Let us inspire and educate the gardener in you.™

Become an Organic Gardener

We know that organic gardening is a priority for many of you, as it is for us. This year, we carefully reviewed our seed offerings to showcase more organic varieties, in addition to adding more organic gardening tips in every packet. But as a community of gardeners, we love to add your voice to the catalog, too. We asked, **"Why do you garden organically?"** We love your answers! We noticed a few themes that reverberate with organic gardeners—helping pollinators, enriching the soil and environment, attracting and enjoying wildlife, and feeding your families with organic produce—all the reasons we garden organically too!

We also have some new, amazing varieties, including a gorgeous **China aster**, a cool **sea holly**, and a **purple tomatillo**! One of our awesome new vegetable varieties is the **'Clancy' potato**. A potato grown in one season from seed instead of a tuber? So cool! 'Clancy' potato produces different hues and shapes, has great storage quality, and is a 2019 All-America Selections award winner! If flowers are what you're

page 31

garden-dreaming about, the **'Amazing Grey' poppy** is beyond compare. Its beautiful shades of silvers, greys, purples, and blues are sure to grab attention; and it's another award winner!

page 75

As always, the teams at Botanical Interests are driven to provide you with the best customer service, gardening information, high-quality seeds, and innovative, eco-friendly garden products. Thank you for choosing us for your home gardens!

All of our seeds wear the Non-GMO Project Verified logo

Botanical Interests is committed to natural seeds, which means we do not sell genetically engineered (also known as genetically modified organisms or "GMO") seeds, and we signed the Safe Seed Pledge many years ago to make that commitment clear. Additionally, we are Non-GMO Project Verified, which means our seeds are tested by the Non-GMO Project Verified organization for GE/GMO gene contamination that can occur from cross pollination by pollinators or wind. Our seeds are never treated with pesticides, fungicides, or other harmful chemicals, either. We sell tested, clean, natural, healthy seeds so you can grow clean, natural, healthy plants for your family to eat or for the birds, bees, and butterflies to enjoy.

Diplotaxis tenuifolia

If you like arugula, you are going to love this one. Complex, savory flavor excites your palate when added to salads, sandwiches, and even pesto.

H • 30–50 days

#0298 \$1.99 500g (~1,680 seeds)

Rocky

Walk on the wild side with this perennial vegetable. Complex, spicy flavor and very easy to grow from seed.

H • 45–50 days

#3029 Organic \$2.29 500mg (~1,680 seeds)

why do you grow organically

The easy answer is my vegetables taste better and I can say I grew them. However, I grow organically because it provides the complete cycle of gardening. From sharing seeds, caring for the soil through composting, discouraging unwanted pests and a place all family members young or old can visit.

— Steve
Newbury Park, CA

Baby Greens

Baby greens can be grown indoors at any time of year, and are a nutrient-packed way to get your "green fix" in the dead of winter. Move containers as needed for best light exposure and temperature. Harvest when 2"-4" tall and enjoy!

When to sow outside: Sowing time and soil temperature varies with varieties.

When to start inside: RECOMMENDED.

Sow indoors any time of year, with indoor temperatures 60°-75°F. Use a shallow container with 1"-2" of fine, seed starting mix. Sow seeds in a single layer, and cover with 1/8"-1/4" of mix. *Successive Sowings:* Every 2 weeks for a continual supply.

BABY GREENS

Frost sensitive

Apple Blossom Swiss Chard Blend

Beta vulgaris

Impressive flavor and color of Swiss chard in small, delicate baby greens. Mix of red and white stems and deep-green leaves bring a balance of beauty and flavor to the table.

Kohlrabi

Turnip

Bean

Who can resist the crisp texture and full-bodied flavor of homegrown green beans? They make such a great snack while gardening, that they often don't make it into the kitchen! Bush types produce earlier and have a shorter harvest period; pole types produce later but bear over a longer period of time. Bush beans are compact and good for containers.

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date, and when soil temperature is at least 65°F, ideally 70°–85°F. *Successive sowings:* Every 7 to 14 days up to 80 days before your average first fall frost date. **NOTE:** In very hot summer areas, skip sowing as high heat approaches; temperatures consistently above 90°F will prevent beans from forming.

BEAN

Phaseolus vulgaris (unless noted)

ORGANIC GARDENING METHODS

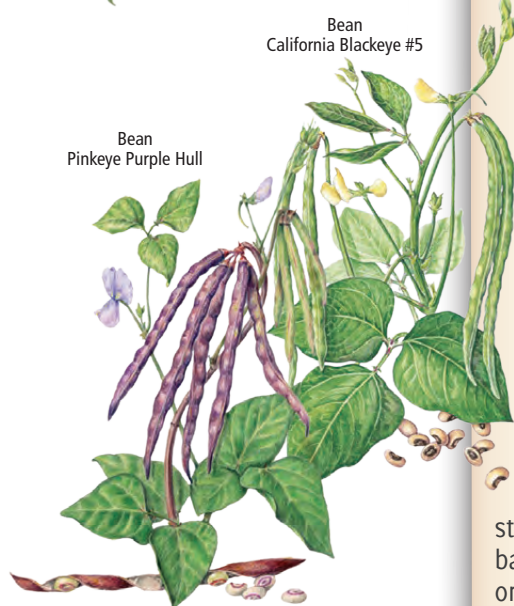

Compost Tea

Compost tea is praised for pest and disease prevention when applied as a root drench or fine foliage spray. Some studies show benefits concerning specific crops and specific diseases.

If you plan to use a sprayer, place aged compost in a cloth bag to contain the solids and prevent your sprayer from clogging.

Place the bag in a large bucket, and using one-part compost to five parts water, steep it in a warm place for 1 to 2 weeks, stirring regularly. Then remove the bag and put the liquid in a sprayer or watering can.

Note: When using homemade sprays, first test a small leaf area and wait 24 to 48 hours to observe if it causes any damage before applying further.

Organic VS Conventional seed

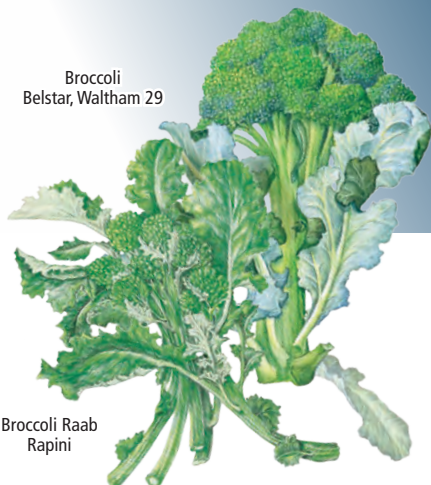

What makes a seed “organic”?

Organic seeds are from plants grown by farmers following organic farm management practices, using federal organic standards for growing and processing that exclude the use of synthetic pesticides and genetically engineered/genetically modified or “GMO” technologies. Transitioning land to be certified organic typically takes 3 years, a good deal of paperwork, fees, and inspections before farmers can legally label what they grow as “organic”. Organic farmers incur more costs to be certified organic than non-organic, which is why organic products are often more expensive. Organic seeds are a good choice for consumers who want to support organic farmers and/or invest in practices that are inline with their own organic lifestyle.

Can non-organic seeds be grown organically to produce an organic plant?

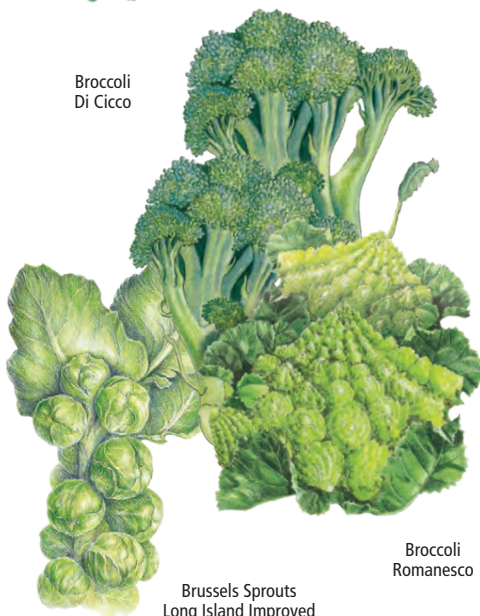

Absolutely! The flowers, herbs, and vegetables you grow in your home garden are a product of what you put into them. If you garden using 100% organic methods, you will grow a 100% organic product.

#0208 \$1.89 1g (~140 seeds)

Cabbage

These heads wear many hats—red, green, wrinkled and crinkled, or upright and strong. Cabbage grows best in fertile, rich soil with good drainage, consistent moisture, and full sun. Temperatures consistently below 50°F or above 75°F may cause bolting. Cabbage “heads up” in cool weather and is sweetened with a nip of frost. Therefore, plan your sowing based on the best weather for harvesting. For example, if your temperatures are cooling in late summer to fall and you want to harvest in mid-October, then a cabbage that takes 120 days should be direct sown in mid-June or transplanted out in July. If your temperatures aren’t cool until January, you would want to direct sow the same variety in September or transplant seedlings out in October. Varieties with short days to maturity are the best candidates for spring sowing.

