## Error by executing Car rental(mobile) on Android virtual device

I am trying to run mobile applications on the Android emulator.

Before I go into detail, I wanted to take overview by running the demo, Car rental(mobile).

On the test module, I only see the error message like :

The test module seems to fail starting the application.

I think that the connection between the emulator and TestArchitect is OK since

I can start Car Rental from Applications Under Test of Android Instrumentation Tool.

Am I missing some steps for setting up the environment to execute the test?

Test environment:

AVD spec	Host spec
API leve:24	Windows 10
Version:7.0	TestArchitect 8.4

I appreciate any information of you.
