

## Color Your Mood Crystal Jewelry

### Crystal Growing Tips

1. Make sure the plastic container is clean. If you are reheating an existing solution, there is no need to clean it out, but be sure there is no external dirt. If so, remove with a spoon before heating or mixing.
2. If you have tried using tap water without success, use the second packet with bottled/purified water. If you tried bottled/purified, try tap water.
3. Make sure water is hot. If only warm, powder may not dissolve. If reheating, make sure you heat the water and crunch up the existing crystals as much as possible. Keep reheating until it fully dissolves and water becomes clear.
4. After heating & mixing, loosely cover the container with a paper towel. It shouldn't be sealed, or left uncovered.
5. Heat & humidity in the room can effect crystal growth due to the evaporation rate that creates the crystals. If it's very humid, try using a small fan nearby (though not pointed directly at the container)
6. Make sure the container is not bumped at all. Even a slight vibration could prevent the crystals from forming. It should remain totally undisturbed.