When to sow outside: Select an ideal, cool time for heads to form, and using the days to maturity count back to find the best sowing date. For head cabbage, this is usually

4 to 6 weeks before your average last frost date for a summer crop, or 10 to 12 weeks before your average first fall frost date for a fall crop.

When to start indoors: RECOMMENDED. 6 to 8 weeks before your average last frost date, transplanting 2 to 4 weeks before your average last frost date. For fall crop, 4 to 6 weeks before transplanting outdoors in summer. Ideal soil temperature for germination is 75°–85°F. *Mild Climates:* Sow in fall for a cool-season harvest. Use row cover at sowing or transplanting to protect from pests, and mulch to keep roots moist and cool.

FOR NAPA: When to sow outside: 2 to 4 weeks before your average last frost date for a summer crop or 8 to 10 weeks before your average first fall frost date for a fall crop. Ideal soil temperature for germination is 75°–85°F. Persistent temperatures of 50°F or below while plants are young can cause bolting (premature flowering), cover as necessary.

When to start inside: 4 to 6 weeks before your average last frost date transplanting after your average last frost date, and 4 to 6 weeks before transplanting outdoors in summer for a fall crop. *Mild Climates:* Sow in fall for a cool-season harvest.

BOK CHOY

Carrots

Once used to color butter, the dye obtained from carrots, called carotene, is quite strong; it has been reported that people who eat large quantities of carrots may take on some of the color in their skin. Perhaps you really "are what you eat"!

When to sow outside: RECOMMENDED. 2 to 4 weeks before your average last frost date, and when soil temperature is at least 45°F, ideally 60°–85°F. *Successive Sowings:* Every 3 weeks until 10 to 12 weeks before your average first fall frost date. *In very warm climates,* carrots are grown primarily in fall, winter, and spring.

When to start inside: Not recommended; root disturbance stunts growth.

CARROT

Daucus carota
Frost tolerant

Atomic Red

Growing carrots is a blast with this nutritious, high lycopene carrot that intensifies in color and sweetness after cooking!

70–75 days

#0278 \$2.49 700mg (~360 seeds)

A true mini-carrot, perfect for containers. Developed to have deep orange color and sweet flavor when harvested small.

H • 57 days

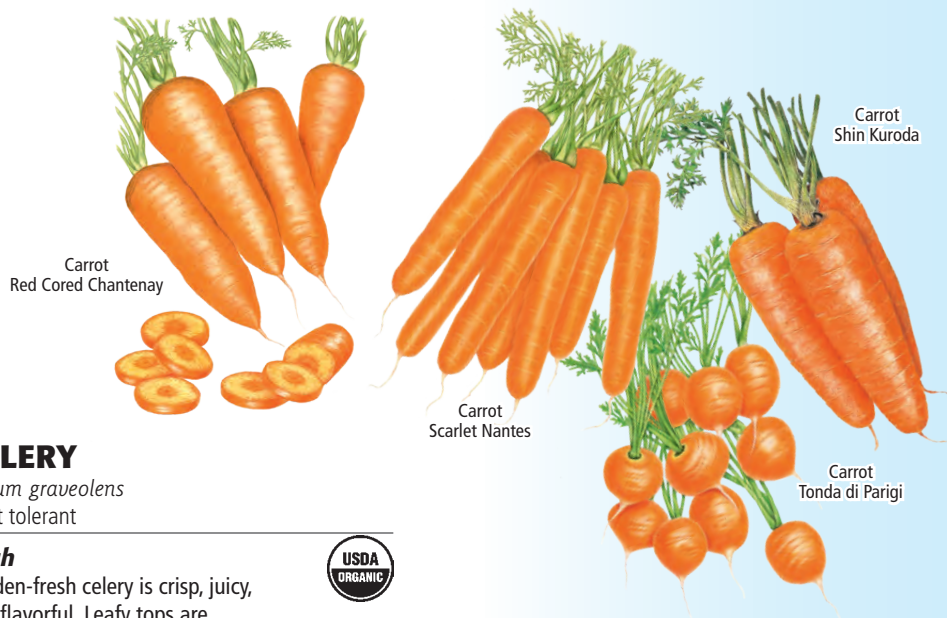

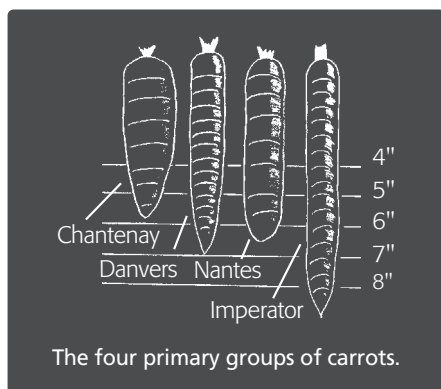

#3105 Organic \$1.99 1g (~510 seeds)

why do you grow organically

Growing organic is... important to me and my family to ensure quality food that is free of pesticides and harmful chemicals. This is a full circle process beginning with my kitchen compost bucket that makes its way to the outdoor compost pile and into the garden with each growing season, (earthworms included) and finally planted with quality organic seeds from Botanical Interests. There is nothing better than eating fresh, chemical free vegetables straight from the garden!

— Roberta
Cantonment, FL

Rainbow (hybrid) **NEW**

Grow a beautiful array of carrots all from one type of seed! Since this is one cultivar, these carrots mature at the same size and have the same shape, making them easy to process and oh-so-pretty pickled in a jar!

Corn

We cannot think of summer without the juicy sweetness of sweet corn on the cob, or enjoy autumn without the gorgeous, sunset tones of dried corn décor. Luckily, we don't have to choose because we can have them both!

The three types of sweet corn (from sweet to sweetest) are **sugary** (su), **sugary enhanced** (se), and **shrunkened/supersweet** (sh) and are defined by their sugar levels, tenderness, and how long they stay

sweet. The two types of **flint corn**—Indian corn and popcorn—are recognizable by their dried, hard, often colorful kernels. The lesser-known **dent corn** which can be used to make corn meal, has a distinctive dimple or “dent” that appears in the outer edge of the kernel during drying. It, too, can come in stunning colors, making a gorgeous addition to your fall décor.

When to sow outside: 1 to 2 weeks after your average last frost date, and when soil temperature is at least 60°F, ideally 65°–90°F.

When to start inside: Not recommended.

why do you **grow organically**

I have become a convert to home garden cover cropping. I learned about cover cropping benefits as a Purdue University Extension Master Gardener; improved soil micro-nutrients and reduced fertilizing, vastly improved soil structure and texture, green manure for water retention, increased garden yields. . . . Now, for my home garden, I regularly purchase the Soil Builder Peas and Oats and the Crimson Clover cover crop seeds . . . Cover crops make it pretty easy to organic garden.

Cucumber
Homemade Pickles

Cucumber
Armenian

Cucumber
Baby

Cucumber

Cucumbers can be classified into two categories, pickling and slicing types. PICKLING types are usually stouter and have drier skins that are ideal for absorbing pickle brine. SLICING cucumbers have thinner, less bitter skins and longer fruit. Pickling cucumbers can still be eaten like slicers, and slicers can also be pickled.

Trellising cucumbers helps them grow straighter, makes them easier to see

when harvesting, and provides good air circulation, which helps prevent mildew. Tie the main stem to the trellis to guide the plant. If preferred, cucumbers can also be grown on mounds. Mounds should be 4' apart with 6 seeds each, thinning to 3 plants per mound.

When to sow outside: 1 to 2 weeks after your average last frost date, and when soil temperature is at least 60°F, ideally 70°–90°F.

When to start inside: 2 to 4 weeks before your average last frost date. Cucumbers are sensitive to root disturbance; sow in biodegradable pots.

CUCUMBER

why do you grow organically

Organic gardening starts with the soil and seeds. Organic soil provides the nutrients needed to help aid successful germination and growth. In my garden, I use organic soil and seeds for my pollinator, fruit, and vegetable plants. We are gardening for a more sustainable future.

— Delilah
Philadelphia, PA

Lettuce

With lettuce in your garden, you can run outside for a quick salad from spring through fall—and it's a cinch to grow.

Butterhead, also called Boston or Bibb, has soft, smooth leaves perfect for carb-free wraps. **Crisphead** is your familiar iceberg, which perfectly complements a BLT sandwich. **Mesclun**, literally means "mixture", creating a diversity of texture and color. Mesclun is harvested when young, and perfect for a multitude of culinary dishes. **Leaf** lettuce is soft, with a crisp rib. **Romaine** (also called Cos) lettuce is upright with broad, stiff ribs—the classic ingredient in a crisp

Caesar salad. **Summer Crisp**, also called Batavia or French Crisp, forms a loose head with leaves that are sweet and crisp.

Lettuce seed requires light (sow shallowly) and cool to moderate soil temperatures to germinate, growing best in mild weather. Look for heat-tolerant varieties for fresh salads all summer long.

When to sow outside: RECOMMENDED. 2 to 4 weeks before your average last frost date, and when soil temperature is least 40°F, ideally 60°–70°F.

When to start inside: 4 to 6 weeks before your average last frost date, and in summer when soil temperature is too warm (above 80°F) to germinate lettuce seed.

