

The Probability of Evolution

Evolutionists explain that life started from non-living matter in some sort of "primeval soup." Over the years, they have presented several scenarios of how this might have happened. They have suggested isolated ponds, pools of water on the sides of volcanoes, and in the oceans. Let's consider the general mathematical principles involved in any of these scenarios.

In science, the person who proposes a theory is supposed to present the evidence for that theory. Yet, for the incredible claim that life sprang into being out of non-living materials, no evidence is offered. Just how incredible are evolution's claims about the origin of life? Given the conditions evolutionists claim existed at the origin of life, the chance of evolving the simple, common, iso -1-cytochrome "c" protein is one chance out of one followed by 75 zeros. But that's not a living, reproducing thing. Given the same conditions, the chance of getting a DNA molecule with the ability to reproduce is 100 billion, billion to one. The chance of getting a minimal cell works out to one chance out of a 1 followed by 4,478,296 zeros!

Rigorous examination of evolution's claims about the origin of life shows that every evolutionary claim about how life started is just as fanciful. As every believer has testified, God is the source of all life, including yours and mine. It has always been so and will always be so.

Job 10:12

"Thou hast granted me life and favour, and thy visitation hath preserved my spirit."

Prayer: Dear Father in heaven, I thank You for the gift of life and eternal life. Amen.
