Test Automation Engineer

# Theoretical structure of an assertion

```
assert boolean_expression
```

# The optional message argument

```
assert boolean_expression, message
```

```
assert 1 == 2, "One is not equal to two!"
```

```
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
AssertionError: One is not equal to two!
```

```
assert 1 == 1, "This will not be printed since assertion passes"
```

# Adding a message to a unit test

- test module: `test_row_to_list.py`

```
import pytest  
...  
  
def test_for_missing_area():  
    assert row_to_list("\t293,410\n") is None
```

# Adding a message to a unit test

- test module: `test_row_to_list.py`

```
import pytest  
...  
  
def test_for_missing_area():  
    assert row_to_list("\t293,410\n") is None
```

- test module: `test_row_to_list.py`

```
import pytest  
...  
  
def test_for_missing_area_with_message():  
    actual = row_to_list("\t293,410\n")  
    expected = None  
  
    message = ("row_to_list('\t293,410\n') "  
              "returned {0} instead "  
              "of {1}").format(actual, expected)  
  
    assert actual is expected, message
```

# Test result report with message

- `test_on_missing_area()` output on failure

```
E      AssertionError: assert ['', '293,410'] is None
E      +  where ['', '293,410'] = row_to_list('\t293,410\n')
```

- `test_on_missing_area_with_message()` output on failure

```
>      assert actual is expected, message
E      AssertionError: row_to_list('\t293,410\n') returned ['', '293,410'] instead
          of None
E      assert ['', '293,410'] is None
```

# Recommendations

- Include a message with assert statements.
- Print values of any variable that is relevant to debugging.

# Beware of float return values!

```
0.1 + 0.1 + 0.1 == 0.3
```

False

# Beware of float return values!

```
0.1 + 0.1 + 0.1
```

```
0.3000000000000004
```

# Don't do this

```
assert 0.1 + 0.1 + 0.1 == 0.3, "Usual way to compare does not always work with floats!"
```

```
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
AssertionError: Usual way to compare does not always work with floats!
```

# Do this

- Use `pytest.approx()` to wrap expected return value.

```
assert 0.1 + 0.1 + 0.1 == pytest.approx(0.3)
```

# NumPy arrays containing floats

```
assert np.array([0.1 + 0.1, 0.1 + 0.1 + 0.1]) == pytest.approx(np.array([0.2, 0.3]))
```

# Multiple assertions in one unit test

```
convert_to_int("2,081")
```

```
2081
```

# Multiple assertions in one unit test

- test module: test\_convert\_to\_int.py

```
import pytest  
...  
  
def test_on_string_with_one_comma():  
    assert convert_to_int("2,081") == 2081
```

- test\_module: test\_convert\_to\_int.py

```
import pytest  
...  
  
def test_on_string_with_one_comma():  
    return_value = convert_to_int("2,081")  
    assert isinstance(return_value, int)  
    assert return_value == 2081
```

- Test will pass only if both assertions pass.

# Let's practice writing assert statements!

UNIT TESTING FOR DATA SCIENCE IN PYTHON

# Testing for exceptions instead of return values

UNIT TESTING FOR DATA SCIENCE IN PYTHON

Dibya Chakravorty  
Test Automation Engineer

# Example

```
import numpy as np  
example_argument = np.array([[2081, 314942],  
                           [1059, 186606],  
                           [1148, 206186],  
                           ]  
                           )  
split_into_training_and_testing_sets(example_argument)
```

```
(array([[1148, 206186],  
       [2081, 314942],  
       [1059, 186606]]))
```

# Example

```
import numpy as np  
example_argument = np.array([[2081, 314942],      # must be two dimensional  
                           [1059, 186606],  
                           [1148, 206186],  
                           ]  
                           )  
split_into_training_and_testing_sets(example_argument)
```

```
(array([[1148, 206186],  
       [2081, 314942],  
       ]  
      ),  
 array([[1059, 186606]]))
```

# Example

```
import numpy as np  
example_argument = np.array([2081, 314942, 1059, 186606, 1148, 206186])      # one dimensional  
split_into_training_and_testing_sets(example_argument)
```

ValueError: Argument data array must be two dimensional. Got 1 dimensional array instead!

# Unit testing exceptions

## Goal

Test if `split_into_training_and_testing_set()` raises `ValueError` with one dimensional argument.

```
def test_valueerror_on_one_dimensional_argument():
    example_argument = np.array([2081, 314942, 1059, 186606, 1148, 206186])
    with pytest.raises(ValueError):
```

# Theoretical structure of a with statement

```
with ----:  
    print("This is part of the context")      # any code inside is the context
```

# Theoretical structure of a with statement

```
with context_manager:  
    print("This is part of the context")    # any code inside is the context
```

# Theoretical structure of a with statement

```
with context_manager:  
    # <--- Runs code on entering context  
    print("This is part of the context")    # any code inside is the context  
    # <--- Runs code on exiting context
```

# Theoretical structure of a with statement

```
with pytest.raises(ValueError):  
    # <--- Does nothing on entering the context  
    print("This is part of the context")  
    # <--- If context raised ValueError, silence it.  
    # <--- If the context did not raise ValueError, raise an exception.
```

# Theoretical structure of a with statement

```
with pytest.raises(ValueError):  
    raise ValueError      # context exits with ValueError  
    # <--- pytest.raises(ValueError) silences it
```

```
with pytest.raises(ValueError):  
    pass      # context exits without raising a ValueError  
    # <--- pytest.raises(ValueError) raises Failed
```

```
Failed: DID NOT RAISE <class 'ValueError'>
```

# Unit testing exceptions

```
def test_valueerror_on_one_dimensional_argument():
    example_argument = np.array([2081, 314942, 1059, 186606, 1148, 206186])
    with pytest.raises(ValueError):
        split_into_training_and_testing_sets(example_argument)
```

- If function raises expected `ValueError`, test will pass.
- If function is buggy and does not raise `ValueError`, test will fail.

# Testing the error message

```
ValueError: Argument data array must be two dimensional. Got 1 dimensional array instead!
```

# Testing the error message

```
def test_valueerror_on_one_dimensional_argument():
    example_argument = np.array([2081, 314942, 1059, 186606, 1148, 206186])
    with pytest.raises(ValueError) as exception_info:      # store the exception
        split_into_training_and_testing_sets(example_argument)

    # Check if ValueError contains correct message
    assert exception_info.match("Argument data array must be two dimensional.
                                  "Got 1 dimensional array instead!")
                                         )
```

- `exception_info` stores the `ValueError`.
- `exception_info.match(expected_msg)` checks if `expected_msg` is present in the actual error message.

