

THIS WEEK'S CREATION MOMENT

Is a Shark Related to the Pig?

“So God created great sea creatures and every living thing that moves, with which the waters abounded, according to their kind, and every winged bird according to its kind. And God saw that it was good.” - Genesis 1:21

If all life evolved from, and is related to, earlier forms of life, then closely related animals should also have similar kinds of chemicals in their bodies. As the science of biochemistry has grown, those who believe in evolution have held high hopes for this idea. For example, insulin from a shark should be more like insulin from other fish than insulin from mammals.

But chemical comparisons between various creatures don't usually show the same relationships as their evolutionary charts. Research at the Medical University of South Carolina compared the hormone relaxin produced by pigs and rats with relaxin produced by sharks. The results showed that the pig's relaxin was more like the shark's relaxin than it was like a rat's. This seems to suggest that pigs are more closely related to sharks than to another mammal, the rat. A similar study comparing insulin showed a closer similarity between the shark and the pig than between the shark and another fish, the carp.

While evolutionists will sometimes point out instances where these comparisons have worked out as they expected, those results are unusual. Normally, these comparisons show that the evolutionary histories and relationships are nothing more than imagination. As the Bible says, each kind of creature gives evidence that it was uniquely created by God.
