

Notix

A plugin by Scaleup Technologies

Table of Contents

A. Setting up your page for notifications:	1
B. Sending push notifications via workflow	7

For more info, please check out <https://notix.co>

A. Setting up your page for notifications:

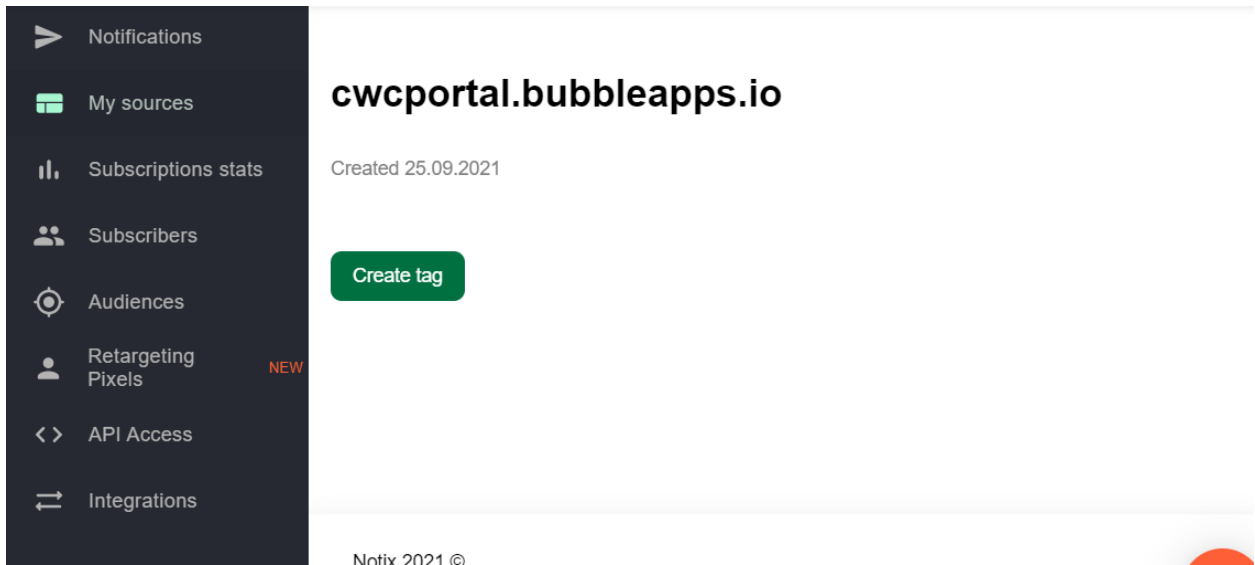

1. In your Notix account, click on 'Add source'

Notix 2021 ©

2. Enter the url of your Bubble page(you do not need to put version-test)

Notix 2021 ©

- Click on create tag (you can create multiple tags for a source if you want to set up multiple subscriber lists)

The screenshot shows the Notifix dashboard for the source **cwcportal.bubbleapps.io**. On the left is a dark sidebar with navigation links: Notifications, My sources, Subscriptions stats, Subscribers, Audiences, Retargeting Pixels (marked with a red 'NEW' tag), API Access, and Integrations. The main content area shows the source name, its creation date (25.09.2021), and a green 'Create tag' button. At the bottom of the main area, it says 'Notifix 2021 ©'.

Create tag

Tag name

Cancel

Create

- Under your tag, download 'sw.enot.js' file.

Excited tag

For Wordpress Plugin and Parallel Testing set up (if you already have 3rd party push service installed) please get in touch with us at support@notix.co.

[Use this instruction to learn more about Notix tag implementation.](#)

