THE WHITE HOUSE
WASHINGTON

MEMORANDUM TO TODD STERN

FROM: Patsy Fleming 

SUBJECT: National AIDS Strategy

For nearly a year, the Office of National AIDS Strategy has been working with representatives of numerous Federal Agencies to develop the first-ever National AIDS Strategy. A final version of this strategy is now ready to be presented to the President and released to the public.

Background

In his 1992 campaign, the President promised that his Administration would develop a national AIDS strategy to guide his Administration's approach to the numerous challenges presented by HIV and AIDS. My office has endeavored to draft the strategy with significant input from all relevant Agencies, the President's Advisory Council on HIV/AIDS, and national AIDS organizations.

The completed document is, by necessity, broad in nature but sets out six major goals: To work to develop a cure and a vaccine; to reduce and eventually eliminate new infections; to provide people with AIDS access to necessary care and services; to fight AIDS-related discrimination; to maintain our international leadership role; and to ensure that scientific advances are translated into improved care and prevention.

The strategy was reviewed by all relevant Agencies, by members of the President's Advisory Council, and by 11 national AIDS organizations. Revisions were made to reflect the comments of Council members and the external organizations. The final document has general support, but it is important to note that support is not universal. Some of the outside organizations would like the strategy to make specific commitments for future funding of AIDS research, prevention, and care. Others would like the strategy to embrace such approaches as needle exchange programs and a "Manhattan Project" research effort. On balance, however, I believe we can depend on support from the majority of these organizations.

Recommendation

The external review process has created expectations that this document will be delivered to the President. I would like to present the report to the President and release it to the public before the next meeting of the President's Advisory Council, scheduled for Dec. 15-17, here in Washington.

SCHEDULING REQUEST PROPOSAL

Date: 12/11/96

☐ ACCEPT

☐ REJECT

☐ PENDING

TO: Stephanie Streett
Deputy Assistant to the President & Director of Scheduling

Anne Walley
Deputy Assistant to the President & Director of Scheduling

FROM: Carol Rasco, Assistant to the President for Domestic Policy
Patricia S. Fleming, Director, Office of National AIDS Policy

REQUEST: Photo op with the President receiving the first-ever National AIDS Strategy from Director of National AIDS Policy and the Chair of the Presidential Advisory Council on HIV/AIDS.

PURPOSE: The President will be presented with the National AIDS Strategy. The event will be in conjunction with the meeting of the Presidential Advisory Council on HIV/AIDS.

BACKGROUND: The President has made the national response to HIV/AIDS a priority of his Administration. By officially receiving the Strategy, a document he promised to develop, he will indicate the continued commitment of the Administration to this public health crisis. Similar to the President's receiving the National Drug Control Strategy, an additional purpose of this meeting is to demonstrate that the President is engaged in leading the Administration's work on HIV-related issues.

PREVIOUS PARTICIPATION: No previous event. The President has met with members of the his Advisory Council on HIV/AIDS July 1995.

DATE & TIME: December 16 or 17, 1996 (During Presidential Advisory Council on HIV/AIDS meeting in Washington.)

DURATION: 10 minutes

LOCATION: The White House

PARTICIPANTS: The President

The Vice President
Carol Rasco, Assistant to the President for Domestic Policy
National AIDS Policy Director Patricia Fleming
Scott Hitt, Chair of the Presidential Advisory Council on HIV/AIDS

**OUTLINE OF
EVENTS:**

National AIDS Policy Director Fleming will present the President with a copy of the National AIDS Strategy. Ms. Fleming will briefly describe the Strategy's genesis (a call by the President for its development) and goals. The President would make brief remarks thanking Director Fleming and Dr. Hitt for assisting in its development.

REMARKS: Brief remarks

MEDIA: Photo op.

FIRST LADY: No.

**VICE
PRESIDENT:** Yes.

**RECOMMENDED
BY:** Carol Rasco and Patsy Fleming.

CONTACT: Jane Sanville or Richard Sorian, 632-1090.

The National AIDS Strategy
10.31.96 Draft for ONAP Review

Folks --

Attached is the latest draft. There are not too many changes.

Council comments and new proposed text are handled as follows:

- **Original council comments are underlined, in brackets, and precede the section they refer to.**
- **New text is redlined.**
- **Eliminated text is struck.**
- **My questions/concerns are double-bracketed in plain text.**

I've added some 'ending the epidemic' language in an effort to respond to general PAC concerns about making the introduction stronger.

I need your comments by Noon on Monday, November 4th. Thanks for all your help.

"We'll keep going until normal life is returned to people who have HIV."

[[Richard -- Do we have a quote about ending the epidemic?]]

**President Clinton, August 29, 1996
Acceptance Speech before the Democratic National Convention**

Message from the National AIDS Policy Director

[Isbell -- Stronger introduction. Define what the strategy is. Begin with PF's ending statements on ending the epidemic.]

The epidemic of HIV and AIDS constitutes a public health crisis of unprecedented proportions. After 15 years, this terrible national tragedy has affected -- and will continue to affect -- far too many people in the U.S. and around the world. HIV is a disease that we can defeat -- just as we have eradicated smallpox from our planet and polio from the western hemisphere. We have made tremendous progress in our understanding of HIV and HIV disease, ways in which we can treat those who are infected, and the means by which we can prevent infection. We also have more work to do. The National AIDS Strategy provides a foundation for the continuing public-private partnerships that are essential to our success in ending this epidemic.

In 1993, the Office of National AIDS Policy (ONAP) was created by President Clinton to provide a national focus and direction for the U.S. government's response to HIV and AIDS. More recently, President Clinton asked ONAP to develop a comprehensive National AIDS Strategy that would detail the Federal government's long-term approach to this epidemic. The National AIDS Strategy has been developed by the Clinton Administration to capitalize upon progress already made in fighting the epidemic and to catalyze collaborative efforts among Federal Agencies, communities, State and local governments, businesses, schools, churches, families, and individuals.

[Isbell -- sharpen all goals to indicate the Administration's sense of urgency.]

The President has identified the following national goals to guide our efforts to end the epidemic of HIV and AIDS against HIV:

- To develop more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected through strong continuing support for HIV-related research;

To provide strong continuing support for HIV-related research in order to find more

~~effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected;~~

[Services & Isbell: make goal stronger to reflect President's quote in beginning of prevention section.]

- ~~To reduce the number of new HIV infections in adults and children in the U.S. and worldwide until the rate of new infections reaches zero by providing strong continuing support for effective AIDS prevention efforts;~~

~~To provide strong continuing support for effective AIDS prevention efforts to continue to reduce the number of new HIV infections in adults and children in the U.S. and worldwide;~~

[Services: There should be quality care for all in the goals.]

- To ensure that all people living with HIV have access to services that are affordable, of high quality, and responsive to their needs;
- To ensure that all people living with HIV are not subject to discrimination;
- To provide strong continuing support for international efforts to address the HIV epidemic; and,
- To ensure that research advances are translated into improved HIV prevention programs and enhanced better care for HIV- positive persons.

[Services: A goal should be added emphasizing that HIV should be taken out of the political arena and viewed as a public health crisis affecting everyone.]

- ~~To ensure that the public health relevance of HIV-related issues are appropriately addressed.~~

This document is a snapshot of where we are as a Nation and where we need to go in achieving these national goals and ultimately end the epidemic. It summarizes some of the key accomplishments of our Nation's scientific and public health professionals and identifies key

The National AIDS Strategy
10.31.96 Draft for ONAP Review

areas for further effort. In addition, the appendices to this report lay out, for the first time, detailed descriptions of the objectives, goals, and budgets of all Agencies involved in the Federal response to HIV in six major areas of HIV policy: prevention, research, care and services, civil rights, international activities, and translation of research advances into practice.

~~The National AIDS Strategy is not an implementation plan but rather sets forth a framework and identifies opportunities for progress that will serve as the foundation for systematic consultations with the Interdepartmental Task Force on HIV and AIDS, the Presidential Advisory Council on HIV and AIDS, the private sector, and the community. These formal and systematic consultations will be integral to identifying and implementing solutions. Moreover, the National AIDS Strategy is intended to be a living working document that requires regular updating and adjustment as goals are reached and new challenges emerge. This Strategy provides a reference point for continuing dialogues and collaborative efforts between the public and private sectors that are necessary to meet our national goals and objectives.~~

~~In that light, the Office of National AIDS Policy is seeking direct input from the Presidential Advisory Council on HIV/AIDS, national and community-based organizations, State and local governments, clinicians and researchers, members of the infected and affected communities, and other individuals and organizations who can contribute to this historic document. This Strategy is being released, first, in draft form to allow for maximum input into the first of an ongoing national effort to chart and plan Federal efforts in response to the epidemic of HIV and AIDS.~~

The development of a National AIDS Strategy is an historic undertaking. No previous Administration has undertaken so broad a planning effort that: (1) involves all Federal Departments and Agencies that engage in HIV-related efforts; (2) reaches out to communities and the private sector; and, (3) identifies areas where the Federal government should focus its efforts.

The National AIDS Strategy was drafted in consultation with, and with guidance from, numerous groups and individuals. Within the Federal government, this effort began at the Agency level. Members of the Interdepartmental Task Force on HIV and AIDS (IDTF), representing all Federal Agencies involved in the national response to HIV and AIDS, identified their HIV-related goals, objectives, and highlighted areas requiring special attention. Individuals living with HIV and AIDS, their families, friends, loved ones, and care givers made vital contributions to this Strategy. Numerous non-governmental groups and organizations have also been consulted, including the Presidential Advisory Council on HIV/AIDS, participants in the White House Conference on HIV and AIDS, the ONAP-sponsored regional briefings, patient and consumer advocates, health care professionals, community-based organizations, educators, religious leaders, and business leaders. Earlier insights provided by the National Commission

The National AIDS Strategy
10.31.96 Draft for ONAP Review

on AIDS, the Institute of Medicine and National Research Council, the General Accounting Office, and the Office of Technology Assessment also have been extraordinarily helpful in developing the National AIDS Strategy.

We face great challenges as a Nation. We are also facing great opportunities. After 15 years, ~~this terrible national tragedy has affected—and will continue to affect—far too many people in the U.S. and around the world. We have, nonetheless, made tremendous progress in our understanding of HIV and HIV disease, ways in which we can treat those who are infected, and the means by which we can prevent infection. Ultimately, HIV is a disease that we can defeat—just as we have eradicated smallpox from our planet and polio from the western hemisphere. The National AIDS Strategy provides a foundation for the continuing public private partnerships that are essential to our success.~~ Together, with steadfast commitment, courage, and leadership, we will win the battle against HIV and AIDS.

Patricia S. Fleming
National AIDS Policy Director

"For nearly every American with eyes and ears open, the face of AIDS is no longer the face of a stranger. Millions and millions of us have now stood at the bedside of a dying friend and grieved. Millions and millions of us now know people who have had AIDS and who have died of it who are both gay and heterosexual. Millions and millions of us are now forced to admit that this is a problem which has diminished the life of every American."

President Clinton, December 1, 1993
Georgetown University

I. INTRODUCTION

Goals of the National Strategy

[Isbell -- sharpen all goals to indicate the Administration's sense of urgency.]

The President has identified the following national goals to guide our efforts to end the epidemic of HIV and AIDS against HIV:

- ~~To develop more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected through strong continuing support for HIV-related research;~~

~~To provide strong continuing support for HIV-related research in order to find more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected;~~

[Services & Isbell: make goal stronger to reflect President's quote in beginning of prevention section.]

- ~~To reduce the number of new HIV infections in adults and children in the U.S. and worldwide until the rate of new infections reaches zero by providing strong continuing support for effective AIDS prevention efforts;~~

~~To provide strong continuing support for effective AIDS prevention efforts to continue to reduce the number of new HIV infections in adults and children in the U.S. and worldwide;~~

[Services: There should be quality care for all in the goals.]

- To ensure that all people living with HIV have access to services that are affordable, of high quality, and responsive to their needs;
- To ensure that all people living with HIV are not subject to discrimination;
- To provide strong continuing support for international efforts to address the HIV epidemic; and,
- To ensure that research advances are translated into improved HIV prevention programs and enhanced better-care for HIV- positive persons.

[Services: A goal should be added emphasizing that HIV should be taken out of the political arena and viewed as a public health crisis affecting everyone.]

- To ensure that the public health relevance of HIV-related issues are appropriately addressed.

Scope of the HIV/AIDS Epidemic

The epidemic of Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS) presents unique social, economic, and public health challenges to governments and individuals here in the United States and around the world. While significant progress has been made in understanding the disease and developing treatments since the first case was reported in the U.S. in June 1981, HIV remains a deadly infection for which there is no vaccine, no cure, and for which there is an expanding, but still limited, inventory of available treatments. An average of 100 Americans are diagnosed with AIDS every day and a similar number of men, women, and children become infected with HIV every 24 hours. Globally, 8,500 people become infected each day.

An Expanding Public Health Threat

As of December 1995, the Centers for Disease Control and Prevention (CDC) had received reports of 513,486 cases of AIDS among persons in the U.S. and 319,849 of these persons have been reported to have died as a result of complications related to HIV. Since 1987, AIDS has risen from being the 15th cause of death among all Americans to the 8th. AIDS is now the

leading cause of death among Americans aged 25 to 44 (See Figure 1). In 1995 alone, approximately 74,000 new cases of AIDS were reported in the U.S. and more than 46,000 AIDS related deaths were reported to the CDC in 1994. CDC estimates that between 40,000 and 60,000 Americans are becoming newly infected with HIV each year, and that between 650,000 and 900,000 Americans are currently living with HIV.

As the epidemic in the United States has expanded, the demographics of the epidemic have changed. The early years of the epidemic were dominated by cases involving gay or bisexual men living in major urban centers (e.g., New York, San Francisco, and Los Angeles). Today, this group represents less than half of all new cases, although it still represents a majority of persons living with HIV and AIDS. Among the populations that are heavily affected today are young gay and bisexual men, women, and injecting drug users and their sexual partners as well as users of non-injecting drugs (e.g., crack cocaine and alcohol). In 1995, nearly 14,000 women were reported to CDC as having been diagnosed with AIDS. Women now comprise 14 percent of cumulatively reported AIDS cases. If this trend continues, it is estimated that 80,000 American children will have been orphaned as a result of AIDS by the end of this decade. In 1995, approximately 800 new cases of pediatric AIDS cases were reported.¹

Adolescents (age 13-19) are increasingly at risk for HIV infection. CDC estimates that one-quarter of new HIV infections in the U.S. occur among people under age 21. A significant number of young people are engaging at earlier ages in sexual intercourse and drug and alcohol use. This fact, coupled with the disturbing number of adolescents who are prone to high-risk behavior due to homelessness, sexual abuse, and other circumstances, makes young Americans extremely vulnerable to HIV infection.

Racial and ethnic minorities have been disproportionately affected by the epidemic of HIV and AIDS. African-Americans, who represent approximately 12 percent of the U.S. population, accounted for 40 percent of newly reported AIDS cases in 1995. Hispanics, who account for about 9 percent of the general population, represented 19 percent of new cases reported in 1995. The number of African-Americans and Hispanics affected by HIV and AIDS has risen dramatically. In 1982, Blacks and Hispanics represented 31 percent of all AIDS cases; however, as of December 1995, these groups comprised 52 percent of cumulative AIDS cases.

The HIV epidemic continues to spread into suburban and rural areas, with dramatic increases in certain regions of the South and Midwest. Between January 1993 and December 1995 the largest numbers of AIDS cases (86,462) were reported from the South.² While most cases are still reported from urban areas, the rate of reported cases in non-metropolitan areas is increasing more rapidly than in urban areas. AIDS cases now have been reported in all 50 States, the District of Columbia, Puerto Rico, Guam, and each of the U.S. territories (See Figure 2).

[Services subcommittee -- reference that AIDS is far from the only "costly" disease and many person receive substantial support for those illnesses from Federal and State government.]

[Isbell -- AIDS is not inordinately expensive. Many federal programs mentioned in the document are extremely cost-effective because they help reduce HIV-related medical costs. HOPWA funds a continuum of housing programs that provide far less costly alternatives to institutionalization. Similarly, by reducing the epidemic's long-term burden, HIV prevention services represent an immediate and future economic savings for the country. AIDS isn't an endless drain on public resources; rather the federal government has developed excellent strategies for reducing the epidemic's impact. ... the document should make these points to combat the growing sentiment that "AIDS gets more than its fair share."]