Melons

Imagine biting into a perfectly vine-ripened, highly aromatic melon at the peak of sweetness and flavor, so juicy that it drips down your chin and you don't even care! Melons flourish in the heat and use lots of water while growing (thus the unending juiciness). Melons also grow well on a trellis, which saves space and helps prevent disease. Did you know that what we call cantaloupes are really **muskmelons**? True cantaloupes are hard-shelled melons from Europe. **Honeydew**

melons differ from muskmelons in that the skin is smooth, the flesh is green, and the scent is markedly different. There are some hybridized melons out there that will truly win you over!

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date, and when soil temperature is 70°–90°F.

When to start inside: Recommended for short-season areas. 2 to 4 weeks before transplanting within 2 weeks after your average last frost date. Sow into biodegradable pots that can be directly planted in the ground; roots are sensitive to disturbance.

MELON

Cucumis melo (unless noted)

why do you grow organically

I intentionally garden organic because I see it as the best fit for my families nutrition as a nurse, the best for the environment & all the insects/ critters that surround my garden, and a sustainable way to continue food production for the future.

Organic gardens with nourished soil generate crops with fewer harmful chemicals. Organic gardens also encourage better health for good bacteria & fungi in the soil, all the way up to supporting helpful insects (like bees!), & keeping animals safer nearby. It is truly a joy watching my garden grow with all kinds of life from the native bees, honey bees, butterflies, and other insects I had never seen present until I gardened organically. I also look for a gardening process that allows me to replenish my soil year after year, and generate a variety of heirloom seeds available for generations to come. All of these factors make it easy to understand why a fresh, organic home garden is worth reaping what has been sown!

ORGANIC GARDENING METHODS

Time Your Plantings

If you have had unwanted visits from pests, try switching your growing season. For example, if flea beetles are skeletonizing your brassicas (broccoli, cabbage, kale, mustard, radish) in spring, try growing them in late summer for a fall crop instead. In fall, pests are often winding down, becoming much less populous and active, and will be less likely to cause problems. Frost-tolerant crops are also more likely to achieve a large size without bolting when the weather is consistently cooler. Obviously, switching planting seasons isn't a luxury available in short-season areas, but you could consider growing successive crops throughout the summer. If squash bugs decimate your first planting of pumpkins in spring, they may not attack the second crop sown a month later. Then, with a little frost protection in fall, you still may get a great crop!

Bulbing Onions

Whether you're frying up onion rings or caramelizing them for onion jam (mouth-watering recipe included inside 'Cabernet' seed packets), onions require special attention at sowing because their growth is triggered by day length (indicated by latitude). Therefore, you'll need to choose onion seed based on where you live, allowing them enough time to grow before bulbing begins. Check out the map for easy location reference.

- **Long-day (LD)** varieties grow well in the northern latitudes, as they need 14 to 16 hours of daylight to trigger bulb formation.
- **Intermediate-day (ID)** varieties overlap the long and short day ranges a bit and cover the middle of the country. These varieties start the bulbing process with 12 to 14 hours of daylight.
- **Short-day (SD)** varieties are best sown in fall in the southern latitudes, for a late winter/early spring harvest or sown in early spring for small, early

harvests in the North. These varieties need 10 to 12 hours of daylight to trigger bulbing. Depending on soil temperature, southern gardeners may choose to sow onion seed directly into the garden. *In the North, short-day onions may be started indoors and transplanted out in the spring, producing early, but smaller bulbs.*

- **Sweet onions** generally have a limited storage life (1 to 2 months) compared to **storage onions**.

When to sow outside: 4 to 6 weeks before your average last frost date, or as soon as soil can be worked; when soil temperature is at least 45°F. *Mild Climates only:* Late summer or early fall. Mid-October is the recommended, traditional sowing period.

When to start inside: RECOMMENDED. 10 to 12 weeks before your average last frost date. Transplant outdoors 4 to 6 weeks before your average last frost date. The earlier the start, the bigger the bulb. Ideal soil temperature is 60°–85°F. *Mild Climates only:* 10 to 12 weeks before your average first fall frost date. Transplant outside no later than 6 weeks before your average first fall frost date. Ideal soil temperature is 60°–85°F.

why do you grow organically

We love growing organically! Our sustainable farming practices encourage biodiversity. As we grow with each season, our healthy food begins with the healthy soil that we cultivate and maintain for the habitat surrounding us, and also for the well being of others.

We started our first garden in 2015 on my father-in-law's farm land. . . . We have gained an abundance of knowledge in only four years of gardening organically. The garden has created its own life by continually seeding itself with plants like borage, cosmos, zinnias, sunflowers and more. We plant annual vegetables around the perennial herbs and self-seeding flowers that are present each season. It truly is a wild seeded garden-of-life that we work around each day.

We are most grateful to Botanical Interests for providing us bountiful seeds since 2014 that yield us a garden of healthy biodiversity. Our journey together has inspired us to explore with the rhythm of nature as a whole.

— Marjorie
Belton, TX

Peas

If kids turn up their noses at peas, it's because they've never had them freshly picked from the garden. With the crunchiness giving way to the sweetness, you'd almost think you were eating candy! **Snap** peas have both sweet, edible pods and tender peas so you can enjoy them whole! **Shelling** peas are grown for the fat, sweet peas that form

in the pods (pods are not eaten) that are a staple alongside mashed potatoes. **Snow** peas have sweet, edible pods with very small peas inside, typically enjoyed in stir-fries and salads.

When to sow outside: RECOMMENDED. 4 to 6 weeks before your average last frost date, when soil temperature is at least 40°F, ideally 60°–80°F, and again 10 to 12 weeks before your average first frost date. *In mild climates*, sow in fall or winter for winter harvest. Best grown in temperatures lower than 85°F.

Peppers

It doesn't get any better, or easier, than throwing peppers on the grill. The open fire chars the skin of sweet or chile peppers to a smoky perfection. And that's just one out of hundreds of ways to prepare this interesting vegetable. Capsaicin—the compound that gives chile peppers their heat—occurs mostly in the light-colored ribs (pith) inside the

pepper. Contrary to popular belief, the seeds are hot only because they are in contact with the ribs/pith which contains the spicy capsaicin.

When to start inside: RECOMMENDED. 8 to 10 weeks before transplanting. Ideal soil temperature for germination is 70°–90°F. Transplant seedlings outside 2 to 4 weeks after your average last frost date, and when daytime temperatures are at least 70°F, and nighttime temperatures are at least 55°F. *Mild Climates:* Can also sow in late summer for fall/winter crop.

ORGANIC GARDENING METHODS *Garlic & Pepper Spray*

Garlic and hot pepper spray is used for a wide assortment of garden pests, including aphids, leaf hoppers, squirrels, caterpillars, birds, deer, vampires, and more.

Use a blender to combine several chile peppers (fresh or dried), about a dozen garlic cloves, and about 2 cups of water. Let the mixture sit overnight and then strain in the morning so it won't clog your sprayer. Add about 2 tablespoons of non-toxic, biodegradable soap to the concentrate. When ready to spray, add a tablespoon of the concentrate to 16 ounces of water and put in the sprayer.

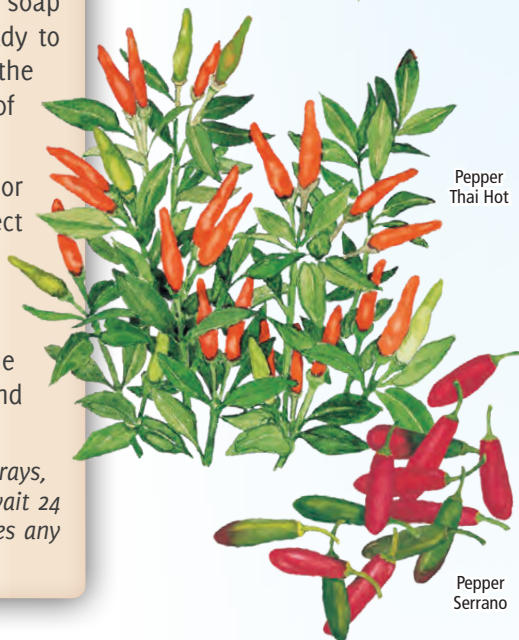

Spraying in the morning or evening helps to protect pollinators; spray evaporates more slowly, and it helps ensure plants are not stressed or at risk of burning from the spray. Reapply after a rain and every 7 to 10 days as needed.

Note: When using homemade sprays, first test a small leaf area and wait 24 to 48 hours to observe if it causes any damage before applying further.

Sprouts

Sprouting seeds is fun and fast, and because it's done indoors, it can be done any time of the year for very nutritious, delicious sprouts! All you need is a Botanical Interests Seed Sprouter™ (or a container with a drainage lid) for twice daily rinsing.

Fun—You can almost watch them grow! Fast—Most sprouts are harvested in under a week.

Nutritious—Ounce for ounce, sprouts are

much more nutrient-dense than their full-grown counterparts.

With so many flavors, textures, and colors to experiment with, sprouting seeds is a delicious adventure!

To ensure you are purchasing the safest possible sprouting seeds, a sample from each lot we receive is sent to an independent laboratory where it is tested for foodborne pathogens, including *Escherichia coli* (E. coli), *Salmonella*, *Listeria*, and *Staphylococcus aureus* (staph).