**Let's practice unit  
testing exceptions.**

# Type I: Bad arguments

- When passed bad arguments, function raises an exception.

# Type I: Bad arguments (one dimensional array)

- When passed bad arguments, function raises an exception.

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError

Example: `np.array([845.0, 31036.0, 1291.0, 72205.0])`

# Type I: Bad arguments (array with only one row)

- When passed bad arguments, function raises an exception.

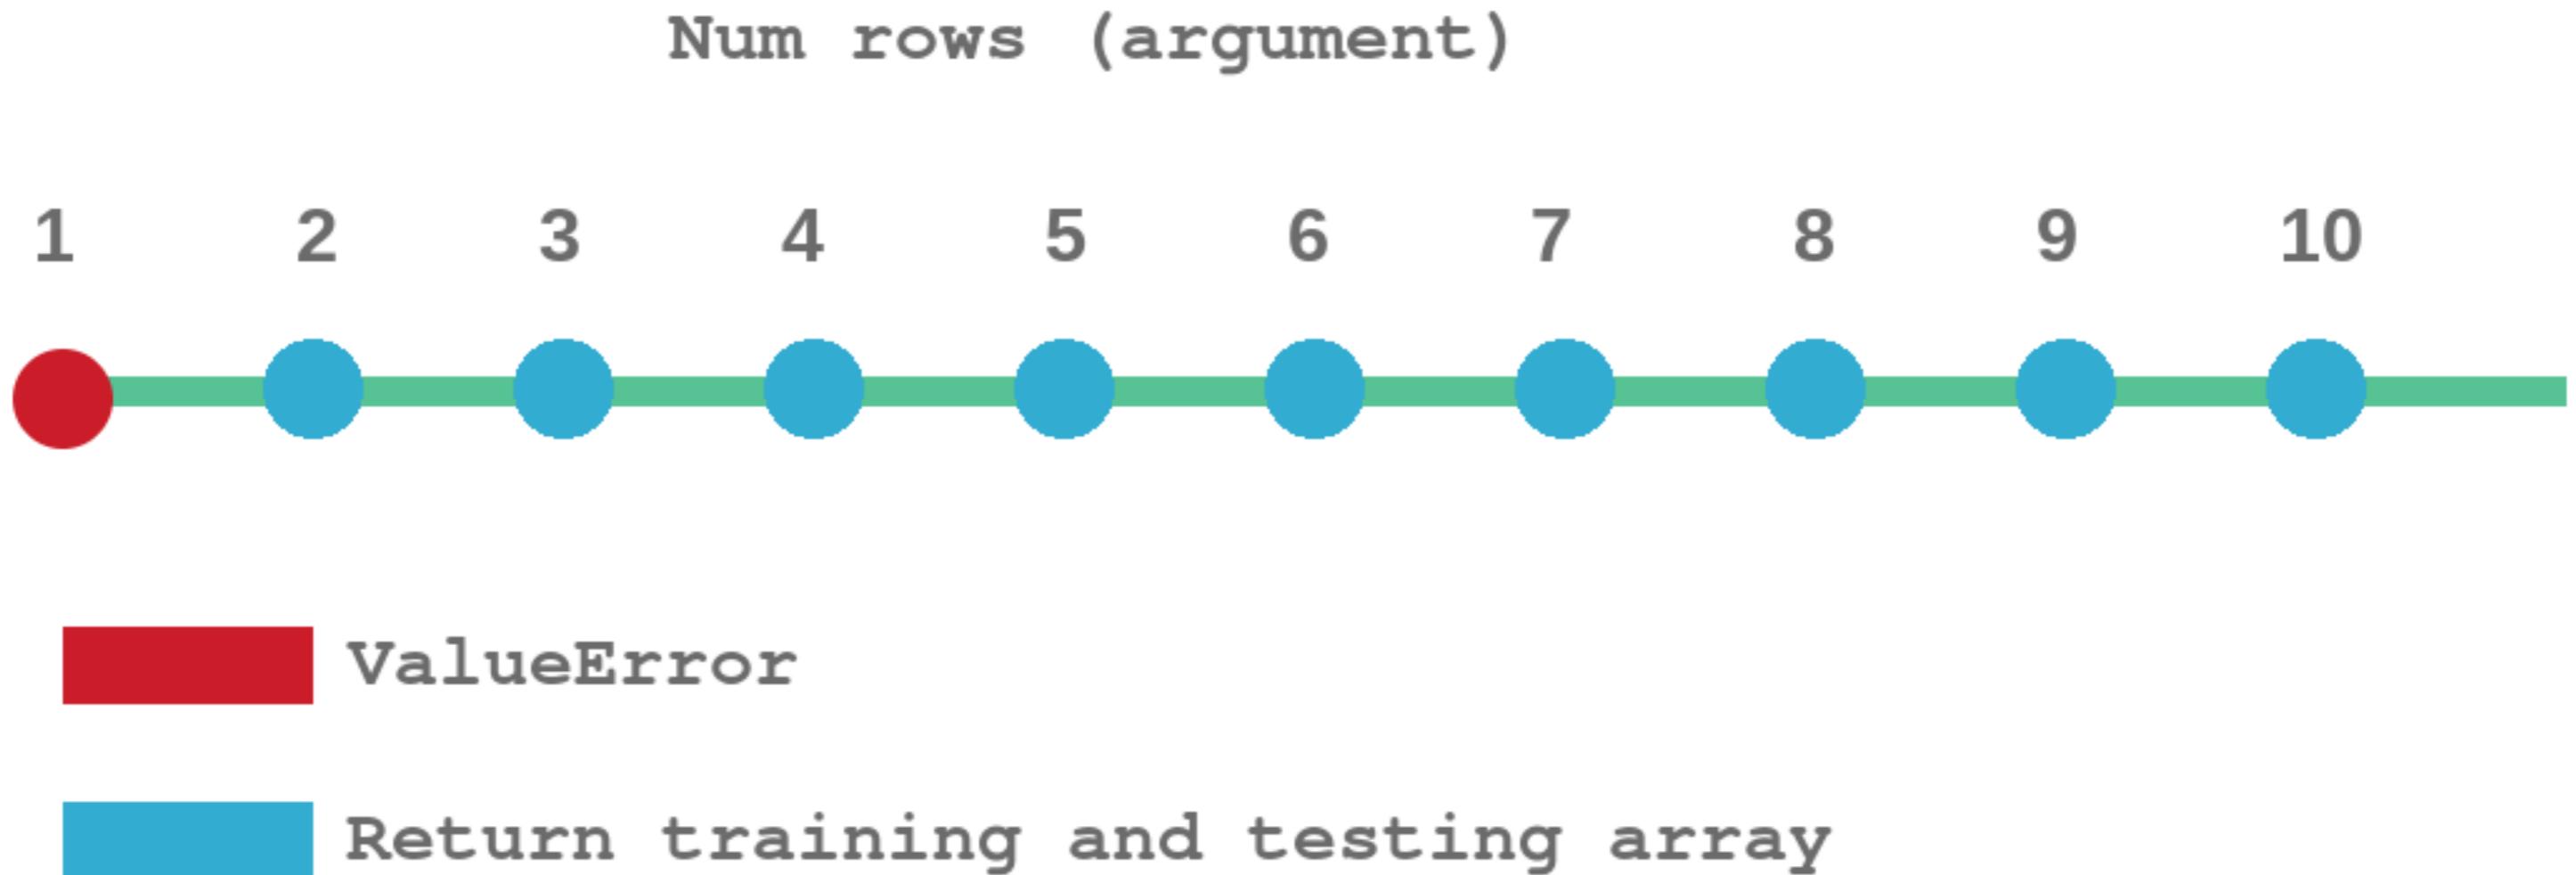

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError
Contains 1 row	Bad	-	-	ValueError

