

The Stinking Poison Bird

The hooded pitohuis is an evil-smelling, blue jay-sized bird that is native to New Guinea. The bird has been known to science since 1827, but it held a secret that only began to be uncovered in 1989.

An American graduate student made the discovery while studying another local bird, the bird of paradise. Unfortunately, hooded pitohuis kept getting caught in his nets. As he released the unwanted pitohuis, they would claw and peck at him. After he released the birds, he licked the wounds they had caused. As a result, his mouth began to burn and finally became numb for several hours. This led the graduate student to send dead hooded pitohuis to the National Institutes of Health for further study. The poison the birds produce was finally identified as one of the most poisonous substances known. It is hundreds of times more poisonous than strychnine. The amount of poison in one bird can kill 500 mice. Most amazing is that only one other creature produces the same poison, the poison dart frog of Central America.

Those who believe in evolution maintain that the ability to produce the poison must have evolved twice. But it's not that simple. Not only do both bird and frog, half a world apart, have to evolved this unlikely ability twice, but they both had to evolve immunity to their own poison. Ultimately, evolution is a faith. It is a faith that is poisonous to Christianity because it makes death natural rather than a result of the first Adam's sin. And without the fact of the first Adam, there is no need for the Second Adam, Jesus Christ.

Acts 14:2

“But the unbelieving Jews stirred up the Gentiles, and made their minds evil affected against the brethren.”

Prayer: Lord, I thank You for Your victory over sin, death and the devil. Amen.