AIDS is a costly disease. Average lifetime costs of medical care after an HIV diagnosis \$119,000.³ For heart disease and cancer the comparable figures are \$ 61,211⁴ and \$ 25,000 to \$4,000⁵, respectively. People living with HIV are disproportionately dependent on the public sector for their health care. More than 50 percent of people living with AIDS are enrolled in Medicaid, including more than 90 percent of children with AIDS. In FY 1996, the Federal government spent an estimated \$1.8 billion on Medicaid benefits for people living with HIV and AIDS and another \$690 million on Medicare benefits. Social Security benefits for people disabled by HIV/AIDS totaled nearly \$1.1 billion in FY 1996. Many Federal programs such as HOPWA and CDC's prevention efforts contribute to reducing the short- and long-term economic costs of the epidemic.

Globally, the toll of the epidemic is much greater and threatens to reverse decades of economic and public health progress in developing countries. The Joint United Programme on HIV and AIDS (UNAIDS) and the World Health Organization (WHO) estimate that 27.9 million people have been infected with HIV. Since the beginning of the pandemic, 6 million people, including 1.6 million children, have been diagnosed with AIDS. By the year 2000, WHO projects that between 30 million and 40 million people will have been infected with HIV and 10 million to 15 million children will be orphaned due to AIDS.

II. OVERVIEW OF FEDERAL EFFORTS

The scope and nature of the HIV/AIDS epidemic have drawn States, local governments, schools, academic institutions, private foundations, health care institutions, community-based organizations, and the Federal government into many HIV-related activities. The Federal government, through its public health responsibilities in areas such as research, prevention, health care, and housing has seen a dramatic increase in its activities since the beginning of the epidemic. In FY 1986 the Federal government expenditures for AIDS research, surveillance, income maintenance, and care were \$508 million. By FY 1995 that figure reached \$6.8 billion.

In the past four years, under the leadership of President Clinton, the Administration has proposed to increase spending for AIDS research, prevention, income maintenance, and care by 49 percent. Funding proposed for the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act in the FY 1997 Budget has increased by 157 percent since FY 1993. Support for housing for people living with AIDS has increased by 96 percent in the same time period. AIDS-related research funding in the FY 1997 budget has increased by 21 percent and AIDS prevention funding has increased by 12 percent. The National Institutes of Health Revitalization Act of 1993 provided the Office of AIDS Research with enhanced authority to develop and implement an annual AIDS research plan and budget. Approval of AIDS drugs by the Food and Drug Administration has been accelerated. A community-based planning process has empowered local communities to develop innovative AIDS prevention programs. Eligibility for Social Security disability benefits for people with AIDS has been simplified and Federal laws prohibiting discrimination against people living with HIV and AIDS have been vigorously enforced.

As the epidemic continues, we must renew our vision for ending this epidemic. The sections that follow focus on six major policy areas: prevention, research, care and services, civil rights, international activities, and the translation of research advances into practice. They identify recent progress and future opportunities for further progress.

A. PREVENTION

"We have to set a goal. . . We have to reduce the number of new infections each and every year until there are no more new infections."

**President Clinton, December 5, 1995
The White House Conference on HIV and AIDS**

Record of Accomplishment

Since the epidemic began, there has been important progress in preventing HIV infection. Early in the epidemic, CDC estimated that more than 100,000 Americans were becoming infected with HIV each year; today, that total is estimated to be between 40,000 and 60,000 people each year.

Sentinel accomplishments in prevention of HIV include:

- o Publication in *Morbidity and Mortality Weekly Report* by the Centers for Disease Control and Prevention (CDC) in 1981 of the first AIDS cases;
- o Identification in 1981 by the Centers for Disease Control and Prevention (CDC) of the risk factors associated with HIV infection;
- o Due to NIH-sponsored research, demonstration that administration of AZT can prevent transmission of HIV from an infected mother to her newborn; and,
- o Due in part to successful implementation of CDC-sponsored prevention strategies, a slowing in the growth of the epidemic.

Since President Clinton took office in 1993, efforts in HIV prevention have been accelerated. Actions include:

- o Proposing to increase funding in the FY 1997 Budget for AIDS prevention at HHS by 27 percent (since FY 1993);
- o Launching the community planning partnership -- empowering local communities to develop innovative prevention efforts;
- o Launching the Prevention Marketing Initiative, focusing on young adults (18 to 25) with frank public service announcements advocating sexual abstinence and, for the first time, the correct and consistent use of latex condoms; and,

- o Reorganizing AIDS prevention efforts at the Centers for Disease Control and Prevention to foster greater coordination of efforts to reduce sexually transmitted diseases and tuberculosis.

Federal agencies have been instrumental in expanding our knowledge base about HIV prevention (see Appendix A). CDC, the Agency with primary Federal HIV surveillance and prevention responsibilities, has been pivotal in identifying risk factors associated with HIV transmission, seroprevalence of HIV in society, and trends in HIV infection and AIDS.

[Prevention Subcommittee (Runions) -- Adolescents and youth are one of America's most underserved populations in terms of access to health care services and health education. The Division of Adolescent and School Health (DASH), a program of the Centers for Disease Control and Prevention, addresses the prevention of priority health risks (including HIV/AIDS) among adolescents and youth.]

DASH provides support to national, state, and local agencies and organizations with the capacity to help address adolescent health. CDC provides fiscal support and technical assistance to the education agencies in every state, six territories, Washington, D.C. and 18 large cities to help schools implement effective health education to prevent the spread of HIV.]

Federal efforts have shown that HIV prevention programs can be effective. CDC's prevention projects, many in partnership with states, local governments, schools, and community-based organizations, have demonstrated that prevention programs are most effective when designed and implemented at a local level. Biomedical, behavioral, and social science prevention research, including epidemiological and natural history studies, conducted and supported by the National Institutes of Health (NIH) and CDC has expanded and will continue to expand our understanding of HIV transmission and the determinants of HIV-related risk behavior.

The nation has also combatted the dual epidemics of HIV and drug abuse. The National Institute on Drug Abuse (NIDA), the Substance Abuse and Mental Health Services Administration (SAMHSA), and CDC support efforts to prevent HIV infection among drug users. The White House Office of National Drug Control Policy (ONDCP) has pursued and coordinated efforts to counter the problem of substance abuse and its devastating consequences.

There have been advances in integrating primary prevention into health care service systems. The Health Resources and Services Administration (HRSA) and the Department of Veterans Affairs (VA) have encouraged broader access to AIDS prevention information through the integration of prevention interventions into primary health care services and through support of early intervention services. HRSA and HCFA have also undertaken special initiatives designed to reduce perinatal transmission of HIV and HRSA has promoted primary prevention through

the training of health professionals in the AIDS Education and Training Centers program.

[Isbell -- document does not address counseling and testing. ... while testing should not be centerpiece of our prevention efforts, it is equally clear that the nationals laissez faire approach to testing effectively squanders countless opportunities to intervene with effective HIV prevention services.]

[[Jeff -- do we want to add something?]]

Future Opportunities for Progress

To achieve the national goal of no new infections requires efforts in the prevention area on five fronts:

[Isbell -- change this bullet to "Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors."]

- o Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors. ~~Improving understanding of trends in HIV transmission and seroprevalence;~~
- o Improving scientific knowledge about effective prevention models and strategies;
- o Strengthening community-based programs;
- o Integrating HIV and other prevention efforts; and,
- o Targeting vulnerable populations

[Isbell -- Add goal of enhanced coordination of federal efforts in order to ensure that prevention programs are grounded in behavioral and ethnographic research and based on the latest epidemiologic data. Currently there is insufficient coordination....]

[[I think the next paragraph addresses this concern. Also, the program integration section in the Care and Services chapter already specifically mentions HIV prevention.]]

■ *Improving Understanding of Trends in the Epidemic*

Understanding who is becoming infected and through what behaviors is critical to designing effective HIV prevention interventions, as well as for targeting appropriate service resources. As discussed in the introduction, the demographics of the epidemic are evolving, and effective prevention depends on rapidly understanding these shifts and responding to them.

CDC's AIDS case and case death reporting system provides important data for assessing AIDS prevalence and mortality by gender, race/ethnicity, age, and mode of exposure. However, this approach does not capture sufficient "front-end" information on the incidence and prevalence of HIV prior to an AIDS diagnosis. Therefore, we miss critical warning signs about new trends in affected populations and increasing risky behaviors.

To address this shortcoming, CDC will work to improve its surveillance of HIV infection and related diseases and surveillance of HIV behavioral risk factors, both to better monitor the course of the epidemic and to provide guidance to community planners for targeting prevention and service dollars. This can and will be undertaken without compromising the confidentiality of those involved.

■ *Research on Effective Prevention Strategies*

Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are both committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation.

[Services subcommittee -- make a statement that would actually suggest the lack of this research be presented even stronger as a barrier to HIV prevention.]

[Isbell -- Given the potentially important impact on prevention of viral load, genetic mutations and drug resistance, some mention should be made of the need to link prevention science with the ongoing basic science research agenda.]

[[I think this concern is addressed in the research section where state NIH will "Develop a comprehensive NIH HIV prevention science agenda, combining biomedical, behavioral, and social interventions" .]]

Behavioral Research. Basic behavioral research answers key questions about the determinants of HIV-associated sexual and drug-using behaviors. We still lack critical knowledge in this area, which is central to developing effective interventions.

[Isbell -- mention the need for enhanced support for ethnographic and qualitative research on community cultures, social networks, etc.]

Intervention Research. Intervention research focuses on individual and community level interventions that result in modified sexual and drug-using behaviors and, as a consequence, reduced HIV transmission. There have been significant accomplishments in this area, but, as this portfolio expands, it will be critical to assess interventions in the context of community cultures and social networks ~~real-world settings~~ that are relevant to the growing number of populations that must be reached by HIV prevention programs. This research should be designed by a broad range of scientists, public health and community experts to assure its relevance.

Social Marketing Research. The use of social marketing techniques is a relatively new approach to HIV prevention. This promising area requires use of basic and intervention research, as well as careful design and evaluation of social marketing efforts.

[Isbell -- there is a need to greatly enhance government support for program evaluation, with particular emphasis on replicable, cutting-edge, community-based interventions. ... I'd like to see a commitment to a comprehensive evaluation of the impact of community planning on HIV prevention services.]

Evaluation. To ensure that prevention programs actually are working -- and to ensure that scarce resources are spent on the most effective intervention -- all Federally-funded prevention activities routinely will include evaluation components. Funding Agencies will share widely the knowledge gained about what works and what does not work to ensure promotion of innovation and best practices in the field. In addition, as part of the Federal government's compliance with the Government Performance and Results Act, CDC and SAMHSA will continue to work with their grantees to develop appropriate performance measures for HIV prevention programs.

■ ***Strengthening Community-based Programs***

Community prevention planning is one of the key innovations in CDC's prevention programming over the last several years. This public-private partnership puts Federal funds to work based on locally-designed priorities. This three-year-old initiative is at a crucial stage of development,

and ensuring its success is the third key element of this Strategy's prevention agenda.

Community planning requires ongoing leadership from CDC and its partners as well as the resources to provide the technical assistance the community planning process needs to flourish. Successful HIV prevention often depends on small, new, community-based organizations, many serving minority populations. These organizations need assistance not only on how to plan and compete successfully for available resources but also how to appropriately incorporate epidemiological and research information into community prevention programs.

■ *Program Integration and Collaboration*

The fourth component of the prevention agenda is improving the integration of HIV prevention into other program areas that reach individuals at risk for HIV. HIV prevention programs cannot stand apart from other related public health efforts.

[Prevention subcommittee (Runions) --

Prevention Education. The Center for Disease Control and Prevention's Guidelines for *Effective School Health Programs to Prevent the Spread of AIDS* state the Nation's public and private schools have the capacity and responsibility to help assure that young people understand the nature of the HIV epidemic and the specific actions they can take to prevent HIV infection.

In addition, the guidelines recommend that "Education about AIDS may be the most appropriate and effective when carried out within a more comprehensive school health education program that establishes a foundation for understanding the relationships between personal behavior and health.

CDC's Division of Adolescent and School Health (DASH) currently supports Comprehensive School Health Programs in thirteen states. The model uses an eight component program that is planned, sequential, Kindergarten through grade 12 approach that integrates important categorical topics such as HIV., STDs, unintended pregnancy, alcohol, drugs, tobacco, and intentional and unintentional injury.

Comprehensive School Health Education is one of the more efficient means of preventing risk behaviors. These activities have been accomplished by funding infrastructure at the state level in departments of health and education. It must be expanded into every state in the nation. (The cost would be \$25 million each year to expand CSHE to all 50 states.)

Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and

Prevention's Guidelines for *Effective School Health Programs to Prevent the Spread of AIDS* help assure that young people understand the nature of the HIV epidemic and the specific actions they can take to prevent HIV infection. Strong support for these programs should and will continue.

[Isbell -- The section on substance abuse places undue emphasis on the intersection of HIV prevention with the nation's drug abuse control efforts. Completely missing is the need to greatly enhance programs for out-of-treatment drug users. In New York and elsewhere, community-based organizations have experienced remarkable success with peer-based programs targeting drug users. The document should call for greater support for these and other programs.]

Substance Abuse. HIV transmission is intimately related to substance abuse, through needle-sharing behaviors, as sex is traded for drugs, and as drug and alcohol use impairs judgment and increases risk-taking behaviors. Breaking these linkages will require:

- o *Integration of HIV prevention into substance abuse treatment and prevention programs.* In August 1996, at the request of President Clinton, the Public Health Service agencies jointly co-sponsored a national meeting of state and local officials, researchers, and community experts from the fields of HIV and substance abuse to develop an action plan to more effectively integrate HIV and substance abuse prevention efforts, including post-treatment programs. These agencies are committed to implementing this strategy in the year ahead.
- o *Enrolling more substance abusers into drug treatment.* Substance abuse treatment is a major form of HIV prevention. This Administration will continue to press for increased funding for substance abuse treatment. Further, through outreach, research, and demonstration programs, SAMHSA, NIH, and CDC will work to enroll more people in treatment and to find more successful interventions to accomplish this end.
- o *Reducing the availability of illegal drugs.* The White House Office of National Drug Control Policy (ONDCP) is leading this fight on two fronts: reducing demand for drugs through treatment and prevention programs and reducing the availability of drugs through supply reduction programs.

[Services subcommittee -- recommends a stronger statement that the research and public health data suggests in the absence of treatment for substance abuse on demand, or at least funded more adequately, "needle exchange" should become part of the Strategy.]

[Isbell -- need federal leadership to lift ban, address policy barriers ... Better coordination is needed at the federal level among the multiple agencies that address substance use and/or HIV.]

- o *Preventing HIV transmission from the use of contaminated injection equipment.* The sharing of needles and syringes among injecting drug users is a major means of HIV transmission in the drug-injecting population. While abstinence from drug use is always the preferred means of prevention, the CDC has issued guidelines regarding the use of bleach to clean injection equipment. In addition, CDC-supported research has indicated that removal of restrictions on over-the-counter sale of syringes resulted in decreased reported needle sharing. Current Federal law prohibits the use of Federal funds for needle exchange programs; however, a number of communities across the country have undertaken these programs with local resources. NIH-supported research on existing needle exchange programs is identifying the characteristics that influence program success as an HIV prevention strategy. The Secretary of the Department of Health and Human Services will conduct a review of the scientific data on needle exchange programs and issue a report to the Congress in early 1997.

Primary Care. HIV prevention needs to be better integrated into primary health care. New and promising medical interventions make it critical to improve our approach to HIV counseling and testing -- creating a critical bridge between prevention and primary care. CDC is committed to improving the return rate of those tested at publicly-funded sites and the quality of referral to services for those who test positive.

The linkage must also go in the opposite direction: from primary care to prevention. Primary care providers must learn to incorporate a person's sexual and drug-using history when a medical history is taken, offering HIV-related counseling and voluntary testing, and providing prevention education to HIV positive individuals as part of the provider-patient relationship. HRSA's AIDS Education and Training Centers (AETCs) have played a crucial role in giving health care professionals the information and skills they need. The Administration strongly supports the AETC program and will give it a renewed focus to support this goal.

Often primary care is a direct form of HIV prevention. The NIH-supported research that showed AZT reduces perinatal transmission of HIV was a tremendous medical breakthrough. Realizing the promise of this advance requires a commitment to assuring that all pregnant women are counseled and offered HIV testing -- and that AZT treatment is available for all who desire it. All Federally-funded programs reaching pregnant women -- from Medicaid to Ryan White CARE Act grantees to community and migrant health centers -- are required to take part in this effort. We are committed to expanding outreach and assuring appropriate care so that

the Congressionally-set goal of reducing perinatal transmission by 50 percent by the year 2000 is achieved.

