrollment rose by 55 percent.

In the period, the number of children 3 and 4 years old

enrolled in nursery school increased from 1.2 to 2.7 million; the proportion enrolled increased from 18 percent in 1973 to 34 percent in 1993.

At the same time, elementary school enrollment declined from 31.5 to 30.6 million students. This decline was in direct response to changes in the number of births that occurred 6 to 13 years before the enrollment estimates. So, cohorts that followed the end of the Baby Boom (1964) eventually resulted in a decline in elementary school enrollment in the 1970's and early 1980's, the gradual increase in the annual number of births during the 1980's ensures increases in elementary school enrollment during the 1990's. Elementary school enrollment reached a low of around 27 million in the mid-1980's (1985-87) and has increased since.

Changes in high school enrollment reflect shifts in the 14 to 17 age group. The number of persons in this age group declined during the 1980's, causing the number of students enrolled in high school to drop from 15.7 million in the mid-1970's to about 12.8 million in 1990.

As relatively larger birth cohorts began to move into the 14 to 17 age range in the early 1990's, high school enrollment grew to 13.7 million in 1993.

At the college level, 13.9 million students were enrolled in 1993, compared with 9.0 million in 1973. The percentage of full-time students declined from 70 percent in 1973 to 64 percent in 1993. Among students 25 years old and over, only 38 percent were enrolled full time in 1993, compared with 83 percent of younger students. The number of these "older" college students increased from 2.6 million in 1973 to 5.6 million in 1993 or from 29 to 40 percent of all college students. At the same time, the percentage of all college students who were women increased from 44 to 54 percent. Thus, during this 20-year period, there has been a shift in the age and sex distribution of the college population from majority male to majority female and a substantial gain for older students. The largest losses were among younger men and the largest gains among older women.

College Enrollment, by Age and Sex:
1973 and 1993

Long-Term Benefits of Preschool

The High/Scope Perry Preschool Project assessed whether high-quality preschool programs could provide both short- and long-term benefits to children living in poverty and at high risk of failing in school. The study followed into adulthood 123 such children from African-American families who lived in the neighborhood of the Perry Elementary School in Ypsilanti, Michigan, in the 1960s. At the beginning of the study, the children were randomly divided into a program group, who received a high-quality, active learning preschool program, and a no-program group, who received no preschool program. This table presents findings at age 27.

Variable	Preschool	No preschool
\$2,000 or more in earnings per month	29%	7%
Own home	36%	13%
High school graduates	71%	54%
Ever on Social Services in past 10 years	59%	80%
Five or more arrests	7%	35%

¹ Survey question changed in 1993; data are not comparable to figures for earlier years.

² Other illicit drugs include any use of hallucinogens, cocaine, and heroin, or any use of other opiates, stimulants, sedatives, or tranquilizers not under a doctor's orders.

—Data not available.

NOTE.—A revised questionnaire was used in 1982 and later years to reduce the inappropriate reporting of nonprescription stimulants. This slightly reduced the positive responses for some types of drug abuse.

Child Care

Employer-Supported Child Care: 1982-1990

Number of companies supporting child care. The estimated 5,600 employers with child care programs in 1990 represent 13 percent of the 44,000 U.S. employers with more than 100 employees.

Year	# of companies
1982	600
1984	1,500
1986	2,500
1988	3,300
1990	5,600

Source: "Growth of employer-supported child care," "Early Childhood Program Distinctions," Galinsky and Friedman, *Education Before School: Investing in Quality Child Care*, Families and Work Institute, 1993, Figure 5.8, p. 124. Primary source: D.E. Friedman, "Update on Employer-Supported Child Care," distributed memo, Families and Work Institute, 1991.

G. Abortion

Pregnancies and Abortions, 1976- 1992 [Table 109 of Statistical Abstract; data from Monthly Vital Statistics Report, Vo. 41, no. 6, Supplement; and Table 71 of SRC] *Table 110 from S.Ab, Table 116 from S.Ab9.*

Numbers * 1,000

Year	Total pregnancies	Induced abortions	Number of abortions on girls aged 15-19	Rate of pregnancy per 1,000 women, 15 -44 yrs old	Rate of induced abortions per 1,000 women
1976	5002	1179	363	102.7	24.2
1980	5912	1554	445	111.9	29.4
1985	6144	1577	399	107.4	28.1
1990	6668	1609	351	113.8	27.4
1992	6484	1529	(1991) - 314	109.9	25.9

H. Infant Mortality (Deaths per 1,000 live births.) [Table 124 of Stat Ab]

Year	Infant deaths	Maternal deaths	Fetal deaths	Neonatal deaths
1970	20.2	21.5	14.2	15.1
1980	12.6	9.2	9.2	8.5
1985	10.6	7.8	7.9	7.0
1990	9.2	8.2	7.5	5.8
1992	8.5	7.8	7.4	5.4

Infant deaths are deaths of infants under 1 year old, exclusive of fetal and neonatal deaths. Maternal deaths are per 100,000 live births from deliveries and complications of pregnancy and childbirth. Fetal deaths are those with stated or presumed gestation of 20 weeks or more. Neonatal deaths are those of infants under 28 days, exclusive of fetal deaths.

I. Child Abuse and Neglect Cases Substantiated and Indicated (1990-1994) [Table 347 of S.A.; DHHS, *Child Maltreatment, 1994*]

Type of Substantiated Maltreatment	1990	1992	1993	1994
Victims, total	761,153	1,054,456	1,067,231	1,197,133
