

Mountville Rubber utilizes an automated chemical weighing system, which has reduced the need to manually weigh many small volume chemicals. This investment in technology improves efficiency, assures accuracy, and provides the ability for lot traceability. The automated weighing system prepares its own bags, weighs chemicals to an accuracy of less than $\frac{1}{2}$ a gram per chemical, then seals the bag and prints its own bar code without direct operator involvement. Additionally, this automation improves workplace safety, enhances plant cleanliness and reduces our employee's exposure to chemicals.