Other STDs and TB. Recent research has confirmed that treatment of sexually transmitted diseases (STDs) other than HIV can reduce the likelihood of HIV transmission -- making the need for collaboration between HIV and STD prevention efforts more compelling. In addition, people living with HIV are at very high risk for developing active tuberculosis. Studies suggest that the risk of developing active TB is 7 to 10 percent per year for persons who are infected with both TB and HIV, as opposed to a 10 percent lifetime risk for persons not infected with HIV.⁶

To address the need to integrate work on these interrelated epidemics, CDC organized the new National Center for HIV, STD, and TB Prevention. CDC has initiated -- and will aggressively pursue -- efforts to increase collaboration among these programs, including expanding the community planning program to cover STD programs.

[Isbell -- ... there is insufficient accountability at the CDC to ensure that sufficient funding is targeted at the populations in greatest need. Some plan to require CDC to account for funding allocation is called for.]

■ ***Targeting Vulnerable Populations***

The HIV epidemic continues to have a disproportionate impact on certain populations where infection rates are rising at a rapid pace. A fifth and final challenge for prevention programming is to pay particular attention to groups that traditionally receive fewer services, but where the risk of infection is greatest. These include adolescents (especially young gay men), women, minorities, prisoners, and substance abusers. Many Federally-funded HIV prevention activities already target these populations, but the President's increased funding request for CDC would provide \$35 million in new funds in FY 1997, specifically for programs and research targeting adolescents, women, and substance abusers.

B. RESEARCH

"Our common goal must ultimately be a cure, a cure for all those who are living with HIV, and a vaccine to protect us from the virus."

**President Clinton, December 5, 1996
The White House Conference on
HIV and AIDS**

Record of Accomplishment

Since 1981, the nation has made significant advances in HIV-related research including:

- o Identification of HIV as the etiologic agent for AIDS;
- o Development of a reliable test to determine exposure to HIV;
- o Determination by NIH of the three-dimensional structure of reverse transcriptase, providing the target for the use of AZT as the first antiretroviral drug proven effective against HIV in NIH-supported clinical trials;
- o Approval of AZT, the first treatment of HIV primary infection;
- o Development by the Food and Drug Administration (FDA) of a system of expedited review,⁷ initiated in 1992, of treatments for life-threatening diseases, including HIV; and
- o Approval by the FDA since January 1993 of 16 new HIV-related drugs, 8 new indications, and three new diagnostics for HIV and related conditions, developed through public and private sector development efforts.

Since he took office in 1993, President Clinton has escalated AIDS research efforts by:

- o Proposing in the FY 1997 Budget to increase AIDS research funding at DHHS by 27 percent (since FY 1993);
- o Signing the NIH Revitalization Act of 1993, granting the Office of AIDS Research at NIH new authority to develop and implement an annual AIDS research plan and budget;
- o Accelerating AIDS drug approval to record times;

- o Supporting research that led to finding that use of AZT during pregnancy, childbirth, and the first six weeks of life can reduce the transmission of HIV from mother to child by two-thirds;
- o Approving in record time a promising new class of AIDS drugs known as protease inhibitors;
- o Launching a four-year, \$100 million research effort to develop effective topical microbicides;
- o Developing the first Federal Plan for Biomedical Research on HIV and AIDS to improve coordination of HIV-related research; and
- o Facilitating creation of the Forum for Collaborative HIV Research to identify opportunities for clinical effectiveness research to improve care for HIV-positive individuals.

Contributions of AIDS Research to Research on Other Diseases

AIDS research has provided significant benefits in the fight against many other diseases. AIDS research has accelerated study of the human immune system, helping to better understand and treat such diseases as cancer; autoimmune diseases, including systemic lupus erythematosus; type I diabetes mellitus; rheumatoid arthritis; and multiple sclerosis. AIDS research advances also have contributed to the prevention and treatment of other infectious diseases and provided a new paradigm for treatment of viral diseases.

Progress in the treatment and prevention of HIV-related opportunistic infections has had an enormous impact on the care of patients with other immunodeficiency conditions who are susceptible to many of the same pathogens. This research effort has enhanced the care of cancer patients, patients who have received immunosuppressive therapy for transplants, and the treatment of diseases caused by elevated immune responses (e.g., allergies and lupus).

HIV research has assisted in identifying new infectious agents that may be responsible for malignancies, such as the recent discovery of the etiologic agent for Kaposi's sarcoma. These findings may help to identify other oncogenic agents. HIV research has led to a better understanding of the mechanisms by which infectious agents and inflammatory cells cross the blood/brain barrier, providing valuable clues for research on Alzheimer's disease, dementia, multiple sclerosis, neuropsychological disorders, encephalitis, and meningitis. Studies to develop anti-HIV therapies have improved our understanding of additional viral diseases and led to

development of treatments.

Efforts to develop drugs for the treatment of HIV have accelerated the development of methods of targeted drug design using sophisticated techniques of structural biology and advanced computer imaging methods. These advances have implications for drug design for virtually all disorders. Clinical trials of poxvirus vaccine vectors and adjuvants in HIV vaccine candidates have supported safety information for cancer vaccines. Research on HIV-related wasting has provided important information for research on nutritional disorders, metabolic abnormalities, and gastrointestinal dysfunctions.

Future Opportunities for Progress

While tremendous progress has been made in HIV research, we cannot and will not diminish our effort until we have found a cure and a preventive vaccine. To accomplish this national goal, we must address four ongoing challenges:

- o Provide leadership and coordination for the Federal research effort;
- o Develop biomedical interventions that prevent HIV infection, including both vaccines and microbicides;
- o Develop new and more effective therapies for HIV and related conditions; and
- o Assure adequate funding for this research effort.

■ *Leadership and Coordination of Research*

[Isbell -- The document appropriately recognized the need for federal leadership and coordination on AIDS research. I'd also add the need for strategic planning, since this is the essence of the NIH reforms that led to the Office of AIDS Research (as well as the philosophy of the Levine Commission Report.)]

Developing and implementing the Federal government's AIDS research agenda presents both scientific and logistical challenges that require leadership, coordination, and strategic planning, first among the 24 institutes, centers, and divisions of the NIH, and second among the various Departments and Agencies throughout the government that support HIV research.

The strengthened authority and new leadership of the NIH Office of AIDS Research and the first

Federal Biomedical and Behavioral Research Plan and Budget for HIV and AIDS form the basis for better coordination of our research effort and provide the assurance that key questions are being answered systematically and without duplication. Over the next year, the Clinton Administration is committed to the reauthorization of the OAR's authority and assuring that its budget powers are maintained throughout the appropriations process.

As part of the ongoing commitment to assess all aspects of our research effort, the OAR convened a panel of outside experts to evaluate NIH's AIDS research programs. The Report of the NIH AIDS Research Program Evaluation Task Force included several key recommendations that will be implemented in the year ahead. These include:

- o Increase NIH support for basic science through investigator-initiated research;
- o Establish a restructured trans-NIH vaccine research effort;
- o Augment research efforts to better understand the human immune system;
- o Develop a comprehensive NIH HIV prevention science agenda, combining biomedical, behavioral, and social interventions; and,
- o Improve coordination among all NIH-supported AIDS clinical trials programs.

■ ***Biomedical Prevention of HIV Infection***

Vaccine Development. The scientific community continues to strive for an effective vaccine against HIV infection. The Federal government, through the NIH and the Department of Defense, will continue to support two approaches to vaccine development. The first approach is based on the belief that gathering additional basic science information offers the best hope in steering vaccine development and that many critical questions must be answered before human trials should begin. The second approach is guided by the belief that data gathered from clinical efficacy trials of vaccine candidates in humans can lead to the development of a successful candidate and that if a safe candidate is available, it is not necessary to resolve all of the scientific questions before proceeding with human trials. Both approaches will continue to be pursued on a parallel and interrelated path. Small trials of more complex vaccine products and two types of vaccine candidates have been underway for several years, and larger trials are planned for the near future.

Microbicides. Many scientists believe that in the absence of a vaccine the development of safe and effective mechanical or chemical barrier methods that will block HIV transmission or

prevent other sexually transmitted infections could dramatically reduce the sexual transmission of HIV. Worldwide, more than 80 percent of HIV infections are acquired heterosexually and women are more easily infected than men. Moreover, the risk of becoming infected or infecting others is substantially increased by the presence of other STDs.⁸

Latex condoms, the most effective barrier methods currently available, still have limitations. Most require the consent, if not the active participation, of both partners and therefore cannot be independently used at the discretion of one partner. An easily available and inexpensive microbicide could provide a prevention option for millions of people worldwide.

To address these goals, the following steps will be taken:

- o During FY 1997, NIH and CDC will begin to implement a four-year, \$100 million initiative on microbicides announced by HHS Secretary Shalala at the Eleventh International Conference on AIDS;
- o The Vice President will continue a high-level dialogue designed to encourage private sector involvement in the development of both microbicides and vaccines; and,
- o Through U.S. participation in UNAIDS, and in other forums, we will encourage international efforts to develop effective microbicides.

■ ***Developing New and More Effective Therapies***

Another challenge in the research arena is developing new and more effective therapies that may allow us to transform HIV disease into a chronic manageable condition. While the FDA is approving new treatments in record numbers and at record speed, the long-term clinical effectiveness of these new therapies remains unknown. There is no doubt that new drugs must be developed.

To accomplish this, NIH will spend an estimated \$470 million in the area of therapeutic research in FY 1997. In addition, several other initiatives will be undertaken or maintained:

- o *Federal support for the Forum for Collaborative HIV Research will promote public-private collaboration in AIDS research.* This new group, formed at the behest of Vice President Gore, is designed to catalyze collaborations among the government research establishment, pharmaceutical companies, and third-party payers to capitalize on recent scientific advances and learn how to optimally use available treatment

regimens. The Federal government is committed to being an equal partner in this new effort.

- o *A Federal commitment to continued access to sophisticated equipment and personnel that can be shared among researchers in both the private and public sectors.* The Department of Energy (DOE) has made available the use of sophisticated imaging equipment that would otherwise be prohibitively expensive for individual researchers or companies. This shared resource has accelerated the understanding of molecular structures in a number of research fields, including HIV. Information gained from this research can form the basis for targeted drug design and development.
- o *Increased focus in Federal research on vulnerable populations.* Our research effort will increase its focus on the needs of vulnerable populations, including youth, women, minorities, and substance abusers. The efforts of programs such as the Women's Interagency HIV Study (WIHS), the Terry Bein Community Programs for Clinical Research on AIDS (CPCRA), and the Adolescent Medicine HIV/AIDS Research Network are important to improving our understanding of HIV disease in these populations and will continue.

■ *Continued Support for Research*

HIV research is an investment in our future. Already, it has helped prolong and improve the quality of lives of HIV-infected individuals, and we must continue to make this investment. To unleash the talents of the best and the brightest in finding a cure, better therapies, and a vaccine will require a sustained funding commitment to meet the research challenges. NIH currently receives many more outstanding research applications than it is able to fund -- representing a lost opportunity for scientific progress. Other Agencies, such as DOD, CDC, and VA, also support crucially important HIV research that strengthens the overall U.S. research effort. Recognizing the importance of biomedical and AIDS research generally, for FY 1997, the President has requested an increase of \$449 million for the NIH overall, an increase of \$24 million for NIH-conducted and -supported AIDS research, and an increase of \$4 million for AIDS research government-wide.

C. CARE & SERVICES

"AIDS has taken too many friends and relatives and loved ones from everyone of us in this room. It has shaken the faith of many, but it has inspired a remarkable community spirit."

President Clinton, May 20, 1996

**Signing of the Ryan White
CARE Act Reauthorization**

Record of Accomplishment

Since the epidemic of HIV and AIDS began in 1981, more than 500,000 Americans have been diagnosed with AIDS and required care. As the number of Americans living with AIDS increased, the demands on the U.S. health care system increased dramatically, but Federal, State, and local governments along with community-based organizations and private clinicians have responded with compassionate, high-quality medical care. In 1986, Federal expenditures for HIV-related care and services were \$193 million, by 1995 the Federal share reached \$3.5 billion.

In the early years of the epidemic, the health care infrastructure was particularly unprepared to accommodate the health care needs of persons with HIV. To meet their complex health care needs, HIV-positive persons were often forced to negotiate a fragmented system of care. There were few programs designed to meet the unique care needs of HIV-positive individuals. Moreover, available care services were often directed towards meeting the acute care needs of persons diagnosed with AIDS, rather than intervening in the early stages of HIV disease. While we still have far to go, the quality and availability of services for HIV-positive persons has improved significantly.

People living with HIV now access and finance health care services in a variety of ways. Currently, approximately 50 percent of adult Americans and 90 percent of children living with AIDS receive their medical coverage through the Medicaid program and another 5 percent receive Medicare benefits. An estimated 15 percent of people living with AIDS have private health insurance and the remaining 30 percent are uninsured and must rely on personal payment or charity care.⁹

In addition to Medicaid, the centerpiece of the national safety net for HIV positive people is the programs funded through the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act of 1990, administered by the Health Resources and Services Administration (HRSA). The CARE Act programs were established to fill gaps in coverage and build systems of care to create access to health care for people living with HIV and AIDS. The first four titles of the CARE

Act support direct services for people living with HIV:

- o Titles I and II of the CARE Act provide funds for outpatient care, support services, and case management that are given to cities and States primarily on a formula basis. Title II also provides drug reimbursement funding for persons living with HIV/AIDS under the AIDS Drug Assistance Program (ADAP).
- o Title IIIb of the CARE Act provides early intervention services such as counseling and testing, medical care, and educational services for medically underserved persons with the goal of reducing HIV-related illness.
- o Title IV seeks to increase the availability of research, care and services for women, infants, children, and youth in a community-based family-centered system of care.

HRSA also provides primary care to persons living with HIV through its Community Health Centers and Maternal and Child Health Block Grant programs. Other sources of primary care supported by the Federal government include the Department of Defense, the Department of Veterans Affairs, and the Indian Health Service (IHS), which provides health care for HIV-positive Native Americans and Alaska Natives. Additionally, the Bureau of Prisons within the Department of Justice provides care for HIV-positive people in Federal prisons.

People living with HIV and their families face significant obstacles to locating affordable housing. Housing assistance for people living with HIV and AIDS is provided by the Department of Housing and Urban Development (HUD) through its Housing Opportunities for Persons with AIDS (HOPWA), enacted in 1990, and other programs, such as the Section 811 Supportive Housing Programs for Persons with Disabilities. These programs work in partnership with local initiatives incorporating housing assistance into a community's continuum of services.

To further foster community involvement, HUD also has established the Consolidated Planning process for communities that receive funds under the Department's economic and community development programs, including recipients of HOPWA formula allocations. The Community Development Block Grant (CDBG), the HOME affordable housing program, as well as public housing programs are key resources that are available to communities.

Since he took office in 1993, President Clinton has built on this record by making AIDS a top national priority and increasing that national commitment by:

- o Signing the Ryan White CARE Act Amendments of 1996, and proposing to increase Ryan White CARE Act funding by 157 percent since FY 1993;

- o More than doubling Federal funding for State AIDS Drug Assistance Programs, which assist uninsured and underinsured individuals purchase prescription drugs;
- o Proposing to increase funding for HOPWA in the FY 1997 Budget by 96 percent since FY 1993;
- o Fighting to preserve the Medicaid guarantee of coverage for the more than 50 percent of people with AIDS and 90 percent of children with AIDS who rely on this program for their health coverage; and,
- o Revising eligibility rules for Social Security disability benefits to make it easier for people living with HIV to qualify for benefits.

Future Opportunities for Progress

The national goal in this area is to ensure that people living with HIV have the opportunity to live productive lives by having access to services that are affordable, of high quality, and responsive to their needs. AIDS care and service programs must continue to provide access to care for those without insurance coverage, improve prioritization and accountability, and increase the cost-effectiveness of services they provide. As treatments improve and extend the productive lives of people with HIV, we must continually reexamine the range of services that are needed.

Two major challenges exist in meeting this goal:

- o Maintaining HIV-related care and services as an investment priority in budgeting in the context of a balanced Federal budget: fighting to preserve Medicaid and continuing to seek funding for CARE Act and HOPWA programs.
- o Assuring that available resources are used as effectively as possible.

