DRTrack 2019.4.1 Release Highlights

This document briefly outlines items included in the DRTrack 2019.4.1 software update. DRTrack releases and updates are cumulative, meaning they include all items from previously released versions in the same number series, and any changes and updates completed since the last update in the same series. The last update in this series was DRTrack 2019.4 (Jan 2020).

New Items/Enhancements in This Release

Category	Service
Config/Admin	Created a configurable page banner that can be turned on/off and displayed on customer pages to notify users of temporary issues, i.e. maintenance updates or performance issues that are known and being corrected. The banner can be built into the admin pages for use by customers; it is easily configurable and will display on every page. If two banners are created simultaneously (one by Trimble, one by customer), the Trimble banner would take precedence over the customer banner.
Device Manager/ Routes Page	Increased the maximum limit of GPS points to be pulled/located from 400 to 2000, allowing for significantly faster and accurate device location tracking reporting.
Web Service	Improved the Account Provisioning process by creating a new ImportUsers API to replace the previous file transfer. The file size in the previous file transfer sent every 30 minutes, caused a loss of user access to DRT. The new API is intended to send a smaller file, contain only modifications and deletions (users) performed within a certain time frame, and should not affect DRTrack access during the file transfer.

Issues Resolved in This Release

Category	Service
Web Service	Corrected/Added missing sproc (usp_GetEmailListForAssetTransByBranch) to the db mod script.
