

PHOTOPOLYMER

Featuring interior or exterior grade materials, the photopolymer process results in a vandal resistant, one piece sign. Material is available in 1/16", 1/8" and 1/4" thicknesses in addition to .020" and .040" materials for use as inserts in sign frame systems. All materials can be adhered to acrylic providing a wide variety of material thicknesses. Pantone and custom paint matching is available.

Photopolymer signs are produced from a light sensitive material that hardens when exposed to light, providing a one piece integral product. After fabrication a ADA compliant polyurethane paint is applied for a long lasting, durable finish.

Custom Photopolymer Signs

Clear polymer can be surface applied to a large selection of laminate wood grains, marbles and granites. Environmentally friendly materials are available in the 3Form Varia series featuring many natural materials such as grass, branches and pebbles.

Photopolymer signs allow for custom fabrication including clear insert areas, sliding panels, metal accents and special shapes.