■ *Making Investment in Care and Services a Budget Priority*

Preserving Medicaid. As the epidemic continues to spread in lower-income communities, Medicaid will be an even more essential lifeline of support for Americans living with HIV and AIDS. The need to maintain the historic Federal-State partnership on Medicaid has never been greater. Proposals in Congress to convert Medicaid into a block grant would endanger access to care for people living with HIV and AIDS, particularly proposals to eliminate or weaken the

Federal guarantee of coverage for people living with disabilities. The President has vetoed one such proposal and has made sustaining the entitlement to Medicaid central to the national goal of ensuring appropriate and affordable care and services for persons living with HIV and AIDS.

[Services subcommittee -- We should be thinking about the implications of people who have previously been disabled because of HIV that now feel well enough to at least begin to work again, they are not faced with having to "remain disabled" in order to continue to receive treatment and care.]

[[Do we want to add section on SSA in light of the hope offered by protease inhibitors?]]

Continuing Support for the Ryan White CARE Act. The five-year reauthorization of the CARE Act signed by President Clinton on May 20, 1996 provides people living with HIV and AIDS with peace of mind that support from the Federal government will continue. President Clinton has proposed \$896 million for this program in FY 1997.

Expanding Support for Housing Services. Finally, maintaining consistent funding for the housing component of the services safety net will continue to be a national priority. Without stable housing a person living with HIV has diminished access to care and services and a diminished opportunity to live a productive life. It is estimated that up to 50 percent of people living with HIV and AIDS are or will be at risk of becoming homeless during the course of their illness.¹⁰ The President's FY 1997 amended budget request for HOPWA is \$196 million.

■ ***Ensuring Effective Use of Limited Resources***

There are three primary ways the Federal government will work to make the most of its limited resources by: (1) improving coordination among Federal programs, (2) improving the quality of care provided by those programs, and (3) evaluating program effectiveness to ensure that funds are well spent.

[Services subcommittee -- The emphasis on the difficulty in coordination of so many different programs that help people with HIV/AIDS should have even more emphasis and a way needs to be found to do a better job with that effort. We need to find a way to help people understand the importance of integrating HOPWA into the broader system of care and treatment for people with HIV if HOPWA is to be fully effective in its purpose.]

Improving Program Coordination. Integrating HIV and related services is an important step in assisting communities to build seamless systems of support for our most vulnerable citizens. Organizations receiving Federal funding to provide AIDS-related care often require support from

several Federal agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD.

The agencies funding HIV-related services are committed to simplifying and improving the application process for Federal funding and to facilitating service integration. HRSA and SAMHSA have issued joint program announcements, and HUD and HRSA have issued a joint program announcement for the Special Projects of National Significance (SPNS) program. These concerted efforts to improve integration will be continued and expanded, with special attention to linking HIV and substance abuse prevention and services.

[Services subcommittee -- the guidelines need to be broad and flexible given the rate of change being experienced. This is illustrated by the fact that so many HIV patients often know more than their MD. Further, the uneven knowledge often leads to less than "state of the art" care in many parts of the country.]

[Mike Rankin -- (1) There should be a statement from Secretary Brown to all DVA VUSN Directors, Regional Directors, and Chiefs of Staff of medical centers, that he personally considers outreach to, and treatment of veterans living with HIV/AIDS to be a top priority. (2) To that end, medical centers and clinics whenever possible should identify clinicians with special expertise in the treatment of HIV/AIDS. Those clinicians should be supported in establishing AIDS clinics and prevention programs.]

(3) The DVA should provide training conferences for physicians, nurses, and other clinicians on a regular basis. Those attending these conferences should be expected to return to their various centers with skills and knowledge they can transmit to their colleagues.]

(4) The DVA should direct those in the field to have regular contact with veterans organizations, public and private hospitals and clinics, and with community HIV/AIDS organizations, with the goal of identifying veterans living with the virus, and bringing them into VA treatment centers if they so desire.]

Improving Quality of Care. Federally-supported programs efforts such as Medicaid, Medicare, and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. Ensuring consistency in care delivery requires increased training for health care professionals and greater accountability through the use of performance measures for quality care. It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section Translation of Research Advances in Practice.) HRSA and

The National AIDS Strategy
10.31.96 Draft for ONAP Review

HCFA will continue to offer guidance to grantees and the States regarding maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the VA and DOD and private-sector clinicians.

Evaluating Program Effectiveness. Strong Federal support for safety net programs must be accompanied by improved accountability and priority setting. Evaluating current activities provides valuable information for planners and those at the front lines of the epidemic and assists in providing better care to people living with HIV.

D. CIVIL RIGHTS

"Every person with HIV or AIDS is someone's son or daughter, brother or sister, parent or grandparent. We cannot allow discrimination of any kind to blind us to what we must do."

President Clinton, May 20, 1996

**Signing of the Ryan White
CARE Act Reauthorization**

Discrimination against people living with HIV or AIDS violates the human rights of individual Americans and undermines our efforts to prevent and treat HIV infection. The extraordinary stigma that has been attached to HIV disease hampers the ability of people living with HIV and AIDS to live full lives free of fear.

Discrimination also undermines efforts to prevent and treat HIV infection and bring the epidemic under control. Fear of discrimination and stigma causes many people not to seek testing for HIV; thus many remain unaware of their HIV status and go without the care that could help them live longer, healthier lives. Opportunities to educate people are also lost as people avoid prevention programs because of the stigma associated with HIV.

[Schatz -- the focus is unduly narrow. Should also emphasize combating discrimination in education, housing, service establishments, an other areas covered by Federal law.]

The fourth goal of the National AIDS Strategy is to fight discrimination on all fronts, including employment, access to health care, education, housing, service establishments, an other areas covered by Federal law, and to provide national leadership in erasing the stigma associated with HIV and AIDS.

Record of Accomplishment

During the early years of the AIDS epidemic, protection of the civil rights of people living with HIV and AIDS was sporadic, at best. Individual lawsuits were the first line of action. By the late 1980s, however, the Federal government began to respond more aggressively with actions including:

- o Enactment of the Harkin-Humphrey Amendment to the Civil Rights Restoration Act, clarifying that Section 504 of the Rehabilitation Act of 1973 applied to people with

contagious diseases, including HIV; and

- o Enactment of the Americans with Disabilities Act of 1990 (ADA), which protects individuals living with HIV and AIDS and people perceived to be at risk for HIV from discrimination in housing, employment, and public accommodation.

Since he took office, President Clinton has directed relevant Agencies to make enforcement of the civil rights of people living with HIV and AIDS a priority. Key actions include:

- o Vigorously enforcing the ADA by the Justice Department, the Equal Employment Opportunities Commission, and the Department of Health and Human Services;
- o Vigorously enforcing Section 504 of the Rehabilitation Act of 1973 as it pertains to recipients of DHHS funds such as hospitals, nursing homes, and social service agencies;
- o Forcefully opposing the "Dornan Amendment," which would have required the discharge of all military personnel who are living with HIV. President Clinton declared his belief that the proposal is unconstitutional and directed the Department of Justice not to defend it if challenged in court. The President led a successful effort to repeal the "Dornan Amendment" and continues to oppose its enactment;
- o Establishing an HIV/AIDS education program available to all Federal workers; and
- o Using the Presidential "bully pulpit" to speak out repeatedly against discrimination against people with HIV and AIDS. In December 1995, the President hosted the first ever White House Conference on HIV and AIDS, bringing to the White House more than 300 people from around the country to discuss with the President the impact of the epidemic on their lives and communities.

Future Opportunities for Progress

There are four key ways that the Federal government is maintaining its commitment to meeting the goal of ensuring that people living with HIV are not subject to discrimination:

[Discrimination subgroup -- .. the Strategy should promote a broader federal approach to combating HIV-related discrimination. ... the section on providing leadership should emphasize devoting resources to proactive initiatives designed to aggressively address systemic problems of discrimination -- e.g. refusal by dentists, physicians, and other health care workers to provide

care for patients with HIV ...]

Enforcing Rights. Efforts to protect the civil rights of people with HIV and AIDS must be ever-vigilant. The Federal government will continue to exhibit strong leadership on this issue through its enforcement of the Americans with Disabilities Act and public condemnation of discriminatory acts or statements. Of particular concern is discrimination against people with HIV seeking access to health care and health care facilities. A joint effort by the Department of Health and Human Services and the Department of Justice aimed at access to nursing homes is a significant step forward in protecting the rights of people living with HIV.

Protecting Workers. The Federal government is examining existing policies related to the exclusion of people living with HIV from Federal employment. The Director of the Office of National AIDS Policy is working with Federal Agencies to examine individual policies to determine whether they comply with Federal public health guidelines.

Opposing Discriminatory Legislation. The Administration will continue to oppose, in the strongest terms possible, efforts by the Congress to discriminate against people living with HIV and AIDS.

[Services subcommittee -- Broaden the bully pulpit to include many more people in the Administration than the President.]

Providing Leadership. Leaders of government have an obligation to use the power of their elected office to speak out against acts or words of discrimination against any group of people. President Clinton and members of his Administration have used and will continue to use their positions to oppose discrimination against people living with HIV and AIDS.

Add Opportunity for Progress -- Provide leadership in advocating reasonable legal/policy approaches on discrimination issues not specifically addressed by federal law. As one possible example, the Justice Department, of the HHS Office of Civil Rights, might issues advisory opinions on such issues as HIV discrimination in the contexts of family law (e.g. denials of child custody and visitation privileges) or criminal law (e.g. charging HIV+ people who spit with attempted murder). Reasoned advisory opinions on such matters by the DOJ or HHS OCR, while not legally binding, could prove to be extremely helpful to courts that are grappling with these issues.]

[[Do we want to do this??]]

[[Too late for the 1997 version.]]

E. INTERNATIONAL ACTIVITIES

"The American people need to know that everybody in this country and, indeed, throughout the world, is now vulnerable to this disease."

**President Clinton, December 5, 1996
The White House Conference on
HIV and AIDS**

AIDS is a global epidemic. The World Health Organization (WHO) estimates that 94 percent of new infections occur in developing countries. In the United States it is estimated that between 650,000 and 900,000 people are currently infected with HIV. The WHO and UNAIDS estimates that 27.9 million adults and over 1.5 million children are currently infected worldwide and there will be 10 to 15 million orphans worldwide attributable to HIV by the year 2000. Two to three million new HIV infections can be expected annually, and by the year 2000, 30 to 40 million people will have been infected around the globe.

The epidemic jeopardizes decades of economic and social advances in many developing nations. In some of the nations of Africa and Asia, economic advances are threatened and in some cases may be reversed due to HIV and AIDS. Socio-economic studies have shown a decrease in overall domestic savings and investment levels, negative effects on foreign investments, reductions in the volumes of imports and exports, and a reduction in receipts from tourism.¹¹ In many countries governments will be forced to cope with increasing numbers of cases, weakened health care systems, a deleterious economic impact on the most productive segments of society, and the reduction in the number of healthy men and women able to serve in the government and the military.

Record of Accomplishment

Since it began, HIV and AIDS has been a global concern. The U.S. has worked closely with developed and developing nations to design an international response that is both vigorous and coordinated. Sentinel achievements include:

- o Providing initial funding and key leadership for the creation of the Global Programme on AIDS at the World Health Organization (WHO) in 1987; and
- o Playing an instrumental role in establishing the new streamlined Joint United Nations Programme on HIV/AIDS (UNAIDS) in 1996.

The United States is the largest contributor to international efforts to combat the pandemic of HIV and AIDS. Several Federal Agencies are working to slow the AIDS epidemic

internationally. (See Appendix E). The Department of State works with other Agencies and non-governmental organizations to implement a framework to guide U.S. foreign policy in the global efforts against HIV and AIDS. The major areas of U.S. leadership in the global HIV arena are: mobilizing and unifying national and international efforts; preventing new infections; biomedical research; and reducing the personal and social impact of the epidemic.

The U.S. Agency for International Development (USAID) plays a leadership role in the global HIV response through development assistance, research, and policy formulation. USAID focuses its efforts on developing prevention programs based on proven interventions; addressing social, cultural, regulatory, and economic issues related to HIV and AIDS and other sexually transmitted infections; and developing and testing new interventions and methods to prevent transmission and mitigate the impact of the epidemic. The Peace Corps trains a portion of its volunteers to directly address HIV-related concerns in their countries of placement. The U.S. Information Agency (USIA) supports programs that promote dissemination of U.S. policies and information related to HIV and AIDS.

In addition, several Agencies support research overseas, including the National Institutes of Health, the Centers for Disease Control and Prevention, and the Department of Defense. The DOD is conducting clinical trials of candidate HIV vaccines in Thailand and NIH (working in collaboration with USAID), supports a range of scientific studies in developing countries. The results of the studies ultimately will be used to develop interventions to reduce behaviors that place individuals at risk for contracting HIV infection.

Future Opportunities for Progress

To accomplish the goal of providing strong continuing support for international efforts to address the HIV epidemic, the following steps will be taken:

International Leadership. The United States has established a global leadership role in combatting the epidemic. This leadership will continue. The U.S. strongly supports the newly established Joint United Nations Programme on HIV/AIDS (UNAIDS).¹² The U.S. is a member of the governing body of UNAIDS, signed the 1994 Paris Declaration, and also supports the Greater Involvement of People Living with HIV and AIDS Initiative (GIPA).

The U.S. also supports efforts to access available resources more effectively as well as encourage non-traditional donor countries to provide much-needed contributions. Supporting UNAIDS organizations such as UNICEF, WHO, UNDP (United Nations Development Program), the U.S.-Japan Common Agenda and its innovative programmatic efforts, and UNAIDS' goal of working to increase the availability of therapeutics (and vaccines when developed) to the residents of developing countries is not only morally correct, but also furthers

U.S. interests by promoting economic and social stability worldwide.

Strengthening Partnerships. In addition to maintaining multilateral partnerships, the U.S. must strengthen its bilateral programs for HIV activities and continue to support developing countries where more than 90 percent of the world's AIDS cases are found.

Sharing Technology and Bringing Lessons Home. Through USAID's "Lessons Without Borders Project," the U.S. has gained valuable insights from experiences in participating countries and is applying them to communities here at home. The initiative brings lessons learned abroad back to inner-city and rural areas with problems similar to those experienced overseas. These efforts will be continued and expanded for HIV and AIDS.

Improving Program Coordination. One of the most challenging aspects of the U.S. effort is effective coordination among a host of Agencies with varied missions and activities. In order to ensure that efforts are productive, the U.S. Agencies supporting international activities must develop a mechanism for coordinating programs in a systematic and efficient manner.

F. TRANSLATION OF RESEARCH ADVANCES INTO PRACTICE

"I want all our fellow Americans to know that this investment in science has paid tremendous dividends."

**President Clinton, December 5, 1996
The White House Conference on
HIV and AIDS**

Isbell -- little mention of the need to perform follow-up studies needed to perform follow-up studies to give providers and consumers the information they require to make informed treatment decisions. would emphasize this in national strategy.

The document stressed the need for provider education, but fails to note the overwhelming need for consumer education programs. At GMHC, our experience suggests that the doctor's office is not always the best place for consumers to get the information they need or desire. In light of the potential public health consequences of widespread drug resistance, the country should invest in programs that provide consumers with the information they need (a) to make treatment decisions and (b) to comply with their medical regimens.

... I'm dubious of the meaningfulness of clinical care guidelines. ... While clinical guidelines probably have some role in provider education, I think there are numerous other strategies that could be useful, such as comprehensive professional and public education campaigns.]

An important element in the fight against HIV and AIDS is ensuring that research advances are translated into improved HIV prevention programs and better care for HIV-positive persons. While directly related to earlier goals relating to research, prevention, and care and services, it is important to highlight this aspect of the nation's response to the epidemic to assure that we are taking what we are learning and translating it into benefit for people with or at risk for HIV.

An example of the importance of such efforts is the translation of the NIH-supported research study that found that the use of AZT by pregnant women during pregnancy and childbirth and its application to newborns for the first six weeks of life can reduce the risk of perinatal transmission of HIV by two-thirds. Translation of these results required actions by the National Institutes of Health and the Centers for Disease Control and Prevention, which prepared guidelines for physicians caring for pregnant women and for consumers; the Health Resources and Services Administration, which provided guidance to grantees on coverage of such services; the Health Care Financing Administration, which provided similar guidance to State Medicaid

Directors.