Example: `np.array([[845.0, 31036.0]])`

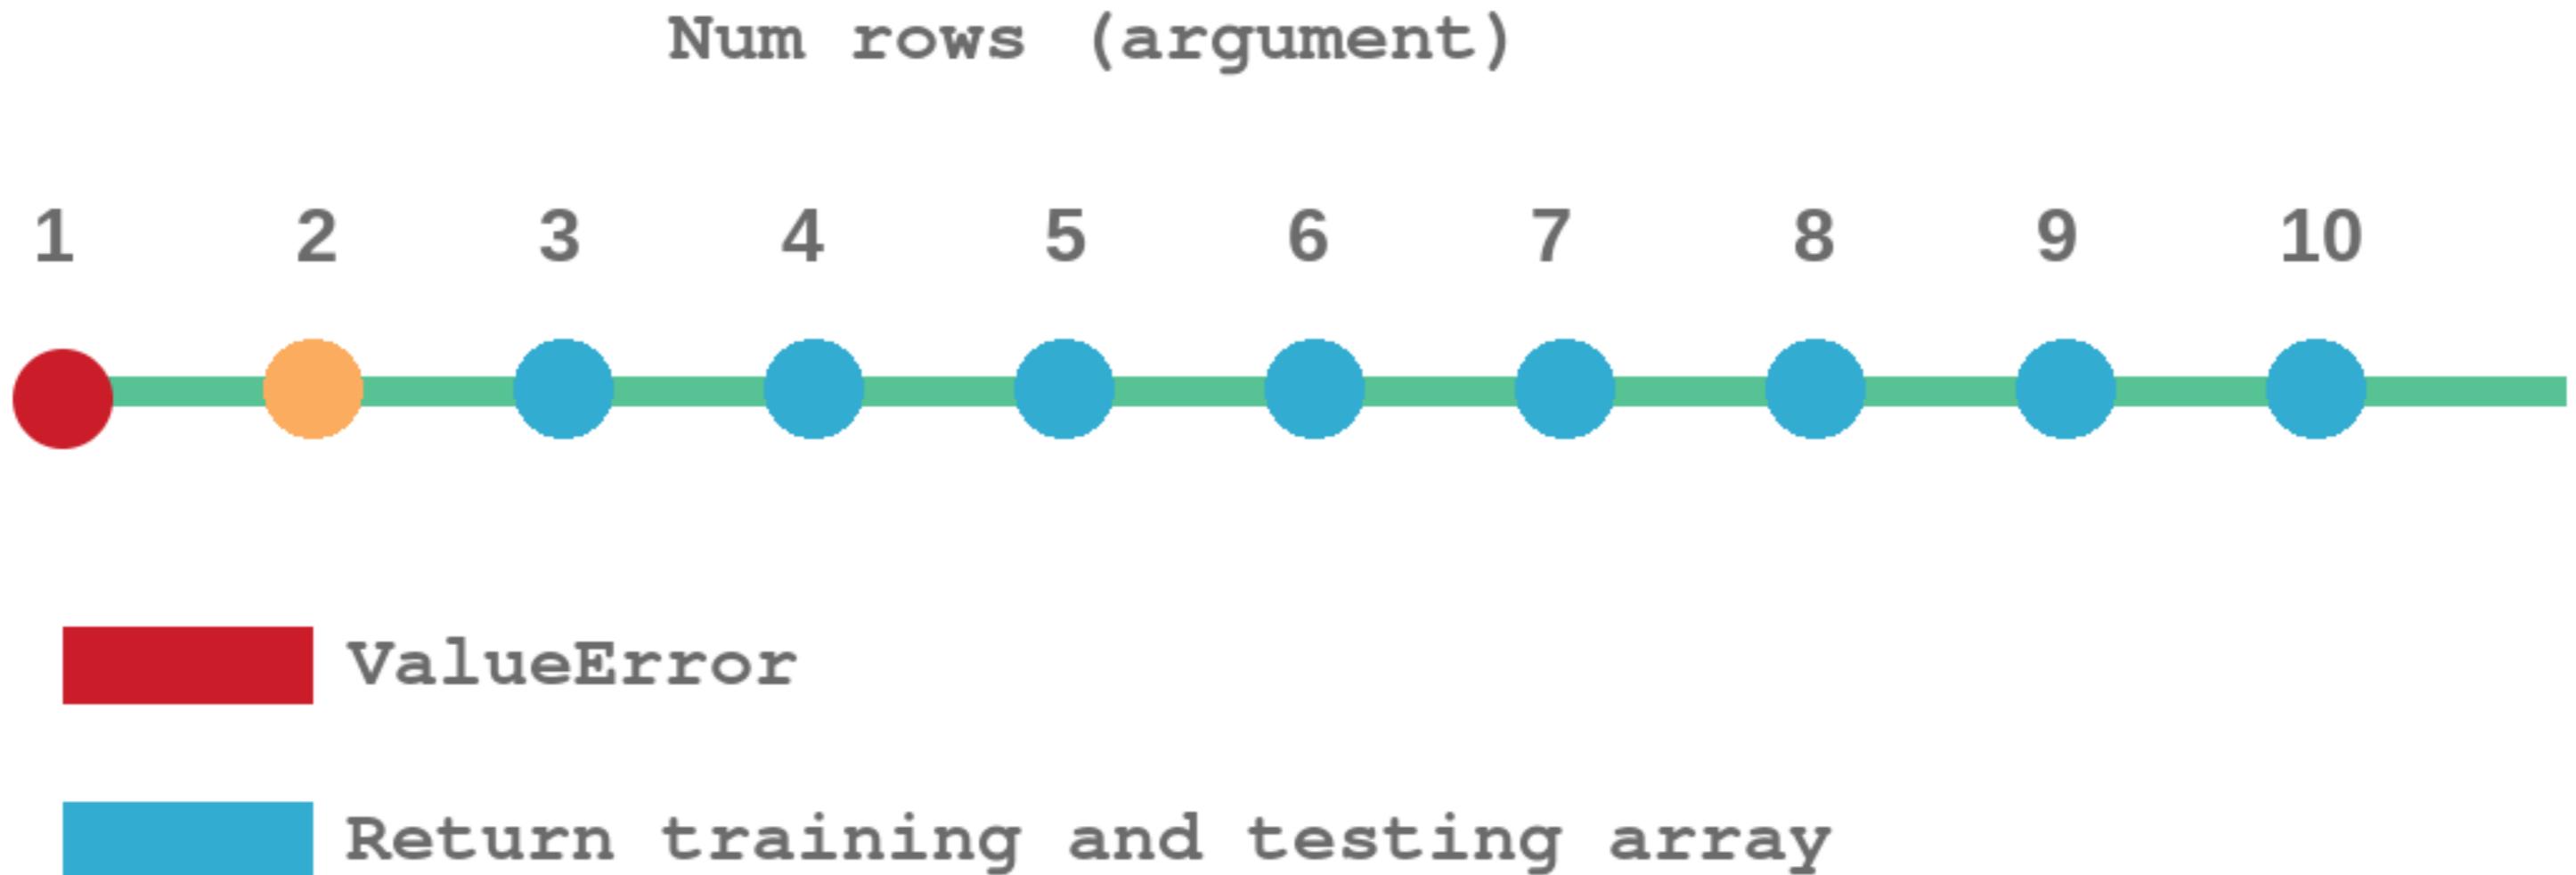

# Type II: Special arguments

- Boundary values.
- For some argument values, function uses special logic.

# Boundary values

# Boundary values

# Test arguments table

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError
Contains 1 row	Bad	-	-	ValueError
Contains 2 rows	Special	$\text{int}(0.75 * 2) = 1$	$2 - \text{int}(0.75 * 2) = 1$	-

