

The ADAPT Toolkit: Implementing Interoperability in Precision Agriculture

Interoperability has been a formidable hurdle to the use of precision ag technologies. ADAPT provides an easy-to-use industry framework, with the tools to simplify communication between growers, their machines, and their partners.

"The as-is state of precision ag data management is frustrating to say the least. . . . Widespread acceptance and use of the new ADAPT framework will reduce our effort and frustration greatly."

– Luke Lightfoot, Ag Technology Manager at Co-Alliance, LLP, an Indiana ag cooperative

ADAPT's Mission

To support the ongoing process of providing open-source solutions to enhance interoperability between systems that create and manage agricultural data.

The ADAPT Committee is composed of two teams, Business and Technical.

Adopt ADAPT! (Here's why...)

Different brands of farm equipment and software currently collect and consume data in a variety of proprietary file formats. While this is a natural consequence of how the industry has grown, it makes it hard for end-users to "connect the dots" and extract value from the data.

The promise of seamless interoperability among precision ag systems – regardless of the system manufacturer – has entered an exciting new stage with AgGateway's ADAPT framework. ADAPT (Agricultural Data Application Programming Toolkit) eliminates this barrier to the broad use of precision agriculture data, by easily enabling interoperability between different software and hardware applications.

ADAPT contains:

- A **common object model** for field operations.
- A set of **data conversion plug-ins** (both open source and proprietary).
- A **plug-in management framework** (a software development kit) that enables all the parts to work together.

Plug-ins convert data between the common object model and other formats. A major goal of the ADAPT team is to reach the point where plug-ins exist for all the formats of interest to the industry. The ADAPT team wrote and maintains two fundamental plug-ins, which have been tested successfully: one for ISO 11783, the other to serialize ADAPT for FMIS-to-FMIS communication. Manufacturers and third parties are encouraged to write plug-ins for their formats of interest.

ADAPT is an open-source project, allowing stakeholders worldwide to use the software and to contribute to its continued development. The toolkit has been developed over several years by a large, collaborative group of AgGateway members from a variety of terminal equipment manufacturers and farm management information system (FMIS) software companies, who all recognized that the grower and other agricultural users have a critical need to use data from multiple sources in field operations decision-making. ADAPT's open-source structure now encourages participation by everyone – AgGateway members and non-members alike.

More ADAPT Features

- **Simple to use:** A common object model that you can use in your farm management software. Plug-in libraries that allow the farm management software to convert to and from the common object model and different file formats.
- **Eclipse Public License 1.0:** The open-source license allows you to include ADAPT in your software and modify it if needed.
- **Plug-ins are licensed by their developer:** Anyone can build a plug-in for ADAPT; the developer is free to license their plug-in based on their business needs.
- **Farm Management Information System (FMIS) companies** are responsible for the implementation of reading and writing to/from the object model.
- **Cross platform:** ADAPT can run on Windows, Mac or Linux if your software runs the .NET Framework or Mono.
- **Strong support for different geographies, languages and geopolitical contexts.**
- **Transparent governance:** Open-source, governed by AgGateway's ADAPT Committee. Non-members can participate.

The ADAPT Toolkit

How ADAPT works to enable data conversion

The figure above shows two examples of data conversions and flows.

Incoming data from a Mobile Implement Control System (MICS, i.e., the controller in the cab.

Data flow shown in red: A proprietary-format data file coming from a controller in the field is converted by a manufacturer-specific plug-in into an instance of the object model; a Farm Management Information System ("FMIS A") consumes the data.

Communication between Farm Management Information Systems (FMIS, i.e., farm management software. **Data flow shown in blue:** FMIS A creates an instance of the object model, populates it with the data it wants to transmit, and uses the ADAPT plug-in to serialize it to a file. This ADAPT-formatted file is transmitted to another FMIS using the Internet or another means. (File transport is out of scope of ADAPT, accommodating the various solutions available in the industry.) FMIS B uses the ADAPT plug-in to convert the ADAPT-formatted file to an instance of the object model, and then consumes the data.

Note how FMIS A and FMIS B are both supported by Reference Data, a distributed system of common unique identifiers for products to be shared across the industry by manufacturers and third-party data providers.

A Robust, Open-Source Project

The ADAPT team is working in the context of the continuing cooperation between AgGateway and relevant standards organizations such as the **Agricultural Industry Electronic Foundation (AEF)**, which implements the **ISO 11783 standard**.

ADAPT has received the bulk of its requirements from AgGateway's SPADE (<http://bit.ly/26vg7ry>) and PAIL (<http://bit.ly/1S269kR>) projects.

Remember: You can use and contribute to ADAPT without being an AgGateway member!

How you can get involved

Go to www.ADAPTFramework.org to review the ADAPT model and to access a growing set of resources to help with implementation!