① Upload sw.enot.js to your site

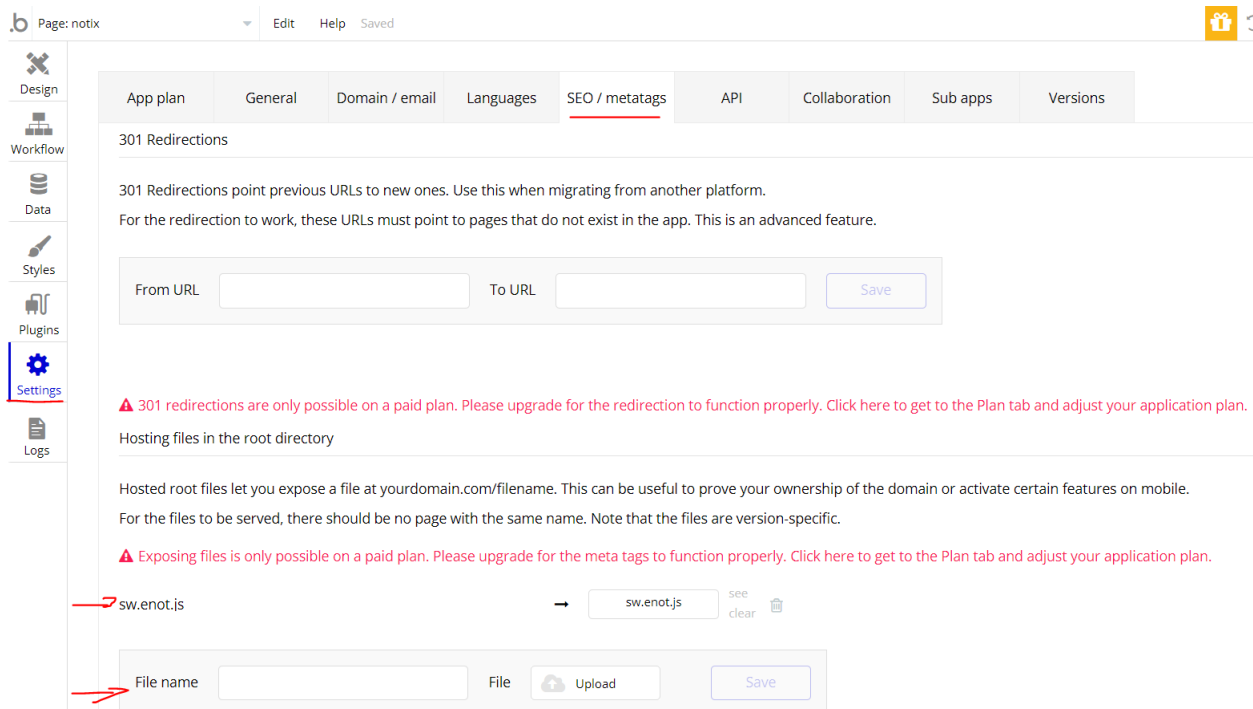

Upload this file to the root directory of your site to start collecting subscribers

sw.enot.js

[Download file](#)

- In your Bubble app, go to 'Settings' -> 'SEO/metatags' -> upload the file with the specified name as below image. Take note that the naming needs to be exact and your app needs to be on a paid plan.

301 Redirections

301 Redirections point previous URLs to new ones. Use this when migrating from another platform.
For the redirection to work, these URLs must point to pages that do not exist in the app. This is an advanced feature.

From URL To URL [Save](#)

⚠ 301 redirections are only possible on a paid plan. Please upgrade for the redirection to function properly. Click here to get to the Plan tab and adjust your application plan.

Hosting files in the root directory

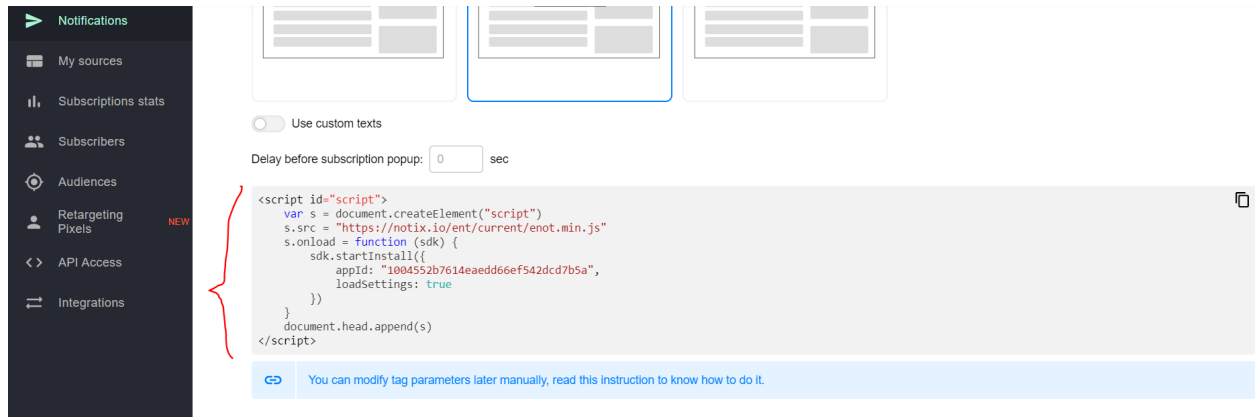

Hosted root files let you expose a file at yourdomain.com/filename. This can be useful to prove your ownership of the domain or activate certain features on mobile.
For the files to be served, there should be no page with the same name. Note that the files are version-specific.