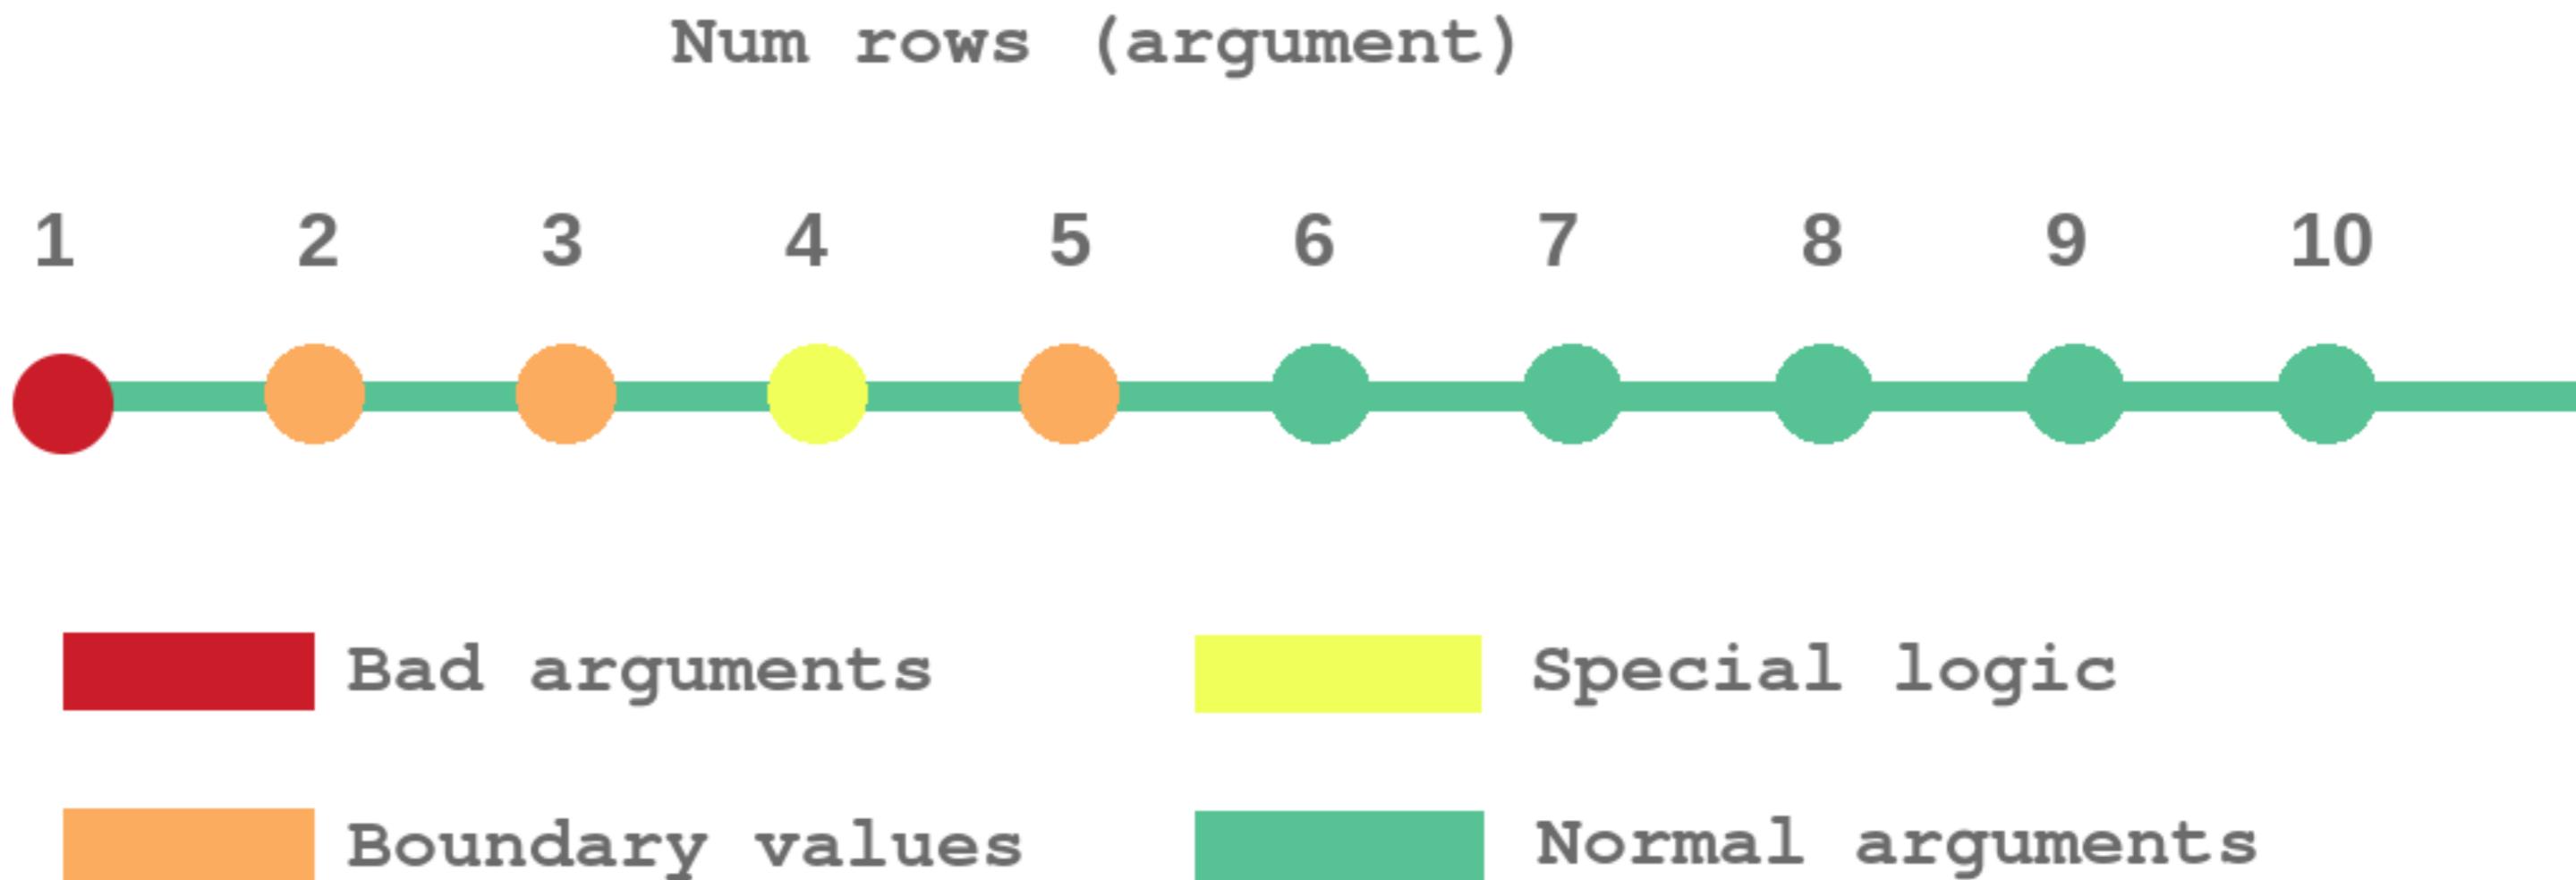

# Arguments triggering special logic

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError
Contains 1 row	Bad	-	-	ValueError
Contains 2 rows	Special	$\text{int}(0.75 * 2) = 1$	$2 - \text{int}(0.75 * 2) = 1$	-
Contains 4 rows		$\text{int}(0.75 * 4) = 3$	$4 - \text{int}(0.75 * 4) = 1$	-

# Arguments triggering special logic

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError
Contains 1 row	Bad	-	-	ValueError
Contains 2 rows	Special	$\text{int}(0.75 * 2) = 1$	$2 - \text{int}(0.75 * 2) = 1$	-
Contains 4 rows	Special	32	±2	-

# Normal arguments

Argument	Type	Num rows (training)	Num rows (testing)	exceptions
One dimensional	Bad	-	-	ValueError

Contains 8 rows	Normal	<code>int(0.75 * 8) = 6</code>	<code>8 - int(0.75 * 6) = 2</code>	-

```
split_into_training_and_testing_sets()
```

# Caveat

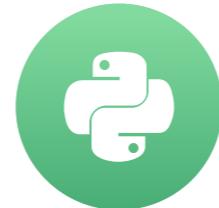

- Not all functions have bad or special arguments.
  - In this case, simply ignore these class of arguments.

