

Worms with Kneecaps

New fossil discoveries in China are being greeted by evolutionists as among the most spectacular of the century. The fossils, say evolutionists, represent some of the earliest multicelled creatures. Evolutionists are publicizing these fossils as evidence for evolution. It's not difficult, however, to see how these fossils support creation rather than evolution.

Evolutionists admit the fossils show that the first multicelled creatures have appeared suddenly. This confirms creationist claims that life appeared suddenly and without evolutionary ancestors.

These "first" multicelled creatures were complex and complete. There were no fossils with partially developed eyes or other organs. They include trilobites that had some of the most complex eye structures of any creature that ever lived. There are also fossils of shrimp-like creatures and creatures with hard shells. Some of the animals were over two feet long. Now that's a big jump when you remember that the previous step was a single-celled algae!

There are no evolutionary missing links. The evolutionists said that the creatures all belong to groups that still exist. This means that science has now documented the history of some kinds of creatures alive today right back to the very first record of multicelled life. In other words, these creatures never evolved! Also of interest is how evolutionists explain the size of this fossil deposit, which is miles across. One evolutionist said, "A violent storm probably stirred up the sea bottom and the mud settled over a large area..."

Exodus 31:17

“It is a sign between me and the children of Israel for ever: for in six days the Lord made heaven and earth, and on the seventh day he rested, and was refreshed.”

Prayer: Dear Father in heaven, I do not understand how You could have designed and so quickly created the millions of kinds of living things that You did. Help me to believe Your Word, even when my poor, sinful, created mind cannot understand how wonderful You are. In Jesus' Name. Amen.