⚠ Exposing files is only possible on a paid plan. Please upgrade for the meta tags to function properly. Click here to get to the Plan tab and adjust your application plan.

6. Under Notix, copy the script.

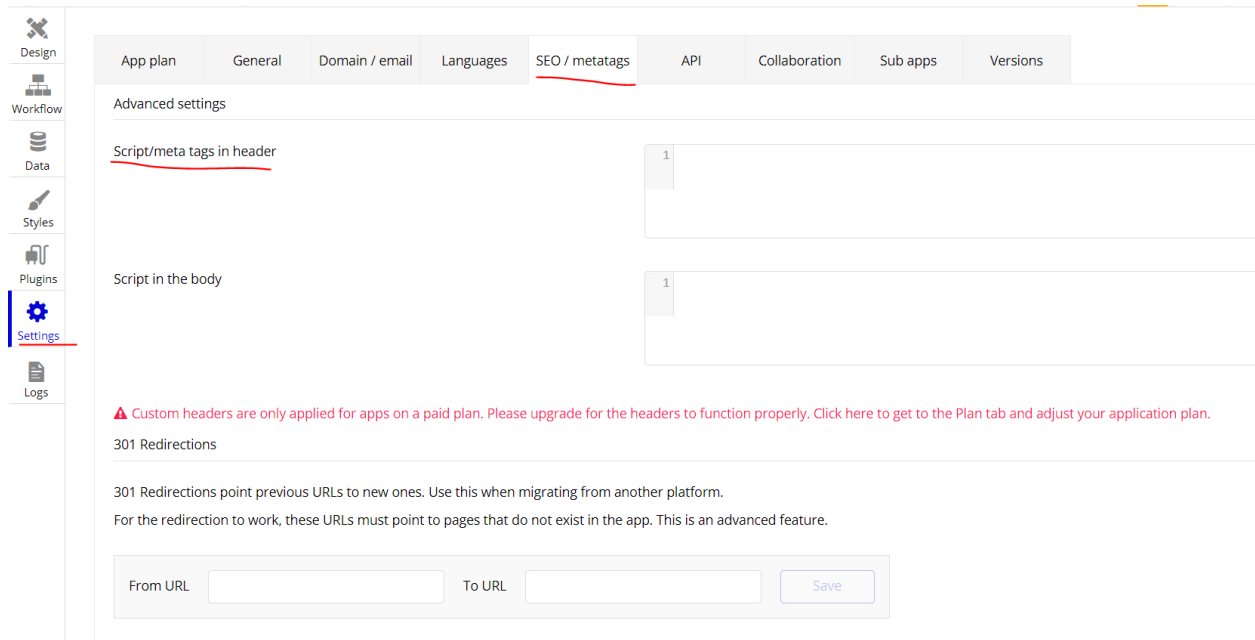

The screenshot shows the Notix dashboard with a sidebar on the left containing menu items: Notifications, My sources, Subscriptions stats, Subscribers, Audiences, Retargeting Pixels (marked as NEW), API Access, and Integrations. The main content area displays three placeholder boxes for subscription popups. Below these is a toggle for 'Use custom texts' and a 'Delay before subscription popup' field set to 0 seconds. A large text box contains the following JavaScript code:

```
<script id="script">
var s = document.createElement("script")
s.src = "https://notix.io/ent/current/enot.min.js"
s.onload = function (sdk) {
  sdk.startInstall({
    appId: "1004552b7614eaedd66ef542dcd7b5a",
    loadSettings: true
  })
}
document.head.append(s)
</script>
```

