

The Deception of Evolutionary Dating

We have all heard evolutionists claim certain rocks and fossils to be millions of years old. They claim to arrive at these long ages using index fossils. Index fossils are creatures that supposedly lived during specific ages. We are told that these ages are independently verified using radiometric-dating methods. But is all of this as neat and certain as evolutionists say it is?

A rock formation in England yielded more than just rocks. This rock layer is said to be 189 million years old, based on its index fossils. The index fossils, ammonites and belemnites, were bottom-living deep-sea creatures. Along with these deep-sea creatures, however, partially petrified wood was also found. One piece was found immediately adjacent to a deep-sea fossil. Scientists who believe in young earth creationism sent samples of the wood to three different radiocarbon dating laboratories. If the index fossil was really as old as evolutionists say, it is almost 4,000 times too old to give a radiocarbon date. Yet all the samples dated at the three laboratories showed consistent young dates. Adjusted by Biblical considerations, they date to the time of Noah's Flood.

We would expect to find land-based life mixed with deep-sea creatures in any rocks that are a result of the violence of the Flood. This find illustrates and supports the Biblical account of a worldwide Flood.

II Corinthians 11:3

“But I fear, lest by any means, as the serpent beguiled Eve through his subtilty, so your minds should be corrupted from the simplicity that is in Christ.”

Prayer: Lord, the earth witnesses Your Truth. Help me to do the same. Amen.