Record of Accomplishment

Due in part to Federally-sponsored information dissemination activities, dramatic changes in the way HIV is treated have taken place. Ensuring dissemination of HIV-related information falls under the missions of several Agencies (See Appendix F). Key examples are:

- o The National Institutes of Health (NIH) supports a broad range of efforts including a "Clinical Alerts" mechanism for the dissemination of clinical trials results to health professionals, patients, the media, and the public;
- o DHHS supports and directs the International HIV/AIDS Clinical Conference Call series, which disseminates state-of-the-art clinical care information to primary care providers via live worldwide audio tele-conferencing;
- o NIH supports publicly available computerized databases such as AIDSDRUGS, AIDSTRIALS, and AIDSLINE;
- o The toll-free 1-800 TRIALS-A AIDS Clinical Trials Information Service (ACTIS) is co-sponsored by NIH, CDC, and FDA;
- o The Centers for Disease Control and Prevention disseminates information to clinicians, patients, and the public through the National AIDS Hotline (1-800-342-AIDS); its toll-free 1-800-HIV-0440 HIV/AIDS Treatment Information Service (ATIS); and the National AIDS Information Clearinghouse;
- o The CDC also develops and issues guidelines for health professionals and the public through its *Morbidity and Mortality Weekly Report*;
- o The Agency for Health Care Policy and Research (AHCPR) publishes a series of HIV-related clinical practice guidelines for clinicians and companion pamphlets for their patients; and,
- o The Health Resources and Services Administration directs a nationwide system of AIDS Education and Training Centers that provide state-of-the-art HIV clinical information to health care providers. HRSA also has developed guidances for its Ryan White CARE Act grantees and funds an AIDS "warmline" that responds to questions from clinicians across the country.

Future Opportunities for Progress

Ensuring that research advances are translated into improved HIV prevention programs and better care for HIV positive persons, will require a number of steps including:

Increasing Education and Training. As we continue to expand our base of knowledge about AIDS care, efforts to educate and train health care professionals in state-of-the-art care for people living with HIV and AIDS must be maintained. An AHCPR-supported study indicated that primary care physicians may miss significant HIV-related symptoms during patient examinations.¹³ Other research indicates that a disturbing number of clinicians do not use universal precautions in the course of routine patient care.¹⁴ To reverse this pattern, the Administration is fighting to restore funding for the AIDS Education and Training Centers, which play a vital role in training providers. Achieving this goal will also require a renewed emphasis on HIV on the part of medical schools, professional organizations, and individual clinicians.

[Services subcommittee -- As we continue to see improvements in drugs and knowledge about treatment, the time between the development of the information and its dissemination needs to be shortened.]

Disseminating Guidelines. One of the most difficult tasks for clinicians and patients is interpreting the patchwork of data and articles regarding treatments and converting it into a therapeutic strategy for their patients. With every research breakthrough, this task becomes more difficult. It is essential that practical information for practicing clinicians and their patients be provided ~~as quickly as possible in a timely manner~~. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies and private sector clinicians.

Improving Coordination of Federal Activities. Enhancing coordination of information dissemination activities among Public Health Service Agencies is an important priority. Within DHHS, the Office of HIV/AIDS Policy (OHAP) has the lead responsibility for coordinating the HIV-related activities of the Public Health Service Agencies. Ensuring that information about a research breakthrough is easily available, reaches the appropriate people and organizations, and that policies and standard-of-care practices for Federally-sponsored programs are modified to reflect the latest treatment developments, requires a continued high level of cooperation and coordination among Public Health Service Agencies.

Disseminating Prevention Models. Improved dissemination efforts also are needed in the area of primary prevention models. Models of effective prevention interventions have been

developed, but often this valuable information is not reaching those people developing, implementing, and evaluating prevention programs. The Public Health Service will take the lead in ensuring that information that can be used to stem the tide of new infections reaches those who can make a difference.

Endnotes

1. It is, however, hoped that with greater use of AZT by HIV-positive pregnant women, the number of new cases in newborns can be reduced.

7. The accelerated approval regulation permits companies to seek approval of drugs for serious or life-threatening diseases when the drug provides meaningful therapeutic benefit over existing therapies. Under these procedures, the FDA may approve drugs based on surrogate endpoints, such as CD4+ cell counts that reasonably predict that a drug provides clinical benefit. The company is then required to confirm this clinical benefit through additional human studies to be completed after marketing approval. The accelerated approval regulation provides for removal of the drug from the market if further studies do not confirm the clinical benefit of the therapy.

12. Until recently, the United Nations' response to HIV/AIDS was carried out primarily by the World Health Organization's Global Programme on AIDS. On January 1, 1996 the U.N. launched UNAIDS, co-sponsored by six U.N. agencies to strengthen coordination and focus support for HIV/AIDS activities at the global and country levels. UNAIDS has established three mutually reinforcing roles: to be a major source of policy development and research; provide technical support; and be an advocate for comprehensive, multi-sectoral responses to the pandemic.

MEMORANDUM FOR THE PRESIDENTIAL ADVISORY COUNCIL ON HIV AND AIDS

FROM: Patsy Fleming

SUBJECT: National AIDS Strategy (NAS)

Thank you for your comments and feedback on the draft National AIDS Strategy. The Council's insightful advice has been invaluable and has made the NAS a stronger and better document. We look forward to continuing to work with you on this and other important projects.

Again, thank you for your efforts in helping us to develop the first-ever National AIDS Strategy.

Adam -

Here's the note. It's under n:\pac memo. K96.

Jane

1 for each council member.

MEMORANDUM TO JS & RS:

PF has convened a meeting with Jeremy B, JL and you for Wednesday, November 13, from 3:00-4:00p.m. on the Strategy.

cc: PF

TO: Wertheimer, Wendy
FROM: Ursula Sanville
 AIDS Policy Council

CC: Whitescarver, Jack
CC: Jeffrey Levi
CC: wepaul

SUBJECT: RE: FW: NIH Goals for National Strategy

Wendy --

Got the goals, they'll go in as written.

Also, in the beginning in the civil rights section, you said that the changes didn't solve the concerns from the last draft -- what was that concern specifically?

July 2, 1996

Jane:

The attached sheets are self-explanatory. I faxed them as noted at the bottom to the Conference Center. If you have any changes or additions to make, please call them at 457-7507.

A handwritten mark, possibly a signature or initials, consisting of a large, stylized 'e' or 'c' shape.

SUBJECT: National AIDS Strategy

It looks like the National AIDS Strategy will be released this week. I'd like very much to have a photo op with the President AND the Vice President and the Council Chair, Scott Hitt. Anything you can do to promote this idea I would welcome. Thanks. Call with questions.

Crosswalk between PACHA Comments on National AIDS Strategy and Incorporated Text

<i>PACHA Comments on National AIDS Strategy</i>	<i>NAS Text Changes</i>
Message from the National AIDS Policy Director. Need stronger introduction. Define the strategy. Begin with Ms. Fleming's ending statements on ending the epidemic.	Changed order, added text about the strategy, and added letter from President. (p.2, pp. 5-6).
Introduction. Sharpen all goals to indicate the Administration's sense of urgency.	Goals were changed to: The President has identified the following national goals to guide our efforts to end the epidemic of HIV and AIDS: ■ To develop more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected through strong, continuing support for HIV-related research; ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts; ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs; ■ To ensure that all people living with HIV are not subject to discrimination; ■ To provide strong, continuing support for international efforts to address the HIV epidemic; and, ■ To ensure that research advances are translated into improved HIV prevention programs and enhanced care for HIV- positive persons. (p.7)

Make prevention goal stronger to reflect President's quote in beginning of prevention section.	The goal was changed to match the President's quote: ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts. (p. 7)
There should be quality care for all in the goals.	The goal was changed: ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs. (p.7)
A goal should be added emphasizing that HIV should be taken out of the political arena and viewed as a public health crisis affecting everyone.	The six goals match the 6 sections of the text and appendices. The importance of viewing HIV/AIDS as an international public health crisis is addressed in the President's letter (p. 2), and the Introduction (pp. 7-9).
Introduction states that AIDS is a costly disease... [but] AIDS is not inordinately expensive. Many federal programs mentioned in the document are extremely cost-effective because they help reduce HIV-related medical costs. HOPWA funds a continuum of housing programs that provide far less costly alternatives to institutionalization. Similarly, by reducing the epidemic's long-term burden, HIV prevention services represent an immediate and future economic savings for the country. AIDS isn't an endless drain on public resources; rather the federal government has developed excellent strategies for reducing the epidemic's impact. The document should make these points to combat the growing sentiment that "AIDS gets more than its fair share."	Text was modified to emphasize the cost of care and the role of Federal programs in reducing the economic impact: The average lifetime cost of medical care after an HIV diagnosis is \$119,000. People living with HIV are often dependent on the public sector for their health care, particularly in the later stages of HIV disease. More than 50 percent of people living with AIDS are enrolled in Medicaid, including more than 90 percent of children with AIDS. In FY 1996, the Federal government spent an estimated \$1.8 billion on Medicaid benefits for people living with HIV and AIDS and another \$690 million on Medicare benefits. Social Security benefits for people disabled by HIV/AIDS totaled nearly \$980 million in FY 1996. Many Federal programs such as Housing Opportunities for Persons with AIDS (HOPWA) and CDC's prevention efforts contribute to reducing the short- and long-term economic costs of the epidemic. (p. 9)

Prevention. Adolescents and youth are one of America's most underserved populations in terms of access to health care services and health education. The Division of Adolescent and School Health (DASH), a program of the Centers for Disease Control and Prevention, addresses the prevention of priority health risks (including HIV/AIDS) among adolescents and youth.	Language on schools was added: Federal efforts have shown that HIV prevention programs can be effective. CDC's prevention projects, many in partnership with states, local governments, schools, and community-based organizations, have demonstrated that prevention programs are most effective when designed and implemented in partnership with communities to which they are targeted. (p.12) The following section on prevention education was also added: Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's <i>Guidelines for Effective School Health Programs to Prevent the Spread of AIDS</i> helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p.14)
Document does not address counseling and testing. ... while testing should not be centerpiece of our prevention efforts, it is equally clear that the nation's laissez faire approach to testing effectively squanders countless opportunities to intervene with effective HIV prevention services.	Counseling and testing are addressed in the following text: New and promising medical interventions make it critical to improve our approach to HIV counseling and testing -- creating a critical bridge between prevention and primary care. CDC is committed to improving the follow-up services for those counseled and tested at publicly-funded sites including the quality of referral to services for those who test HIV-positive. (p. 15) Primary care providers must learn to incorporate a person's sexual and drug-using history when a medical history is taken, offering HIV-related counseling and voluntary testing, and providing prevention education to HIV-positive individuals as part of the provider-patient relationship. (p. 15)

Add goal of enhanced coordination of federal efforts in order to ensure that prevention programs are grounded in behavioral and ethnographic research and based on the latest epidemiologic data. Currently there is insufficient coordination.	Basing prevention interventions on research is addressed in the following text: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13) Improving program coordination and integrating prevention is addressed in the following text: <i>Improving Program Coordination.</i> Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD. (p. 25)
Change this bullet to read "Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors."	The text was changed to read: • Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors. (p. 12)

Make a statement that would actually suggest the lack of this research be presented even stronger as a barrier to HIV prevention.	One of the major goals for HIV prevention states: • Improving scientific knowledge about effective prevention models and strategies. (p. 12) Text states: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13)
Given the potentially important impact on prevention of viral load, genetic mutations and drug resistance, some mention should be made of the need to link prevention science with the ongoing basic science research agenda.	This concern is addressed in the research section, where NIH will: • Develop a comprehensive NIH HIV prevention science agenda, combining biomedical, behavioral, and social interventions. (p. 19)
Mention the need for enhanced support for ethnographic and qualitative research on community cultures, social networks, etc.	Language regarding community cultures was added: Intervention research focuses on individual and community-level interventions that result in modified sexual and drug-using behaviors and, as a consequence, reduced HIV transmission. There have been significant accomplishments in this area, but, as this portfolio expands, it will be critical to assess interventions in the context of community cultures and social networks that are relevant to the growing number of populations that must be reached by HIV prevention programs. This research should be designed by a broad range of scientists, public health, and community experts to assure its relevance. (p. 13)

There is a need to greatly enhance government support for program evaluation, with particular emphasis on replicable, cutting-edge, community-based interventions. ... I'd like to see a commitment to a comprehensive evaluation of the impact of community planning on HIV prevention services.

Language on cutting-edge programs was added to the evaluation and dissemination section:

Evaluation and Dissemination. To ensure that prevention programs actually are working -- and to ensure that scarce resources are spent on the most effective interventions -- all Federally-funded prevention activities routinely will include evaluation components. Funding Agencies will share widely the knowledge gained about what works and what does not work to ensure promotion of innovation and best practices in the field. In addition, as part of the Federal government's compliance with the Government Performance and Results Act, CDC and SAMHSA will continue to work with their grantees to develop appropriate performance measures for HIV prevention programs, including those developed under the community planning process. (p. 14)

Add the following:

Prevention Education. The Center for Disease Control and Prevention's Guidelines for *Effective School Health Programs to Prevent the Spread of AIDS* state the Nation's public and private schools have the capacity and responsibility to help assure that young people understand the nature of the HIV epidemic and the specific actions they can take to prevent HIV infection.

In addition, the guidelines recommend that "Education about AIDS may be the most appropriate and effective when carried out within a more comprehensive school health education program that establishes a foundation for understanding the relationships between personal behavior and health.

CDC's Division of Adolescent and School Health (DASH) currently supports Comprehensive School Health Programs in thirteen states. The model uses an eight component program that is planned, sequential, Kindergarten through grade 12 approach that integrates important categorical topics such as HIV, STDs, unintended pregnancy, alcohol, drugs, tobacco, and intentional and unintentional injury.

Comprehensive School Health Education is one of the more efficient means of preventing risk behaviors. These activities have been accomplished by funding infrastructure at the state level in departments of health and education. It must be expanded into every state in the nation. (The cost would be \$25 million each year to expand CSHE to all 50 states.)

A section on prevention education was added:

Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's *Guidelines for Effective School Health Programs to Prevent the Spread of AIDS* helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p. 14)

The section on substance abuse places undue emphasis on the intersection of HIV prevention with the nation's drug abuse control efforts. Completely missing is the need to greatly enhance programs for out-of-treatment drug users. In New York and elsewhere, community-based organizations have experienced remarkable success with peer-based programs targeting drug users. The document should call for greater support for these and other programs.	The document addresses the need for continuing community-based planning to develop locally-designed prevention priorities. (p. 14)
Include a stronger statement that the research and public health data suggests in the absence of treatment for substance abuse on demand, or at least funded more adequately, "needle exchange" should become part of the Strategy. There is a need federal leadership to lift ban on needle exchange and address policy barriers ... Better coordination is needed at the federal level among the multiple agencies that address substance use and/or HIV.	Language on needle exchange programs is: • <i>Preventing HIV transmission from the use of contaminated injection equipment.</i> The sharing of needles and syringes among injecting drug users is a major means of HIV transmission in the drug-injecting population. Abstinence from drug use is always the preferred means of HIV prevention. The CDC recommends using sterile or never-used injection equipment. CDC-supported research has indicated that removal of restrictions on over-the-counter sale of syringes resulted in decreased reported needle sharing. Current Federal law restricts the use of Federal funds for syringe exchange programs; however, a number of communities across the country have undertaken these programs with local resources. NIH-supported research on existing needle exchange programs is identifying the characteristics that influence program success as an HIV prevention strategy. (p. 15)

There is insufficient accountability at the CDC to ensure that sufficient funding is targeted at the populations in greatest need. Some plan to require CDC to account for funding allocation is called for.	The text section on targeting vulnerable populations states the importance of providing funding for those at greatest risk: The HIV epidemic continues to have a disproportionate impact on certain populations where infection rates are rising at a rapid pace. A fifth and final challenge for prevention programming is to pay particular attention to groups that traditionally receive fewer services, but where the risk of infection is greatest. These include adolescents (especially young gay men), women, minorities, gay men of color, substance abusers, and prisoners. Many Federally-funded HIV prevention activities already target these populations. The additional \$32 million appropriated in FY 1997 for the CDC will provide new funds specifically intended for programs and research targeting adolescents, women, and substance abusers. To ensure that prevention programs, including community planning efforts, are as effective as possible all Federally-funded prevention activities routinely will include monitoring and evaluation components. (p. 16)
Research. The document appropriately recognized the need for federal leadership and coordination on AIDS research. I'd also add the need for strategic planning, since this is the essence of the NIH reforms that led to the Office of AIDS Research (as well as the philosophy of the Levine Commission Report).	Text on strategic planning was added: Developing and implementing the Federal government's AIDS research agenda presents both scientific and logistical challenges that require leadership, coordination, and strategic planning, first among the 24 institutes, centers, and divisions of the NIH, and second among the various Departments and Agencies throughout the government that support HIV research. (p. 18-19)

Care and Services. We should be thinking about the implications of people who have previously been disabled because of HIV that now feel well enough to at least begin to work again, they are not faced with having to "remain disabled" in order to continue to receive treatment and care.