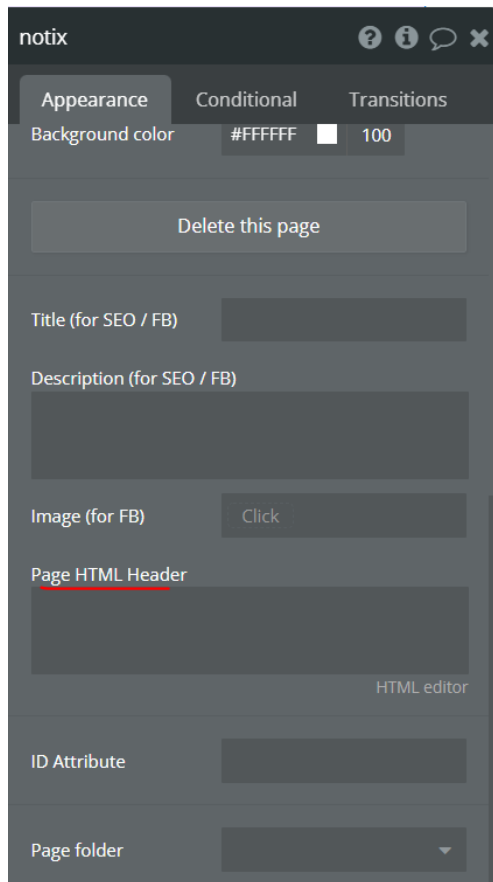

Below the code box is a blue link: "You can modify tag parameters later manually, read this instruction to know how to do it."

7. If you intend to only have 1 tag for the whole website, paste the script in the settings as per below.

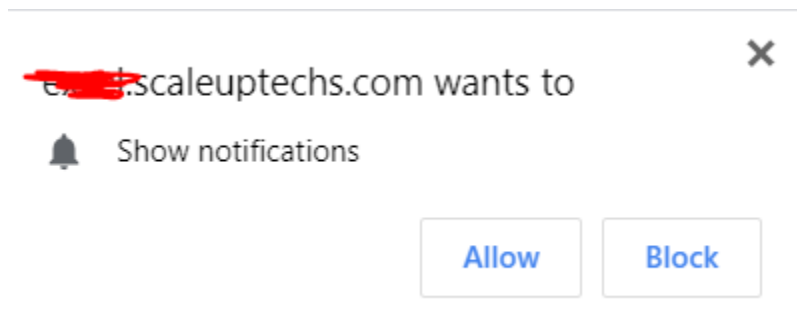

The screenshot shows the Notix Settings page with a sidebar on the left containing menu items: Design, Workflow, Data, Styles, Plugins, Settings (highlighted), and Logs. The main content area has a tabbed interface with the following tabs: App plan, General, Domain / email, Languages, SEO / metatags, API, Collaboration, Sub apps, and Versions. The 'SEO / metatags' tab is active, showing 'Advanced settings' with two sections: 'Script/meta tags in header' and 'Script in the body'. Each section has a text area and a '1' in a box. Below these sections is a red warning message: "⚠ Custom headers are only applied for apps on a paid plan. Please upgrade for the headers to function properly. Click here to get to the Plan tab and adjust your application plan." Underneath is a '301 Redirections' section with a text box containing the following text: "301 Redirections point previous URLs to new ones. Use this when migrating from another platform. For the redirection to work, these URLs must point to pages that do not exist in the app. This is an advanced feature." At the bottom is a form with 'From URL' and 'To URL' input fields and a 'Save' button.

8. If you have multiple tags, you may instead paste the tag in the 'Page HTML Header'. To find this setting, click on page settings in the design tab.