SPROUTING SEEDS

Adzuki Bean

Vigna angularis

Strengthen your body with this versatile, high-protein superfood. Healthful and delicious, its nutty flavor and crunchy texture give meals an enlivened makeover. In Asia, they are considered to be a “yang” (warming) bean that strengthens the body.

#7814 Organic Large \$3.99 60g (~380 seeds)

Alfalfa

Medicago sativa

One of the most popular sprouts, and for good reason; alfalfa sprouts are high in nutrients, low in calories, and their nutty flavor and crisp texture make them delectable in salads, sandwiches, and dozens more dishes. No need for a lot of space or time; this is a “garden” anyone can grow in any climate, year-round!

#7801 Organic Large \$3.99 30g (~12,670 seeds)

Bean Mix

Vigna angularis, *Vigna radiata*, *Lens culinaris*

Alfalfa

Adzuki Bean

Bean Mix

Broccoli

why do you grow organically

I garden organically because it's important to me to use what nature has given us. We compost all the leaves from 30+ year old cottonwood trees in our backyard and turn that into rich “black gold” the next year - the seeds and plants love it and it reduces our carbon footprint rather than buying bagged fertilizers at the store.

— Elly
Thornton, CO

China Rose Radish

Raphanus sativus

Pretty rose-colored sprouts are prized for their beauty, making an attractive addition to salads and sandwiches. Enjoy the spiciness of radishes in any other dish you sprinkle them on. High in nutrients, low in calories, and very easy to grow!

#7804 Organic Large \$4.99 30g (~1,920 seeds)

Purple Kohlrabi

Brassica oleracea

What vibrant color! Deep purple and green sprouts add fabulous eye appeal and crunch, not to mention an abundance of vitamins and minerals to make your sandwiches and salads special! All the flavor of the kohlrabi stem but milder in these little sprouts.

Costata Romanesco Summer Squash

Summer Squash

We've all been tempted to secretly leave zucchini on our neighbor's doorsteps at night because we simply have too much. But that's why we love it! Summer squash is irresistible when it is seared in a pan of olive oil and salt, charred on the grill, or grated into your mom's famous zucchini bread. As one of the most productive plants in the garden, squash fruits are harvested during the summer when the

seeds are small and soft, and the skin is thin and edible.

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date, and when soil temperature is 70°–85°F.

When to start inside: Not recommended except in very short growing seasons, 2 to 4 weeks before transplanting. Roots are sensitive to disturbance; sow in biodegradable pots that can be planted directly into the ground. Transplant when soil temperature is at least 60°F.

Did you know that 99% of garlic sold in stores is just one or two different cultivars among the diverse choices available? If you have ever had the pleasure of tasting a garden-fresh, heirloom tomato, rich with flavor, imagine what you've been missing in the world of garlic! Garlic is a basic ingredient in most every cuisine, and homegrown garlic elevates dishes with its unique character.

Garlic is grown all over the world in just about every climate, and believe it or not, it is pretty easy. Plant garlic in the fall, it will emerge in the spring, and then you harvest in summer. Your garlic harvest will be enjoyed for months to come because garlic stores for several months to a year!

Every summer we offer several organic varieties of specialty garlic so you can grow your own and experience garlic's rich and diverse flavors for yourself!

ORGANIC GARDENING METHODS

Milk Spray

Milk spray works great for powdery mildew. Dilute milk to 20–50% in water and add a couple of drops of non-toxic, biodegradable soap. The soap helps the spray stick to leaves, rather than rolling off. Apply weekly, spraying plants thoroughly for good coverage. Like other powdery mildew treatments, it is best to start this as a preventative action before plants are infected.

Note: When using homemade sprays, first test a small leaf area and wait 24 to 48 hours to observe if it causes any damage before applying further.

Winter Squash

On the coldest day of the winter, you can reach into your storage cellar and retrieve a hefty winter squash, fresh as the day it was harvested. Their long storage time means you can grow dozens in the summer and enjoy butternut squash soup, pumpkin chocolate chip cookies, and spaghetti squash “pasta” long into the winter. Most winter squash varieties enjoy rambling around the garden, needing plenty of space. But don’t let that deter you! We have several **compact bush**

varieties that can be grown in containers, and small spaces, too! Choose from **short** (up to 6'), **medium** (6'–10'), or **long** (over 10', some as long as 20') vine lengths in the cultivar descriptions.

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date, and when soil temperature is 70°–85°F.

When to start inside: Not recommended except in very short growing seasons, 2 to 4 weeks before transplanting. Roots are sensitive to disturbance; sow in biodegradable pots that can be planted directly into the ground. Transplant when soil temperature is at least 60°F.

ORGANIC GARDENING METHODS *Floating Row Covers*

A floating row cover is a light, gauzy type of material (available at your local garden center) that helps protect plants from flying pests like aphids, flea beetles, and birds. It allows enough sunlight through for plants to grow, protects plants from frost in spring or fall, and provides a little shade for frost-tolerant crops, like lettuce, in summer. For plants requiring pollination to produce fruit (i.e. squash, pumpkins), row cover must be removed every the morning for a few hours to allow access for bees and other pollinating insects.

6 STEPS to an ORGANIC GARDEN

One of the greatest benefits of having a garden is controlling how your food is grown. Growing organically ensures your food is free of commercial pesticides—pollutants that can transfer into the soil, water, and atmosphere. Starting an organic garden is the perfect way to provide clean, healthful food to your family, and help protect the earth.

1 Right plant in right place.

Don't fight your site, rather, embrace your sunlight levels, climate, and soil type by choosing varieties that will naturally thrive in your gardens' conditions, reducing the need for excess water or amendment.

2 Know your soil.

Submit a soil test for analysis. By understanding your unique garden site, you can know exactly what amendments are needed, reducing and possibly eliminating pests, diseases, and pollution, which can be caused by over-fertilizing. Improving soil by reaching the ideal 5–6% organic matter also helps conserve water and prevent run-off.

3 Water wisely.

Conserve water by watering deeply and less frequently, encouraging plants to build deep, water-mining roots. Make sure you are watering with just the right amount; under- or over-watering can cause plant stress, which acts like an open invitation to pest and disease. To slow water evaporation from your soil, water in the evening/morning and/or mulch to insulate and protect soil. You can also improve your soil's ability to hold water by adding organic material (see step 6 compost).

4 Prevention is key to a healthy garden.

Rotate plants in the same family (for example, kale and broccoli are brassicas), so they are not grown in the same space for at least three years. Rotating reduces the potential for disease and depletion of the same nutrients year after year. Or you can diversify your planting area so it isn't all one crop. Having different crops mingled together confuses pests and looks less like an all-you-can-eat buffet for them. Scout for pests, diseases, and natural predators weekly so you can identify

problems early, and decide if action is needed. If you find a problem, first choose physical controls (e.g., row cover, plant removal, or trap crops) or biological controls (e.g., attracting beneficial insects or insect-eating birds). Invite beneficial insects to the garden by sowing flowering varieties that they are attracted to (e.g., borage, alyssum, and dill). This way, when pests arrive, you already have a hungry, resident army "waiting in the wings". Use organic pesticide (e.g., soaps or neem) as a last option, spraying in the early morning or evening when bees are less active and avoiding spraying flowers to protect pollinators.

5 Sow a cover crop!

Cover crops enrich the soil, fight weeds, and break up compacted soil naturally. Cover crops can also be used to create an insectory (a dedicated area that provides habitat for beneficial insects).

6 Compost.

Reduce landfill waste by composting yard scraps and food waste. Plant-based food scraps and yard waste create methane in a landfill environment which, unharnessed, is a pollutant. However, in your garden, this material can be converted into organic compost, which is a great soil amendment. Avoid composting any diseased or pest-infested material.

See your garden as a living system and over time you'll learn patterns in your garden habitat. For instance, it is common to see predatory insects like ladybugs quickly follow an influx of pests like aphids. Gardening the organic way has us look for a balance rather than striving for a pristine and lifeless space. Let's embrace the Japanese principle of simplicity and the perfectly imperfect, called *wabi-sabi*, in the garden and enjoy the beautiful journey!

Tomato

If you're a real tomato lover, picking a fresh tomato and eating it like an apple isn't unheard of, and that makes you our kind of people! So while we love all tomatoes, different types can fill a different purpose.

Determinate (Det.) tomatoes ripen all at the same time so you can make all your sauces and salsas at once for preserving. They grow on compact bushes, so you probably don't need to stake these plants. **Indeterminate** (Ind.) varieties usually grow tall, requiring support and

produce fruit all season; therefore, you could use these tomatoes more regularly in salads and sandwiches. In between these two types is the **semideterminate** (Semi-det.). As you might guess, they do both—produce a main crop that ripens at once, but also continue to produce up until frost.

When to sow outside: For mild climates **only:** 1 to 2 weeks after your average last frost date, and when soil temperature is at least 60°F.

When to start inside: RECOMMENDED. 4 to 6 weeks before transplanting. Transplant when air temperature is 45°F or warmer, usually 1 to 2 weeks after your average last frost date. Ideal soil temperature for germination is 70°–90°F.

