

If you have not created any custom template and have merely been using the templates provided by Amazon, then you can simply update your plugin by clicking on the update link.

### How to create a backup of the custom templates?

Note, if you are running a customized template you will lose any customizations if you simply update your plugin. In this case, you will need to take a backup of the custom templates first by following these steps:

1. Locate the `/wp-content/plugins/amazon-associates-link-builder/template` directory.
2. Each of your custom template should have a `.css` and a `.mustache` file. Copy both these files for all the custom templates you have created.

3. Paste the copied files in a secure location.
4. Now, update the Amazon Associates Link Builder plugin to v1.2.
5. After successfully updating the plugin, go to the `/wp-content/plugins/amazon-associates-link-builder/template` directory and move the files from the secure location to this directory.

The custom templates should now work seamlessly.