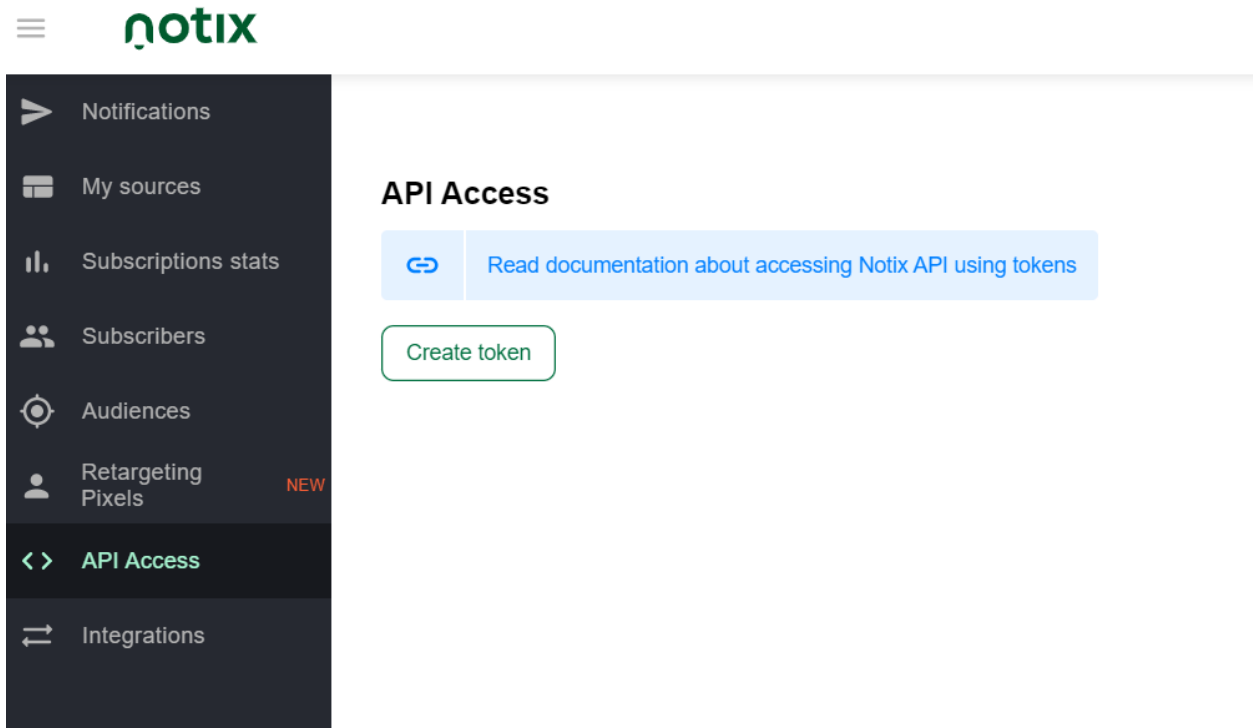

10. You are done! Once a user lands on your page, they will be asked to subscribe to notifications.

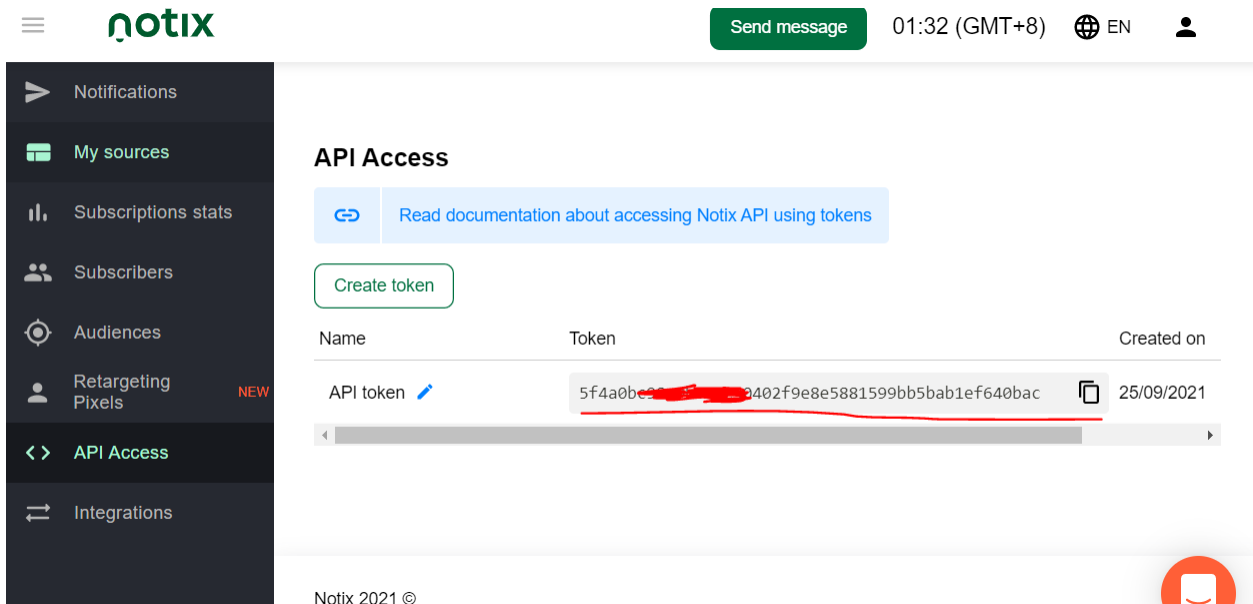

B. Sending push notifications via workflow

1. Under Notix account, 'API Access', click Create an API token and give it any name.

2. Copy token details

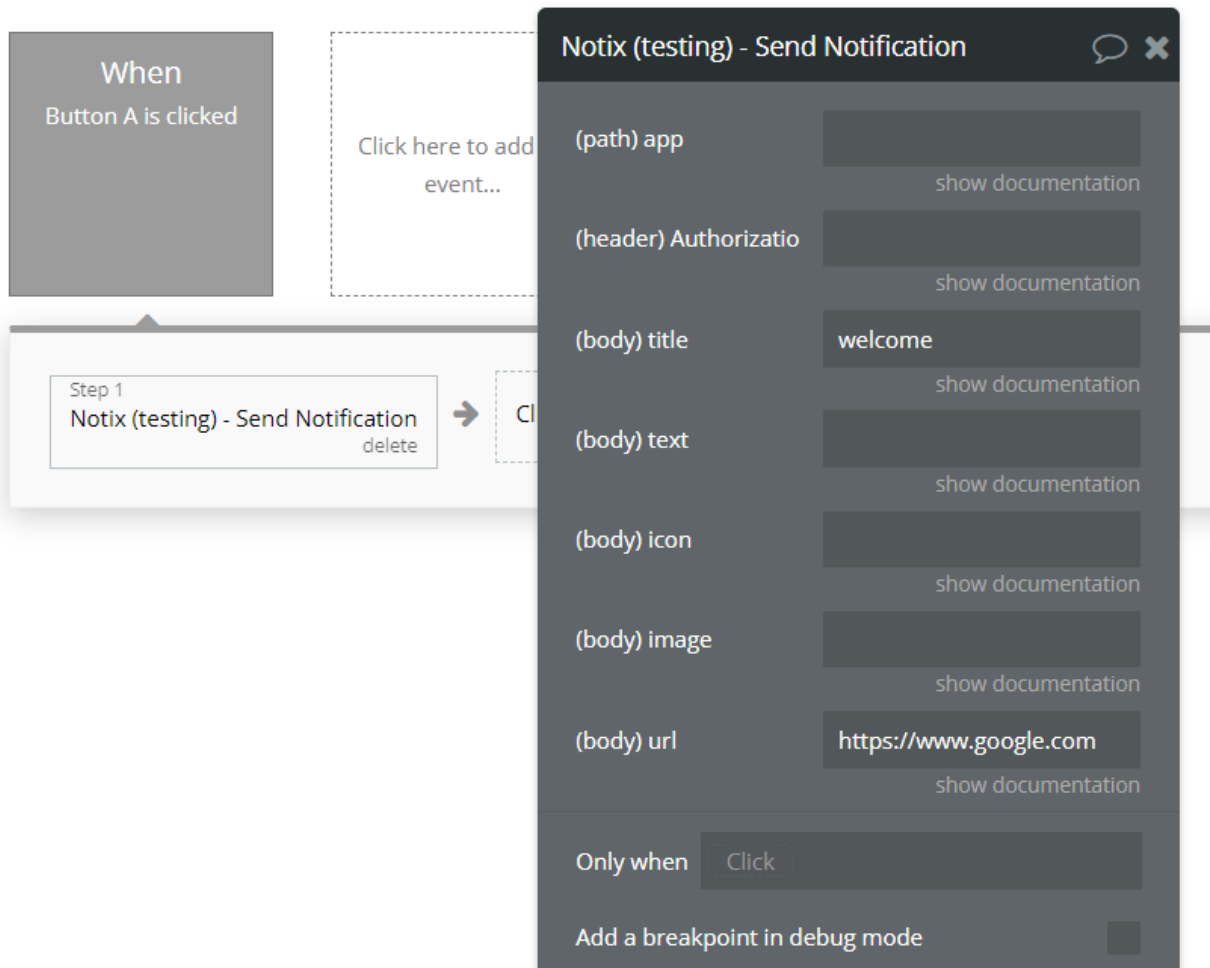

3. In your Bubble workflow, choose 'Notix - Send Notification' under plugin actions. Fill in the following details:

App - put AppID (see step A.6)

Authorisation - put the api key as per earlier step

The rest of the fields are related to your notification details.

You can now send push notifications to your users! Do note that push notifications take time to propagate to all users - refer to <https://docs.notix.co/> for more info.
