NEWS YOU CAN RELATE TO

World Health Organization

August 30, 2013

The world is in an uproar today! Yesterday, the nucleus was brought up on charges by the endoplasmic reticulum. The nucleus is being held without bond.

The nucleus...behind bars.

Witnesses say that it was, “A sight to be seen.” The nucleus was throwing ribosomes out of the nucleolus, and the endoplasmic reticulum tried to intervene.

Judge Golgi said it was unlikely the nucleus would ever return to the cell. “It’s a sad case,” said Golgi. “DNA is floating around in cells like it has lost its home.”

Golgi has discussed matters with the President of the World Health Organization, and she agrees that the world must select an organelle to replace the nucleus. “The nucleus is not presently doing its job. We must choose an interim.” The organelle selected as the interim nucleus may likely find that it has a permanent new job in the cell.

The “Campaign Season” is now open to all organelles who wish to apply for the interim position.