**Let's apply this to  
other functions!**

**UNIT TESTING FOR DATA SCIENCE IN PYTHON**

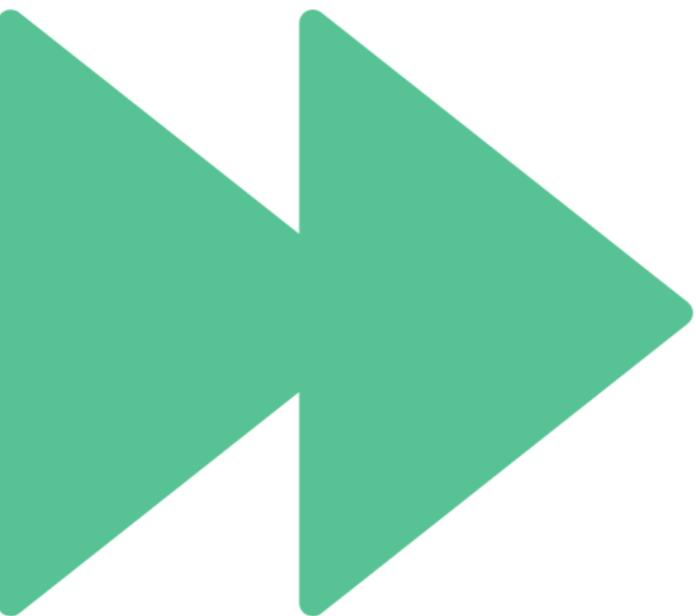

# Test Driven Development (TDD)

UNIT TESTING FOR DATA SCIENCE IN PYTHON

Dibya Chakravorty  
Test Automation Engineer

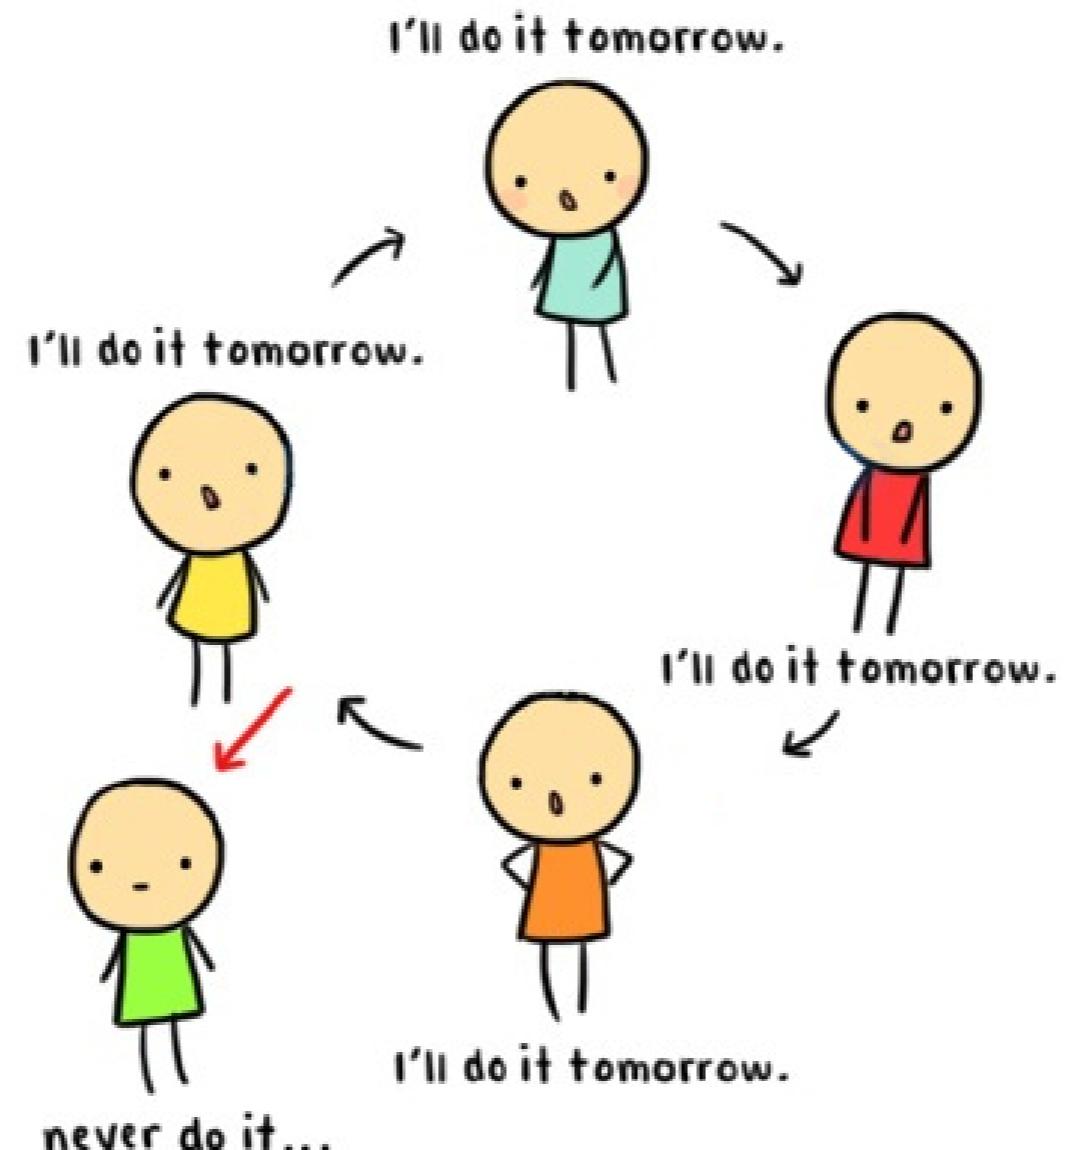

# Writing unit tests is often skipped

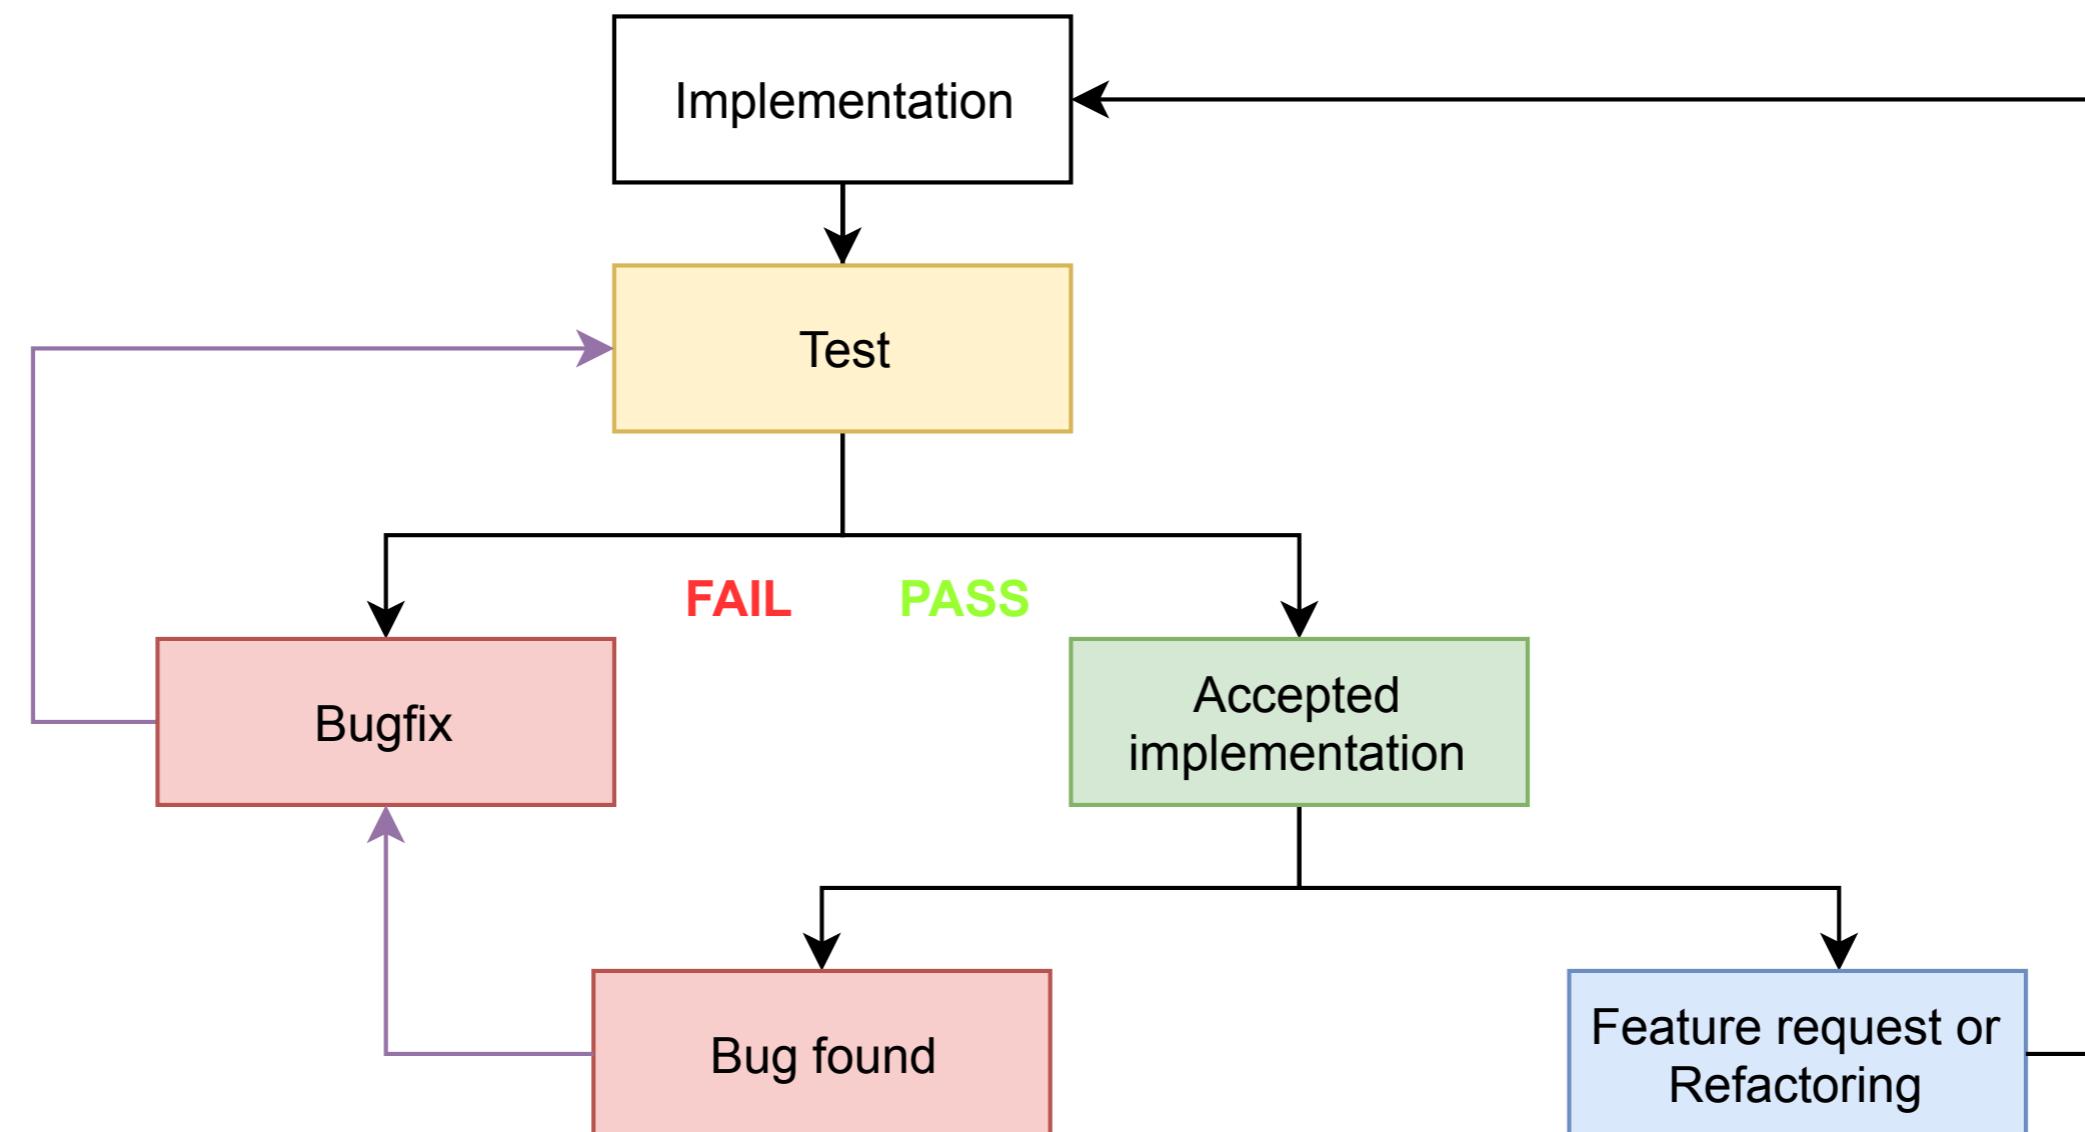

