Perfect Blinds for the Heat!

0:01 - Introduction

Hi I'm Jason from the brand Blockout Blinds, and today I'm going to show you another home transformation with some blinds that are absolutely fantastic for keeping your home cool.

0:21 - What sort of blinds suit this time of the year?

Well this time of year, we want to try and keep our home cool and we have some blinds that are specifically designed for keeping your home cool and we had a customer recently to put some in and they look wonderful. So let's have a look at this first photo.

0:37 - Old Venetians be gone

In this first photo with the cooler window, you can see we have some old Venetians there which just look a little bit tired and dated, they let a little light in, they're not great for heat because they have so many gaps between the slats.

0:55 - Cellular Blinds is the answer for you

So, this customer decided to put in some Cellular blinds, Cellular blinds have a cell coming along them which trap the heat a little bit like a double glazing window, and in fact they're the absolute best blinds you can put inside your home to help keep your home cool in summer, and keep your home just as warm in winter so they're saving you lots of money. So let's have a look at the after photo...

1:20 - What do the Cellular blinds look like?

Here we go we have the Cellular blinds in the down position here. As you can see there's a little bit of glow coming through them. In this case they decided to go for the translucent fabric, which lets through a bit of light. So they can have the blinds down during the day on a hot day and still get the light coming in.

Now let's have a look at this next window where you can see two windows facing out to the front of the house there with the old Venetians in them. And once again not looking the best. And let's look at the after photo now. And you'll see Cellular blinds, but what's different about this one? Well, in this case, the customer or client, has decided to put two Cellular blinds in each window. In the last photo we saw the translucent, which let's the light through, well in this case they put a translucent and also the dark colored one which is a block out. So they've gone for the double whammy.

So obviously this window maybe gets the westerly sun in the afternoon and by having two Cellular blinds, you've got double the protection because you've got twice the thickness of fabric that the sun needs to come through, also they've got that flexibility now by having the block out down completely making the room dark. Or they can just have the translucent one down creating privacy and letting some light through during the day. So that is an option, which a lot of customers decide to do.

2:49 - Another Home transformation for you!

So there you have it, another home transformation and another idea or way to put Cellular blinds in to keep your house cool or hot depending on the time of the year and there's a few different ways you can do that.

So I hope you found that interesting and until next time.
