

How To Have A Domain And Hosting (HostGator)

Hello there! In this video, I'm going to show you how to have a domain and hosting it on HostGator.

All this can be done by just following a few simple steps.

So, let's get started shall we?

To start things off, let's register a domain after you have sign up.

On top of the page, enter your domain name and click on Register button.

Now, if the domain name is available, you are also given the choice to register a domain with new TLDs.

Once you have decided on your domain name, click on Add To Cart button next to the domain which you want to register.

Then click on View Cart button.

On this page, you can see that the domain privacy protection has been selected.

You can unselect the checkbox since domain privacy protection is not essential.

Now, you can see that the total charges for domain registrations reduce to \$12.95.

Next accept the terms of service and click on complete order button.

Key in your login details and click on Login button.

Provide the payment details and your domain will be registered.

Go to the browser and make sure that your new domain is working properly.

Thanks for watching.