#3137 Organic \$2.29 30 seeds

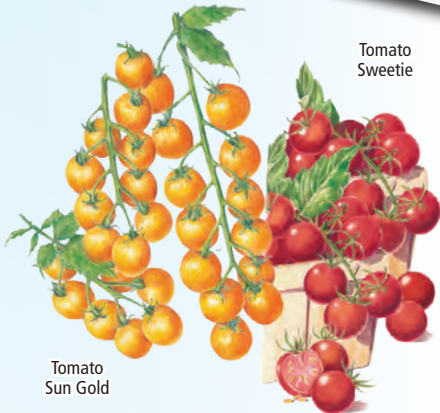

Tomato Red & Yellow Pear Blend

why do you grow organically

Growing an organic garden is one of the most rewarding ways I can nurture my family. Our organic garden provides us with the healthiest vegetables and herbs to nurture our bodies. Including my children in the organic gardening activities help to teach and instill healthy life long habits. We do not use any pesticides, herbicides or fungicides anywhere on our property. Our best defenses against garden pests are our eyes and fingers, to look for pests and remove them. If fertilizer is needed, we use an organic variety.

— Sarah

Is your garden still turnip-less? You'll want to change that! Nutritious, delicious greens and hearty roots are what this homegrown storage crop is all about!

H • 50 days

#3106 Organic \$1.99 2g (~740 seeds)

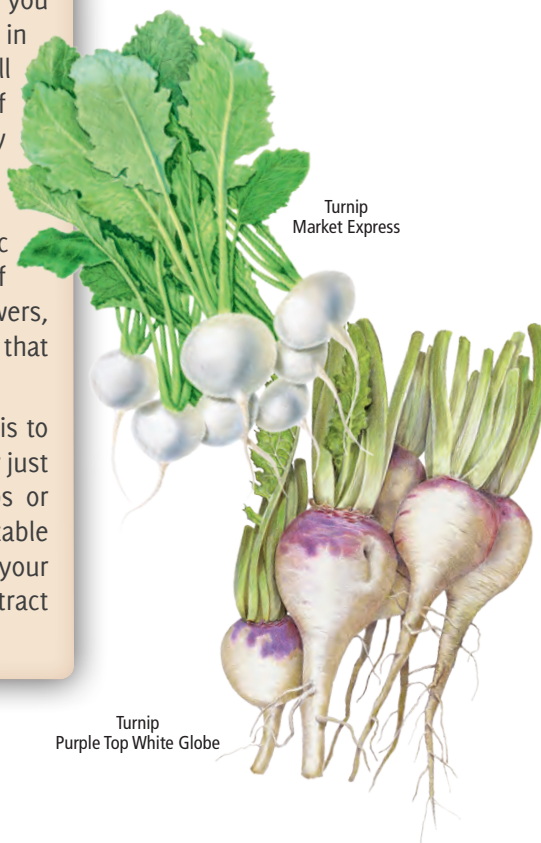

ORGANIC GARDENING TIP Provide Diversity

Why do large single crop farms use so many pesticides? Because, their huge fields of a single crop in long, straight lines are like big neon signs to insects that like to feed on them, saying, "24-Hour All-You-Can-Eat Buffet!"

A diverse garden with lots of different kinds of plants creates a more natural environment that lets nature work with you instead of against you. Even in a residential garden, you will have more pest problems if you grow nothing but twenty varieties of tomatoes than if you grow twenty different species of plants. A synergistic garden includes a diversity of vegetables, herbs, and flowers, attracting beneficial insects that keep pests in check.

A really simple way to do this is to separate similar crops (even by just a few feet), grow a few herbs or flowers in between your vegetable crops, and let some of your herbs produce flowers to attract pollinators.

why do you grow organically

I've been growing organic vegetables in my backyard now for almost a decade, and I do this first of all because I love the way freshly-harvested produce tastes! . . .

But it's bigger than just my flavor palate.

. . . you can see the results in health crises that too often come from toxic environments and toxic foods. You actually don't need pesticides to successfully grow food—there are organic, sustainable methods that have been around much longer than the methods that have been destroying our top soils, water supplies and air for the last hundred years or so.

— Su
Pasadena, CA

Recycled Paper Pots

As organic gardeners, it was important for us to find a “green” alternative to plastic or peat pots, so, we created something better! Our paper pots are made from 100% recycled, food-grade paperboard and are sustainably manufactured using low-water and low-energy methods.

The pots solve other gardener issues as well—they can be individually labeled with variety and date sown, and at transplanting, the perforated bottom tears away so you can plop the whole pot in the ground. Did we mention they are biodegradable?

If you’re like us, you typically start more plants than you can actually fit into your garden. Enter paper pots that make it easy to share your seedlings. There is nothing like seeing the excitement of a gardener’s face when given a little life to tend to in spring! Our fold-flat pots are available in three sizes: 3", 4", and 1½" with a tray. More options equals more sharing!

Simply “pop” open the paper pot, fill with soil, and sow your favorite Botanical Interests seed!

RECYCLED PAPER POTS

1½" Pots with Tray
#4738 12 pots, 1 tray \$5.20

3" Pots
#4729 pack of 6 \$2.95

4" Pots

Herbs

Basil

Tradition has it that if you give a sprig of basil to your beloved, they will fall in love with you forever. An aromatic and savory basil pesto dinner would surely do the trick too! And what's not to love—this traditional Italian herb has roots all over the globe in Thai and Greek foods, as well.

Once basil has 3 to 4 sets of leaves, pinch the top to encourage branching. Clip or pinch off flower buds as they form to maintain the best basil flavor. Basil can be

grown inside in a bright, sunny window or under grow lights.

When to sow outside: 1 to 2 weeks after your average last frost date, and when soil temperature is at least 60°F, ideally 65°–85°F. **Successive Sowings:** We recommend 3 or 4 successive sowings every 3 weeks after initial sowing.

When to start inside: RECOMMENDED. 4 to 6 weeks before transplanting outside. Transplant when your nighttime temperatures are above 50°F.

BASIL

Ocimum basilicum (unless noted)

Cardinal

With large, densely packed, dark-red flowers atop lush foliage and that unmistakable basil aroma and flavor, experience the delight of 'Cardinal' as a stunning cut flower!

A ☼ ☼

#6000 Organic \$2.49 80mg (~32 seeds)

Foeniculum vulgare

Finocchio

Grown as a vegetable for the sweet, licorice-flavored "bulbs" or as an herb for the delicately flavored foliage and aromatic seeds.

H • P ☼

#5032 \$1.89 1g (~120 seeds)

Perfection

Larger, more uniform "bulbs," and delicately flavored foliage. Developed for cool, northern climates with good bolt resistance.

P ☼

#6129 Organic \$1.99 500mg (~60 seeds)

FEVERFEW

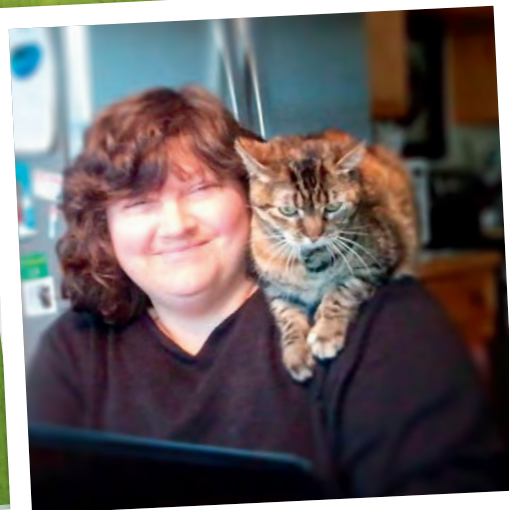

See pg 61

why do you grow organically

There are many reasons for growing organically... for the safety of the food we eat and not harming the environment, mainly...

I want my kitchen garden humming with bees, aflutter with butterflies, and alight with birds. I want to harm nothing. I am not seeking perfection, but can still attain great beauty.

— Wendy and Lucy
Iowa City, IA

LEMON BALM

Melissa officinalis

Relax on a hot summer day with a glass of iced, lemon balm tea. Enjoy the delightful scent in the garden.

H • P ☼ ☼

#6078 Organic \$1.99 200mg (~270 seeds)

MARJORAM

NEW

Origanum majorana

With a sweeter, milder flavor than oregano, marjoram is wonderful used fresh in salads and cooked dishes. Excellent dried.

H • T ☼ ☼

#6001 Organic \$2.29 300mg (~720 seeds)

MINT

Mentha sp.

Common

A versatile herb, mint has a refreshing quality that enlivens iced drinks, jellies, and hot dishes, as well as crafts and bath water!

H • P ☼ ☼

#5003 \$1.89 25mg (~220 seeds)

OREGANO

Origanum vulgare

Common

Use this mild-flavored oregano in pizza sauce, pastas, and salsa. Dainty pink blooms add to its beauty.

H • P ☼ ☼

#6110 Organic \$2.29 100mg (~800 seeds)

True Greek

You will love how this true culinary oregano jazzes up a multitude of foods—eggs, meats, veggies, and, of course, Italian and Greek dishes!

H • P ☼ ☼

PARSLEY

Petroselinum crispum

Flat Leaf

Prized by gourmets as the most flavorful of all parsleys. High nutritional value. Will grow in part shade and indoors in containers.