Text on Medicare and assessing SSA programs was added:

Medicare is also becoming an increasingly important source of health care coverage for people living with HIV/AIDS. Individuals who receive Social Security Disability Insurance (SSDI) benefits for 29 months, including a 5 month waiting period, are eligible to receive Medicare benefits. As the life expectancy of people living with AIDS has increased, a greater number of those individuals have begun to qualify for Medicare. While this provides an important additional source of benefits, there are limitations on benefits -- in particular, the absence of prescription drug coverage -- that may be problematic for persons living with AIDS. Supplementary medical coverage, known as Medigap insurance, is often difficult for a person living with AIDS to obtain. The Administration is exploring options to make Medigap policies more accessible. (p. 24)

Assessing Social Security Administration Programs. With the improved quality of life realized by many people due to the advent of protease inhibitors and combination therapy, it is important to assess programs such as Supplemental Security Income and Social Security Disability Insurance regarding their flexibility in meeting the needs of individuals as they seek to move off and on to disability. The current system of disability programs, which assures continued access to health insurance, often places obstacles in the way of individuals who want to return to work. The Administration is exploring mechanisms to ensure that Federal programs support people with disabilities who want to work or return to work. (p.25)

The emphasis on the difficulty in coordination of so many different programs that help people with HIV/AIDS should have even more emphasis and a way needs to be found to do a better job with that effort. We need to find a way to help people understand the importance of integrating HOPWA into the broader system of care and treatment for people with HIV if HOPWA is to be fully effective in its purpose.

Language on improving program coordination has been expanded:

Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD.

The Agencies funding HIV-related services are committed to simplifying and improving the application process for Federal funding and to facilitating service integration. HRSA and SAMHSA have issued joint program announcements, and HUD and HRSA have issued a joint program announcement for the Special Projects of National Significance (SPNS) program. These concerted efforts to improve integration will be continued and expanded, with special attention to linking HIV and substance abuse prevention and services.

Improving collaborative efforts with the private sector is yet another opportunity for strengthening the effectiveness of current public-private partnerships and developing new ones. Combining resources and innovation makes more efficient use of scarce public and private resources. We must work to strengthen existing partnerships and seek innovative approaches for developing new collaborations. (pp. 25-26)

Quality care guidelines need to be broad and flexible given the rate of change being experienced. This is illustrated by the fact that so many HIV patients often know more than their MD. Further, the uneven knowledge often leads to less than "state of the art" care in many parts of the country.

Text regarding quality of care includes:

Improving Quality of Care. Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. Ensuring consistency in care delivery requires increased training for health care professionals and greater accountability through the use of performance measures for quality care. It may also require enhanced technical assistance to CARE Act grantees, planning councils, and consortia.

Having access to quality care within the context of managed care is an important emerging issue for all Americans including those living with HIV. The President has established the Advisory Commission on Consumer Protection and Quality in the Health Care Industry to examine changes in the industry and make recommendations.

It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)

There is also text in the Translation of Research Advances into Practice section:

Increasing Education and Training. As we continue to expand our base of knowledge about AIDS care, efforts to educate and train health care professionals in state-of-the-art care for people living with HIV and AIDS must be maintained. (p. 33)

(1) There should be a statement from Secretary Brown to all DVA VUSN Directors, Regional Directors, and Chiefs of Staff of medical centers, that he personally considers outreach to, and treatment of veterans living with HIV/AIDS to be a top priority. (2) To that end, medical centers and clinics whenever possible should identify clinicians with special expertise in the treatment of HIV/AIDS. Those clinicians should be supported in establishing AIDS clinics and prevention programs. (3) The DVA should provide training conferences for physicians, nurses, and other clinicians on a regular basis. Those attending these conferences should be expected to return to their various centers with skills and knowledge they can transmit to their colleagues. (4) The DVA should direct those in the field to have regular contact with veterans organizations, public and private hospitals and clinics, and with community HIV/AIDS organizations, with the goal of identifying veterans living with the virus, and bringing them into VA treatment centers if they so desire.	Text on the importance of quality care at VA facilitates was added: Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)
Civil Rights. The focus [of the civil rights section] is unduly narrow. Should also emphasize combating discrimination in education, housing, service establishments, an other areas covered by Federal law.	Language to broaden this section was added: The fourth goal of the National AIDS Strategy is to fight discrimination on all fronts, including employment, access to health care, education, housing, service establishments, and other areas covered by Federal law, and to provide national leadership in erasing the stigma associated with HIV and AIDS. (p. 27)

.. the Strategy should promote a broader federal approach to combating HIV-related discrimination. ... the section on providing leadership should emphasize devoting resources to proactive initiatives designed to aggressively address systemic problems of discrimination -- e.g. refusal by dentists, physicians, and other health care workers to provide care for patients with HIV ...	Language to broaden the section was added: Enforcing Rights. Efforts to protect the civil rights of people with HIV and AIDS must be ever-vigilant. The Federal government will continue to exhibit strong leadership on this issue through its enforcement of the Americans with Disabilities Act and public condemnation of discriminatory acts or statements. Active steps are being taken to prevent discrimination in the areas of employment, access to health care, education, housing, and service establishments. A joint effort by the Department of Health and Human Services and the Department of Justice aimed at access to nursing homes is a significant step forward in protecting the rights of people living with HIV. (p. 28)
Broaden the bully pulpit to include many more people in the Administration than the President.	Text was added to included all members of the Administration: Providing Leadership. Leaders of government have an obligation to use the power of their elected office to speak out against acts or words of discrimination against any group of people. President Clinton and members of his Administration have used and will continue to use their positions to oppose discrimination against people living with HIV and AIDS. (p. 28)
Add an Opportunity for Progress -- Provide leadership in advocating reasonable legal/policy approaches on discrimination issues not specifically addressed by federal law. As one possible example, the Justice Department, of the HHS Office of Civil Rights, might issues advisory opinions on such issues as HIV discrimination in the contexts of family law (e.g. denials of child custody and visitation privileges) or criminal law (e.g charging HIV+ people who spit with attempted murder). Reasoned advisory opinions on such matters by the DOJ or HHS OCR, while not legally binding, could prove to be extremely helpful to courts that are grappling with these issues.	The government will continue to protect the civil rights of people living with HIV and AIDS. Developing advisory opinions can be explored.

Expand Appendices to include other departments that should be addressing civil rights issues.	The 1997 Appendices were finalized with Federal Departments and Agencies this past September. Modifications will be possible for future years.
Translation of Research Advances into Practice. There is little mention of the need to perform follow-up studies needed to perform follow-up studies to give providers and consumers the information they require to make informed treatment decisions. would emphasize this in national strategy. The document stressed the need for provider education, but fails to note the overwhelming need for consumer education programs. At GMHC, our experience suggests that the doctor's office is not always the best place for consumers to get the information they need or desire. In light of the potential public health consequences of widespread drug resistance, the country should invest in programs that provide consumers with the information they need (a) to make treatment decisions and (b) to comply with their medical regimens. ... I'm dubious of the meaningfulness of clinical care guidelines. ... While clinical guidelines probably have some role in provider education, I think there are numerous other strategies that could be useful, such as comprehensive professional and public education campaigns.	Added language on the need for consumer education: Consumer education efforts are also important. In light of the potential public health benefits that could result from the proper use of a wide range of therapies, it is vital to support programs that provide consumers with the information they need to make treatment decisions and comply with therapeutic regimens. (p. 33) Language about the need for rapid translation of research results was also added: It is essential that practical information for practicing clinicians and their patients be provided as quickly as possible. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies and private sector clinicians. (p. 33)
As we continue to see improvements in drugs and knowledge about treatment, the time between the development of the information and its dissemination needs to be shortened.	Language about the need for rapid translation of research results was added: It is essential that practical information for practicing clinicians and their patients be provided as quickly as possible. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies and private sector clinicians. (p. 33)

Crosswalk between PACHA Comments on National AIDS Strategy and Incorporated Text

<i>PACHA Comments on National AIDS Strategy</i>	<i>NAS Text Changes</i>
Message from the National AIDS Policy Director. Need stronger introduction. Define the strategy. Begin with Ms. Fleming's ending statements on ending the epidemic.	Changed order, added text about the strategy, and added letter from President. (p.2, pp. 5-6).
Introduction. Sharpen all goals to indicate the Administration's sense of urgency.	Goals were changed to: The President has identified the following national goals to guide our efforts to end the epidemic of HIV and AIDS: ■ To develop more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected through strong, continuing support for HIV-related research; ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts; ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs; ■ To ensure that all people living with HIV are not subject to discrimination; ■ To provide strong, continuing support for international efforts to address the HIV epidemic; and, ■ To ensure that research advances are translated into improved HIV prevention programs and enhanced care for HIV- positive persons. (p.7)

Make prevention goal stronger to reflect President's quote in beginning of prevention section.	The goal was changed to match the President's quote: ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts. (p. 7)
There should be quality care for all in the goals.	The goal was changed: ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs. (p.7)
A goal should be added emphasizing that HIV should be taken out of the political arena and viewed as a public health crisis affecting everyone.	The six goals match the 6 sections of the text and appendices. The importance of viewing HIV/AIDS as an international public health crisis is addressed in the President's letter (p. 2), and the Introduction (pp. 7-9).
Introduction states that AIDS is a costly disease... [but] AIDS is not inordinately expensive. Many federal programs mentioned in the document are extremely cost-effective because they help reduce HIV-related medical costs. HOPWA funds a continuum of housing programs that provide far less costly alternatives to institutionalization. Similarly, by reducing the epidemic's long-term burden, HIV prevention services represent an immediate and future economic savings for the country. AIDS isn't an endless drain on public resources; rather the federal government has developed excellent strategies for reducing the epidemic's impact. The document should make these points to combat the growing sentiment that "AIDS gets more than its fair share."	Text was modified to emphasize the cost of care and the role of Federal programs in reducing the economic impact: The average lifetime cost of medical care after an HIV diagnosis is \$119,000. People living with HIV are often dependent on the public sector for their health care, particularly in the later stages of HIV disease. More than 50 percent of people living with AIDS are enrolled in Medicaid, including more than 90 percent of children with AIDS. In FY 1996, the Federal government spent an estimated \$1.8 billion on Medicaid benefits for people living with HIV and AIDS and another \$690 million on Medicare benefits. Social Security benefits for people disabled by HIV/AIDS totaled nearly \$980 million in FY 1996. Many Federal programs such as Housing Opportunities for Persons with AIDS (HOPWA) and CDC's prevention efforts contribute to reducing the short- and long-term economic costs of the epidemic. (p. 9)

Prevention. Adolescents and youth are one of America's most underserved populations in terms of access to health care services and health education. The Division of Adolescent and School Health (DASH), a program of the Centers for Disease Control and Prevention, addresses the prevention of priority health risks (including HIV/AIDS) among adolescents and youth.	Language on schools was added: Federal efforts have shown that HIV prevention programs can be effective. CDC's prevention projects, many in partnership with states, local governments, schools, and community-based organizations, have demonstrated that prevention programs are most effective when designed and implemented in partnership with communities to which they are targeted. (p.12) The following section on prevention education was also added: Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's <i>Guidelines for Effective School Health Programs to Prevent the Spread of AIDS</i> helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p.14)
Document does not address counseling and testing. ... while testing should not be centerpiece of our prevention efforts, it is equally clear that the nation's laissez faire approach to testing effectively squanders countless opportunities to intervene with effective HIV prevention services.	Counseling and testing are addressed in the following text: New and promising medical interventions make it critical to improve our approach to HIV counseling and testing -- creating a critical bridge between prevention and primary care. CDC is committed to improving the follow-up services for those counseled and tested at publicly-funded sites including the quality of referral to services for those who test HIV-positive. (p. 15) Primary care providers must learn to incorporate a person's sexual and drug-using history when a medical history is taken, offering HIV-related counseling and voluntary testing, and providing prevention education to HIV-positive individuals as part of the provider-patient relationship. (p. 15)

Add goal of enhanced coordination of federal efforts in order to ensure that prevention programs are grounded in behavioral and ethnographic research and based on the latest epidemiologic data. Currently there is insufficient coordination.	Basing prevention interventions on research is addressed in the following text: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13) Improving program coordination and integrating prevention is addressed in the following text: <i>Improving Program Coordination.</i> Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD. (p. 25)
Change this bullet to read "Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors."	The text was changed to read: • Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors. (p. 12)

Make a statement that would actually suggest the lack of this research be presented even stronger as a barrier to HIV prevention.	One of the major goals for HIV prevention states: • Improving scientific knowledge about effective prevention models and strategies. (p. 12) Text states: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13)
Given the potentially important impact on prevention of viral load, genetic mutations and drug resistance, some mention should be made of the need to link prevention science with the ongoing basic science research agenda.	This concern is addressed in the research section, where NIH will: • Develop a comprehensive NIH HIV prevention science agenda, combining biomedical, behavioral, and social interventions. (p. 19)
Mention the need for enhanced support for ethnographic and qualitative research on community cultures, social networks, etc.	Language regarding community cultures was added: Intervention research focuses on individual and community-level interventions that result in modified sexual and drug-using behaviors and, as a consequence, reduced HIV transmission. There have been significant accomplishments in this area, but, as this portfolio expands, it will be critical to assess interventions in the context of community cultures and social networks that are relevant to the growing number of populations that must be reached by HIV prevention programs. This research should be designed by a broad range of scientists, public health, and community experts to assure its relevance. (p. 13)

There is a need to greatly enhance government support for program evaluation, with particular emphasis on replicable, cutting-edge, community-based interventions. ... I'd like to see a commitment to a comprehensive evaluation of the impact of community planning on HIV prevention services.	Language on cutting-edge programs was added to the evaluation and dissemination section: <i>Evaluation and Dissemination.</i> To ensure that prevention programs actually are working -- and to ensure that scarce resources are spent on the most effective interventions -- all Federally-funded prevention activities routinely will include evaluation components. Funding Agencies will share widely the knowledge gained about what works and what does not work to ensure promotion of innovation and best practices in the field. In addition, as part of the Federal government's compliance with the Government Performance and Results Act, CDC and SAMHSA will continue to work with their grantees to develop appropriate performance measures for HIV prevention programs, including those developed under the community planning process. (p. 14)
--	---

Add the following:

Prevention Education. The Center for Disease Control and Prevention's Guidelines for *Effective School Health Programs to Prevent the Spread of AIDS* state the Nation's public and private schools have the capacity and responsibility to help assure that young people understand the nature of the HIV epidemic and the specific actions they can take to prevent HIV infection.

In addition, the guidelines recommend that "Education about AIDS may be the most appropriate and effective when carried out within a more comprehensive school health education program that establishes a foundation for understanding the relationships between personal behavior and health.

CDC's Division of Adolescent and School Health (DASH) currently supports Comprehensive School Health Programs in thirteen states. The model uses an eight component program that is planned, sequential, Kindergarten through grade 12 approach that integrates important categorical topics such as HIV, STDs, unintended pregnancy, alcohol, drugs, tobacco, and intentional and unintentional injury.

Comprehensive School Health Education is one of the more efficient means of preventing risk behaviors. These activities have been accomplished by funding infrastructure at the state level in departments of health and education. It must be expanded into every state in the nation. (The cost would be \$25 million each year to expand CSHE to all 50 states.)