# Usual priorities in the industry

1. Feature development.
2. Unit testing.

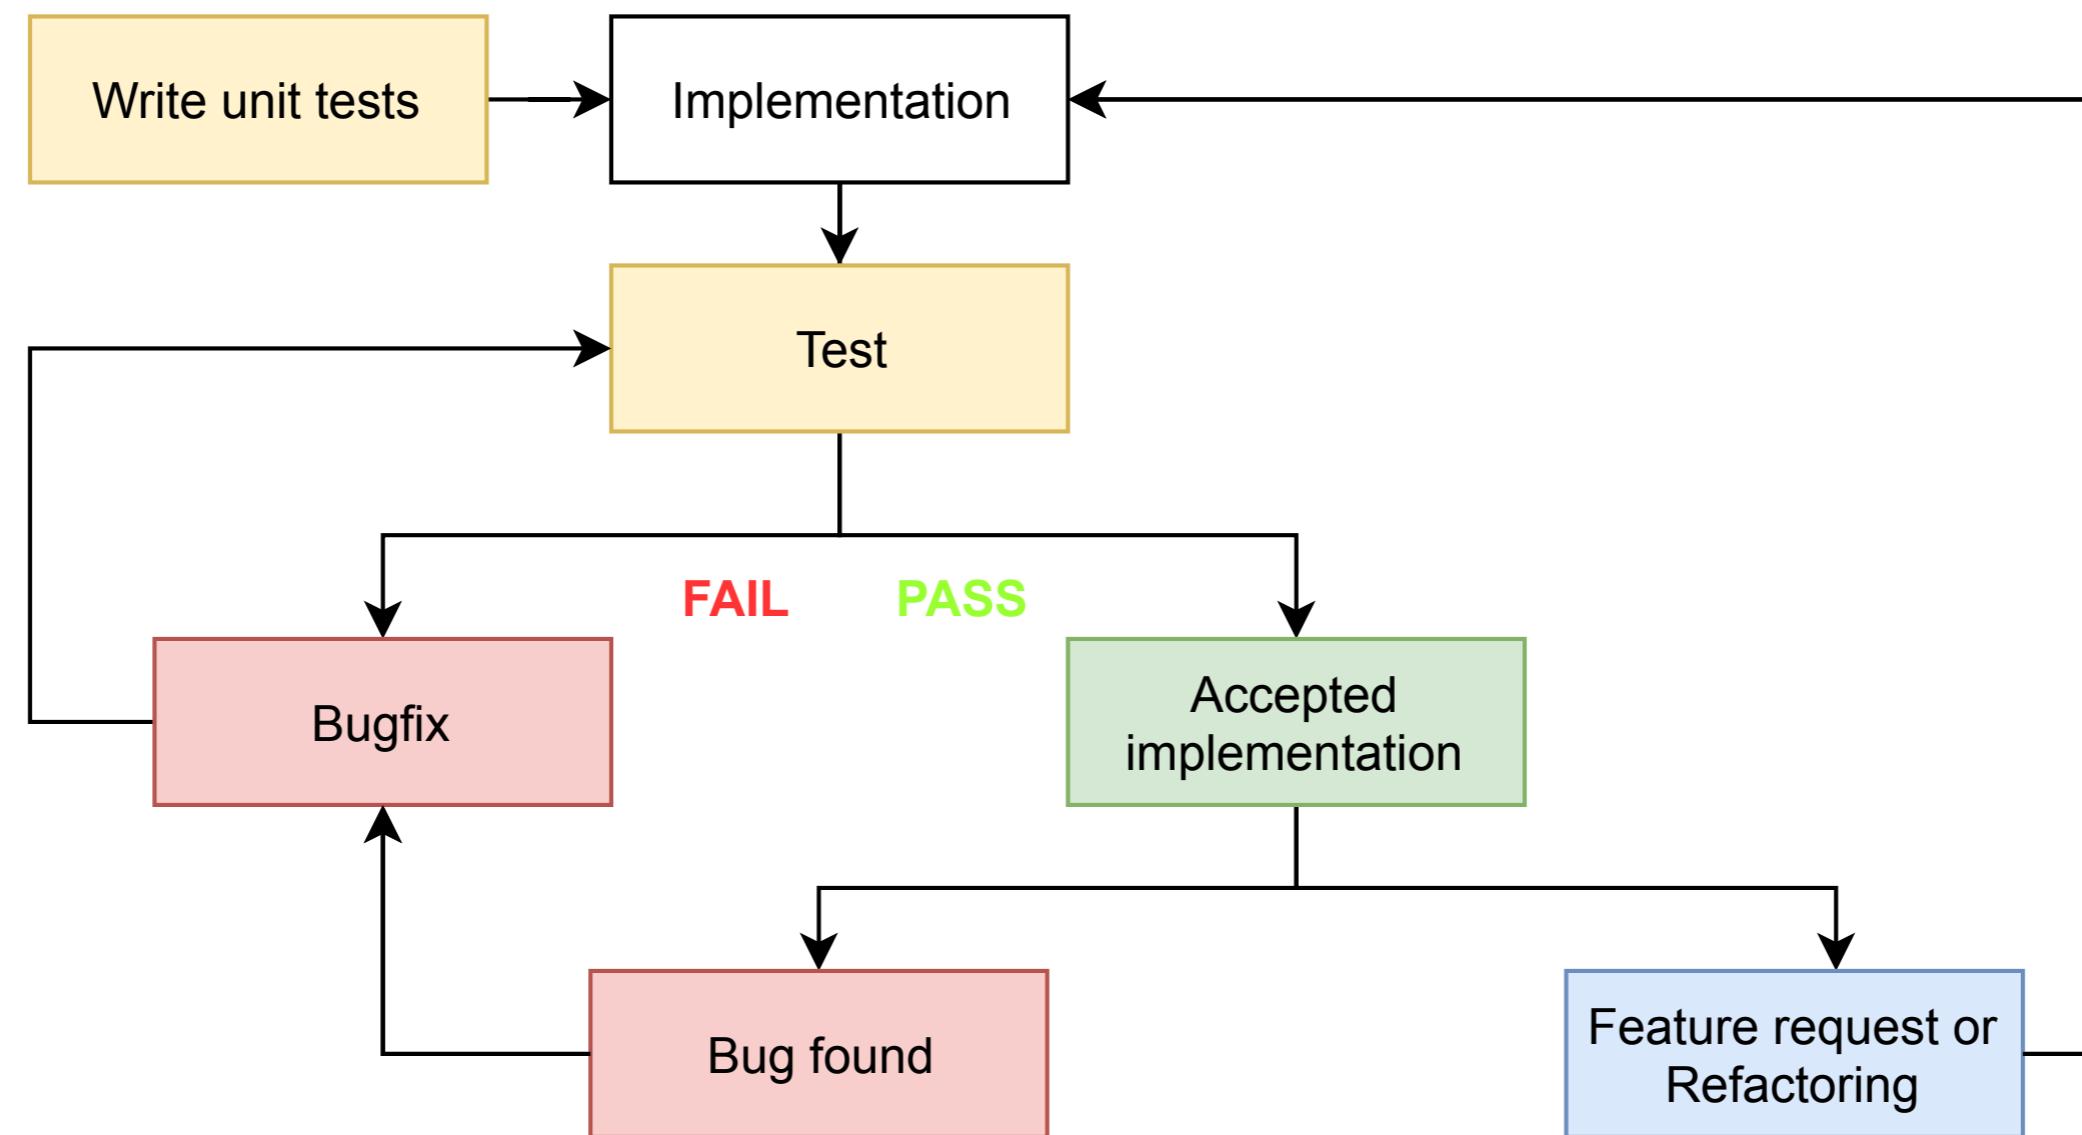

# Unit tests never get written

# Test Driven Development (TDD)

# Test Driven Development (TDD)

# Write unit tests before implementation!

- Unit tests *cannot* be deprioritized.
- Time for writing unit tests factored in implementation time.
- Requirements are clearer and implementation easier.

# In the coding exercises...

- We will use TDD to develop `convert_to_int()`.

```
convert_to_int("2,081")
```

```
2081
```

# Step 1: Write unit tests and fix requirements

Test module: `test_convert_to_int.py`

```
import pytest