H • B ☼ ☼

#6095 Organic \$1.99 1.5g (~690 seeds)

Moss Curled

Enjoy the mild, refreshing flavor of this beautiful, all-purpose herb. Cleanse the palate, freshen breath, and benefit from its nutritional value!

H • B ☼ ☼

#6011 Organic \$2.29 1g (~460 seeds)

ROSEMARY

Rosmarinus officinalis

Wonderful flavor and aroma! Perk up lamb, fish and poultry, potatoes, soups, and bread! An excellent container herb for indoors.

H • T ☼ ☼

#5039 \$1.99 50mg (~32 seeds)

SAGE

Salvia officinalis

Broadleaf

Strong, unique taste and aroma that enhances the flavor of many dishes. It is a striking ornamental in borders, rock gardens, and containers.

H • P ☼ ☼ ☼

#6092 Organic \$1.99 25 seeds

SAVORY

Summer

Satureja hortensis

Savor the peppery flavor of this highly aromatic herb. Fresh leaves add an exciting twist to salads. Terrific in herb rubs for grilling and a fragrant bouquet filler.

H • A ☼

#5041 \$1.89 750mg (~930 seeds)

Winter

Satureja montana

You'll wonder how you ever lived without this easy-to-grow treasure. Peppery with hints of thyme, this herb adds complex flavor to savory meals.

H • P ☼ ☼

#5064 \$1.99 200mg (~320 seeds)

SHISO | PERILLA

Perilla frutescens

Green and Red

Also known as Japanese basil or beefsteak plant, shiso's flavor can be described as a combination of cinnamon, mint, clove, and cumin. Also commonly used as a heat- and drought-tolerant ornamental.

H • A ☼ ☼ ☼

#5048 \$1.99 500mg (~280 seeds)

STEVIA

Stevia rebaudiana

Candy

The sweetest plant you'll ever grow! Fresh or dried leaves add natural sweetness to tea, fruit salads, and many other dishes. A terrific house plant!

A ☼ ☼

#6128 Organic \$2.99 12 seeds

TARRAGON

Tagetes lucida

Mexican

Add a burst of flavor to any dish. Sunny, golden flowers are edible, too. Beautiful in your herb garden and flowerbed!

H • T ☼ ☼

#6135 Organic \$2.29 250mg (~200 seeds)

THYME

Thymus vulgaris

English

A savory herb that no cook should be without! Endless culinary possibilities. An aromatic and attractive plant. Good container variety.

H • P ☼ ☼ ☼

#6079 Organic \$2.29 350mg (~1,400 seeds)

WATERCRESS

Nasturtium officinale

Add snappy, peppery flavor to salads, omelets, and potato salads. Classic ingredient in finger sandwiches served at an English tea.

H • P ☼ ☼

#6116 Organic \$2.49 200mg (~320 seeds)

WILD BERGAMOT

Monarda fistulosa

Enjoy the cooling, minty flowers and leaves in tea or jellies. This fragrant, prairie wildflower, also known as "Oswego tea", resists mildew and grows well even in poor soil and with short periods of drought. Attracts hummingbirds and other pollinators.

P ☼ ☼ ☼

#6012 Organic \$1.99 50mg (~6 seeds)

Flowers

AFRICAN DAISY

Dimorphotheca sinuata

Blooms heaviest in cool weather.

Attracts pollinators.

Cape Marigold

These cheerful blossoms warm up any spot in your garden. When kissed by the sun, their petals open to reveal their stunning purple eyes.

A ☼ ☼ 8"-16" tall

#1011 \$1.89 500mg (~240 seeds)

AGERATUM

Ageratum houstonianum

Blooms summer to frost. Attracts pollinators.

Blue Planet (hybrid)

An out-of-this-world shade of blue! Feathery flower clusters on tall stems call butterflies and bees to the garden and beg to be picked for bouquets.

A ☼ ☼ 24"-30" tall

#1402 \$2.99 30 seeds

ALYSSUM

Sweet

Lobularia maritima

Blooms spring to frost. Attracts pollinators.

Allure Pastel Blend

Add magic to the garden with the charisma of sweet alyssum in a rainbow of pastel shades. Compact and covered with blooms!

A ☼ ☼ 3"-4" tall

#1267 \$1.99 250mg (~700 seeds)

Oriental Nights

Tiny, deep-purple flowers with a sweet, delicate fragrance make this low ground cover a delight. Great in pots and baskets.

A ☼ ☼ 2"-4" tall

#1072 \$1.99 250mg (~500 seeds)

Rosie O'Day

Sweetly scented beauty brightens the garden with a carpet of rosy pink blossoms. Wonderful in containers or as a cheery border.

H • A ☼ ☼ 4" tall

BLUEBELLS

Phacelia campanularia

Blooms spring. Attracts pollinators.

California Bluebells

A magnificent wildflower. Very easy to grow and quick to bloom! Cold tolerant.

N • A ☼ 8"–16" tall

#1108 \$1.99 1g (~1,600 seeds)

BLUEBONNET

Lupinus texensis

Blooms spring. Attracts pollinators.

Bluebonnet

Dressed to the nines in royal blue, the state flower of Texas is breathtaking when planted in mass. An important host plant for butterflies.

N • A ☼ 12"–24" tall

#1043 \$2.29 2g (~50 seeds)

Sundial Lupine

Lupinus perennis

One of six official Texas bluebonnets, these tall pillars of blossoms reflect the beauty of the sky. An important host plant for butterflies.

N • P ☼ 24"–36" tall

#1287 \$2.29 1.5g (~55 seeds)

BROOM CORN

Sorghum bicolor

Blooms late summer to fall.

Amish Rainbow Blend

The ultimate fall decoration and treat for the birds! Harvest seed sprays for dried arrangements or grow enough to make an old-fashioned broom.

H • A ☼ 6'–15' tall

#2006 Organic \$2.99 2g (~100 seeds)

ORGANIC GARDENING METHODS

Attract Beneficial Insects

Lure beneficial insects to your garden by planting specific plants that provide them with food sources and/or reproduction habitats. Planting a variety of these, especially so you have some of them blooming throughout the season, is ideal. Some of these plants include:

Ornamentals

Alyssum
Bee balm
Cosmos
Feverfew
Marigolds
Zinnias
Buckwheat
(cover crop)

Herbs

Cilantro
Dill
Fennel
Lavender
Lemon balm
Parsley
Thyme

Some beneficial insects include: bees (pollinators), lady bugs (larvae and adults eat aphids), green lacewings (eat spider mites), ground beetles (eat pest larvae, slugs, snails), soldier beetles (eat aphids, cucumber beetles, grasshopper eggs), spiders (eat a variety of insects), praying mantises (eat many pests including beetles and grasshoppers), and trichogramma wasps (their larvae feed on cabbage worms, corn earworms, and tomato hornworms).

Castor Bean
Impala

why do you grow organically

As an urban gardener and beekeeper, I want to ensure that everything I'm growing for my family and my pollinators is organic. It makes me happy to know that when my city bees are gathering nectar and pollen, all of the vegetables and flowers I offer them are still free of harmful chemicals.

— Alice
Silver Spring, MD

CASTOR BEAN

Ricinus communis

Blooms summer to frost.

Impala

Exotic, tropical plant with dark bronze foliage creates a dramatic garden backdrop or a statement when grown center-stage. Fast growing. *All plant parts are toxic if ingested.*

ORGANIC GROWER

farm feature

Anaka Mine

Twisp River Seed, Washington

Anaka Mines of Twisp River Seed in Washington, has been farming organically for 15 years; one of our many organic partners, growing vegetable, herb, and flower seeds. "I grow organically because I want to have a relationship with my plants and my soil that is one of mutual respect and understanding. I want the relationship to be one in which I give and receive, and my farm does the same." Anaka strives for as much diversity as possible with native plants and other living things that visit and live on her farm. "These things give me joy," she adds.

Anaka shares these valuable tips:

- Think of your soil as a living organism.
- Add organic material to your soil.

CORN Ornamental

Zea mays

Striped Japonica

Add brilliant color and novelty to your flower or vegetable garden. Enjoy the variegated leaves and jewel-like, dark burgundy cobs as gorgeous autumn décor. Burgundy kernels can be ground into cornmeal!

ORGANIC GARDENING METHODS Wood Ashes

Wood ashes can be used around plants to deter slugs and snails, which avoid crossing it. It will need to be reapplied after rain or watering. Wood ash does raise soil pH, making soil more alkaline, so be cautious using it if your soil is already alkaline.

Our Flower Mixes are combinations of Annuals, Perennials, and some Biennials.

FLOWER MIX

Assorted species

Blooms spring to frost. Attracts pollinators.

Bring Home the Butterflies

Imagine the joy of seeing more butterflies in your garden! This long-blooming colorful mix supports their lifecycle.

☼ 12"–72" tall

#1901 Conventional \$2.69 3g (~48 sq. ft.)

#7009 Large \$4.59 10g (~136 sq. ft.)

California Color

This custom mix will create a landscape filled with the exuberant beauty of native California wildflowers. Blooms begin in early spring and continue through the season in an ever-changing tapestry of color and form.