A section on prevention education was added:

Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's *Guidelines for Effective School Health Programs to Prevent the Spread of AIDS* helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p. 14)

The section on substance abuse places undue emphasis on the intersection of HIV prevention with the nation's drug abuse control efforts. Completely missing is the need to greatly enhance programs for out-of-treatment drug users. In New York and elsewhere, community-based organizations have experienced remarkable success with peer-based programs targeting drug users. The document should call for greater support for these and other programs.	The document addresses the need for continuing community-based planning to develop locally-designed prevention priorities. (p. 14)
Include a stronger statement that the research and public health data suggests in the absence of treatment for substance abuse on demand, or at least funded more adequately, "needle exchange" should become part of the Strategy. There is a need federal leadership to lift ban on needle exchange and address policy barriers ... Better coordination is needed at the federal level among the multiple agencies that address substance use and/or HIV.	Language on needle exchange programs is: <i>Preventing HIV transmission from the use of contaminated injection equipment.</i> The sharing of needles and syringes among injecting drug users is a major means of HIV transmission in the drug-injecting population. Abstinence from drug use is always the preferred means of HIV prevention. The CDC recommends using sterile or never-used injection equipment. CDC-supported research has indicated that removal of restrictions on over-the-counter sale of syringes resulted in decreased reported needle sharing. Current Federal law restricts the use of Federal funds for syringe exchange programs; however, a number of communities across the country have undertaken these programs with local resources. NIH-supported research on existing needle exchange programs is identifying the characteristics that influence program success as an HIV prevention strategy. (p. 15)

There is insufficient accountability at the CDC to ensure that sufficient funding is targeted at the populations in greatest need. Some plan to require CDC to account for funding allocation is called for.	The text section on targeting vulnerable populations states the importance of providing funding for those at greatest risk: The HIV epidemic continues to have a disproportionate impact on certain populations where infection rates are rising at a rapid pace. A fifth and final challenge for prevention programming is to pay particular attention to groups that traditionally receive fewer services, but where the risk of infection is greatest. These include adolescents (especially young gay men), women, minorities, gay men of color, substance abusers, and prisoners. Many Federally-funded HIV prevention activities already target these populations. The additional \$32 million appropriated in FY 1997 for the CDC will provide new funds specifically intended for programs and research targeting adolescents, women, and substance abusers. To ensure that prevention programs, including community planning efforts, are as effective as possible all Federally-funded prevention activities routinely will include monitoring and evaluation components. (p. 16)
Research. The document appropriately recognized the need for federal leadership and coordination on AIDS research. I'd also add the need for strategic planning, since this is the essence of the NIH reforms that led to the Office of AIDS Research (as well as the philosophy of the Levine Commission Report).	Text on strategic planning was added: Developing and implementing the Federal government's AIDS research agenda presents both scientific and logistical challenges that require leadership, coordination, and strategic planning, first among the 24 institutes, centers, and divisions of the NIH, and second among the various Departments and Agencies throughout the government that support HIV research. (p. 18-19)

Care and Services. We should be thinking about the implications of people who have previously been disabled because of HIV that now feel well enough to at least begin to work again, they are not faced with having to "remain disabled" in order to continue to receive treatment and care.

Text on Medicare and assessing SSA programs was added:

Medicare is also becoming an increasingly important source of health care coverage for people living with HIV/AIDS. Individuals who receive Social Security Disability Insurance (SSDI) benefits for 29 months, including a 5 month waiting period, are eligible to receive Medicare benefits. As the life expectancy of people living with AIDS has increased, a greater number of those individuals have begun to qualify for Medicare. While this provides an important additional source of benefits, there are limitations on benefits -- in particular, the absence of prescription drug coverage -- that may be problematic for persons living with AIDS. Supplementary medical coverage, known as Medigap insurance, is often difficult for a person living with AIDS to obtain. The Administration is exploring options to make Medigap policies more accessible. (p. 24)

Assessing Social Security Administration Programs. With the improved quality of life realized by many people due to the advent of protease inhibitors and combination therapy, it is important to assess programs such as Supplemental Security Income and Social Security Disability Insurance regarding their flexibility in meeting the needs of individuals as they seek to move off and on to disability. The current system of disability programs, which assures continued access to health insurance, often places obstacles in the way of individuals who want to return to work. The Administration is exploring mechanisms to ensure that Federal programs support people with disabilities who want to work or return to work. (p.25)

The emphasis on the difficulty in coordination of so many different programs that help people with HIV/AIDS should have even more emphasis and a way needs to be found to do a better job with that effort. We need to find a way to help people understand the importance of integrating HOPWA into the broader system of care and treatment for people with HIV if HOPWA is to be fully effective in its purpose.	Language on improving program coordination has been expanded: Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD. The Agencies funding HIV-related services are committed to simplifying and improving the application process for Federal funding and to facilitating service integration. HRSA and SAMHSA have issued joint program announcements, and HUD and HRSA have issued a joint program announcement for the Special Projects of National Significance (SPNS) program. These concerted efforts to improve integration will be continued and expanded, with special attention to linking HIV and substance abuse prevention and services. Improving collaborative efforts with the private sector is yet another opportunity for strengthening the effectiveness of current public-private partnerships and developing new ones. Combining resources and innovation makes more efficient use of scarce public and private resources. We must work to strengthen existing partnerships and seek innovative approaches for developing new collaborations. (pp. 25-26)
--	--

Quality care guidelines need to be broad and flexible given the rate of change being experienced. This is illustrated by the fact that so many HIV patients often know more than their MD. Further, the uneven knowledge often leads to less than "state of the art" care in many parts of the country.

Text regarding quality of care includes:

Improving Quality of Care. Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. Ensuring consistency in care delivery requires increased training for health care professionals and greater accountability through the use of performance measures for quality care. It may also require enhanced technical assistance to CARE Act grantees, planning councils, and consortia.

Having access to quality care within the context of managed care is an important emerging issue for all Americans including those living with HIV. The President has established the Advisory Commission on Consumer Protection and Quality in the Health Care Industry to examine changes in the industry and make recommendations.

It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)

There is also text in the Translation of Research Advances into Practice section:

Increasing Education and Training. As we continue to expand our base of knowledge about AIDS care, efforts to educate and train health care professionals in state-of-the-art care for people living with HIV and AIDS must be maintained. (p. 33)

(1) There should be a statement from Secretary Brown to all DVA VUSN Directors, Regional Directors, and Chiefs of Staff of medical centers, that he personally considers outreach to, and treatment of veterans living with HIV/AIDS to be a top priority. (2) To that end, medical centers and clinics whenever possible should identify clinicians with special expertise in the treatment of HIV/AIDS. Those clinicians should be supported in establishing AIDS clinics and prevention programs. (3) The DVA should provide training conferences for physicians, nurses, and other clinicians on a regular basis. Those attending these conferences should be expected to return to their various centers with skills and knowledge they can transmit to their colleagues. (4) The DVA should direct those in the field to have regular contact with veterans organizations, public and private hospitals and clinics, and with community HIV/AIDS organizations, with the goal of identifying veterans living with the virus, and bringing them into VA treatment centers if they so desire.	Text on the importance of quality care at VA facilitates was added: Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)
Civil Rights. The focus [of the civil rights section] is unduly narrow. Should also emphasize combating discrimination in education, housing, service establishments, an other areas covered by Federal law.	Language to broaden this section was added: The fourth goal of the National AIDS Strategy is to fight discrimination on all fronts, including employment, access to health care, education, housing, service establishments, and other areas covered by Federal law, and to provide national leadership in erasing the stigma associated with HIV and AIDS. (p. 27)

.. the Strategy should promote a broader federal approach to combating HIV-related discrimination. ... the section on providing leadership should emphasize devoting resources to proactive initiatives designed to aggressively address systemic problems of discrimination -- e.g. refusal by dentists, physicians, and other health care workers to provide care for patients with HIV ...	Language to broaden the section was added: Enforcing Rights. Efforts to protect the civil rights of people with HIV and AIDS must be ever-vigilant. The Federal government will continue to exhibit strong leadership on this issue through its enforcement of the Americans with Disabilities Act and public condemnation of discriminatory acts or statements. Active steps are being taken to prevent discrimination in the areas of employment, access to health care, education, housing, and service establishments. A joint effort by the Department of Health and Human Services and the Department of Justice aimed at access to nursing homes is a significant step forward in protecting the rights of people living with HIV. (p. 28)
Broaden the bully pulpit to include many more people in the Administration than the President.	Text was added to included all members of the Administration: Providing Leadership. Leaders of government have an obligation to use the power of their elected office to speak out against acts or words of discrimination against any group of people. President Clinton and members of his Administration have used and will continue to use their positions to oppose discrimination against people living with HIV and AIDS. (p. 28)
Add an Opportunity for Progress -- Provide leadership in advocating reasonable legal/policy approaches on discrimination issues not specifically addressed by federal law. As one possible example, the Justice Department, of the HHS Office of Civil Rights, might issues advisory opinions on such issues as HIV discrimination in the contexts of family law (e.g. denials of child custody and visitation privileges) or criminal law (e.g charging HIV + people who spit with attempted murder). Reasoned advisory opinions on such matters by the DOJ or HHS OCR, while not legally binding, could prove to be extremely helpful to courts that are grappling with these issues.	The government will continue to protect the civil rights of people living with HIV and AIDS. Developing advisory opinions can be explored.

Expand Appendices to include other departments that should be addressing civil rights issues.	The 1997 Appendices were finalized with Federal Departments and Agencies this past September. Modifications will be possible for future years.
Translation of Research Advances into Practice. There is little mention of the need to perform follow-up studies needed to perform follow-up studies to give providers and consumers the information they require to make informed treatment decisions. would emphasize this in national strategy. The document stressed the need for provider education, but fails to note the overwhelming need for consumer education programs. At GMHC, our experience suggests that the doctor's office is not always to best place for consumers to get the information they need or desire. In light of the potential public health consequences of widespread drug resistance, the country should invest in programs that provide consumers with the information they need (a) to make treatment decisions and (b) to comply with their medical regimens. ... I'm dubious of the meaningfulness of clinical care guidelines. ... While clinical guidelines probably have some role in provider education, I think there are numerous other strategies that could be useful, such as comprehensive professional and public education campaigns.	Added language on the need for consumer education: Consumer education efforts are also important. In light of the potential public health benefits that could result from the proper use of a wide range of therapies, it is vital to support programs that provide consumers with the information they need to make treatment decisions and comply with therapeutic regimens. (p. 33) Language about the need for rapid translation of research results was also added: It is essential that practical information for practicing clinicians and their patients be provided as quickly as possible. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies and private sector clinicians. (p. 33)
As we continue to see improvements in drugs and knowledge about treatment, the time between the development of the information and its dissemination needs to be shortened.	Language about the need for rapid translation of research results was added: It is essential that practical information for practicing clinicians and their patients be provided as quickly as possible. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies and private sector clinicians. (p. 33)

Crosswalk between PACHA Comments on National AIDS Strategy and Incorporated Text

<i>PACHA Comments on National AIDS Strategy</i>	<i>NAS Text Changes</i>
Message from the National AIDS Policy Director. Need stronger introduction. Define the strategy. Begin with Ms. Fleming's ending statements on ending the epidemic.	Changed order, added text about the strategy, and added letter from President. (p.2, pp. 5-6).
Introduction. Sharpen all goals to indicate the Administration's sense of urgency.	Goals were changed to: The President has identified the following national goals to guide our efforts to end the epidemic of HIV and AIDS: ■ To develop more effective treatments, a preventive vaccine to protect the uninfected, and a cure for those currently infected through strong, continuing support for HIV-related research; ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts; ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs; ■ To ensure that all people living with HIV are not subject to discrimination; ■ To provide strong, continuing support for international efforts to address the HIV epidemic; and, ■ To ensure that research advances are translated into improved HIV prevention programs and enhanced care for HIV- positive persons. (p.7)

Make prevention goal stronger to reflect President's quote in beginning of prevention section.	The goal was changed to match the President's quote: ■ To reduce the number of new HIV infections in adults and children in the U.S. until the rate of new infections reaches zero by providing strong, continuing support for effective HIV prevention efforts. (p. 7)
There should be quality care for all in the goals.	The goal was changed: ■ To ensure that all people living with HIV have access to services, from health care to housing and supportive services, that are affordable, of high quality, and responsive to their needs. (p.7)
A goal should be added emphasizing that HIV should be taken out of the political arena and viewed as a public health crisis affecting everyone.	The six goals match the 6 sections of the text and appendices. The importance of viewing HIV/AIDS as an international public health crisis is addressed in the President's letter (p. 2), and the Introduction (pp. 7-9).
Introduction states that AIDS is a costly disease... [but] AIDS is not inordinately expensive. Many federal programs mentioned in the document are extremely cost-effective because they help reduce HIV-related medical costs. HOPWA funds a continuum of housing programs that provide far less costly alternatives to institutionalization. Similarly, by reducing the epidemic's long-term burden, HIV prevention services represent an immediate and future economic savings for the country. AIDS isn't an endless drain on public resources; rather the federal government has developed excellent strategies for reducing the epidemic's impact. The document should make these points to combat the growing sentiment that "AIDS gets more than its fair share."	Text was modified to emphasize the cost of care and the role of Federal programs in reducing the economic impact: The average lifetime cost of medical care after an HIV diagnosis is \$119,000. People living with HIV are often dependent on the public sector for their health care, particularly in the later stages of HIV disease. More than 50 percent of people living with AIDS are enrolled in Medicaid, including more than 90 percent of children with AIDS. In FY 1996, the Federal government spent an estimated \$1.8 billion on Medicaid benefits for people living with HIV and AIDS and another \$690 million on Medicare benefits. Social Security benefits for people disabled by HIV/AIDS totaled nearly \$980 million in FY 1996. Many Federal programs such as Housing Opportunities for Persons with AIDS (HOPWA) and CDC's prevention efforts contribute to reducing the short- and long-term economic costs of the epidemic. (p. 9)

Prevention. Adolescents and youth are one of America's most underserved populations in terms of access to health care services and health education. The Division of Adolescent and School Health (DASH), a program of the Centers for Disease Control and Prevention, addresses the prevention of priority health risks (including HIV/AIDS) among adolescents and youth.	Language on schools was added: Federal efforts have shown that HIV prevention programs can be effective. CDC's prevention projects, many in partnership with states, local governments, schools, and community-based organizations, have demonstrated that prevention programs are most effective when designed and implemented in partnership with communities to which they are targeted. (p.12) The following section on prevention education was also added: Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's <i>Guidelines for Effective School Health Programs to Prevent the Spread of AIDS</i> helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p.14)
Document does not address counseling and testing. ... while testing should not be centerpiece of our prevention efforts, it is equally clear that the nation's laissez faire approach to testing effectively squanders countless opportunities to intervene with effective HIV prevention services.	Counseling and testing are addressed in the following text: New and promising medical interventions make it critical to improve our approach to HIV counseling and testing -- creating a critical bridge between prevention and primary care. CDC is committed to improving the follow-up services for those counseled and tested at publicly-funded sites including the quality of referral to services for those who test HIV-positive. (p. 15) Primary care providers must learn to incorporate a person's sexual and drug-using history when a medical history is taken, offering HIV-related counseling and voluntary testing, and providing prevention education to HIV-positive individuals as part of the provider-patient relationship. (p. 15)

Add goal of enhanced coordination of federal efforts in order to ensure that prevention programs are grounded in behavioral and ethnographic research and based on the latest epidemiologic data. Currently there is insufficient coordination.	Basing prevention interventions on research is addressed in the following text: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13) Improving program coordination and integrating prevention is addressed in the following text: <i>Improving Program Coordination.</i> Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD. (p. 25)
Change this bullet to read "Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors."	The text was changed to read: • Improving understanding of trends in HIV transmission, seroprevalence, and risk behaviors. (p. 12)

Make a statement that would actually suggest the lack of this research be presented even stronger as a barrier to HIV prevention.	One of the major goals for HIV prevention states: Improving scientific knowledge about effective prevention models and strategies. (p. 12) Text states: Effective interventions must be based on sound research findings and evaluations. In response to the recommendations from the Report of the NIH AIDS Research Program Evaluation Task Force, NIH is developing a comprehensive HIV prevention science agenda. NIH and CDC are committed to increasing future support for basic research on behavior, interventions, social marketing, and program evaluation. (p. 13)
Given the potentially important impact on prevention of viral load, genetic mutations and drug resistance, some mention should be made of the need to link prevention science with the ongoing basic science research agenda.	This concern is addressed in the research section, where NIH will: Develop a comprehensive NIH HIV prevention science agenda, combining biomedical, behavioral, and social interventions. (p. 19)
Mention the need for enhanced support for ethnographic and qualitative research on community cultures, social networks, etc.	Language regarding community cultures was added: Intervention research focuses on individual and community-level interventions that result in modified sexual and drug-using behaviors and, as a consequence, reduced HIV transmission. There have been significant accomplishments in this area, but, as this portfolio expands, it will be critical to assess interventions in the context of community cultures and social networks that are relevant to the growing number of populations that must be reached by HIV prevention programs. This research should be designed by a broad range of scientists, public health, and community experts to assure its relevance. (p. 13)

There is a need to greatly enhance government support for program evaluation, with particular emphasis on replicable, cutting-edge, community-based interventions. ... I'd like to see a commitment to a comprehensive evaluation of the impact of community planning on HIV prevention services.

