Leading Health Conditions Impacting Student Attendance

Central to the connection between health and learning is students’ ability to attend school and be ready to learn. Many students have one or more health problems that compromise their ability to learn and put them at risk for increased absenteeism. The prevalence of many of these conditions that impact both physical and behavior health have increase in the last decades. This has implications not only for children’s long-term health but also for their opportunities to learn and succeed at school. This chart shows those conditions for which there is prevalence and for which health disparities negatively affect minority youth; evidence of having a direct impact on student attendance; and feasibility of implementing proven or promising school-based programs and policies to address the health condition.

This chart was prepared by the National Collaborative on Education and Health, an initiative co-convened by Healthy Schools Campaign and Trust for America’s Health. The Collaborative has brought together over 70 stakeholders representing federal, state and local government agencies, health and education professionals, advocates and foundations and has taken important steps towards transforming the health and education sectors to support the conditions for health and wellness in schools across the country.

| **Asthma**       | ● 8.3% of children (< age 18) are currently diagnosed with asthma | Asthma is one of the leading causes of school absenteeism, accounting for 1/3 of all days missed instruction. | Asthma Friendly Environments:  
  ● Asthma Friendly Schools Initiative,  
  ● Asthma Friendly Homes  
  ● Environmental assessments and remediation in schools and homes | • Community health providers  
  • School staff, including school health team and maintenance team  
  • School-based health centers  
  • Regional EPA office  
  • Local American Lung Association chapter  
  • Housing advocates  
  • Before and after school programs |
  ● 4.2% of children 0-4  
  ● 9.9% of children 4-14  
  ● 8.6% of children 15-19 | | | | |
  ● Compared to Caucasian children, asthma prevalence is higher in children who are Puerto Rican (2.4 times), African American (1.6 times), and American Indian/Alaska Native (1.3 times). | | | | |
  ● Children with persistent asthma are 3.2 times as likely to have 10 or more absences as their peers. | | | | |
### Bullying, Violence and Abuse

- **20%** of high school students report being bullied on school property in the past year.
- **24.7%** of high school students report being in a fight in the past year.
- **20%** of children witnessed violence in their family or the neighborhood during the previous year.
- **16.6%** of children experience physical abuse, **9.3%** experience sexual abuse and **7.1%** experience emotional/psychological abuse.

34.7% of African American students, 28.4% of Hispanic students and 20.8% of Caucasian students report being in a physical fight in the past year.

9.8% of Hispanic students, 7.9% of African American students and 5.6% of Caucasian students report missing school in the past month because of feeling unsafe either at, or traveling to or from school.

African American children have higher rates of maltreatment than Caucasian and Hispanic children.

7.1% of students report not going to school at least 1 day during the past 30 days because they felt unsafe at school or on their way to or from school.

Safe Routes to Schools
- School and community-based health, counseling and social services
- Bullying education programs, including playground-based and cyber-bullying
- School support groups such as Gay/Straight Alliance clubs
- School discipline policy reform and protective school climates

**Oral health**

- **20%** of children aged 5 to 11 years have at least one untreated decayed tooth.
- **13%** of adolescents aged 12 to 19 years have at least one untreated decayed tooth.
- Among school-age children, tooth decay is the most common chronic disease, five times more prevalent than asthma.

Untreated caries are nearly twice as prevalent in Hispanic children (26%) compared to non-Hispanic white children (14%) aged 6–9, and are more than twice as prevalent for non-Hispanic black adolescents (25%) compared with non-Hispanic white adolescents (9%) aged 13–15.

The percentage of children 5 to 19 years with untreated tooth decay is twice as high for those from low-income families (25%) compared with children from higher-income families (11%).

Children between 5 and 17 years miss nearly two million school days in a single year nationwide due to dental health-related problems.

Children with poor oral health status are nearly 3 times more likely than were their counterparts to miss school as a result of dental pain.

Community-based oral health programs, including school-based sealant programs, free clinics and mobile programs

- City/county health departments
- Hospitals and health centers
- School-based clinics
- Dental schools and programs
- Local dental health providers
- WIC or Head Start programs
- Well child clinics
- Community centers
- School staff, including school health team