N ☼ 6"–48" tall

#7022 Large \$5.59 14g (~362 sq. ft.)

Edible Beauties

Form and function at its best! This yummy mix of annual and perennial edible flowers bring color throughout the season in a range of spicy and mild flavors to enliven salads, herb butters, and vinegars.

☼ 8"–30" tall

#1910 Conventional \$2.69 3g (~20 sq. ft.)

#7026 Large \$4.59 9g (~60 sq. ft.)

Fabulous Fireworks

Light up any sunny spot with the sparkle and flair of these flowers specially selected for their bright colors and showy blossoms. An explosion of color begins soon after plants emerge and continues until frost.

☼ 4"–30" tall

#1908 Conventional \$2.69 3g (~108 sq. ft.)

#7025 Large \$4.59 8g (~288 sq. ft.)

Fairy Meadow

Create an enchanting garden just for fairies. This unique mix of colorful wildflowers, herbs, and low-growing plants will captivate children and adults alike, and provide a charming home for garden sprites!

☼ 6"–24" tall

#1902 Conventional \$2.69 3g (~156 sq. ft.)

#7018 Large \$5.59 12g (~624 sq. ft.)

Grandmother's Cut Flower Garden

A charming mix of tried and true flowers your grandmother might have grown. This mix will provide flowers for cutting from spring until fall. A range of colors, shapes, and textures to enliven a whole season's worth of bouquets!

☼ 18"–48" tall

#1903 Conventional \$2.69 3g (~78 sq. ft.)

#7006 Large \$4.59 10g (~260 sq. ft.)

Hummingbird Haven

Calling all hummingbirds! If this mix of showy, bright blooms doesn't catch their attention, nothing will! Each variety is an irresistible invitation to imbibe in summer's sweet nectar.

☼ 6"–48" tall

#1904 Conventional \$2.69 3.5g (~34 sq. ft.)

#7008 Large \$4.59 10g (~96 sq. ft.)

Made in the Shade

There's nothing like a nice shady spot to rest in on a hot summer day. Relax among the dazzling colors and textures.

☼ 6"–48" tall

#1905 Conventional \$2.69 3g (~130 sq. ft.)

#7005 Large \$5.59 9g (~364 sq. ft.)

why do you grow organically

When I see the happy pollen-covered bees gliding from flower to flower and butterflies fluttering all around, I know that we have made the right choice to practice organic gardening. . . . All of these beneficial bugs that are workhorses for my garden would not be here if we didn't garden organically. It is nature at its purest. . . .

I mix our vegetable plants with flowers in the garden to bring in the beneficial insects such as ladybugs, beneficial wasps and lacewings that would prey on the pests. Then I get to sit back and let them do what they do best. They have a welcome place here in my garden where they will remain safe from chemicals and get their fill of pests.

— Lindsay
Victoria, TX

Prairie Splendor

Experience the rich hues and warm colors of a native Midwest prairie as your garden comes alive with flowers.

N ☼ 6"–48" tall

#7023 Large \$5.59 10g (~284 sq. ft.)

Precious Pollinators

why do you grow organically

Why expose your family or yourself to chemicals if you don't have to? Just like life, growing organically is about balance. I've learned over the years not to fret over every little bug. Your garden is an ecosystem and you could never eliminate every single so-called "bad bug." The steps I have taken to grow organically really all center on education. Knowing what are good things to do in your garden and what are not so good things. Composting has been the single best good thing I have done for my garden lately!

— Parrish
Birmingham, AL

LACE FLOWER

Trachymene coerulea

Blooms summer to fall. Attracts pollinators.

Madonna Blend

Like delicate, lace doilies on long stems, these fragrant, 2"-3" flowers are a fancy addition to the garden and make long-lasting, cut flowers.

ORGANIC GARDENING METHODS Soil Solarization

Soil solarization uses plastic sheeting to heat the top of the soil during hot summer months, which at high enough temperatures can kill many soil organisms, including those that cause disease, nematodes, weed seeds, and seedlings. One drawback to this method is that it will also kill beneficial organisms, so use with caution.

Mina Lobata

Monarchs and Milkweed

Attract gorgeous butterflies to your garden! Because milkweed is a host plant for the monarch butterfly throughout the Western U.S. and Canada, you'll observe the life cycle of the monarch (*Danaus plexippus*) by growing this plant. Monarch caterpillars feast exclusively on milkweed (*Asclepias* spp.) foliage as a defense

mechanism; the toxins in the plant render them distasteful and even poisonous to predators. Milkweed flowers are also valuable to other pollinators, too, including native bees, honeybees, bumblebees, Sphinx moths, and hummingbirds.

When to sow outside: 2 to 4 weeks before your average last frost date, or fall for spring germination. Benefits from stratification (cold, moist period).

When to start inside: 6 to 8 weeks before your average last frost date.

Milkweed | Butterfly Flower
Narrowleaf

MILKWEED BUTTERFLY FLOWER

Blooms summer. Attracts pollinators.

Milkweed | Butterfly Flower

Asclepias tuberosa

Nasturtium

The botanical name, *Tropaeolum*, comes from the Greek word for 'trophy', in reference to its shield-shaped leaves. The common name, nasturtium, comes from *nasus* and *tortus*, roughly translating as 'nose twister' due to the plant's pungent scent and peppery taste. During WWII, nasturtium seeds were used as a pepper substitute. President Jefferson

grew nasturtium at Monticello, and ate the pickled seeds, which make a great substitute for capers.

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date. *Mild Climates:* Sow in fall for winter bloom. Ideal soil temperature for germination is 55°–65°F.

When to start inside: Not recommended. 2 to 4 weeks before your average last frost date. Roots sensitive to transplant disturbance; sow in biodegradable pots that can be directly planted in the ground.

NASTURTIIUM

Tropaeolum majus (unless noted)

Blooms late spring to frost. Attracts pollinators. Edible flowers.

Alaska Variegated

Delicious as well as beautiful, colorful blooms float above variegated lily-pad leaves on compact plants.

H • A ☼ ☼ ☼ 10"–12" tall

ORGANIC GARDENING METHODS *Grow Healthy Plants*

Have you ever heard that predators in the wild look first for the weakest animal in the herd? It's also true in the plant world. A healthy plant that is getting its needs met (nutritious bio-diverse soil, adequate water, plentiful sunlight, and good air circulation) is less attractive to predators and can divert more of its resources from survival to defense. Healthy vegetable plants produce more antioxidants, substances that are nutritious for us, but are deterrents to predators. When you grow plants in ideal conditions, you give them the resources they need to defend themselves.

California Poppy

It's easy to understand why Spanish explorers nicknamed the poppy-covered California landscape, "Land of Fire." These native, North American wildflowers put on an exceptional display when grown in mass and in wildflower plantings, bringing the landscape to life. Fluttery blossoms open in the sunlight and close with cloud cover or nightfall.

California poppies are so easy to care for, too, as they are drought tolerant and deer resistant. Perennial in USDA zones 8–10; in other areas, grown as an annual that often reseeds, returning every year.

When to sow outside: RECOMMENDED. 4 to 6 weeks before your average last frost date, when soil temperature is 50°–60°F, or early to mid-fall for bloom the following spring. *Mild Climates:* Late summer to early fall for winter and spring bloom.

POPPY

Attracts pollinators.

Bread Seed

Papaver somniferum

Blooms late spring (unless noted).

Black Swan

Blooms summer.

You'll be mesmerized when this prima donna of the garden—an elegant, deep burgundy show-stopping poppy—unfurls its unabashedly frilly petals.

T ☼ 🌧 36"–40" tall

#1414 \$1.89 100mg (~110 seeds)

Sunflower

The majestic sunflower, arguably the most recognized "American" flower, displays a perfect and intricate symmetry that will inspire you to pause and admire. Native Americans were the first to domesticate sunflowers to have a single large blossom and a variety of seed colors. Sunflowers are an excellent food source for bees, and birds flock to the seed heads in fall.

Even pollenless varieties have nectar for pollinators. Whichever variety you choose, your garden will be even sunnier for it.

When to sow outside: RECOMMENDED. 1 to 2 weeks after your average last frost date.

When to start inside: 2 to 4 weeks before your average last frost date. Sunflowers are sensitive to root disturbance, so they are best sown in biodegradable pots that can be planted directly in the ground. Sow single-flower varieties every 2 to 4 weeks to extend the bloom period.

SUNFLOWER

Helianthus annuus (unless noted)

Blooms summer to frost. Attracts pollinators. Edible petals.

Drop Dead Red (hybrid)

A florist's dream, and a gardener's delightful reality! Every multi-branching variety in this designer mix of gorgeous, long-lasting, cut-flower quality sunflowers is pollenless for spotless tabletops.

#1038 \$1.89 1g (~47 seeds)

why do you **grow organically**

Growing organically protects our beneficial insects, while reducing the exposure of harmful pesticides and chemicals in our soil, water and air. By planting organic seeds, our honeybees and local pollinators are able to flourish and keep our food supply plentiful. . .

Each year, we expand our pollinator gardens and meadows by growing thousands of flower seedlings from Botanical Interests. These plants provide healthy forage for our honeybees and local pollinators.