Language on cutting-edge programs was added to the evaluation and dissemination section:

Evaluation and Dissemination. To ensure that prevention programs actually are working -- and to ensure that scarce resources are spent on the most effective interventions -- all Federally-funded prevention activities routinely will include evaluation components. Funding Agencies will share widely the knowledge gained about what works and what does not work to ensure promotion of innovation and best practices in the field. In addition, as part of the Federal government's compliance with the Government Performance and Results Act, CDC and SAMHSA will continue to work with their grantees to develop appropriate performance measures for HIV prevention programs, including those developed under the community planning process. (p. 14)

Add the following:

Prevention Education. The Center for Disease Control and Prevention's Guidelines for *Effective School Health Programs to Prevent the Spread of AIDS* state the Nation's public and private schools have the capacity and responsibility to help assure that young people understand the nature of the HIV epidemic and the specific actions they can take to prevent HIV infection.

In addition, the guidelines recommend that "Education about AIDS may be the most appropriate and effective when carried out within a more comprehensive school health education program that establishes a foundation for understanding the relationships between personal behavior and health.

CDC's Division of Adolescent and School Health (DASH) currently supports Comprehensive School Health Programs in thirteen states. The model uses an eight component program that is planned, sequential, Kindergarten through grade 12 approach that integrates important categorical topics such as HIV, STDs, unintended pregnancy, alcohol, drugs, tobacco, and intentional and unintentional injury.

Comprehensive School Health Education is one of the more efficient means of preventing risk behaviors. These activities have been accomplished by funding infrastructure at the state level in departments of health and education. It must be expanded into every state in the nation. (The cost would be \$25 million each year to expand CSHE to all 50 states.)

A section on prevention education was added:

Prevention Education. Collaboration with communities and schools is a critical factor in communicating HIV prevention messages to our youth. The Centers for Disease Control and Prevention's *Guidelines for Effective School Health Programs to Prevent the Spread of AIDS* helps assure that young people understand the nature of HIV transmission and the specific actions they can take to prevent HIV infection. Support for these programs should and will continue. (p. 14)

The section on substance abuse places undue emphasis on the intersection of HIV prevention with the nation's drug abuse control efforts. Completely missing is the need to greatly enhance programs for out-of-treatment drug users. In New York and elsewhere, community-based organizations have experienced remarkable success with peer-based programs targeting drug users. The document should call for greater support for these and other programs.	The document addresses the need for continuing community-based planning to develop locally-designed prevention priorities. (p. 14)
Include a stronger statement that the research and public health data suggests in the absence of treatment for substance abuse on demand, or at least funded more adequately, "needle exchange" should become part of the Strategy. There is a need federal leadership to lift ban on needle exchange and address policy barriers ... Better coordination is needed at the federal level among the multiple agencies that address substance use and/or HIV.	Language on needle exchange programs is: • <i>Preventing HIV transmission from the use of contaminated injection equipment.</i> The sharing of needles and syringes among injecting drug users is a major means of HIV transmission in the drug-injecting population. Abstinence from drug use is always the preferred means of HIV prevention. The CDC recommends using sterile or never-used injection equipment. CDC-supported research has indicated that removal of restrictions on over-the-counter sale of syringes resulted in decreased reported needle sharing. Current Federal law restricts the use of Federal funds for syringe exchange programs; however, a number of communities across the country have undertaken these programs with local resources. NIH-supported research on existing needle exchange programs is identifying the characteristics that influence program success as an HIV prevention strategy. (p. 15)

There is insufficient accountability at the CDC to ensure that sufficient funding is targeted at the populations in greatest need. Some plan to require CDC to account for funding allocation is called for.	The text section on targeting vulnerable populations states the importance of providing funding for those at greatest risk: The HIV epidemic continues to have a disproportionate impact on certain populations where infection rates are rising at a rapid pace. A fifth and final challenge for prevention programming is to pay particular attention to groups that traditionally receive fewer services, but where the risk of infection is greatest. These include adolescents (especially young gay men), women, minorities, gay men of color, substance abusers, and prisoners. Many Federally-funded HIV prevention activities already target these populations. The additional \$32 million appropriated in FY 1997 for the CDC will provide new funds specifically intended for programs and research targeting adolescents, women, and substance abusers. To ensure that prevention programs, including community planning efforts, are as effective as possible all Federally-funded prevention activities routinely will include monitoring and evaluation components. (p. 16)
Research. The document appropriately recognized the need for federal leadership and coordination on AIDS research. I'd also add the need for strategic planning, since this is the essence of the NIH reforms that led to the Office of AIDS Research (as well as the philosophy of the Levine Commission Report).	Text on strategic planning was added: Developing and implementing the Federal government's AIDS research agenda presents both scientific and logistical challenges that require leadership, coordination, and strategic planning, first among the 24 institutes, centers, and divisions of the NIH, and second among the various Departments and Agencies throughout the government that support HIV research. (p. 18-19)

Care and Services. We should be thinking about the implications of people who have previously been disabled because of HIV that now feel well enough to at least begin to work again, they are not faced with having to "remain disabled" in order to continue to receive treatment and care.	Text on Medicare and assessing SSA programs was added: Medicare is also becoming an increasingly important source of health care coverage for people living with HIV/AIDS. Individuals who receive Social Security Disability Insurance (SSDI) benefits for 29 months, including a 5 month waiting period, are eligible to receive Medicare benefits. As the life expectancy of people living with AIDS has increased, a greater number of those individuals have begun to qualify for Medicare. While this provides an important additional source of benefits, there are limitations on benefits -- in particular, the absence of prescription drug coverage -- that may be problematic for persons living with AIDS. Supplementary medical coverage, known as Medigap insurance, is often difficult for a person living with AIDS to obtain. The Administration is exploring options to make Medigap policies more accessible. (p. 24) <i>Assessing Social Security Administration Programs.</i> With the improved quality of life realized by many people due to the advent of protease inhibitors and combination therapy, it is important to assess programs such as Supplemental Security Income and Social Security Disability Insurance regarding their flexibility in meeting the needs of individuals as they seek to move off and on to disability. The current system of disability programs, which assures continued access to health insurance, often places obstacles in the way of individuals who want to return to work. The Administration is exploring mechanisms to ensure that Federal programs support people with disabilities who want to work or return to work. (p.25)
---	---

The emphasis on the difficulty in coordination of so many different programs that help people with HIV/AIDS should have even more emphasis and a way needs to be found to do a better job with that effort. We need to find a way to help people understand the importance of integrating HOPWA into the broader system of care and treatment for people with HIV if HOPWA is to be fully effective in its purpose.

Language on improving program coordination has been expanded:

Integrating HIV-related services is an important step in assisting communities to build seamless systems of support for the most vulnerable persons in our communities. Organizations receiving Federal funding to provide AIDS-related care often require support from several Federal Agencies. For example, creating a comprehensive community-based program that integrates primary care, substance abuse treatment and prevention, sexually transmitted disease screening, Tb prevention and treatment, HIV prevention, access to clinical trials, and housing assistance requires separate applications to SAMHSA, HRSA, CDC, NIH, and HUD.

The Agencies funding HIV-related services are committed to simplifying and improving the application process for Federal funding and to facilitating service integration. HRSA and SAMHSA have issued joint program announcements, and HUD and HRSA have issued a joint program announcement for the Special Projects of National Significance (SPNS) program. These concerted efforts to improve integration will be continued and expanded, with special attention to linking HIV and substance abuse prevention and services.

Improving collaborative efforts with the private sector is yet another opportunity for strengthening the effectiveness of current public-private partnerships and developing new ones. Combining resources and innovation makes more efficient use of scarce public and private resources. We must work to strengthen existing partnerships and seek innovative approaches for developing new collaborations. (pp. 25-26)

Quality care guidelines need to be broad and flexible given the rate of change being experienced. This is illustrated by the fact that so many HIV patients often know more than their MD. Further, the uneven knowledge often leads to less than "state of the art" care in many parts of the country.

Text regarding quality of care includes:

Improving Quality of Care. Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. Ensuring consistency in care delivery requires increased training for health care professionals and greater accountability through the use of performance measures for quality care. It may also require enhanced technical assistance to CARE Act grantees, planning councils, and consortia.

Having access to quality care within the context of managed care is an important emerging issue for all Americans including those living with HIV. The President has established the Advisory Commission on Consumer Protection and Quality in the Health Care Industry to examine changes in the industry and make recommendations.

It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)

There is also text in the Translation of Research Advances into Practice section:

Increasing Education and Training. As we continue to expand our base of knowledge about AIDS care, efforts to educate and train health care professionals in state-of-the-art care for people living with HIV and AIDS must be maintained. (p. 33)

(1) There should be a statement from Secretary Brown to all DVA VUSN Directors, Regional Directors, and Chiefs of Staff of medical centers, that he personally considers outreach to, and treatment of veterans living with HIV/AIDS to be a top priority. (2) To that end, medical centers and clinics whenever possible should identify clinicians with special expertise in the treatment of HIV/AIDS. Those clinicians should be supported in establishing AIDS clinics and prevention programs. (3) The DVA should provide training conferences for physicians, nurses, and other clinicians on a regular basis. Those attending these conferences should be expected to return to their various centers with skills and knowledge they can transmit to their colleagues. (4) The DVA should direct those in the field to have regular contact with veterans organizations, public and private hospitals and clinics, and with community HIV/AIDS organizations, with the goal of identifying veterans living with the virus, and bringing them into VA treatment centers if they so desire.	Text on the importance of quality care at VA facilitates was added: Federally-supported efforts such as Medicaid, Medicare, Ryan White CARE Act programs and the health care delivery systems at the Department of Veterans Affairs (VA) and the Department of Defense (DOD) can and should consistently provide high-quality care. It is also essential that practical information on research advances for practicing clinicians and their patients be provided in a timely manner. (See Section on Translation of Research Advances into Practice.) HRSA and HCFA will continue to offer guidance to grantees and the States in regards to maintaining the quality and standard of care appropriate for people living with HIV. To this end, during FY 1997, the Office of HIV/AIDS Policy at HHS is undertaking a program to develop clinical practice guidelines in conjunction with other government Agencies such as the NIH, VA, and DOD and private-sector clinicians. (p. 26)
Civil Rights. The focus [of the civil rights section] is unduly narrow. Should also emphasize combating discrimination in education, housing, service establishments, an other areas covered by Federal law.	Language to broaden this section was added: The fourth goal of the National AIDS Strategy is to fight discrimination on all fronts, including employment, access to health care, education, housing, service establishments, and other areas covered by Federal law, and to provide national leadership in erasing the stigma associated with HIV and AIDS. (p. 27)

.. the Strategy should promote a broader federal approach to combating HIV-related discrimination. ... the section on providing leadership should emphasize devoting resources to proactive initiatives designed to aggressively address systemic problems of discrimination -- e.g. refusal by dentists, physicians, and other health care workers to provide care for patients with HIV ...	Language to broaden the section was added: Enforcing Rights. Efforts to protect the civil rights of people with HIV and AIDS must be ever-vigilant. The Federal government will continue to exhibit strong leadership on this issue through its enforcement of the Americans with Disabilities Act and public condemnation of discriminatory acts or statements. Active steps are being taken to prevent discrimination in the areas of employment, access to health care, education, housing, and service establishments. A joint effort by the Department of Health and Human Services and the Department of Justice aimed at access to nursing homes is a significant step forward in protecting the rights of people living with HIV. (p. 28)
Broaden the bully pulpit to include many more people in the Administration than the President.	Text was added to included all members of the Administration: Providing Leadership. Leaders of government have an obligation to use the power of their elected office to speak out against acts or words of discrimination against any group of people. President Clinton and members of his Administration have used and will continue to use their positions to oppose discrimination against people living with HIV and AIDS. (p. 28)
Add an Opportunity for Progress -- Provide leadership in advocating reasonable legal/policy approaches on discrimination issues not specifically addressed by federal law. As one possible example, the Justice Department, of the HHS Office of Civil Rights, might issues advisory opinions on such issues as HIV discrimination in the contexts of family law (e.g. denials of child custody and visitation privileges) or criminal law (e.g charging HIV+ people who spit with attempted murder). Reasoned advisory opinions on such matters by the DOJ or HHS OCR, while not legally binding, could prove to be extremely helpful to courts that are grappling with these issues.	The government will continue to protect the civil rights of people living with HIV and AIDS. Developing advisory opinions can be explored.

Expand Appendices to include other departments that should be addressing civil rights issues.	The 1997 Appendices were finalized with Federal Departments and Agencies this past September. Modifications will be possible for future years.

John - This sounds worse than it is - J

SUBJECT: Your meeting on the White House Office on AIDS Strategic Plan, Thursday March 14, 1996, 2:00 PM, BRIEFING

Participants

Claudia Cooley
Jacquelyn White
Jerry Klepner
Sean Donahue
Eric Goosby
Barbara Brady
Leslie Hardy
Richard Sorian

Background

The purpose of this meeting to discuss the Department's concerns with the National Strategy for HIV and AIDS, prepared by Pasty Fleming's office, which is still in clearance.

To date, the general consensus from the OPDIVS and STAFFDIVS is that this plan is in need of a major rewrite for the following reasons:

- 1) The report contains scientific inaccuracies and more time is needed to correct these (NIH and OPHS);
- 2) there are questions concerning the research priorities laid out in the document (NIH);
- 3) there are serious problems with the overall structure of the document (NIH and OPHS); and,
- 4) the treatment of needle exchange and Medicaid are not in line with current Administration policy, (ASL and OPHS).

Offices that have nonconcurred on the plan include NIH, OPHS and ASL.

Glen Harelson

THE WHITE HOUSE

WASHINGTON

The epidemic of HIV and AIDS constitutes a public health crisis of unprecedented proportions. For fifteen years, this terrible tragedy has devastated far too many lives in the U.S. and around the world. HIV is a disease that we can defeat -- just as we have eradicated smallpox from our planet and polio from the western hemisphere. We have made tremendous progress in our understanding of HIV and HIV disease; improving treatments and preventing infections, and we have increased federal funding for AIDS research, prevention, care, and housing by more than 50 percent in the past four years.

But we have much more work to do, and we must build on the public-private partnerships that have begun to work so well. That is why I am so pleased to share with you the first-ever National AIDS Strategy, a historic document that articulates our national goals and establishes a blueprint for achieving them.

We have set six simple, but vital, goals. We will work hard to develop a cure for those living with HIV/AIDS and a vaccine to prevent further infections; to reduce and eventually eliminate new HIV infections; and to guarantee people living with HIV access to necessary care and services. At the same time, we intend to fight AIDS-related discrimination at every turn; to maintain our international leadership role; and to ensure that scientific advances are quickly translated into improved care and prevention.

To achieve these objectives, we must all stand shoulder-to-shoulder in our fight against HIV and AIDS. None of us can afford to sit by and watch this epidemic continue to take our neighbors, friends, and loved ones from us. HIV/AIDS affects us all, and we must wage this battle together until we can proclaim victory.

With your involvement and the commitment of nations around the world, I am confident that we will succeed.

Bill Clinton

THE WHITE HOUSE

WASHINGTON

The epidemic of HIV and AIDS constitutes a public health crisis of unprecedented proportions. For fifteen years, this terrible tragedy has devastated far too many lives in the U.S. and around the world. HIV is a disease that we can defeat -- just as we have eradicated smallpox from our planet and polio from the western hemisphere. We have made tremendous progress in our understanding of HIV and HIV disease, improving treatments and preventing infections, and we have increased federal funding for AIDS research, prevention, care, and housing by more than 50 percent in the past four years.

But we have much more work to do, and we must build on the public-private partnerships that have begun to work so well. That is why I am so pleased to share with you the first-ever National AIDS Strategy, a historic document that articulates our national goals and establishes a blueprint for achieving them.

We have set six simple, but vital, goals. We will work hard to develop a cure for those living with HIV/AIDS and a vaccine to prevent further infections; to reduce and eventually eliminate new HIV infections; and to guarantee people living with HIV access to necessary care and services. At the same time, we intend to fight AIDS-related discrimination at every turn; to maintain our international leadership role; and to ensure that scientific advances are quickly translated into improved care and prevention.

To achieve these objectives, we must all stand shoulder-to-shoulder in our fight against HIV and AIDS.
