Changes and improvements since version 1.6.....	4
New in version 1.6.....	4

Note regarding installation on Windows 7 or Windows 2008 Server

In case of installation of version 1.8 on Windows 7 or Windows 2008 Server, an error message can appear when launching the installer.

If it happens, please install the required Windows KB as described in this procedure : <http://support.woody-technologies.com/solution/articles/24000013495-installation-of-64-bits-version-of-woody-products-causes-error-on-some-operating-systems>

Changes and improvements in version 1.8.019

Sequence analysis

- Avid Interplay sequence analysis has been improved to support more cases without transcode. It includes various audio mixdown methods and subclips usage.

Monitoring

- Monitoring depth and responsiveness has been improved.

API

- An issue affecting the DELETE job command has been fixed.

Woody Outgest – known limitations

Profiles configuration

- When renaming clip using Static metadata containing space, the space will be replaced by two underscores.

Special characters

- In A/V File + Metadata mode, the presence of special characters in target filenames can cause delivery errors. We recommend to user special characters filtering rules available in the Setup tab.

Watchfolders

- After saving a watchfolder, if you switch to another tab immediately, this could make the watchfolder disappear . If this happens, click on **Import Watchfolder** in the Setup tab to get the watchfolder back.

Woody Outgest – details

Profiles import

- [Woody Outgest](#) version 1.8 can import profiles from version 1.6 to the current version.

New in version 1.8.016

Locators extraction

- [Woody Outgest](#) can now extract locators from source clips and sequences. They are available in the output XML structure.

Audio tracks

- The minimum and maximum number of output audio tracks can now be configured in [Woody Outgest](#). It is also possible to determine a fixed number of audio tracks.

Interplay watchfolders

- The Interplay engine settings can now be configured independently for each watchfolder, allowing [Woody Outgest](#) to work with multiple Interplay instances.

Outgest streams

- The maximum number of Outgest streams has been increased to 16 in this version.

New in version 1.8.000

Full 64 bits architecture

- All [Woody Outgest](#) components are now running in 64 bits. The new installation folder of [Woody Outgest](#) is `C:\Program Files\Woody Technologies\Woody Outgest`.

Audio streams management

- In A/V File + Metadata mode, a new option is available in [Woody Outgest](#) profiles, to determine how many audio channels will be included in one target audio stream. The values of this parameter can be “=Source”, Mono, Stereo and Quad.

Changes and improvements since version 1.7

Desktop icon

- The desktop icon of [Woody Outgest](#) has been updated.

Logs

- In previous versions of [Woody Outgest](#), the default log level of some components were very high, which could cause excessive disk space usage. The default log level has been adjusted.

New in version 1.7

FTP delivery

- When using the A/V File + Metadata mode, the FTP/FTPS delivery is now available. Media and metadata can be sent on a FTP or FTPS server.

Metadata

- The metadata scheme has been redesigned and enhanced. This modification applies for the A/V File + Metadata mode, along with the file notification and http notification in other modes.

For further information on the metadata scheme, please refer to the [Woody Outgest](#) documentation.

Logs management

- Cleaning logs on a daily basis is now possible in [Woody Outgest](#). The logs will be zipped and saved before deletion. Manual logs cleaning is also possible.
- The log files can now be downloaded from the [Woody Outgest](#) configuration page in order to easily send it to the Woody support team.

Changes and improvements since version 1.6

Profiles

- Improve of the profiles configuration translation.

New in version 1.6

Post-processing notifications

- A new option **File** is available in the post-processing part of **Woody Outgest** profiles. This new kind of notification allow to create a file in a local or network folder. The target format of this file (xml, json...) can be customized, using a XSL transformation.