— Roda
Rockford, MI

SWEET ANNIE

Artemisia annua

Blooms summer to fall.

Attracts pollinators

Old-fashioned, highly aromatic and popular for wreaths, potpourris, herbal crafts, and floral filler. Fast growing.

H • A ☼ 4'–6' tall

#2010 Organic \$2.69 300mg (~6,000 seeds)

Online • Catalog
EXCLUSIVE

Sweet Annie

SWEET PEA

Lathyrus odoratus (unless noted)

Blooms spring/summer (unless noted).

Attracts pollinators.

Beaujolais

Blooms spring to fall.

A luxurious sweet pea, this highly-perfumed, Spencer-type beauty brings dramatic color and large, ruffled flowers to the garden and cut-flower bouquets.

H • A ☼ 7'–8' vines

#1167 \$2.69 3g (~29 seeds)

Bouquet Blend

This captivating blend has longer, sturdier stems and larger flowers making it ideal for a big, fragrant bouquet.

A ☼ 5'–6' vines

#1097 \$2.69 3g (~29 seeds)

Early Multiflora Blend

Large, softly fragrant flowers on long stems, perfect for cut flowers. Superior for early spring bloom in mild climates, and mid-spring bloom in cold climates.

H • A ☼ 5'–6' vines

#1040 \$2.69 3g (~26 seeds)

Elegance Blend

Blooms winter/spring.

Create your own enchanted garden with this lovely color combination of large sweet peas that bloom early. Superior cut flowers. Ideal blend for mild climates and greenhouses; blooms in the cool of winter.

A ☼ 5'–6' vines

#1329 \$3.89 3g (~29 seeds)

High Scent

The most intensely fragrant sweet pea we could find! Perfume your garden and floral bouquets with the intoxicating aroma of these lovely ruffled blossoms.

A ☼ 6'–8' vines

#1237 \$2.69 3g (~26 seeds)

Knee-Hi Blend

Fragrant blooms in a captivating array of colors on short vines. Charming in baskets, a lovely mass display in flower beds and splendid in bouquets.

A ☼ 2'–3' vines

#1041 \$2.49 3g (~29 seeds)

Little Sweetheart

Charming, lightly fragrant little gems in profusion on dwarf, bush-type plants. Beautiful in hanging baskets, rambling over a stone garden wall or in a vase.

A ☼ 8"–14" vines

#1208 \$2.69 3g (~29 seeds)

My Navy NEW

Breathe in the sweet, nostalgic scent in a rich, new color. Wavy-edged blooms on sturdy, long stems look beautiful standing alone or contrasting with lighter flowers.

A ☼ 8' vines

#1331 \$2.99 2g (~19 seeds)

Old Spice Blend

Gracing gardens for over 100 years, the small flowers with heady perfume hark back to olden days of fragrant, sweet pea enchantment.

H • A ☼ 5'–8' vines

#1165 \$2.49 3g (~29 seeds)

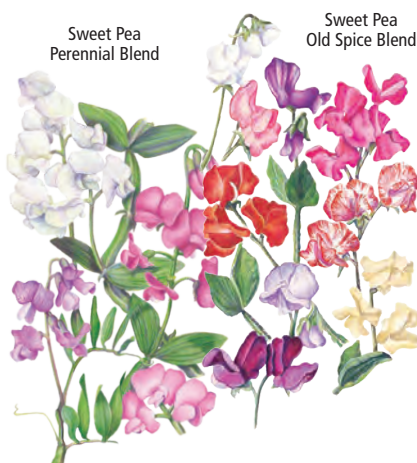

Perennial Blend

Lathyrus latifolius

Lush, rambling vines and colorful clusters of lovely white, pink, violet, and mauve flowers shine in the summer garden, even in hot, dry areas.

Wheat
Utrecht Blue

VERBENA

Verbena bonariensis

Blooms summer to frost. Attracts pollinators.

Brazilian Vervain

Stunning plants of purple flower clusters on tall, airy branches high above the foliage. Quaint cut flower; hardy, easy to grow.

H • T ☼ ☼ 3'-4' tall

#1192 \$1.89 100mg (~320 seeds)

VIOLA

Edible flowers.

Corsican Violet

Viola corsica

Blooms spring to fall.

A reliable, perennial viola. Enjoy delightful, blue-purple flowers with white "whiskers" year after year. A vigorous self-sower.

H • P ☼ ☼ 6"-8" tall

#1321 \$2.29 100mg (~70 seeds)

Johnny-Jump-Up

Viola tricolor

Blooms heaviest in cool weather.

The cheery little faces of Johnny-Jump-Up are as delightful as its name. This is one self-sower that is always welcome!

H • P ☼ ☼ 4"-12" tall

#1045 \$1.89 200mg (~240 seeds)

King Henry

Viola cornuta

Blooms heaviest in cool weather.

This long-time favorite sparkles with edible, velvety, violet-blue flowers to cheer up your gardens and beautify your sweet treats!

H • P ☼ ☼ 4"-8" tall

#1109 \$1.89 150mg (~190 seeds)

WHEAT

Triticum sp.

Blooms summer to frost.

Utrecht Blue

Bright blue seed heads keep their color even after drying, making a stunning ornamental in flower arrangements and crafts.

H • A ☼ 3'-5' tall

#2031 Organic \$1.99 5g (~100 seeds)

YARROW

Achillea millefolium

Blooms summer to frost. Attracts pollinators.

Colorado Blend

An excellent cut or dried flower, this trouble-free, hardy perennial is at home in just about any sunny spot with a bit of room to spread.

P ☼ 24" tall

#1401 \$1.89 50mg (~250 seeds)

Zinnia

With a diversity of colors—bold, vibrant, pastel, white and even green—and plant sizes—short, medium, or tall and stately—there is a zinnia to please everyone. Some varieties boast such large blooms, one flower will fill your cupped hands! Zinnias will always catch the attention of passers-by, and stop you in your garden tracks. It did not start out that way, as the zinnia of the wild was nondescript; it was not a garden success until the mid-19th century.

Named for Dr. Johann Gottfried Zinn who wrote the first description of the flower, years of breeding brought striking new colors, shapes, sizes, and growing habits to the once humble zinnia. Zinnias retain their color and beauty for a very long time in fresh or dried flower arrangements.

When to sow outside: RECOMMENDED.

1 to 2 weeks after your average last frost date.

When to sow inside: 4 to 6 weeks before your average last frost date. Transplant outdoors after last frost. Zinnias do not benefit from being planted early; wait for warmer weather.

ZINNIA

Zinnia elegans (unless noted)

Blooms summer to frost. Attracts pollinators.

Benary's Giant Blend

A backyard florist's dream, these enormous, colorful, fully double zinnias on long, sturdy stems will be the star of your garden and table top!

A ✨ 3'-4' tall

#1187 \$1.99 600mg (~48 seeds)

ORGANIC GARDENING METHODS Scouting

There are lots of great choices when it comes to natural ways to deal with pest problems. There is, however, nothing better than prevention. Well-tended gardens are less apt to be overcome with harmful insects and suffer plant damage. Walking through your garden a few times a week and taking a good look at your plants will help you recognize, treat, and prevent problems before they get out of control.

Persian Carpet

Zinnia haageana

Create a carpet of warm, festive colors in your flowerbed! This Mexican zinnia blend is very heat and drought tolerant. Delightful cut flower.

H • A ☼ 12"–16" tall

#1193 \$1.99 300mg (~180 seeds)

EXCLUSIVE

Zinnia
Thumbelina

why do you grow organically

Growing organically produces more nutrient vegetables, heals the soil as well as protects our families' health both body and mind.

I am a science-based person and know that less is more when it comes to soil health and the soil is the base for the seeds' nutrient.

It also means we get healthier compost when we compost whatever vegetable scraps we have.

So the cycle of health continues on and on.

more ORGANICS

At Botanical Interests, we believe gardening in harmony with nature is best, which is why our seeds are not treated, and non-GMO, as well as Non-GMO Project Verified—a third-party that tests for GMO contamination. We carry over 200 varieties that are certified organic, a number that we strive to increase each year as we test and add more organic options.

All of our seed packets and online instructional materials encourage organic gardening methods taking a natural approach to garden pests, weeds, and soil enrichment while providing complete and

easy-to-follow instructions. With these methods, you can grow nutritious vegetables and beautiful flowers in your own garden.

Gardening organically works with nature to nurture pollinators, other wildlife, and the environment we all share and depend on. That is what drives our passion for organic gardening and natural seed, and it's fulfilling to share these values and high-quality varieties with gardeners like you!

POPPY CORN *Amazing Grey* *Papaver rhoeas*

ANNUAL FULL SUN

Blooms in spring
and summer
15"-27" tall

Amazing is right! This stunning award-winning introduction is quick to bloom and the color is steely, moody, and awe-inspiring.

Botanical INTERESTS®

Amazing is right! Crepe-paper like blossoms unfurl into single and half-double steely flowers, each unique and awe-inspiring. Bred over 18 years from a single bloom in the Mother of Pearl poppy blend, the breeder isolated the purple-grey flowers. A practically care-free annual and a pollinator favorite, these poppies reseed making them ideal for naturalized areas. A 2018 Fleuroselect Novelty award winner.
